Welcome to Change Manager

Embarcadero® Change Manager™ offers database administrators and developers a powerful tool to simplify and automate the database change management lifecycle. The schema compare and alter, data compare and synchronization, and configuration auditing capabilities let you report on database changes, roll out new releases, and troubleshoot database performance problems that result from both planned and unplanned changes. Change Manager supports IBM® DB2® for LUW, Microsoft® SQL Server, Oracle®, and Sybase®. Change Manager is available as a stand-alone application or as an Eclipse plug-in.

[Welcome to Change Manager](#)

[Using Change Manager](#)

[Configuring Change Manager](#)

[Reference](#)

Technical Requirements

Before installing Change Manager, verify that your environment meets the following requirements.

Hardware Requirements

The following minimum hardware requirements are required to run Change Manager:

- 1.2 GHz processor
- 1 GB of RAM
- 500 MB of hard disk space (more space is recommended for large data source comparisons)
- High resolution monitor (1024 x 768), 16-bit display (or greater)
- Internet Explorer 6 Service Pack 1 or later (Windows) or Mozilla (Linux)

Operating System Requirements

Change Manager supports the following operating systems:

- Microsoft Windows XP (x86-32, Win32)
- Microsoft Windows Server 2003
- Microsoft Windows Vista

DBMS Support

Change Manager supports the following platforms:

- IBM DB2 LUW 8.0 - 9.5
- Oracle 8i - 11g
- Microsoft SQL Server 2000, 2005, and 2008
- Sybase ASE 12.5 and 15, 15.0.1, and 15.0.2

Installation Notes

Change Manager can be installed as a standalone application (RCP installation) or as an Eclipse plug-in (Plug-in Installation). Eclipse is an open source development framework that supports application plug-ins to provide additional functionality.

The Eclipse plug-in version of Change Manager requires Eclipse version 3.3 or higher, and Sun Java Standard Edition 5.0 Update 11 or later, in addition to regular system requirements.

Before installing the plug-in version of Change Manager, ensure that Eclipse and Java are installed on your machine. You can download Eclipse from the following Web site: <http://www.eclipse.org/downloads>.

Additional Product Information

The Embarcadero Web site is an excellent source for additional product information, including white papers, articles, FAQs, discussion groups, and the Embarcadero Knowledge Base.

Using Change Manager

This section contains information on how to implement Change Manager on a new machine and additional, basic functionality and procedures that will enable you to begin using the product almost immediately upon installation.

This section contains the following topics:

[Registering Data Sources](#)

[Navigating the Workbench](#)

[Using Basic Commands](#)

[Comparing Data](#)

[Masking Data](#)

[Comparing Configurations](#)

[Creating a Configuration Standard](#)

[Creating a Configuration Archive](#)

[Comparing Schemas](#)

[Creating a Schema Archive](#)

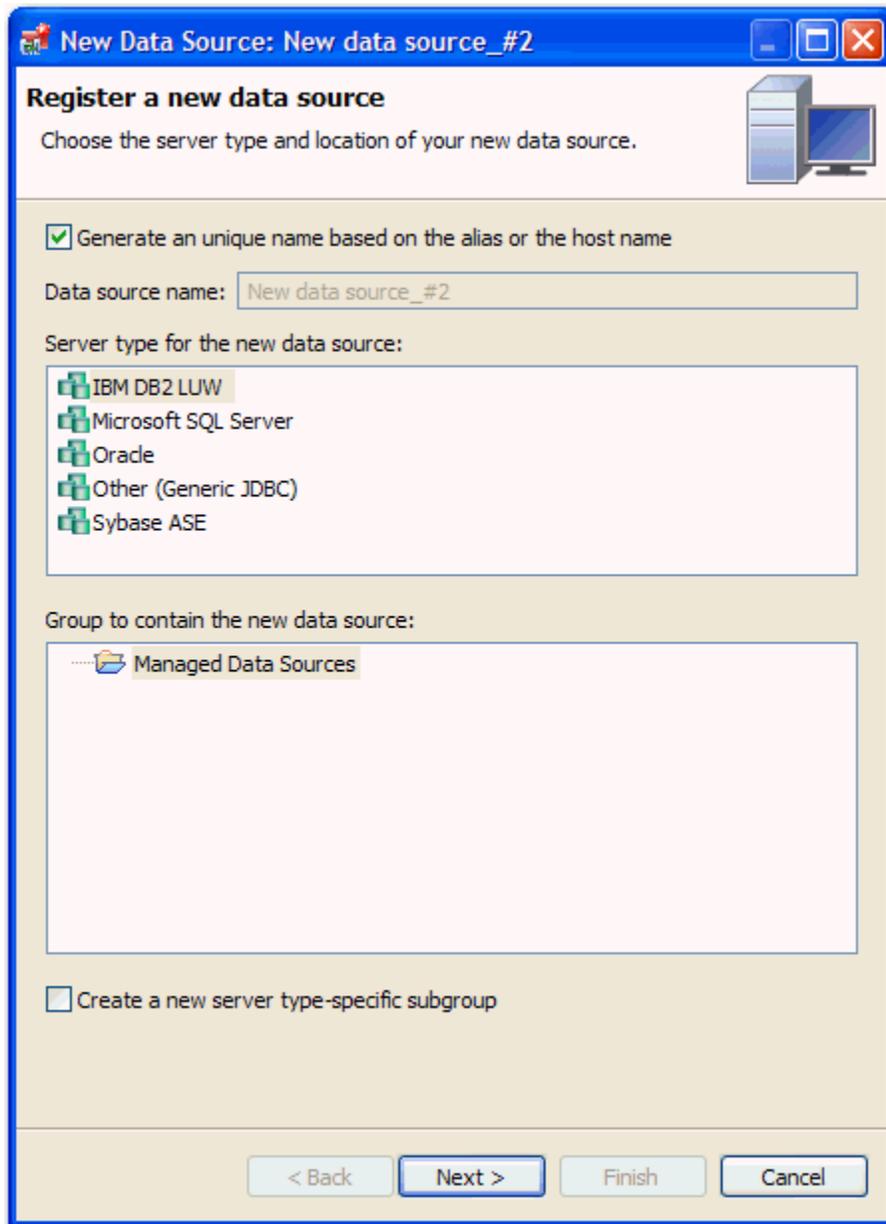

Registering Data Sources

When you execute comparison jobs, [Data Source Explorer](#) provides a tree view of data sources to use in the jobs. Data sources must be registered with the application prior to using them in jobs.

If a data source is not present in the registry, but you need to add it to **Data Source Explorer**, you can manually add it by right-clicking on the **Managed Data Sources** node in **Data Source Explorer** and selecting **New > Data Source**.

To register a new data source:

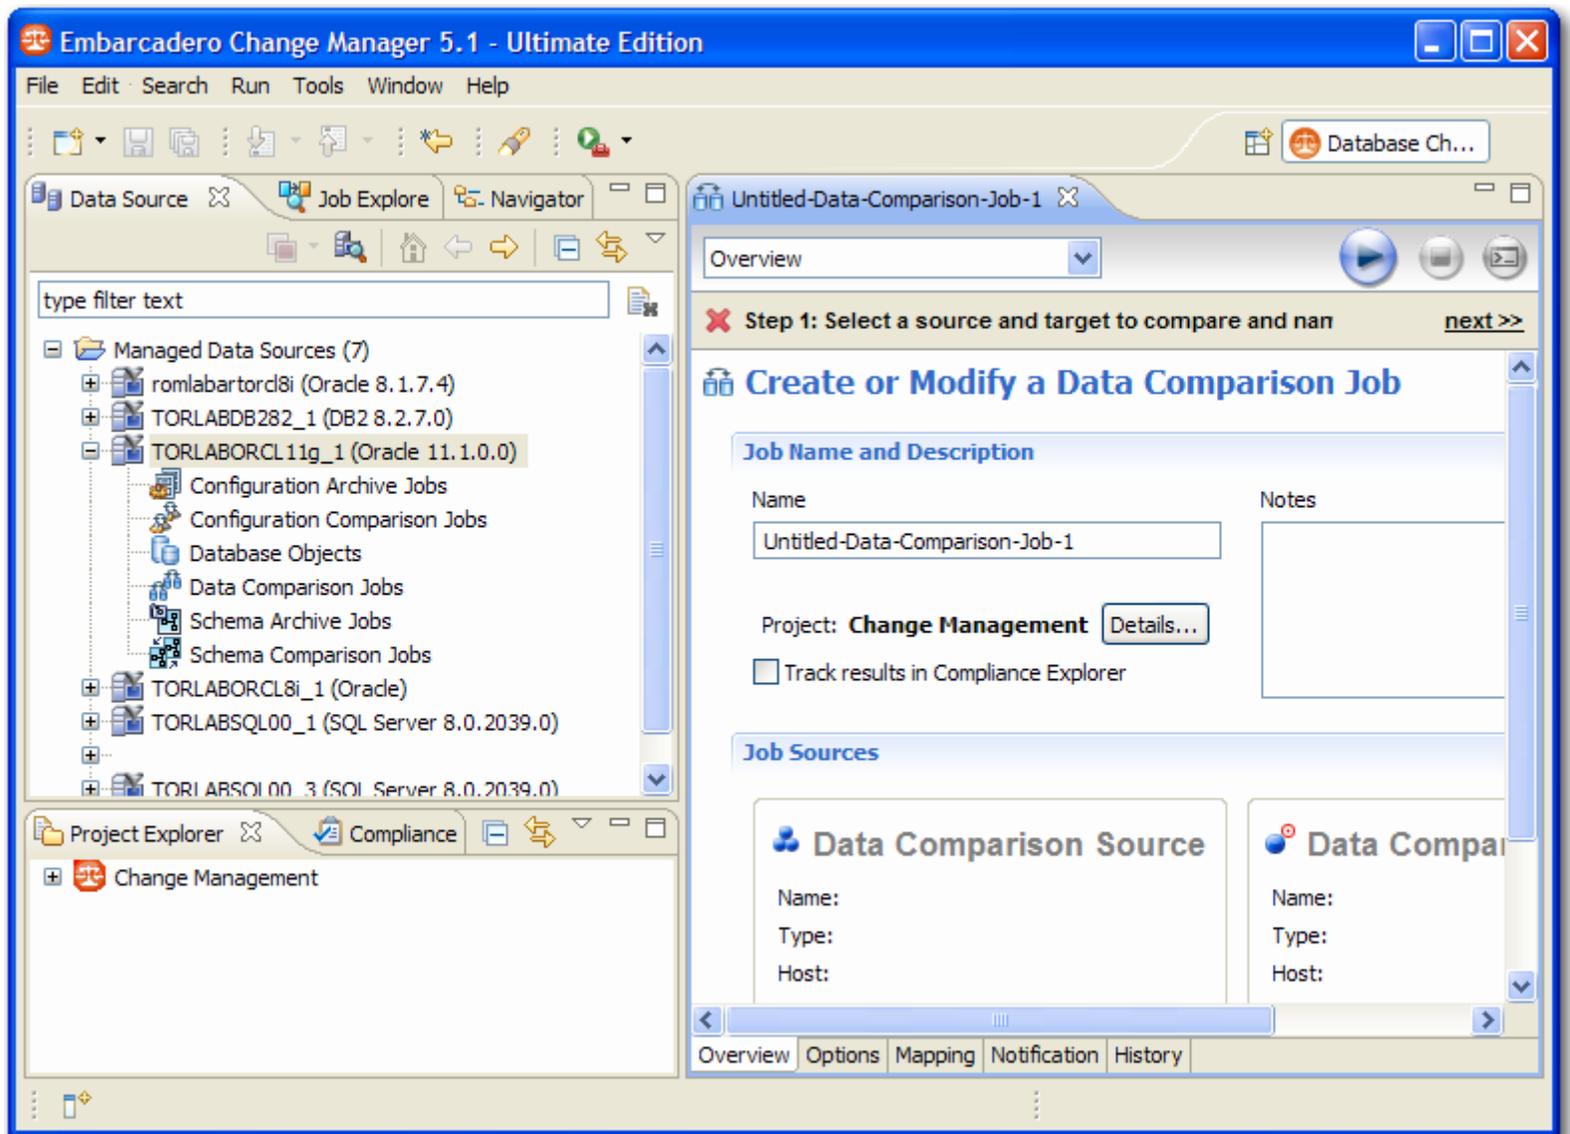

- 1 Right-click the **Managed Data Sources** node in **Data Source Explorer** and select **New > Data Source**. The Data Source Wizard appears.

- 2 Follow the steps in the Data Source Wizard by selecting the data source platform and entering the appropriate connectivity parameters in the fields provided. When you have completed this task click **OK**.
- 3 The new data source appears under the Data Source Group you specified and can be used immediately in comparison jobs.

Navigating the Workbench

The Workbench is the Change Manager development environment. It provides users with the interface to create, manage, and navigate comparison jobs through interaction with Views, Editors, and menus.

The Change Manager environment is composed of a number of common interface elements to help you navigate and work inside the application environment. The individual parts of the Workbench share certain elements in common and provide you with a uniform system for working in Change Manager. Additionally, most of the interface components synchronize with one another, where one interface component on its own is dependant on other interface components to function as a whole.

It is important to understand how these components work individually as well as together. A basic understanding of how these parts function will enable a DBA to work faster and more efficiently within the product. This will also aid in system customization to tailor the application to individual needs and development requirements.

The following interface components compose the Change Manager work environment:

[Welcome Page](#)

[Workbench Space](#)

[Views](#)

[Job Explorer](#)

[Data Source Explorer](#)

[Project Explorer](#)

[Navigator](#)

[Compliance](#)

[SQL Errors View](#)

[Data Diff View](#)

[SQL Log](#)

[SQL Errors Log](#)

[Table Constraints View](#)

[Search View](#)

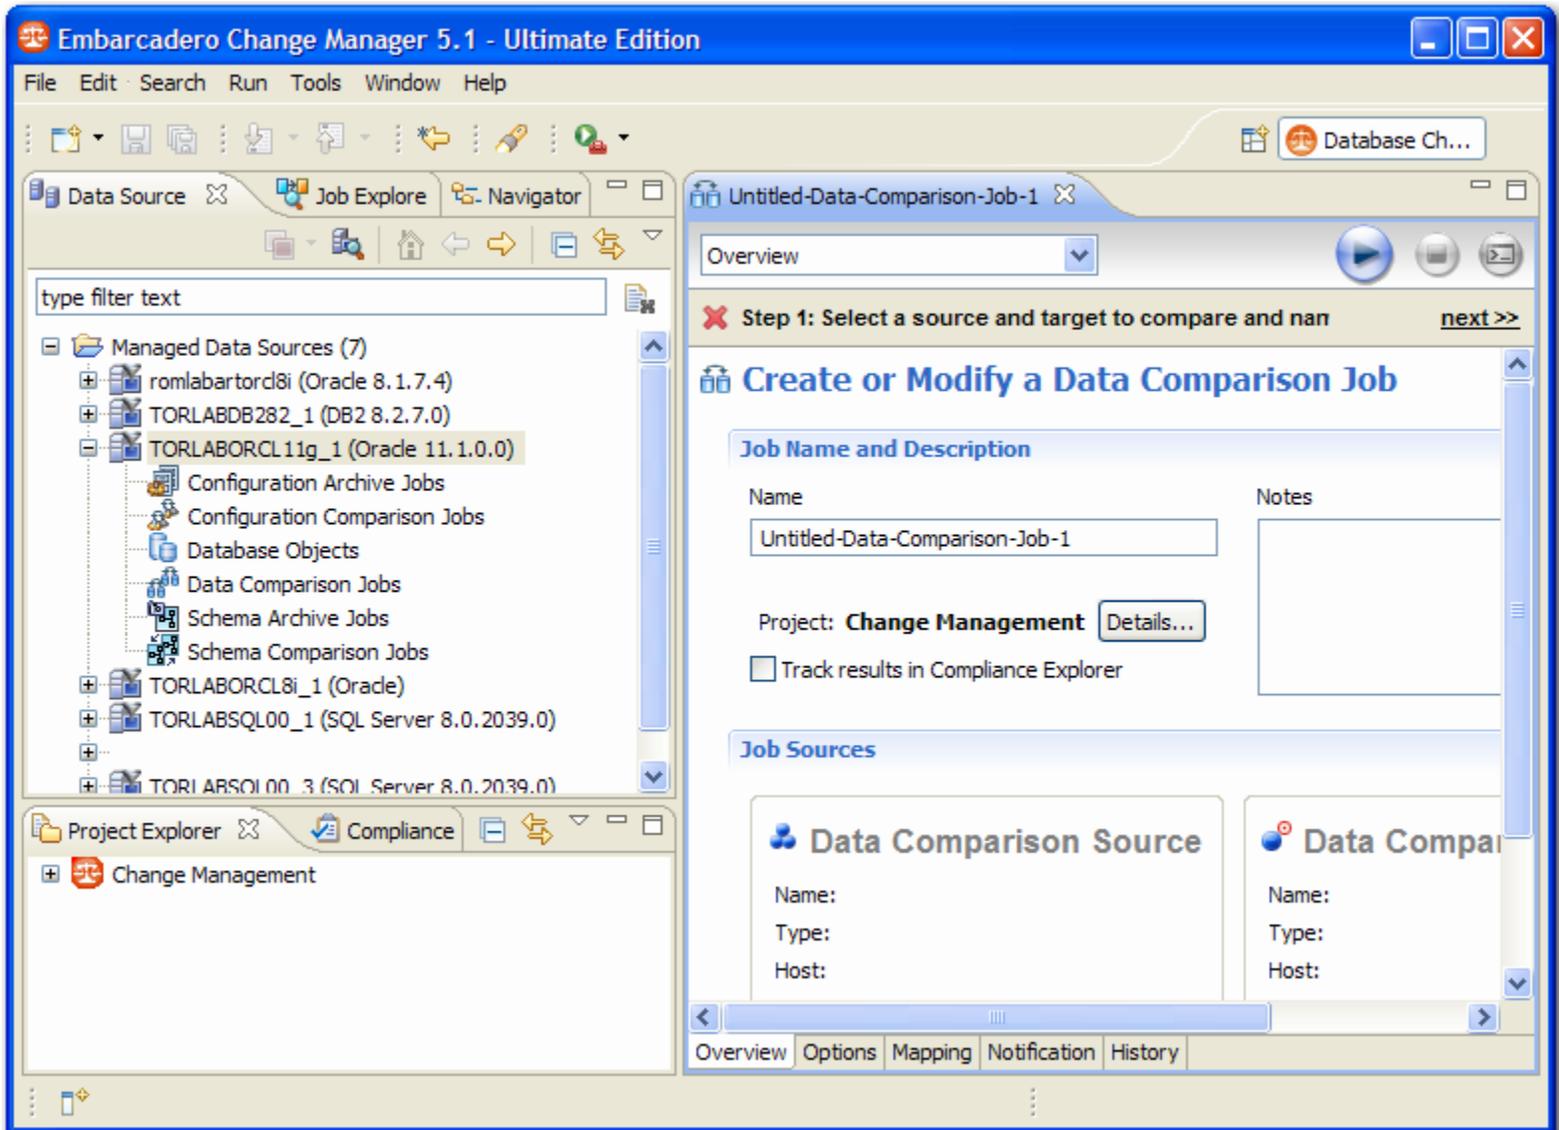

Welcome Page

The Welcome page is the first screen a user encounters when Change Manager is launched. It is composed of icons that are clicked to access tutorials and other information to help you get started. The Welcome page is intended to provide easy access to information that may be of value to new users.

Each module can be accessed directly via the **Welcome** page by clicking on its name. Additionally, a **Workbench** link is offered, which takes you to the Workbench space rather than opening one of the specified jobs. You can choose to open the Welcome page each time you start Change Manager by selecting the **Show on Startup** check box.

Workbench Space

The Workbench is the Change Manager desktop development framework. It provides users with an interface to register, manage, and compare data sources through interaction with Views and Editors.

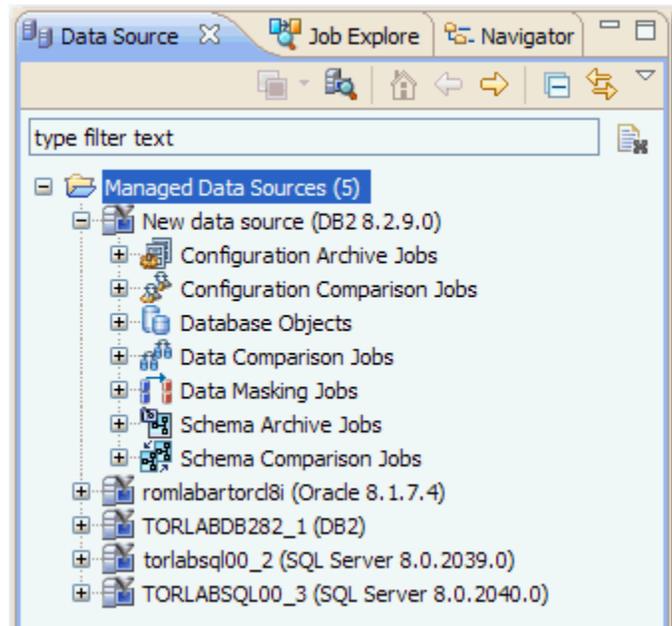

The Workbench Space is composed of Views and Editors (described below), as well as the Menu Bar and Command Toolbar.

- The **Menu Bar** contains command menus. These commands enable users to control Change Manager functionality and processes, and are either specific to the whole application, or individual Views and Editors, depending on the currently-selected frame in the Workbench Space.
- The **Command Toolbar** provides icons that issue common Menu Bar commands.

Views

A View is a Workbench interface component typically used to navigate a hierarchy of information (such as resources in the Workbench), open Editors for data source comparison purposes, or display the properties of various elements.

Views support Data and Configuration Comparison Editors and provide alternative presentations or navigations of the information in the Workbench. For example, Data Source Explorer provides a list of all registered data sources in Change Manager, organized by group folder.

Views can be active or inactive, but only one view can be active at any one time. An active view will have its title highlighted and is the target for common commands such as cut, copy, and paste. Views can be stacked with other views to create tabbed notebooks and all views contain two command menus -- one accessed by right-clicking the View tab, and the second by clicking the icon in the View Toolbar. These menus will contain Menu Bar commands pertinent to the selected View.

The following navigation actions can be performed on Views:

Move a View

Click the tab of the View and drag your mouse. A frame indicates where the view will fit in the Workbench Space. Release the button to move the View to its new location.

Toggle a 'Floating' View

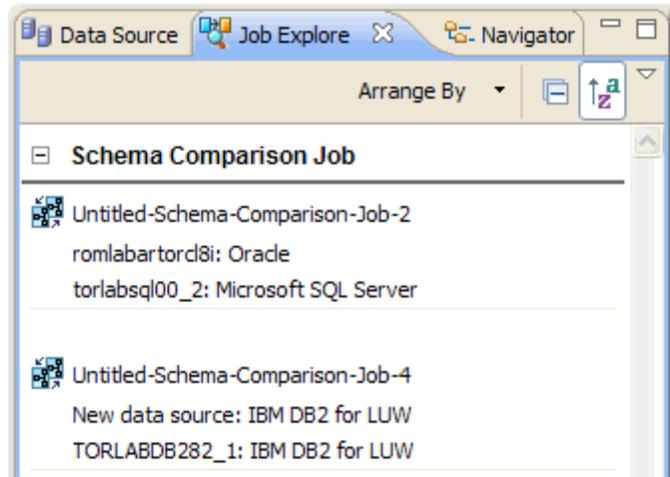

Right-click the tab of the View and select Detached. The View switches to a 'floating' window format that can be used to position it overtop of 'embedded' views in the Workbench Space, as needed.

Build a Stacked View

Drag the View over another View and release the mouse button when the frames meet. Both Views overlap and create a tabbed 'book' within the same frame. Multiple Views can be combined in this format.

Job Explorer

Job Explorer provides an interface for managing existing jobs in Change Manager.

Jobs are organized by date created, source and target platform types, last modified, last executed, job name, data source name, job type and module, job type, and module.

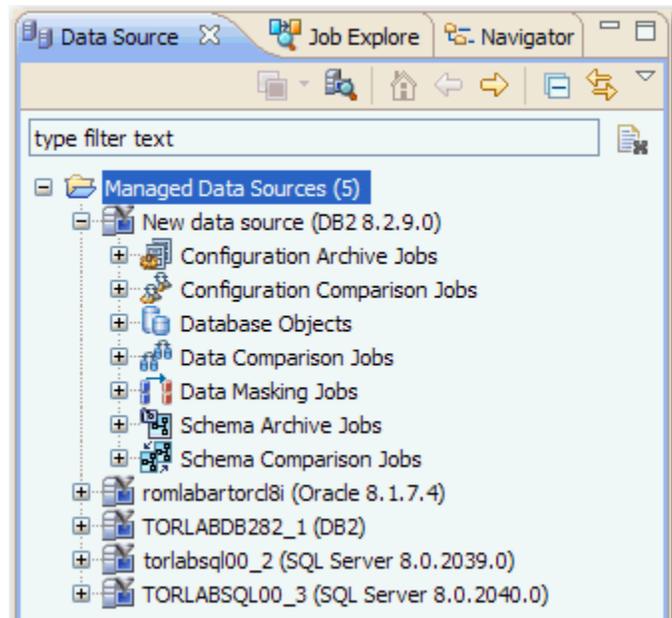

Use Job Explorer when searching for jobs of a specific type or name.

To view jobs in Job Explorer

- 1 Navigate to Job Explorer and click **Arrange By** to view a list of categories by which you can organize the View.
- 2 Select a category. Job Explorer displays all jobs based on your new selection.
- 3 Double-click a job to open it in its respective Editor.

Data Source Explorer

Data Source Explorer provides an organizational tree of registered data sources and the comparison jobs and archives associated with them.

Data sources are registered and managed in **Data Source Explorer**. Each time a new data source is registered, its connection information must be specified, and it should be organized in the View, as needed.

Once a data source has been registered, it remains stored in a catalog and does not need to be re-registered each time you open Change Manager. It can be used in multiple jobs, archived, or otherwise 'shared' with regards to the general functionality of the application.

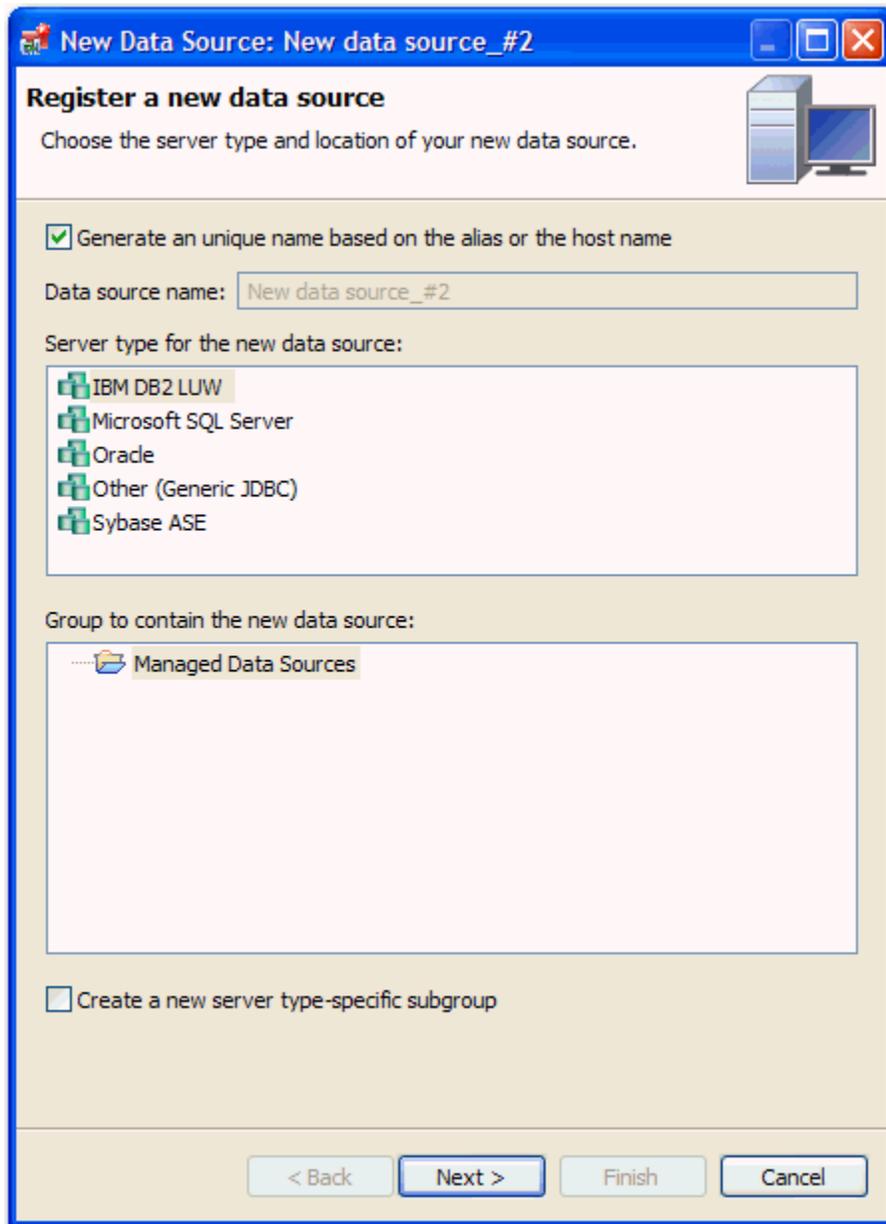

In addition to displaying registered data sources, Data Source Explorer also organizes the Change Manager jobs associated with a data source, and any configuration archives that have been generated. These jobs appear as nodes beneath the specified data source.

Additionally, you can filter the view in the tree based on working sets. A working set is a collection of user-defined data sources that can be organized, as needed, in Change Manager. Click the menu icon in the **Data Source Explorer** toolbar and choose **Select Working Set**. In the **Select Working Set** dialog, choose a working set from the list or click **New** to define one.

When you select a working set, **Data Source Explorer** only shows those data sources you specified for the set. To change the view back to the default tree, click the menu icon and choose **Deselect Working Set**.

To add a data source

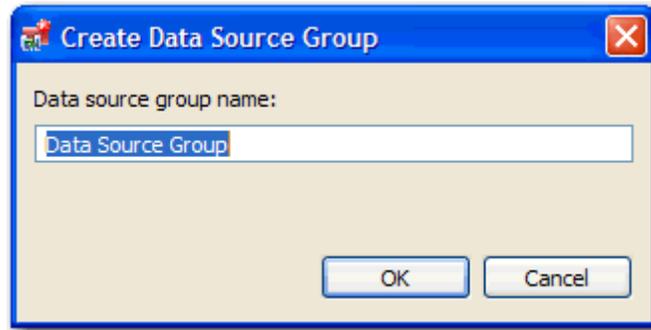

- 1 Right-click on the **Managed Data Sources** node in **Data Source Explorer** and select **New > Data Source**. The **Add Data Source** dialog appears.

- 2 Follow the steps in the Data Source Wizard by selecting the data source platform and entering the appropriate connectivity parameters in the fields provided. Click **OK** when you are finished. The new data source appears in Data Source Explorer.

To create Data Source Group folders and organize Data Source Explorer objects

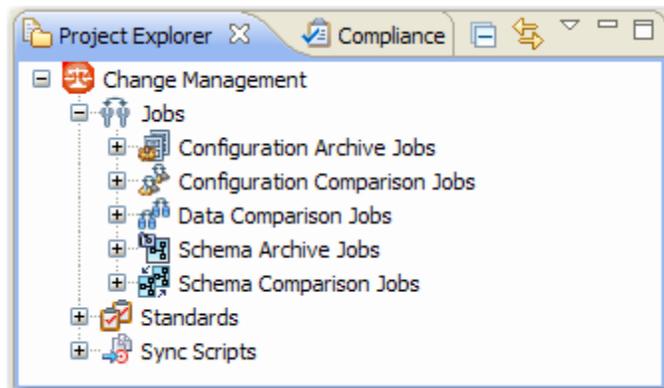

- 1 Right-click on the **Managed Data Sources** node in **Data Source Explorer** and select **New > Data Source Group**. The **Create Data Source Group** dialog appears.

- 2 Enter a meaningful name for the new group in the **Name** field and choose a parent folder, if any.
- 3 Click **Finish**. The **Data Source Group** folder is added to **Data Source Explorer**. You can drag and drop data sources in the folder or add new data sources to the folder, as required.

Project Explorer

Project Explorer provides a view that organizes jobs, standards, and synchronization scripts into a tree-structured project folders for management and source control purposes.

Each branch of the tree is organized by **Jobs**, **Standards**, and **Sync Scripts**, respectively. Elements can be accessed by expanding the specified branch and double-clicking on the it.

For example, if you wanted to open an existing **Data Comparison Job**, you would navigate to the **Jobs > Data Comparison Jobs** node and double-click the job to open it in the **Data Comparison Job Editor**.

Files contained in a project can be shared by a group of administrators by connecting it to a source code control and then accessed via the **Navigator**.

Standards are created via the [Configuration Standard Editor](#) and provide a customized list of configuration properties to use in configuration comparison jobs. Once a Standard has been defined, it automatically appears Project Explorer and can be assigned to configuration jobs, or modified, as required.

Sync Scripts are generated by the system whenever a synchronization job is run. Synchronization scripts are created in the [Data Comparison Job Editor](#) and [Schema Comparison Job Editor](#), respectively.

You can also create project folders to further organize and manage your jobs via the **File > New > Project** command in the Main Menu. When you create a new project, a folder is added to **Project Explorer** with the name that you specified. Files can then be added and deleted under this folder by dragging and dropping them from the **Change Management** branch.

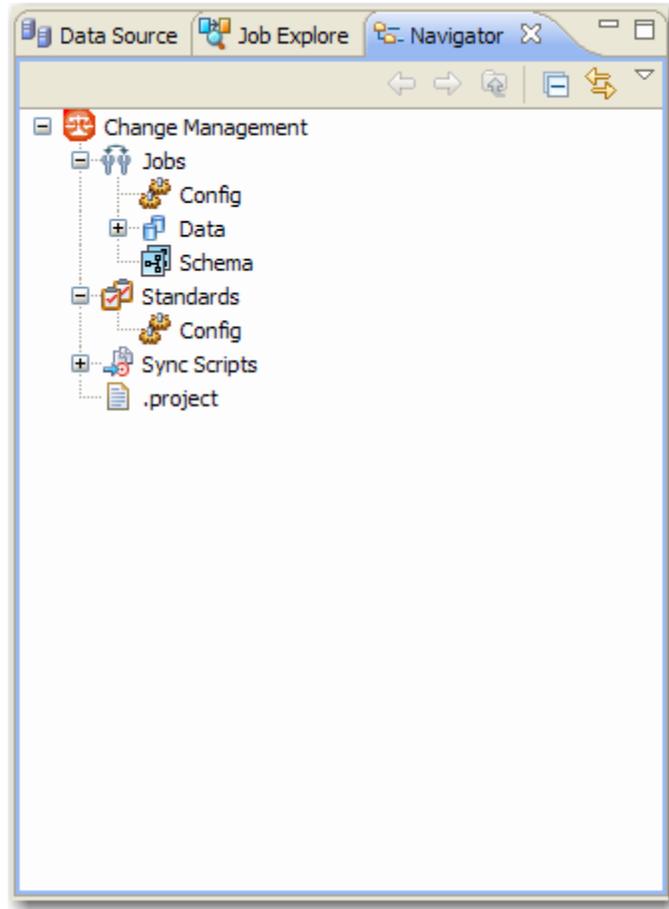

To create a new project:

- 1 Select **File > New > Project**. The **New Project** wizard appears.
- 2 Expand the **General Node** and select **Project**. Click **Next**.
- 3 Type a project name into the field provided. The **Location** field indicates where the project files are stored on your machine. By default, all project data is stored in the location where you installed **Change Manger**. If you want to change this location, de-select the **Use Default Location** check box and define a new directory location in the field provided.
- 4 Click **Finish**. The new project folder appears in **Project Explorer**. You can drag and drop files from the **Change Management** branch to the new folder or otherwise organize your files, as needed.

Navigator

The **Navigator** provides a tree of all files in each of your projects.

You use the Navigator to share files via a source control system for jobs, results output, standards, and synchronization scripts.

Whenever a job, Standard, or synchronization script is generated by the system, its output is saved to a file that is stored in a directory and displayed in the **Navigator** tree. These files can then be shared in a team environment for the purposes of administering and developing the data source enterprise.

All jobs, synchronization scripts, and archive versions are stored in XML format, so that objects can be merged and differentiated between different versions of the same object.

Before you can implement source code control, you need to install a third-party plug-in and the appropriate client tools. See [Using Source Control Systems](#) for more information on this process and what it involves.

Compliance

The **Compliance** view enables users to quickly reference all configuration comparison jobs and schema comparison jobs that have been saved in Change Manager, and determines if those jobs are currently in compliance with organization standards, or contain modified properties.

	Job	Last Run	Last Failed
✘	No CLR	May 22, 2007	May 22, 2007
✘	My Comparison Job	May 22, 2007	May 22, 2007
✔	Job 2	May 21, 2007	Never
✔	Job 3	May 22, 2007	Mar 29, 2007
✔	Job 4	May 21, 2007	Never
✔	Job 5	May 21, 2007	Never

The **Compliance** view contains a list of any configuration or schema comparison jobs that have been run and specifies:

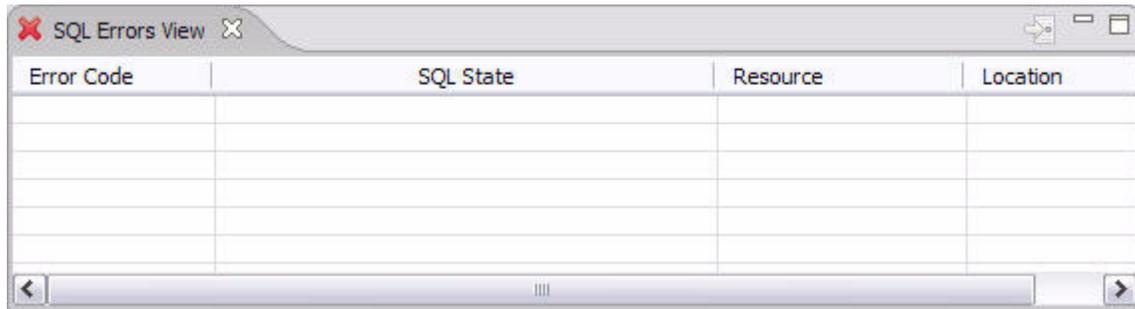

- the last time the job was executed.
- the last time the job failed, if applicable.

To enable a job in the **Compliance** view, you must enable the **Track Results in Compliance Editor** check box on the **Overview** tab of the specified job.

SQL Errors View

When comparison jobs are executed in Change Manager, a SQL script can be generated that provides synchronization code to balance the data repositories of the two comparison data sources. A synchronization script can be saved and retrieved at any time, and executed within the application.

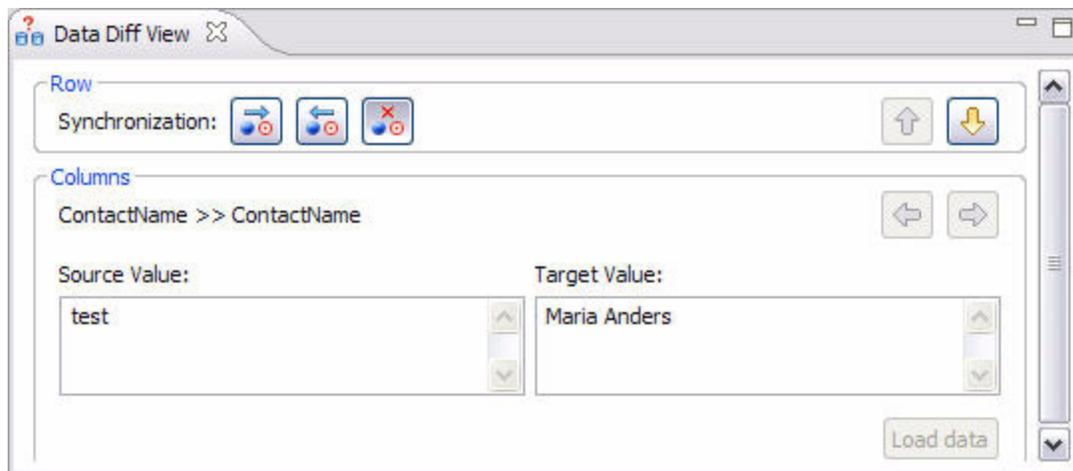

The **SQL Errors** view logs any errors that may occur when executing SQL scripts within Change Manager.

SQL Errors are listed by SQL **Error Code**, **SQL State**, **Resource**, and **Location**.

Data Diff View

The **Data Diff** view displays the values of a mismatched row pairs when viewing the results of a data comparison job. The view contains row synchronization icons and the specific data values of a selected pair.

You can specify how data is resolved in the **Data Diff** view by selecting one of the appropriate icons beside the **Synchronization** prompt. By row, you can choose to **Make Target Match Source for Selected Row**, **Make Source Match Target for Selected Row**, or **Do Not Resolve Selected Row**, respectively.

You can add the **Data Diff View** to the Workbench by selecting **Window > Show View > Data Diff View**.

This view enables you to specify changes without resolving the repositories of both data sources via synchronization scripts.

SQL Log

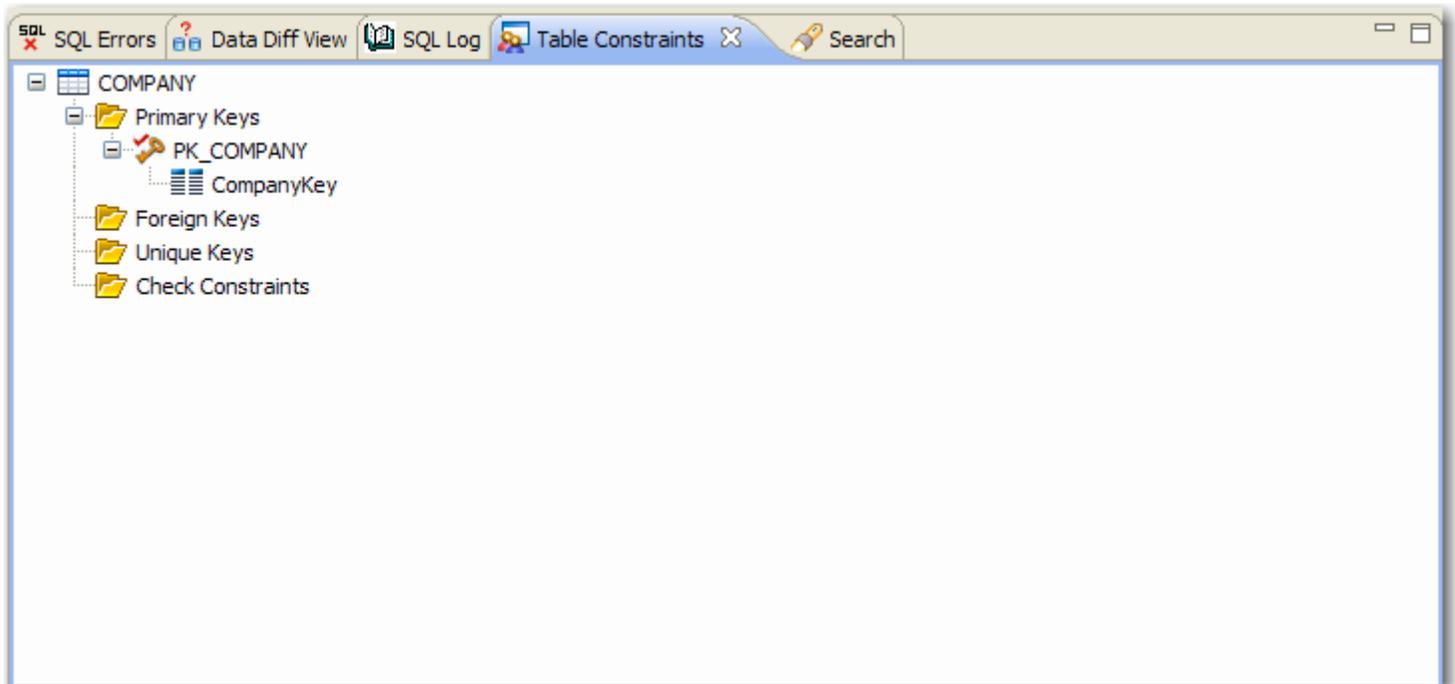

The **SQL Log** captures all SQL commands executed by SQL Editor and the system. **SQL Log** entries are listed by **SQL Statement** name, **Date** issued, **Host/Server**, **Service**, **User**, **Source**, and the **Time** (in milliseconds) it took to execute the command.

SQL Errors Log

The **SQL Errors** log automatically logs all SQL errors encountered when SQL commands are executed through Change Manager. Errors are listed by **Error Code**, **SQL State**, error **Details**, **Resource**, and the **Location** of the error in the SQL file.

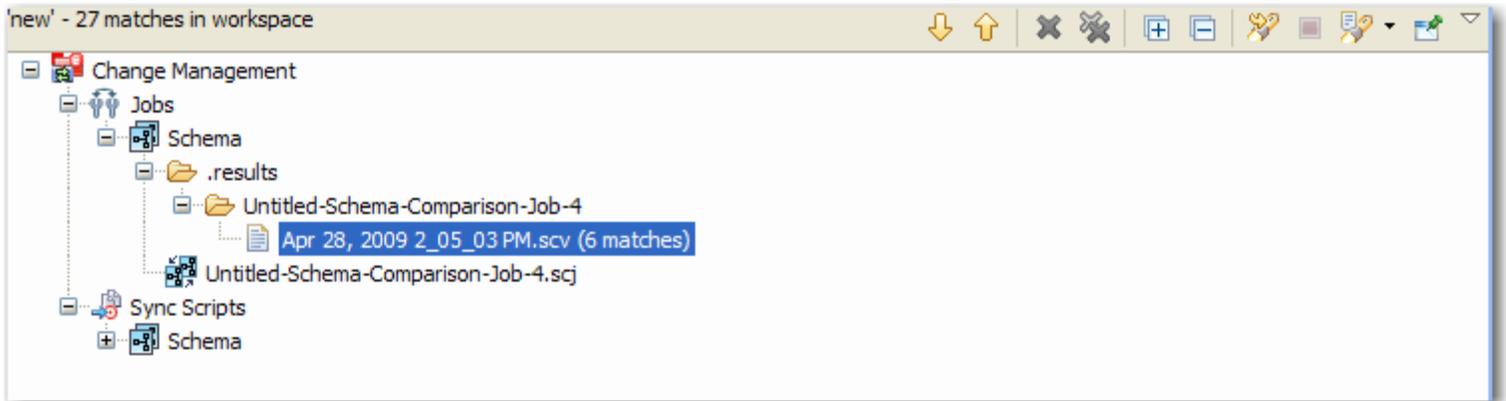

Table Constraints View

The **Table Constraints** view displays the table constraints of a selected table. It organizes constraint information into folders and nodes that consist of **Primary Keys**, **Foreign Keys**, **Unique Keys**, and **Check Constraints**.

Search View

The **Search** view displays result values when you issue the **Search** command from the Main Menu.

The returned results are organized by the job type where the file resides, or by synchronization script, depending on the scope that you specified. Navigate to the file that you want to open and double-click it. The file will open in a separate editor window.

Additionally, the **Search** view Toolbar provides common commands that enhance the functionality of the view. This includes shortcuts to Search function preferences, a filter option when viewing results, and history commands to return or review old search results.

For more information on searching for files in Change Manager, see [Searching for Database Objects and Synchronization Scripts](#).

Editors

Editors are workbench interface components that enable Change Manager processes. That is, data, configuration, and schema comparison jobs. Editors are treated differently than views because as stand-alone components, they function at an individual level rather than a supportive one.

[Data Comparison Job Editor](#)

[Configuration Comparison Job Editor](#)

[Configuration Standard Editor](#)

[Configuration Archive Editor](#)

[Schema Comparison Job Editor](#)

[Schema Archive Editor](#)

[SQL Editor](#)

The following navigational-type actions can be performed on all Editors in general:

Move an Editor

Click the tab of the Editor and drag your mouse. A frame indicates where the Editor will fit in the Workbench Space. Release the button to move the Editor to its new location.

Build a Tabbed Notebook

Drag the Editor over another Editor and release the mouse button when the frames meet. Both Editors overlap and create a tabbed 'book' within the same frame. Multiple Editors can be combined in this format.

Data Comparison Job Editor

The Data Comparison Job Editor compares the data repositories of two specified data sources at the table and row levels. Additionally, the editor provides the ability to specify table mappings and further manipulate data via matching functions that synchronize it at the global, table, and row level, as specified by the user, and provides high-level mapping/refinement options for a job, based on data source (database, schema, or owner selection).

For more information on comparing the data repositories of two specified data sources, see [Comparing Data](#).

Configuration Comparison Job Editor

The Configuration Comparison Job Editor compares the configuration settings of two specified data sources. Additional, the Editor provides the ability to define standard settings templates and archive individual data source properties to be used in comparison jobs.

For more information on comparing the configuration settings of two specified data sources, see [Comparing Configurations](#).

Databases:

Overview Options Mapping Notification History

Configuration Standard Editor

The Configuration Standard Editor provides an interface for creating a configuration Standard in Change Manager. Configuration Standards are used to provide customized data source configuration properties, and, once defined, are used in configuration comparison jobs against data sources and archives to provide a specific set of values and threshold operators that 'check' enterprise settings and ensure all network system configuration values fall within acceptable ranges.

For more information on creating configuration Standards, see [Creating a Configuration Standard](#).

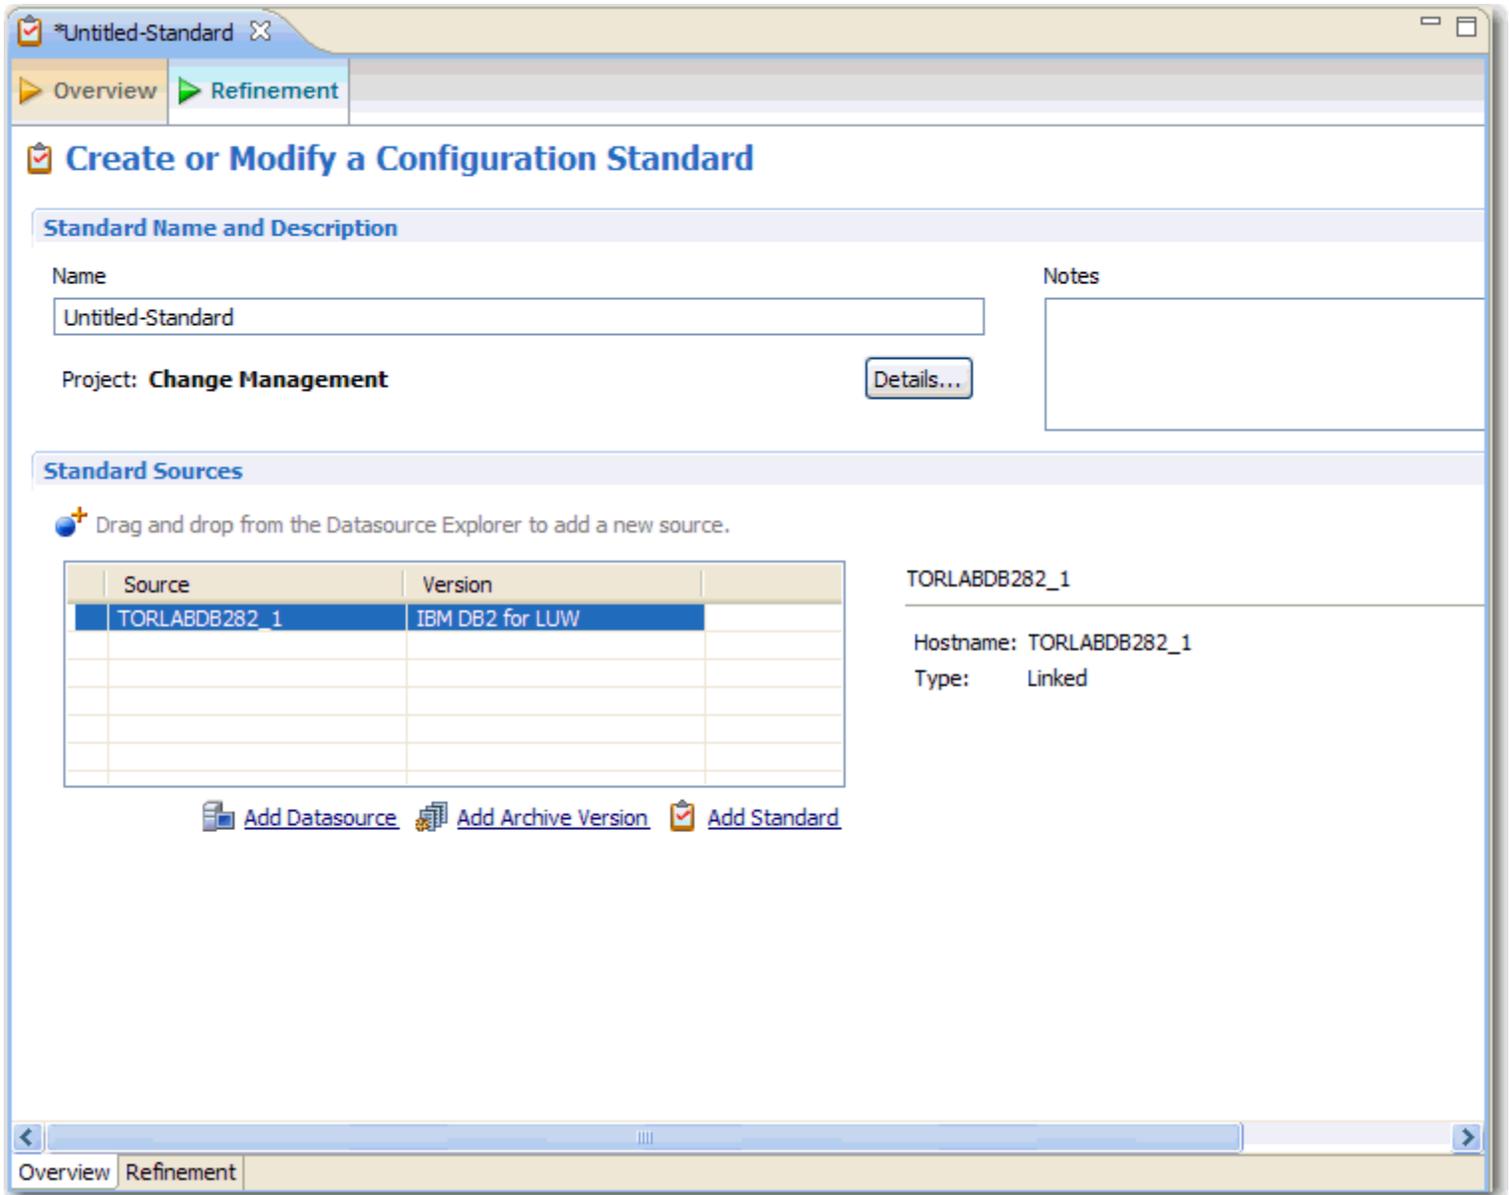

Configuration Archive Editor

The Configuration Archive Editor provides the ability to capture a 'snapshot' of existing data source configuration values. It provides the ability to version the same archive multiple times, so users can store and utilize archive configuration values from different points in time.

Configuration archives are snapshots of existing data source configuration values. Each data source in your environment can contain multiple archive versions. These versions can be used in configuration comparison jobs against other data sources, archives, or standards.

For more information on creating configuration archives for data sources, see [Creating a Configuration Archive](#).

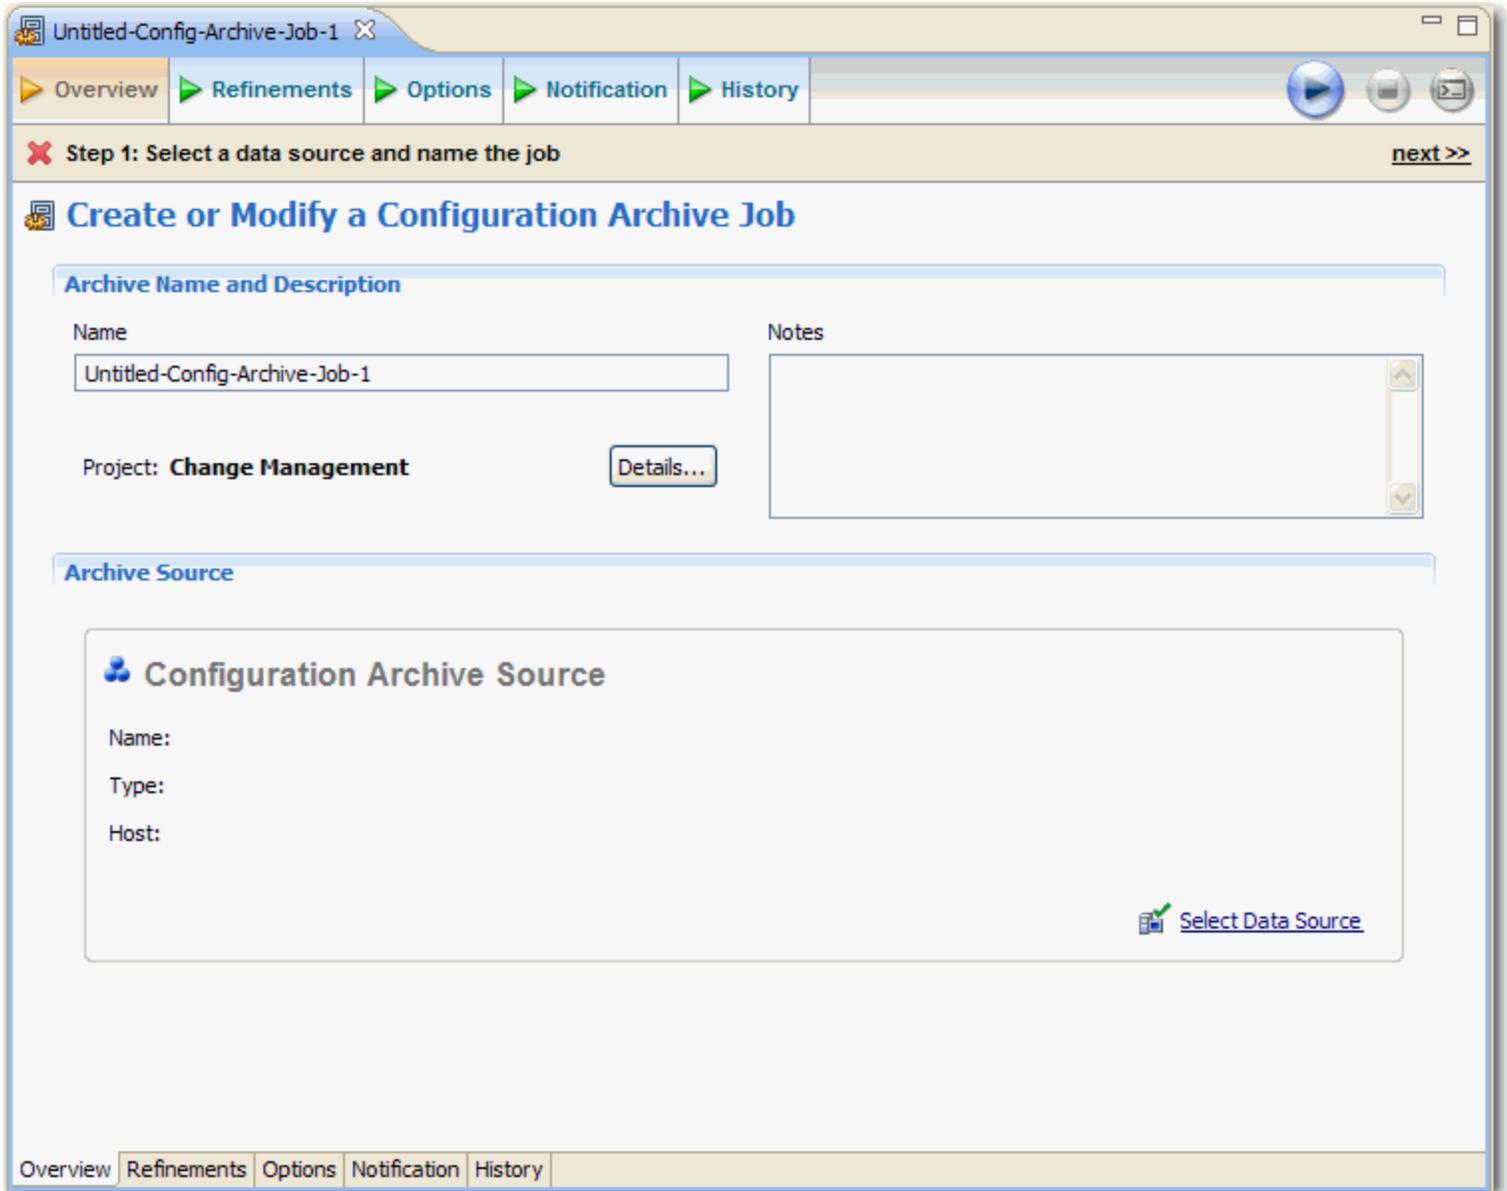

Schema Comparison Job Editor

The Schema Comparison Editor provides an interface for the comparison of two schemas on registered data sources, for the purposes of identifying changes and deviations between the two.

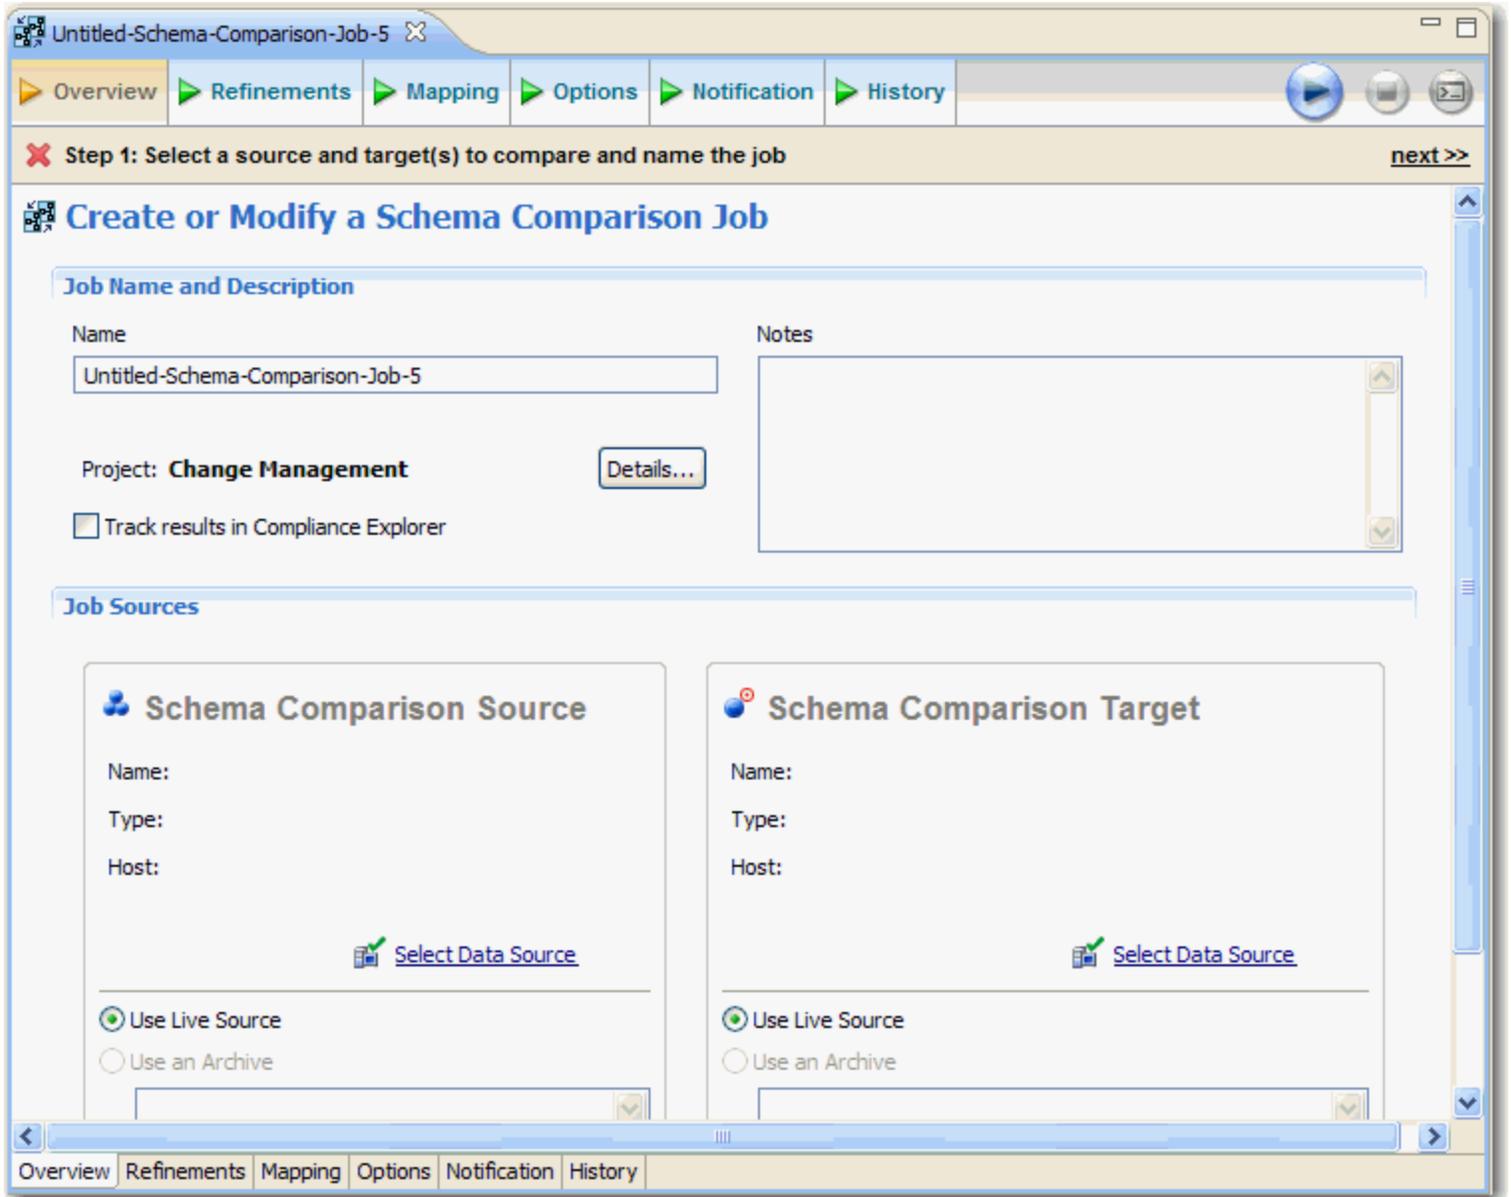

You can compare the schemas of two live data sources, a live data source and an archive, or two archives. For example, in order to ensure that approved changes are rolled forward between testing and production environments, you could first archive a schema baseline and use it to compare with the live environment once the move is completed.

Additionally, Change Manager can support cross-platform schema comparisons, but such jobs are limited to the following DBMS combinations and data source objects:

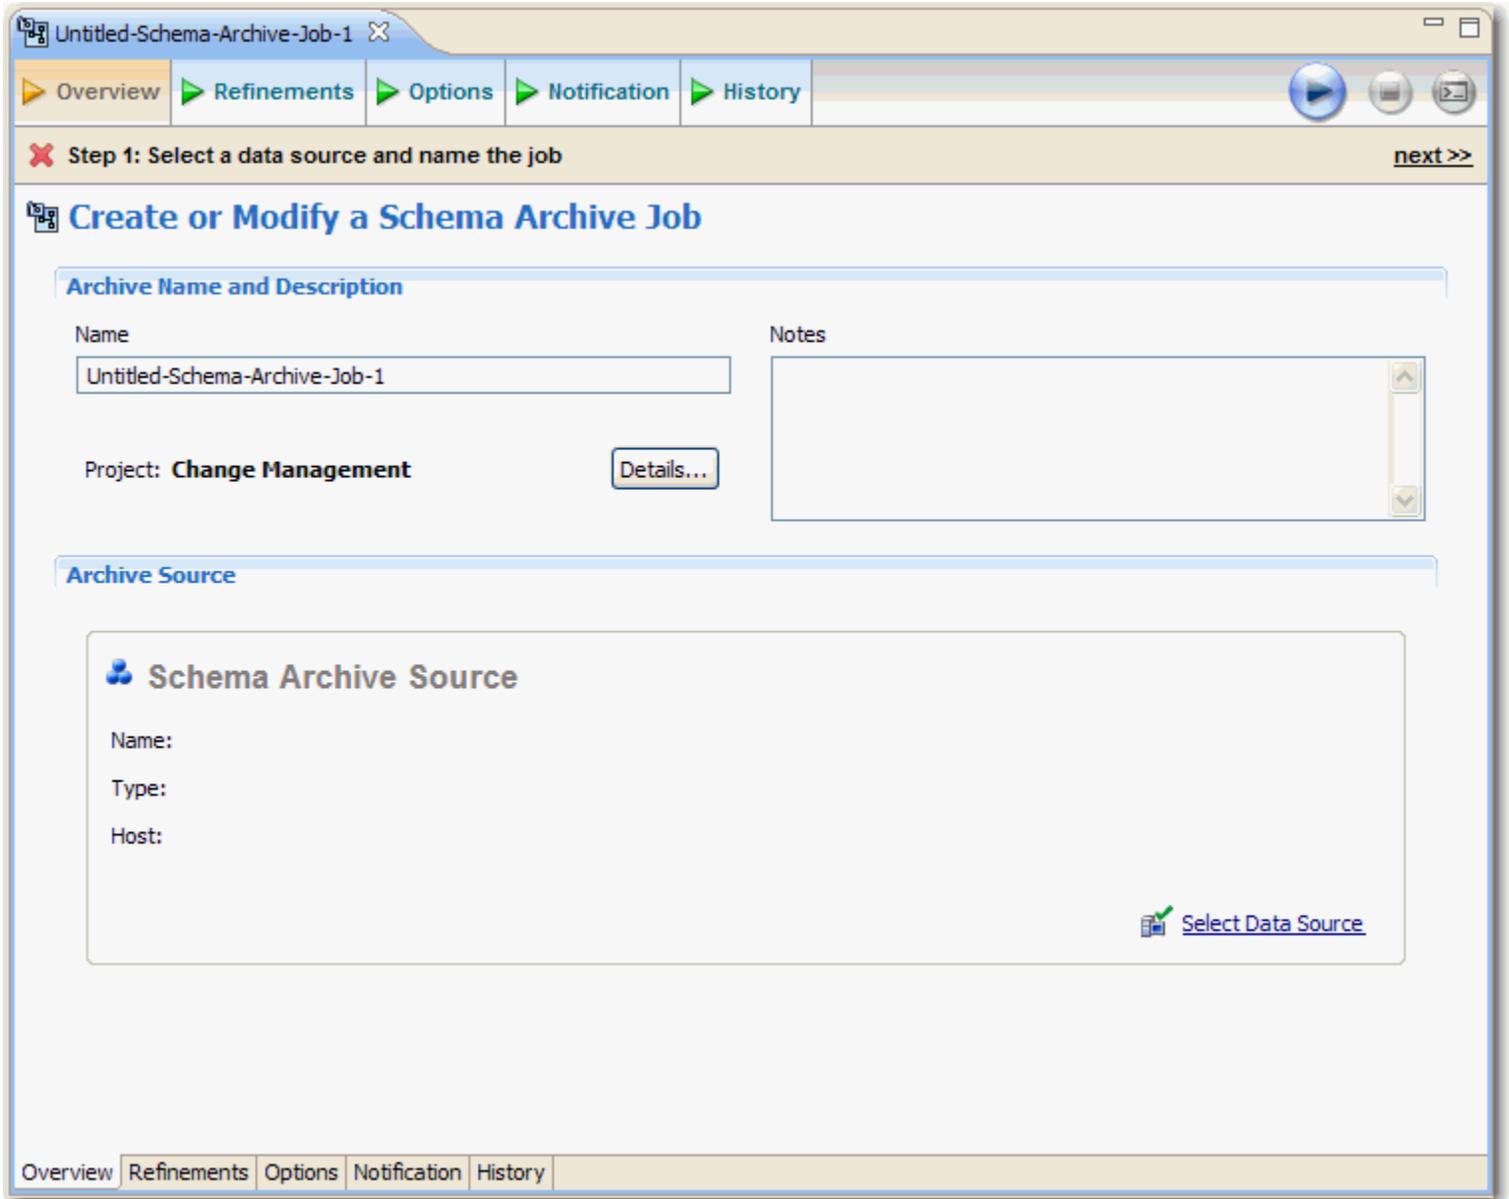

DBMS Source/Target	Objects Compared
Sybase/SQL Server	Tables, Unique Keys, Check Constraints, Foreign Keys, Indexes, Primary Keys, Views
Oracle/SQL Server	Tables, Unique Keys, Check Constraints, Foreign Keys, Indexes, Primary Keys, Views

For more information on comparing the schemas of two data sources, see [Comparing Schemas](#).

Schema Archive Editor

The Schema Archive Editor provides the ability to capture a 'snapshot' of an existing schema archive. The interface provides the ability to version the same archive multiple times, so users can store and utilize archived schemas from different points in time.

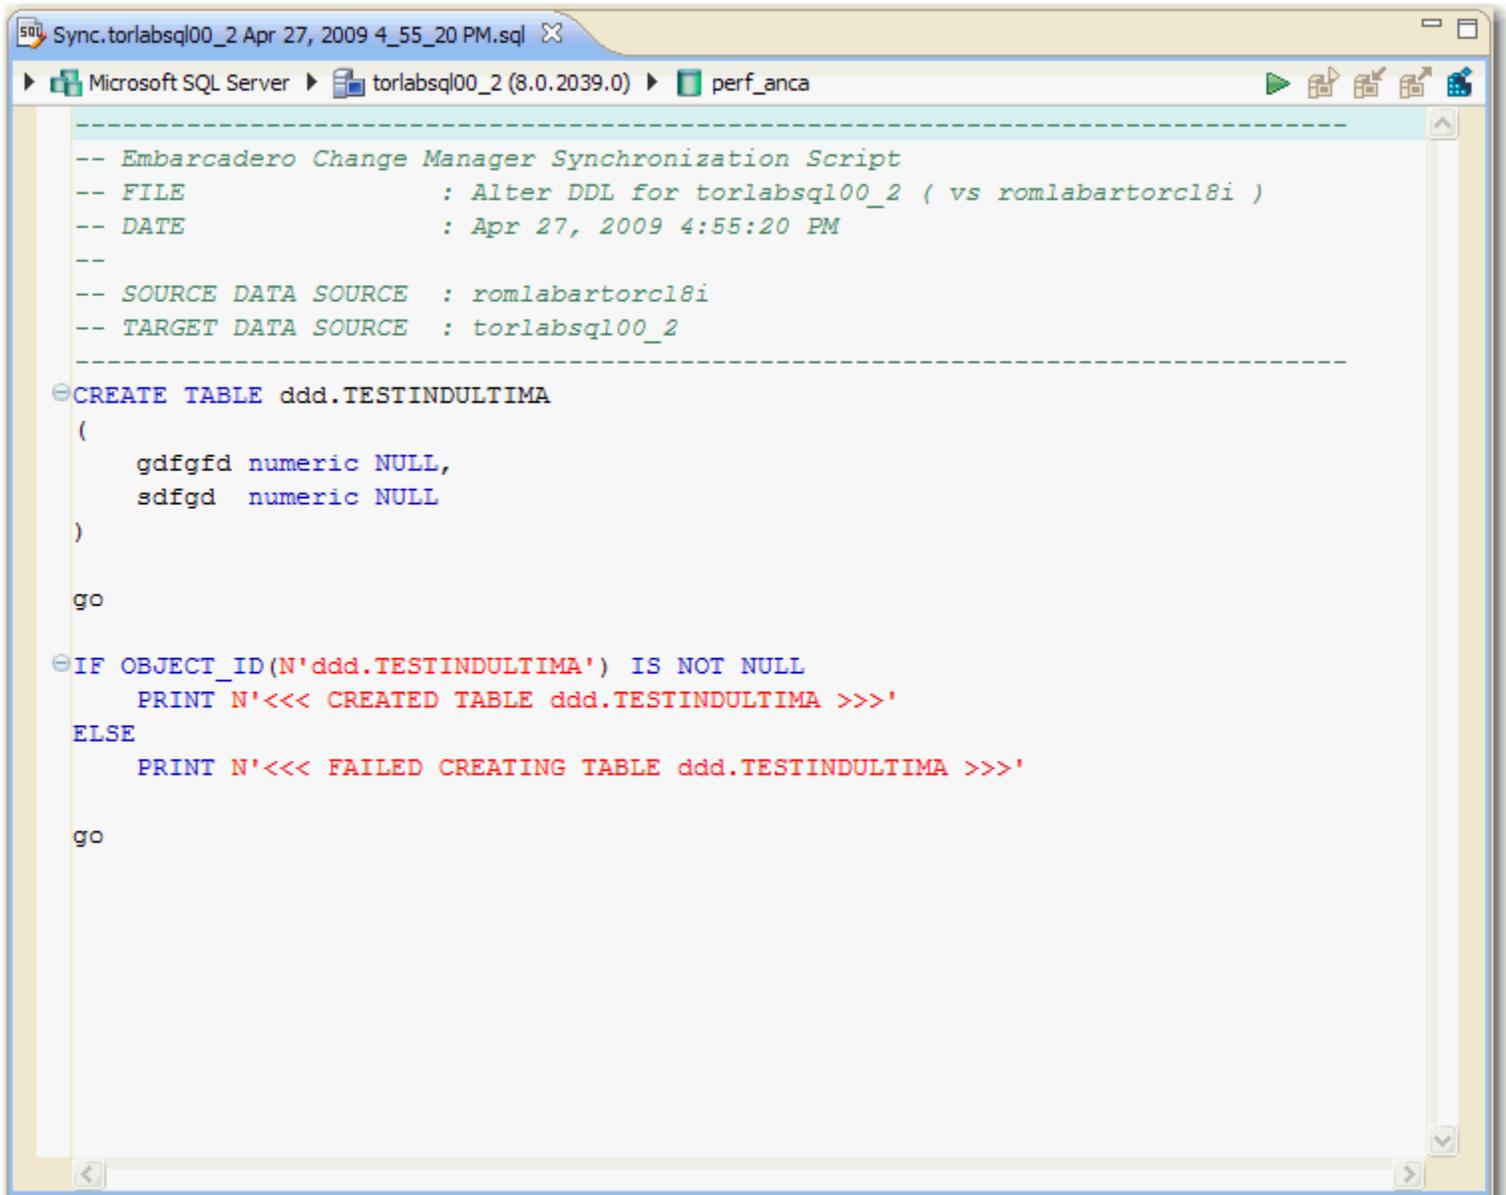

Schema archives are snapshots of existing schema values. Each data source in your environment can contain multiple archive versions. These versions can be used as baselines in schema comparison jobs against other data sources, archives, or standards.

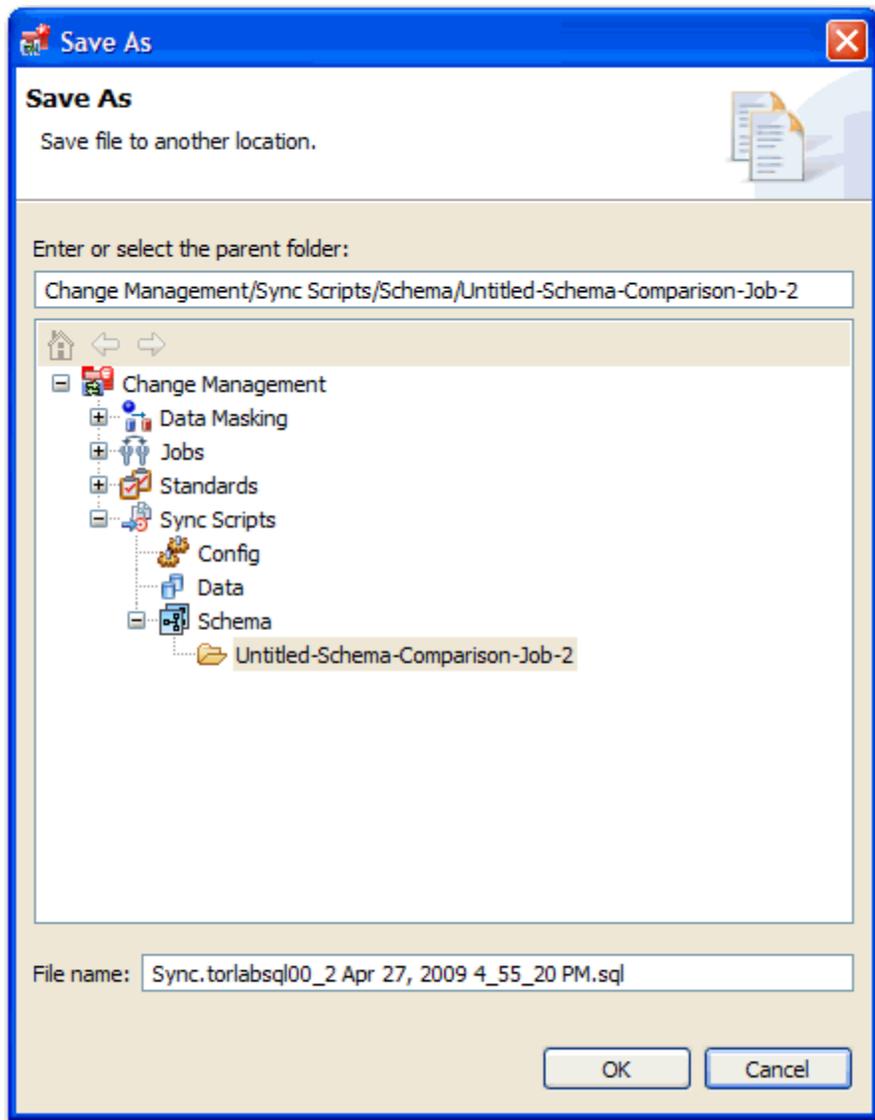

For more information on creating [Creating a Schema Archive](#).

SQL Editor

SQL Editor is an interface that provides the viewing and modification of jobs generated by the Data Comparison Editor.

All scripts, when they are generated initially, appear in SQL Editor. By default, new scripts are automatically saved and appear in the **Navigator** and **Project Explorer** in a default directory specified by Change Manager. However, scripts can be modified manually and saved via the **File > Save As** menu command, and stored in different directories, as required.

You can rerun scripts that are saved in Change Manager by double-clicking the script name in the **Navigator** view.

Using Basic Commands

The following additional Change Manager functions may be useful when navigating, organizing, or creating new jobs, Archives, and Standards.

[Creating New Data Source Groups](#)

[Searching for Database Objects and Synchronization Scripts](#)

[Viewing Change History](#)

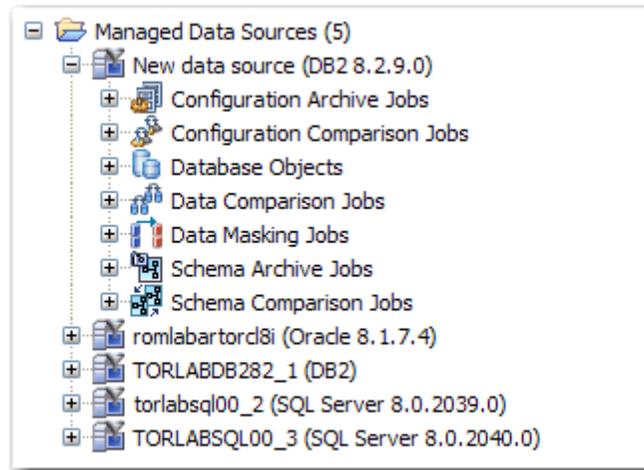

[Building Command Line Syntax and Creating Bulk Job Files](#)

[Filtering Data Source Objects](#)

Creating New Data Source Groups

All data sources displayed in **Data Source Explorer** can be organized in **Data Source Groups**.

Groups are represented as child nodes of the **Managed Data Sources** folder in **Data Source Explorer** and provide an additional level of organization when maintaining a large quantity of data sources.

To create a Data Source Group

- 1 Right-click on the **Managed Data Source** icon in **Data Source Explorer**.
- 2 Enter a meaningful name for the new group in the **Name** field. The value entered in the field is how the group will be labeled in **Data Source Explorer**. If other **Data Source Groups** exist, select the parent folder of the new group folder in the **Choose a Parent Group** section.
- 3 Click **Finish**. The **Data Source Group** folder is added to **Data Source Explorer**. You can drag and drop data sources in the folder or add new data sources to the folder, as needed.

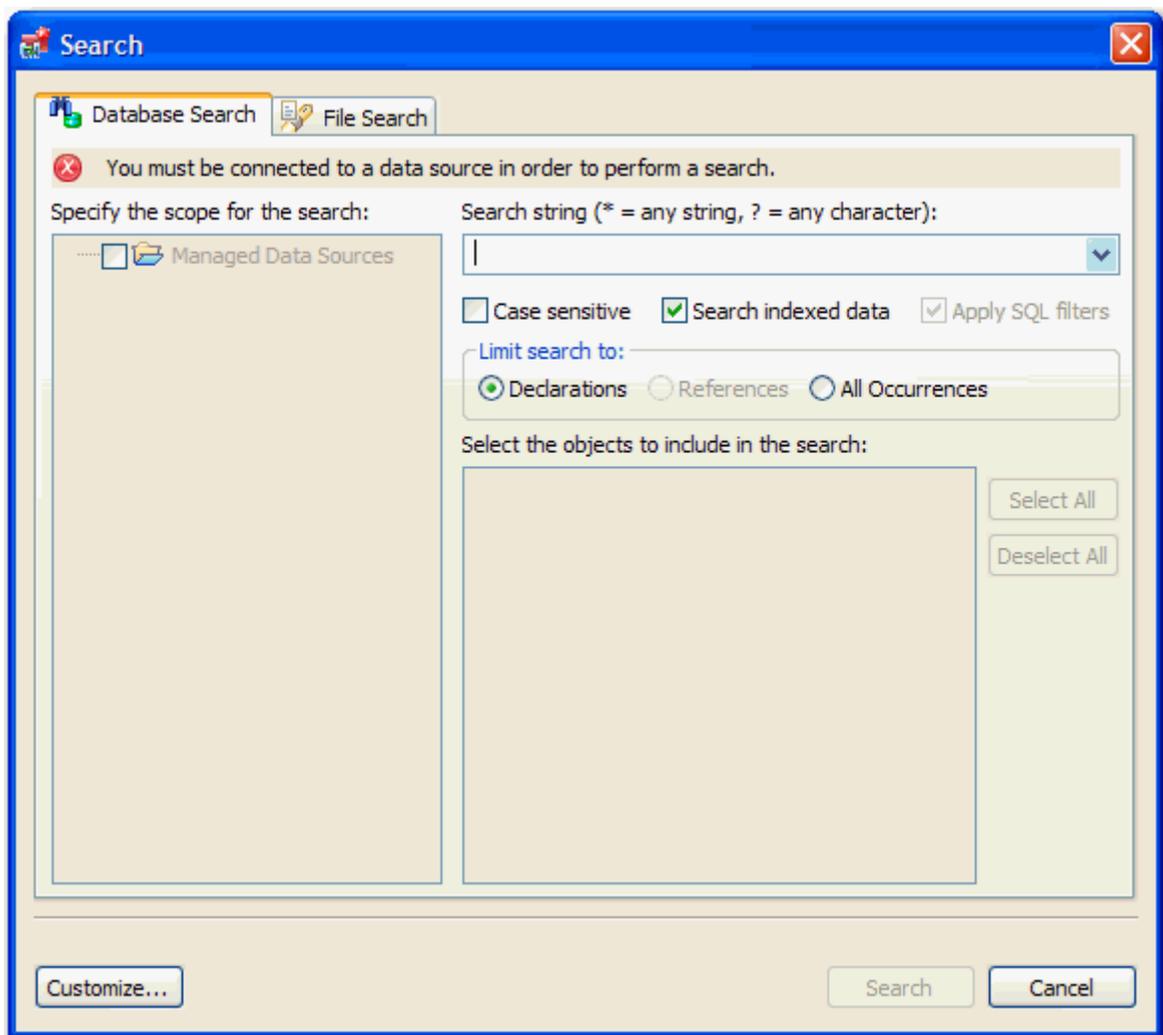

Searching for Database Objects and Synchronization Scripts

The **Search** function provides a means of searching for database objects you have registered, and synchronization scripts that have been generated by Change Manager.

The **Search** function is accessed by clicking the **Search** icon in the Toolbar, or via the **Search > Search** command in the Main Menu.

The **Search** dialog contains two tabs:

- **Database Search**
- **File Search**

To search for databases:

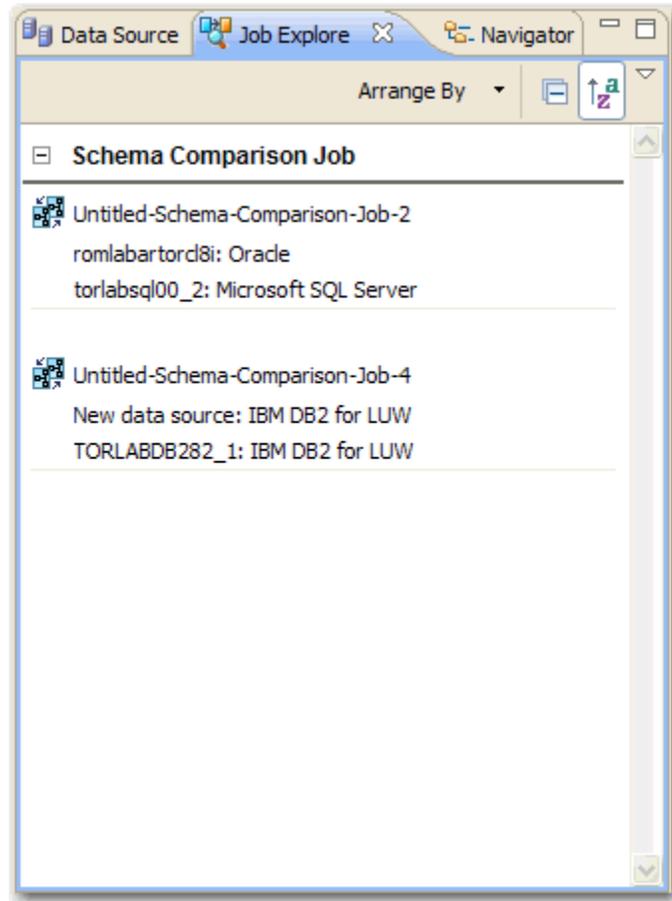

- 1 Navigate to the **Database Search** tab.
- 2 Use the parameter fields provided to search and locate a database:
 - In the box on the left-hand side of the window, use the check boxes to select the Data Source Groups you want to search in.
 - In the **Search String** field, type a value to search. Use the * character to indicate wildcard string values, and the ? character to indicate wildcard character values. The \ character indicates an escape character for literals. (* ? and /).
 - Select **Case Sensitive** to take case into account when searching for string matches.
 - Select **Search Indexed Data** to include any information that has been retained by Change Manager's indexing function.
 - Select **Apply SQL Filters** to apply any filters you may have associated with the registered data sources in the system.
 - Specify if the search is limited to **Declarations, References, or All Occurrences** in the **Limit Search to** section.
 - In the box in the lower right-hand corner of the screen, select and de-select the object types you want to include in the search. Only selected objects that match your search criteria will be returned.
- 3 Click **Search**. Change Manager returns a list of all possible script selections based on the variables you entered.

To search for synchronization scripts:

- 1 Navigate to the **File Search** tab.
- 2 Use the parameter fields provided to search and locate a synchronization script:
 - Type a value to search in the **Containing Text** field. Use the * character to indicate wildcard string values, the ? character to indicate wildcard character values, and the \ character to indicate an escape character for literals. (* ? and /).
 - Select **Case Sensitive** to take case into account when searching for string matches.
 - Select **Regular Expression** to identify the string as a regular function in terms of search criteria.
 - In the **File Name Pattern** field, specify the extension name of the files to search for explicitly. If the value in this field is a * character, the search function will search all files regardless of extension. Manually type the extensions to indicate the file type (separate multiple file types with commas), or click **Choose** and use the **Select Types** dialog to select the file extensions the process will use to search for the string. For example, selecting*.caj will search for configuration archive job files, exclusively.
 - Select **Consider Derived Resources** to include derived resources in the search.
- 3 Click **Search**. Change Manager returns a list of all possible script selections based on the variables you entered.

Viewing Change History

Each time a job is run (data repository or configuration property comparison), the history of that job is recorded and maintained in the **Job Explorer View**.

Use this view to examine all jobs that have been defined in Change Manager. You can click the **Arrange By** drop down menu to organize the list of jobs by **Date Created**, **DBMS**, **Last Modified**, **Last Run**, **Name**, **Data Source**, and **Job Type and Module**, **Job Type**, or **Module**, as required.

The **Report Directory** column indicates the location where reports will be created. The **Store Results** column indicates if the job results will be saved once the job has executed.

NOTE: This feature is only enabled for jobs that have been saved.

Additionally, jobs can be manually launched from the **changec** command line program, which is located in the Change Manager installation directory.

Job options must be specified by inserting the **-job** and **-output** commands when issuing a command from this location.

- The **-job** command specifies the jobs to run by job file name. This line must also include a directory location where the projects and jobs are stored.
- The **-output** command specifies reporting options for the job.

For example, the code below runs the MyConfigCompare database comparison job and generates a report in PDF format:

```
-job
"C:\Users\test1\change_workbench_5_0\workspace\DatabaseChange\MyConfigCompare.ccj"
-output PDF "c:/report"
```

In order to execute multiple jobs from the same command line, use the following syntax:

```
changec -bulk bulkfilename
```

Where *bulkfilename* is a file where each row has a -job attribute.

The -job command also accepts regular expressions:

- ****** indicates all sub folders in a directory location.
- ***** indicates any string.

For example, the following command runs all configuration archive jobs in all projects and folders in the workspace:

```
changec -job workspace:\**\*.caj
```

To create a batch file

- 1 In the editor of the job you want to create an execution script for, select the **Command Line Syntax** icon located in the upper-right hand corner of the interface window. The **Script Generation Wizard** appears, and the job appears in a table.
- 2 Add output report options, as needed, and specify the **Directory** where the files will be generated. Click **Next**.
- 3 Specify the **Location** where the batch file will be generated, and provide a file format for the script.
- 4 Click **Finish**. The batch file is generated in the directory you specified in Step 3.

NOTE: If you want to create a batch file to run multiple jobs, click **Add**, and then add the other jobs. The **Remove**, **Up**, and **Down** commands help you control the jobs in the file, as job order is sometimes important. For example, an archive needs to be captured before the version is used in a comparison.

To run a job from the command line

- 1 From the command line, enter an execution string with the following format:

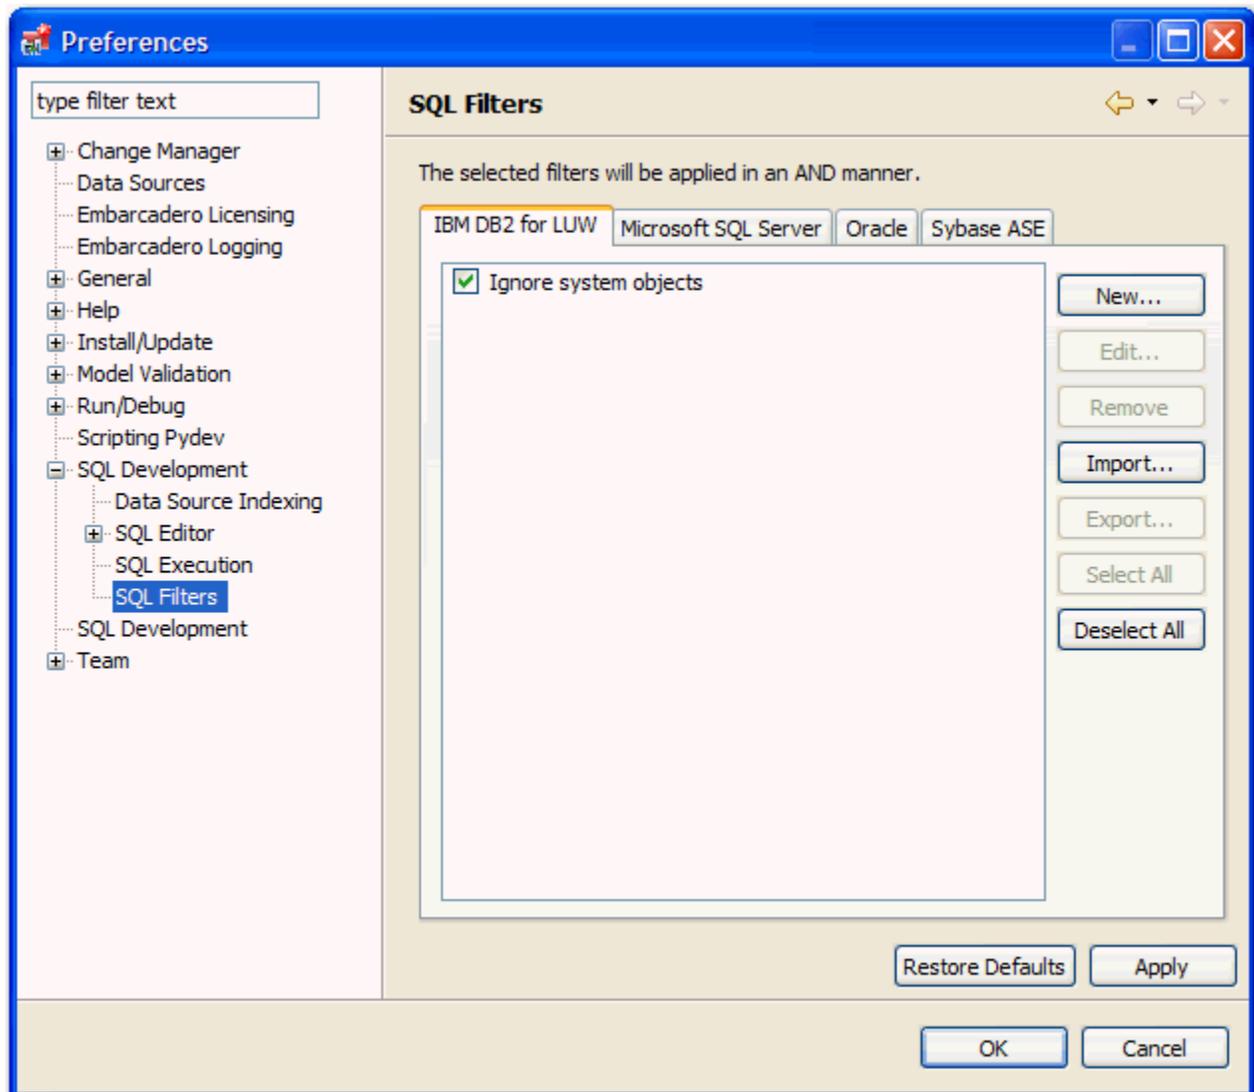

```
changec -job job_directory job_name -option report_format report_directory
```

- The job you specified as the *job_name* runs. If you specified a report format and location, the report is generated as well.

NOTE: The **Script Generation Wizard** builds command line options automatically and stores them in the file you specified. When the batch file is run, it executes the parameters as specified in the wizard.

Filtering Data Source Objects

Filters can be placed on data sources and corresponding data source objects to restrict their display in Data Source Explorer. This feature is useful if you have data sources that contain large numbers of database objects. You can apply filters to view only the schema objects of those you need for the development process.

There are two types of data source filters available:

- **Global filters** that affect all registered data sources in the Change Manager development environment.
- **Data source-specific filters** affect only the specified data source for which they are defined.

In both cases, data source object filters are defined via the **Object Filter Manager**, through the development of filter templates. Once defined, filter templates can be activated and deactivated as you need them.

Several filter templates can be combined at a global level or applied to a specific data source.

Global filters affect all registered data sources in the Change Manager development environment. When you create and apply a global filter to a platform vendor in Change Manager, all databases associated with that vendor are affected by the filter, as defined.

Individual global filter templates are separated, by supported data source platform, on tabs in the **SQL Filter** window. Select the appropriate tab to view existing filter templates or add new ones, as needed.

To define a global filter:

- 1 Select **Window > Preferences** from the Main Menu. The **Preferences** dialog appears.
- 2 Expand the **SQL Development** node and select the **SQL Filter** subnode. The **SQL Filter** pane appears.
- 3 Click **New**. The **Filter Template** dialog appears.
- 4 Specify the parameters of the filter template:
 - In the **Name** field, enter the name of the filter as you want it to appear in the selection window on the **SQL Filter** node.
 - The **Database Type** pane provides a list of data source objects. Deselect the data source objects that this template filters so that they do not appear in **Database Explorer** when displaying data source objects for the data source.
 - Click **New** to add filter parameters for data source objects properties. The **New SQL Filter Predicate** dialog appears.
 - Use the **Property** and **Operator** fields to supply the filter criteria. **Property** specifies if the value is a **Name** or **Schema**, and **Operator** specifies the matching type of the filter syntax. (**Equals**, **Not Equals**, **Like**, **Not Like**, **In**, **Not In**)
 - In the **Value** field, enter the full or partial syntax of the property or properties you want the template to filter in **data source Explorer**.
- 5 Click **OK**. The filter property specification is added to the Filter Template.
- 6 When you have finished defining the filter template, click **OK**. The template name is added to the **Properties** dialog. It can be enabled and disabled by selecting or de-selecting the check box beside its name, respectively.

Data source object filters are added and removed from the development environment by selecting and de-selecting the checkboxes associated with each filter template on both the global and data source-specific dialogs.

To define a specific filter:

Data source-specific object filters affect only the specified data source. Use the tabs on the **SQL Filters** page to specify the DBMS type.

To define data source specific filters:

- 1 In **Data Source Explorer**, right-click the data source and select **Properties**.
The **Properties** dialog appears.
- 2 Select the **SQL Filter** node and deselect **Enable Data Source Specific Settings**. The other controls on the dialog become enabled.
- 3 Click **New**. The **Filter Template** dialog appears.

- 4 Specify the parameters of the filter.
 - In the **Name** field, enter the name of the filter as you want it to appear in the selection window on the **SQL Filter** node.
 - The **Database Type** pane provides a list of data source objects. Deselect the data source objects that this template will not apply filter criteria to when displaying data source objects for the specified data source.
 - Click **New** to add filter parameters for data source object properties. The **New SQL Filter Predicate** dialog appears.
 - Use the **Property** and **Operator** fields to supply the filter criteria. **Property** specifies if the value is a **Name** or **Schema**, and **Operator** specifies the matching type of the filter syntax. (**Equals**, **Not Equals**, **Like**, **Not Like**, **In**, **Not In**)
 - In the **Value** field, enter the full or partial syntax of the property or properties you want to filter in **Data Source Explorer**.

Click **OK**. The filter property specification is added to the Filter Template.
- 5 When you have finished defining the filter template, click **OK**. The template name is added to the **Properties** dialog. It can be enabled and disabled by selecting or deselecting the check box beside its name, respectively.

Comparing Data

Data comparison jobs enable you to compare the data repositories of two registered data sources, specify configuration adjustments and mapping refinement parameters, and synchronize any discrepancies discovered by the job, post-execution.

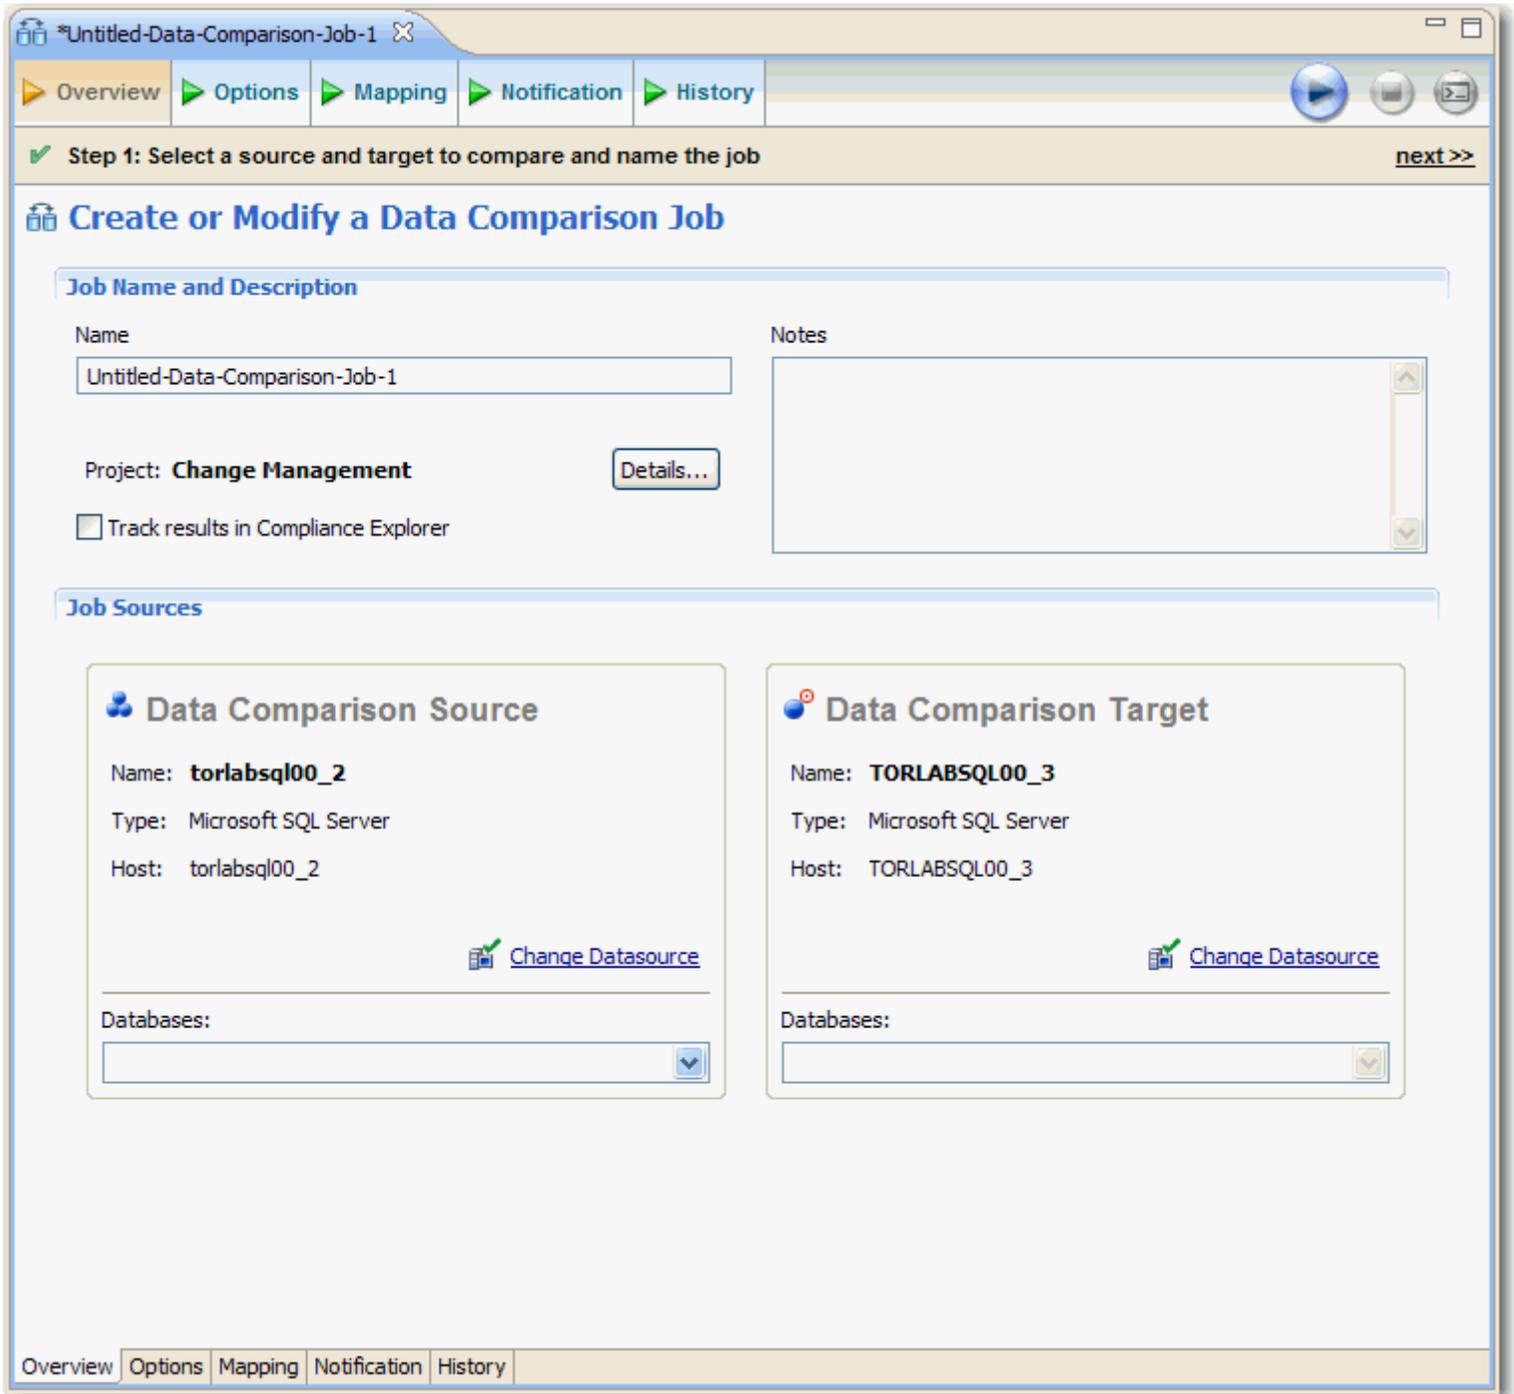

Comparison job results are viewed at row level per resident database, owner or schema, and mismatches can be updated automatically or missing rows added at the table level. The synchronization scripts used to update data sources are stored or executed immediately upon job completion.

The following tasks provide a high-level overview of the data comparison job process:

- 1 [Create a New Data Comparison Job](#)
- 2 [Specify a Job Name](#)
- 3 [Specify the Source and Target Data Sources](#)
- 4 [Specify Execution, Mapping, Comparison, and Resolution Options](#)
- 5 [Understand the Data Source Mapping Process](#)
- 6 [Customize the Data Source Mapping Process](#)
- 7 [Customize Database Mapping](#)
- 8 [Customize Table Mapping](#)
- 9 [Specify Notification Options](#)
- 10 [Execute the Data Comparison Job](#)
- 11 [Resolve Data Repositories](#)
- 12 [Execute an SQL Synchronization Script](#)
- 13 [Generate a Job Report](#)

Create a New Data Comparison Job

Data comparison jobs are performed in the **Data Comparison Job Editor**.

To begin a new comparison job

- Select **File > New > Data Comparison Job**. The **Data Comparison Job Editor** opens.

You can now proceed to set up the parameters of the new job.

NOTE: If any jobs already exist, they can be opened by selecting **File > Open Comparison** and choosing the name from the list of available jobs.

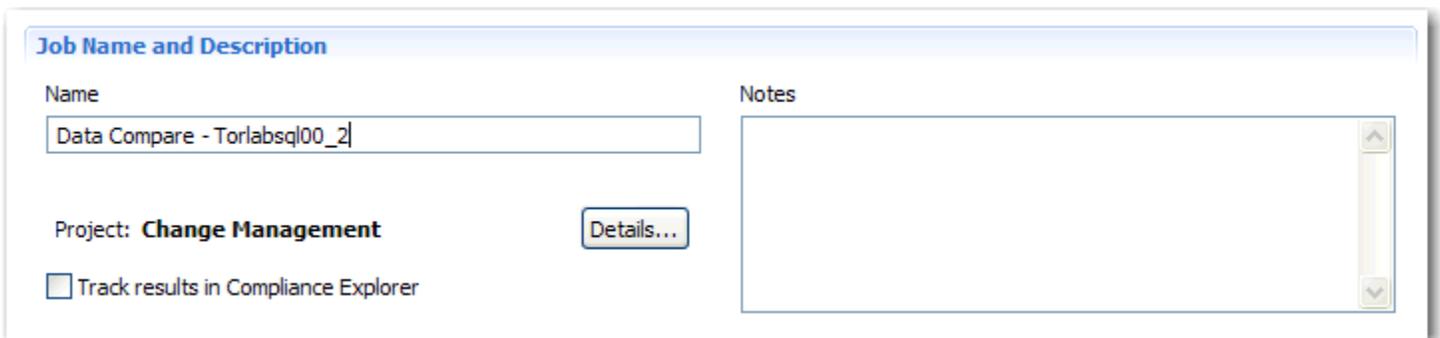

Specify a Job Name

A job name identifies the job in the application and should be specified with this in mind.

Specify a meaningful name that clearly identifies the job in the views and dialogs of the working environment.

Under the **Name** field, the location of the **Project** where the job is stored in **Project Explorer** appears. Click **Details** to view the directory location of the specified project.

Click **Track Results in Compliance Editor** if you want the job added to the [Compliance](#) view.

The screenshot shows a dialog box titled "Job Name and Description". It has two main sections: "Name" and "Notes".

- Name:** A text input field containing "Data Compare - Torlabsq|00_2|".
- Notes:** A large, empty text area with a vertical scrollbar on the right side.
- Project:** Labeled "Change Management".
- Details:** A button labeled "Details..." next to the project name.
- Track results in Compliance Explorer:** A checkbox that is currently unchecked.

To name a job

- Type the name of the job in the **Name** field of the **Data Comparison Job Editor**.

Ensure you specify a meaningful name that identifies the job in other views and dialogs. You can save the job by selecting **File > Save** or **File > Save All** from the Menu Bar, or highlight the Editor window and press **Ctrl+S**.

Specify the Source and Target Data Sources

The **Data Comparison Source** and **Data Comparison Target** boxes identify what data sources are compared when the job executes. Both boxes must contain the sources before the job can be executed. When a data source is added to a job, it is displayed by **Name**, **Type**, and **Host**.

Additionally, the drop down menus below the boxes enables you to map the data source at a high level by providing a list of the databases, schemas, or owners of the specified data source, depending on the DBMS.

The screenshot shows a window titled "Job Sources" with two main panels. The left panel, "Data Comparison Source", has a blue icon and displays: Name: **torlabsql00_2**, Type: Microsoft SQL Server, Host: torlabsql00_2. Below this is a "Change Datasource" link with a green checkmark icon. At the bottom is a "Databases:" dropdown menu currently set to "All Databases". The right panel, "Data Comparison Target", has a blue icon with a red error indicator and displays: Name: **TORLABSQL00_3**, Type: Microsoft SQL Server, Host: TORLABSQL00_3. It also has a "Change Datasource" link and a "Databases:" dropdown menu set to "All Databases".

To add a data source to a job:

- Click and drag a data source from **Data Source Explorer** to the **Comparison Source** or **Comparison Target** box, or click **Select Data Source** in the appropriate box and choose a data source from the dialog.

NOTE: You can change a data source selection by clicking **Change Data Source** from the appropriate box, or by dragging a different data source to the box from **Data Source Explorer**.

Specify Execution, Mapping, Comparison, and Resolution Options

Prior to the execution of a job, parameters can be set to control aspects of the execution process itself. These options can be set prior to job execution on the **Options** tab.

[Execution Options](#)

[Mapping Options](#)

[Comparison Options](#)

[Resolution Options](#)

Execution Options

Execution Options control aspects of the job process execution:

Execution Options

Automatically Synchronize
Clear all data on the target and replace it with all data from the source automatically. If unchecked, manual synchronization will be required, where you can review the comparison results and select rows to synchronize in either direction to generate SQL scripts.

Compression Comparison
With this option enabled data on your datasources is compressed before being transmitted to the workbench and compared. In certain situations data compression enables the job to run at a much faster rate by removing the need to transfer and compare large volumes of data.

Generate DML
Automatically output the synchronization DML resulting from job execution. This DML file can then optionally be sent with any enabled Notification.

- **Automatically Synchronize** indicates that the job will automatically attempt to synchronize any issues it finds between the source and target data sources upon completing comparison execution. If you leave this option unchecked, you will be able to generate a synchronization script at a later point, after job completion.
- The **Compression Comparison** setting enables a faster version of the execution process where the job compresses row data for faster transmission and comparison. This feature allows for a faster comparison process in general and does not affect job accuracy. This option is especially useful over slow networks with large volumes of data in each row, and with faster database servers.
- The **Generate DML** option enables you to specify that the synchronization DML used in the job execution will automatically be placed in a separate file. If this option is selected, you can specify on the **Notifications** tab to send the resulting output with any notification.

Mapping Options

Mapping Options control how the data sources in the job are mapped by the process:

▼ Mapping Options

Ignore Case
Databases, owners, tables and columns will be paired up for comparison without regards to case. For example, with this option selected the table "Product_Prices" will be paired with table "PRODUCT_PRICES".

Ignore Spaces
Pairs database objects for comparison ignoring spaces in their names. For example, with this option selected the table "Product Prices" will be paired with the table "ProductPrices".

Ignore Underscores
Pairs database objects for comparison ignoring underscores in their names. For example, with this option selected the table "Product_Prices" will be paired with the table "ProductPrices".

Include Views
Enable this option to include views in the mapping. Otherwise, views will be filtered out of the mapping and will not be compared. Note that with this option enabled, you may still select which views (if any) you wish to include in the comparison.

Exclude Computed Columns
Enable this option to exclude from mapping (and comparison) the columns whose values are computed.

- **Ignore Case** indicates that objects are analyzed without regards to case. For example, the table **Product_Prices** will be compared to the table **PRODUCT_PRICES**.
- **Ignore Spaces** indicates that spaces will be ignored when analyzing objects. For example, the table **Product Prices** will be compared to the table **ProductPrices**.
- **Ignore Underscores** disregards underscores in object names for comparison purposes. For example, the table **Product_Prices** will be compared to the table **ProductPrices**.
- **Include Views** indicates that the comparison process will include views during the mapping process. If this option is not selected, views are automatically excluded from the comparison.
- **Exclude Computed Columns** indicates that the comparison does not include columns whose values are computed in the mapping and comparison processes.

See [Customize the Data Source Mapping Process](#) for more information about these options.

Comparison Options

The **Comparison Options** section specifies the parameters of how the job treats comparison in terms of naming conventions.

▼ Comparison Options

Ignore Case

Data in table fields are compared without regards to case. For example, a value of "Apple" matches a corresponding value of "apple" when this option is selected. De-selected, "Apple" and "apple" will be flagged as non-matching data in the comparison results.

Trim Trailing Spaces

Spaces at the end of values in table fields are disregarded. For example, a value of "Apple " matches a corresponding value of "Apple" when this option is selected. De-selected, "Apple " and "Apple" are flagged as non-matching data in the comparison results.

Match Empty Strings with Nulls

Empty table fields are considered equal to corresponding fields with null values. If Trim Trailing Spaces is selected with this option, fields containing only space characters are considered equal to null values in addition to empty table fields.

Cache Long Datatypes Values

With this option turned on long data type (blob, clob, varchar(max), etc.) values that do not match will be cached during comparison and available for resolution. When turned off, the results view will show that the values did not match but will not allow resolution.

Check rows from source

Check rows that exist in source tables. If this option is unchecked, the rows that only exist on the source tables won't be included in the results.

Check rows from target

Check rows that exist in target tables. If this option is unchecked, the rows that only exist on the target tables won't be included in the results.

- **Ignore Case** indicates the job ignores case when comparing data. For example, "Apple" matches a corresponding value of "apple".
- **Trim Trailing Spaces** indicates the job comparison ignores extra spaces at the end of values when comparing data. For example, "Apple " matches a corresponding value of "Apple".
- **Match Empty Strings with Nulls** indicates that the job comparison considers empty values to be the same as null values for matching purposes.
- **Cache Long Datatype Values** indicates that long data types (blob, clob, varchar(max), etc.) values that do not match are cached during comparison and available for resolution during that stage of the process. When this value is disabled, the results of the job indicate that the values did not match but resolution is unavailable. Individual long datatype values can be retrieved when exploring results regardless of the selection of this property.
- **Check Rows from Source** checks the rows that exist in the source tables. If the option is not selected, the rows that exist on the source tables will not be included in the comparison.
- **Check Rows from Target** checks the rows that exist in the target tables. If the option is not selected, the rows that exist on the target tables will not be included in the comparison.

Resolution Options

The **Resolution Options** section determines how the job resolves any discrepancies discovered during the comparison process.

▼ Resolution Options

Drop and Recreate Foreign Keys

All foreign keys are dropped prior to applying changes during the synchronization process. This option should be used with **Wrap Statements in a Transaction** to ensure that foreign keys do not remain dropped in the event that the synchronization script fails. This option is currently only supported by SQL Server.

Wrap Statements in a Transaction

The synchronization process utilizes a transaction and rolls back any repository changes if it encounters an error. This option is currently not supported by DB2.

Enable Identity Column Inserts and Updates

In SQL Server and Sybase turn this option on to enable changes to identity column values. Additional statements for each table with identity columns will be included in sync scripts to temporarily allow updates and insertions into these columns.

- **Drop and Recreate Foreign Keys** indicates that all foreign keys are dropped prior to applying changes during the resolution process. This option should be used with **Wrap Statements in Transaction** to ensure that foreign keys do not remain dropped in the event that the synchronization script used to resolve it fails.

NOTE: This option is only available for SQL Server scripts.

- **Wrap Statements in a Transaction** utilizes a transaction and rolls back any repository changes if it encounters an error.

NOTE: This option is not supported for DB2 for LUW scripts.

- **Enable Identity Column Inserts and Updates** enables changes to identity column values on SQL Server and Sybase platforms. The update and insert statements are automatically included in the synchronization script when this option is selected.

Understand the Data Source Mapping Process

Mapping is the process of pairing data source elements between the source and target of a job. These elements (databases, tables, and row) are compared when the job executes to determine matches and mismatches between the two sources. Mapping details are viewed on the **Mapping** tab of the Editor.

The process automatically maps data source elements based on the interpretation of both schemas. Elements that do not match are excluded from the job when it executes, unless manually paired prior to running the job.

The **Database Mapping** table displays the paired databases or owners on the **Source** or **Target**. The **% Mapped** column indicates how much of the database or owner (a percentage value of total tables and rows) is mapped. Unpaired databases appear in the table as well, but are excluded from the job unless manually mapped to a corresponding database.

► Remap to Defaults

Select: All , None

Table Mapping

Initially, Change Manager will automatically analyze and map objects based on your option selections. It pairs up matching objects in the table on the left-hand side of the screen. You can choose not to run a comparison job on a specific object or pair of objects by unchecking the box beside the appropriate objects in the left-hand column.

The **Last Inspected** column indicates if a specified pair has been analyzed by Change Manager. In order to view individual tables and view the mappings of database pairs, you need to initiate the analysis process by clicking an option in the **Inspected** section on the right-hand side of the page. **All** inspects all pairs in the table, **Current** inspects the current object mappings, and **Checked** inspects only those pairs you've specified in the table.

Once inspected, bars appear in the left-hand columns of the table that indicate how much of the selected objects matched. You can view the table mappings of a specific pair by clicking that row and choosing **Yes, retrieve the objects in this pair**. The **Table Mapping** table populates with the paired tables and views of the selected pair.

You can view the row mappings of a table or view by clicking **Edit** in the right-hand column of the appropriate row. The row pairings and corresponding values appear in a new window. Individual owners and database pairs can be examined by selecting the appropriate icon in the **Inspect Now** column.

To restore the Database Mapping table to its original settings, click **Remap to Defaults**. All settings revert to the original object mappings as determined by the job, based on the selected Mapping options.

Customize the Data Source Mapping Process

You can manually configure the way Change Manager maps data source elements and then run the process again. The automatic mapping options are specified on the **Options** tab. You can re-run the mapping process by navigating back to the **Mapping** tab and clicking **Refresh Database and Owners** once this task is completed.

▼ **Mapping Options**

Ignore Case
Databases, owners, tables, and columns, will be paired up for comparison without regards to case. For example, the table "Product_Prices" will be paired with the table "PRODUCT_PRICES" with this table selected.

Ignore Spaces
Pairs database objects for comparison ignoring spaces in their names. For example, with this option selected the table "Product Prices" will be paired with the table "ProductPrices".

Ignore Underscores
Pairs database objects for comparison ignoring underscores in their names. For example, with this option selected the table "Product_Prices" will be paired with the table "ProductPrices".

Include Views
Enable this option to include views in the mapping. Otherwise, views will be filtered out of the mapping and will not be compared. Note that with this option enabled, you may still select which views (if any) you wish to include in the comparison.

To configure the automatic mapping process:

1. Navigate to the **Options** tab and select or deselect the check boxes in the **Mapping Options** section, as needed:
 - **Ignore Case:** Pairs data source objects without regards to case. For example, the table "Product_Prices" is paired with the table "product_prices".
 - **Ignore Spaces:** Pairs data source objects and ignores extraneous spaces in object names. For example, the table "Product Prices" is paired with the table "ProductPrices".
 - **Ignore Underscores:** Pairs data source objects and ignores underscores in job names. For example, the table "Product_Prices" is paired with the table "Product Prices".

- **Include Views:** Includes database views when performing the automatic mapping process. If this option is deselected (the default setting), views are filtered out and will not be compared. If this option is selected, you can still manually choose the views to include or exclude from the comparison.
2. Navigate back to the **Mapping** tab and click **Refresh Databases and Owners** to update the automatic comparison.

Customize Database Mapping

You can customize job database mapping parameters manually by choosing to exclude certain paired rows or redefining objects after the automatic mapping process is completed.

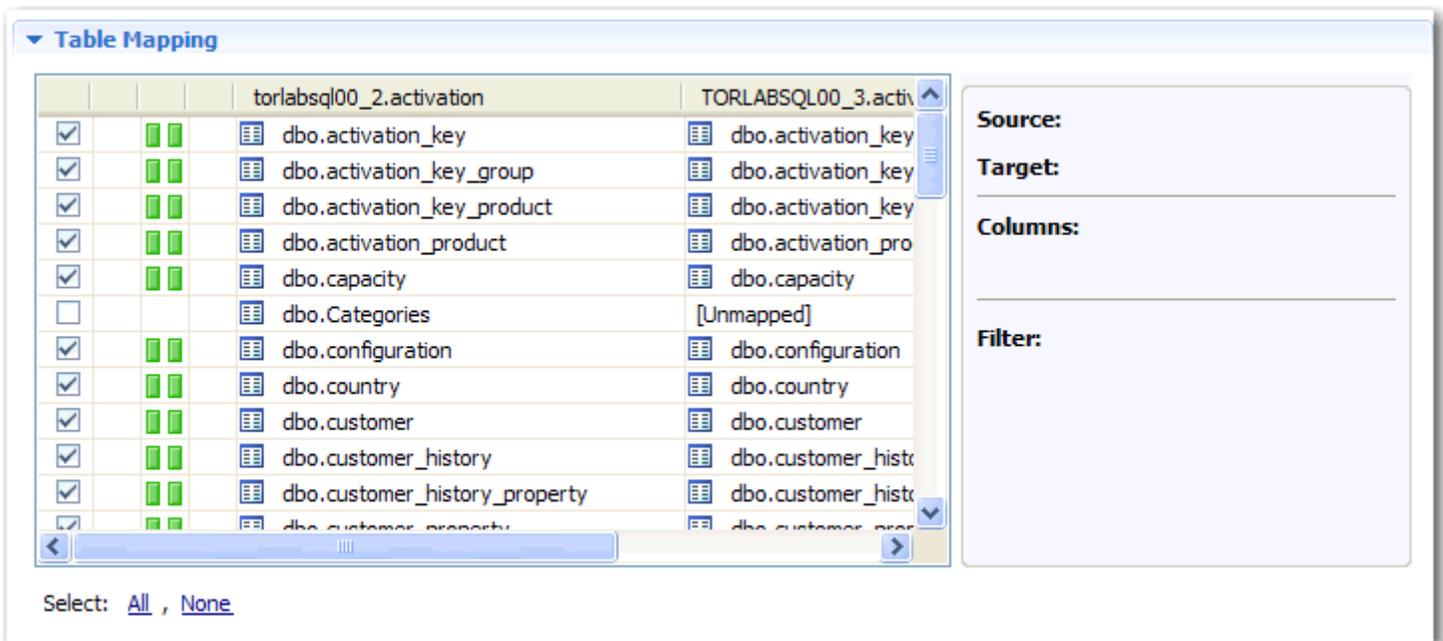

The check boxes beside each paired object displayed in the Database Mapping Source column indicate if a pair is included or excluded when the job runs.

Database pairings are redefined via the drop down menu that appears when the corresponding item in the **Target** data source column is selected. The menu contains a list of all databases or owners that reside on the **Target** data source. Databases or owners that are already paired appear in the drop down menu with an asterisk to denote them. Additionally, using the same method, unpaired databases can be assigned a matching database on the **Source**.

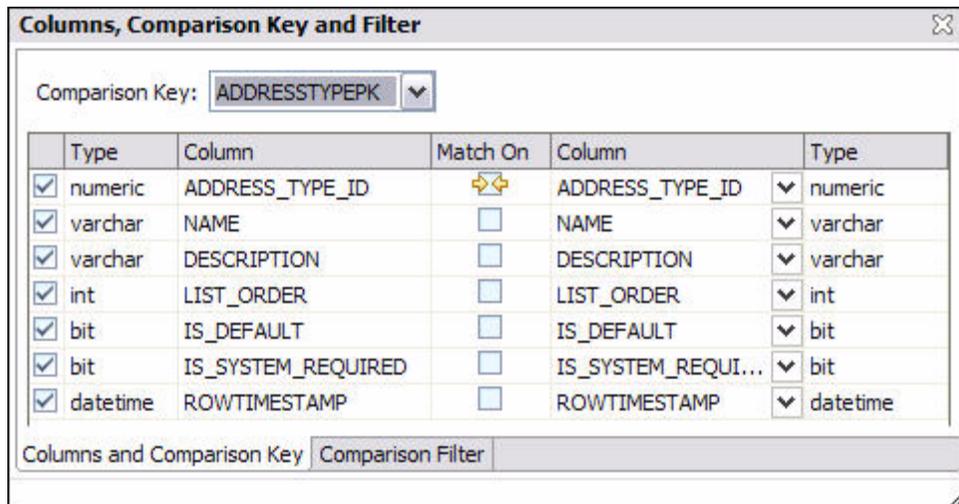

Customize Table Mapping

You can manually map databases, tables, and rows between the **Source** and **Target** data sources. Tables are displayed by name and contain mapping refinement column values and a comparison key value.

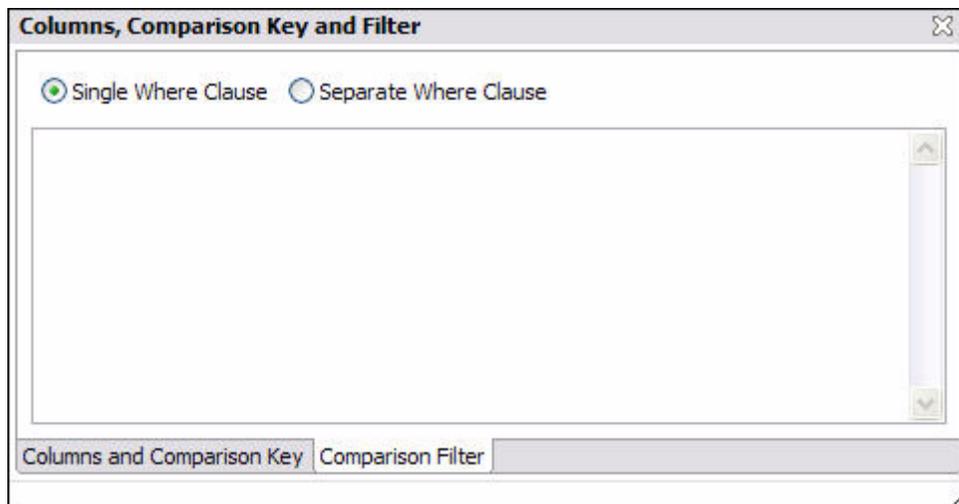

You can manually map unpaired tables between the databases by clicking the corresponding item in the **Target** data source column and define it via the drop down menu that appears, as with database mapping.

Additionally, if you click **View Column Mapping** in the appropriate selection, the **Columns**, **Comparison Key**, and **Filter** dialog enables you to further detail mapping refinements in terms of defining table roles in the execution of the job.

- The **Columns and Comparison Key** enables the mapping of columns to compare between the paired tables. Select or deselect the columns, as needed, in the dialog provided, and use the drop down menu to change the comparison key if multiple keys are available.
- The **Comparison Filter** tab enables you to manually insert a WHERE clause for execution when the job runs. Click the ellipsis button and enter the WHERE clause into the text box provided. If you want to create a different WHERE clause per table in the pair, select the **Separate WHERE Clause** radio button. The dialog adds an additional text box for a second WHERE clause.

NOTE: When entering selective WHERE clauses, **do not include the WHERE keyword** (e.g. use “AGE>12” instead of “WHERE AGE>12”).

Specify Notification Options

Notification options provide parameters for enabling and setting up various notifications regarding executed data comparison jobs. This includes:

[Email Notifications](#)

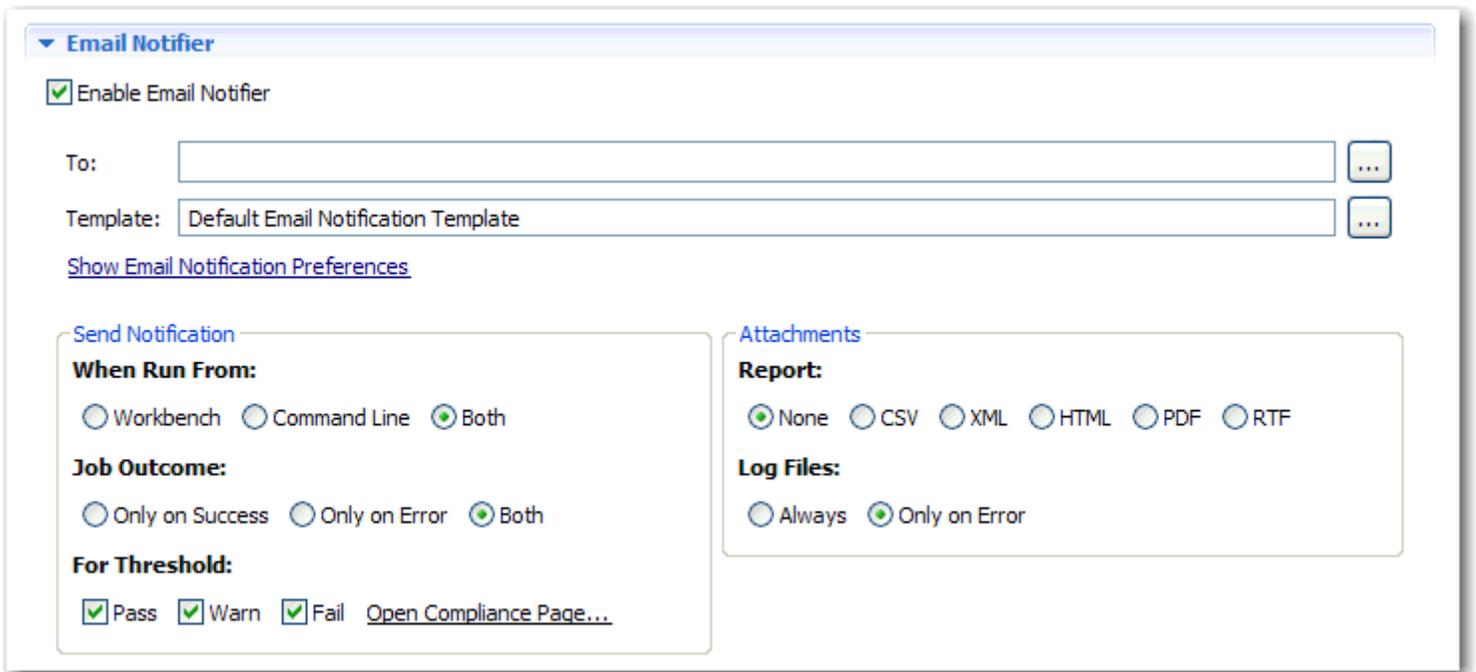

[File System Notifications](#)

[System Tray Notifications](#)

Notification options provide parameters for enabling and setting up email notification and report mailing for executed schema comparison jobs. The notification options tab enables you to specify the email addresses to which you want to send notifications, the email message format, and the conditions under which a notification should be sent.

Email Notifications

Email notification options provide parameters for configuring and enabling email notification and report mailing on executed comparison jobs.

Email Notifier

Enable Email Notifier

Log Files:

Always Only on Error

These parameters enable you to specify the email addresses to which you want to send notifications, the email message format, the conditions under which a notification email should be sent, and other, similar options.

Click **Enable Email Notifier** to enable email notification. When you select this check box, a list of notification parameters appear.

Enter the email addresses to which the notification will be sent in the **To** field. You can specify an email format template in the **Template Field**.

The **Send Notification** options specify when a notification email should be sent based on the results of a comparison job:

- The **When Run From** options enable you to indicate that email notifications should only be sent if a job is executed from the **Workbench**, **Command Line**, or **Both**.

- The **Job Outcome** options enable you to indicate that email notifications should be sent **Only on Success**, **Only on Error**, or **Both**.
- The **For Threshold** options enable you to specify the threshold level for which email notifications are sent, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

The **Attachments** section enables you to specify the file format of an attached report that will display job results with the notification email. Choose **None** (does not attach a report), **CSV**, **XML**, **HTML**, **PDF**, or **RTF** to specify the file format of the report. The **Log Files** indicates when to log the notification file results to the Change Manager log file. You can choose **Always** or **Only on Error**.

File System Notifications

File system notification options provide parameters for configuring and enabling logging options for executed comparison jobs.

File System Notifier

Enable File System Notifier

Report Directory:

Log Directory:

Script Directory:

[Show File System Notification Preferences](#)

Send Notification

When Run From:

Workbench Command Line Both

Job Outcome:

Report:

None CSV XML HTML PDF RTF

Log Files:

Always Only on Error

Click **Enable File System Notifier** to enable comparison job logging. When you select this check box, a list of notification parameters appear.

Specify the directory location of each of the output files that are produced by the notification function in the **Report Directory**, **Log Directory**, and **Script Directory**, respectively. Additionally, you can click the **Show File System Notification Preferences** link if you want to change the directory locations at the application level rather than just the job level.

The **Send Notification** options specify when job results are output to the specified file directories:

- The **When Run From** options enable you to indicate that results should only be sent to file if a job is executed from the **Workbench**, **Command Line**, or **Both**.

- The **Job Outcome** options enable you to indicate that results should be sent to file **Only on Success**, **Only on Error**, or **Both**.
- The **For Threshold** options enable you to specify the threshold level for which results are sent to file, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

The **Attachments** section enables you to specify the file format of the output results. Choose **None** (does not produce a file), **CSV**, **XML**, **HTML**, **PDF**, or **RTF** to specify the file format. The **Log Files** indicates when to log the notification file results to the Change Manager log file. You can choose **Always** or **Only on Error**.

System Tray Notifications

System Tray notification parameters enable pop-up window notifications on your Desktop when Change Manager is minimized, but running jobs.

System Tray Notifier

Enable System Tray Notifier

System tray is available only in minimized mode when 'Show only when minimized to tray' is checked. [Show System Tray Notification Preferences](#)

Send Notification

When Run From:

Workbench Command Line Both

Job Outcome:

Only on Success Only on Error Both

For Threshold:

Pass Warn Fail [Open Compliance Page...](#)

Attachments

Report:

None CSV XML HTML PDF RTF

Log Files:

Always Only on Error

Click **Enable System Tray Notifier** to enable system tray notifications. When you select this check box, a list of notification parameters appear.

Click **Show System Tray Notifications** to specify global parameters with regards to the appearance and behavior of the specific pop-up windows.

The **Send Notification** options specify when a pop-up notification will appear.

- The **When Run From** options enable you to indicate that a pop-up notification should only appear if a job is executed from the **Workbench**, **Command Line**, or **Both**.
- The **Job Outcome** options enable you to indicate that a pop-up notification should appear **Only on Success**, **Only on Error**, or **Both**.

- The **For Threshold** options enable you to specify the threshold level for which a pop-up notification will appear, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

NOTE: The **Attachments** section enables you to specify the file format of a report that can be accessed via the pop-up notification. Choose **None** (does not produce a file), **CSV**, **XML**, **HTML**, **PDF**, or **RTF** to specify the file format of the report. The **Log Files** indicates when to log the notification to the Change Manager log file. You can choose **Always** or **Only on Error**.

Execute the Data Comparison Job

The comparison job runs when you click the **Run** icon located in the upper right-hand corner of the Data Comparison Job Editor.

When the process runs, the **Results** tab appears and displays the progress of the job via the **Overall Progress** bar at the top of the tab.

In the **Comparison Results** table, the database pairs are displayed along with **Progress**, **Compare Index**, **Results**, and **Resolution** columns.

Comparison Summary

Overall Progress

 activation.property_classif - activation.property_classif
 Comparison Progress: 2,208 Rows
 Elapsed Time: 00:05 (mm:ss)

Comparison Results

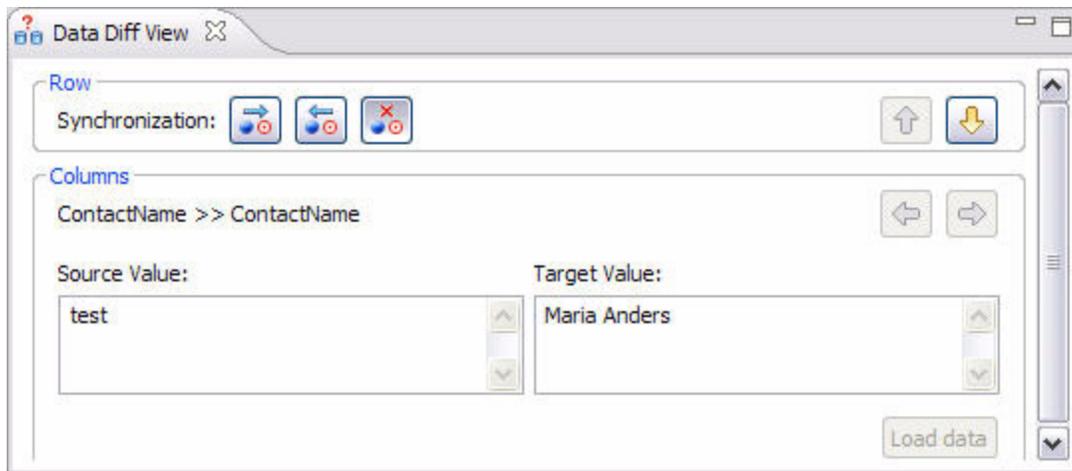

torlabsq00_2	TORLABSQL00_3	Progress	Compare Index	Results	Resolution
		⚠ Nothing to Com...			
ABC1	ABC1	⚠ Nothing to Com...			
activation	activation	 69%			
capacity	capacity	 0%			
CASES	cases	⚠ Nothing to Com...			
claudiu	claudiu	 0%			
coco	coco	⚠ Nothing to Com...			
databasename_mo...	databasename_mo...	 0%			
master	master	 0%			
model	model	⚠ Nothing to Com...			
msdb	msdb	 0%			

- The **Progress** column indicates, per database pair, the progress of the job. When the job is finished comparing the database row, a result of **Done** (should the comparison be successful), **Failed** (should the comparison be unsuccessful), or **Nothing to Compare** (if the pairs were not specified) will display in the column.
- The **Compare Index** column indicates the percentage value of data per database that the job matched. Failed rows and rows in which the progress is not completed do not display results.

When the comparison process is complete, the **Results** and **Resolution** columns populate with data, as appropriate to the matched pairings.

- The **Results** column provides a link in appropriate pairings that enables you to view details about the comparison job. Click **View Results** to open the **Database Results** tab. For more information, see [Resolve Data Repositories](#).

You can specify how data is resolved in the **Data Diff View** by selecting one of the appropriate icons beside the **Synchronization** prompt. By row, you can choose to **Make Target Match Source for Selected Row**, **Make Source Match Target for Selected Row**, or **Do Not Resolve Selected Row**, respectively.

Resolve Data Repositories

Once a data comparison job has completed, synchronization commands are used to even the data in the repositories so that they match. The synchronization process automates generation of UPDATE, INSERT, and DELETE statements on both databases as required at the global resolution level.

On the **Results** tab, click **View** in the row you want to resolve. The **Database Results** tab appears.

[Generate a SQL Script](#)

The table in the **Results Overview - Activation** section displays the pairings in the selected tables.

- The **Matched** column indicates how much of the specified pairings matched between the source and target.
- The **Only in...** columns indicate where discrepancies between the two pairings are in terms of the source and target tables.
- The **Different** column indicates the number of differences Change Manager found between the pairings on the source and target.

When you select a pair from the **Database Results** table, the **Selected Table** section populates with information regarding the specified pair.

Selected Table

torlabsq00_2.activation.dbo.machine_mac_address

[Select All](#)

Show rows: All Mismatched Source Only source Target Only target

Specify the type of **Resolution** by clicking the **All**, **Mismatched**, **Source**, **Only Source**, **Target**, or **Only Target** icons, respectively, and then click **Generate a SQL Script**. The script appears in **SQL Editor**, and can be modified manually, as needed.

The saved script can be executed immediately, or saved and run at any time to synchronize both databases based on the results of the current data comparison job.

```

Sync.extotb23.07_10_2007.06_54_20.sql X
-----
-- Embarcadero Change Manager Synchronization Script
-- FILE           : Sync.extotb23.07_10_2007.06_54_20.sql
-- DATE           : 7/10/2007 06:54:20
--
-- SOURCE DATASOURCE : Extotb15
-- TARGET DATASOURCE : extotb23
-----

SET XACT_ABORT ON

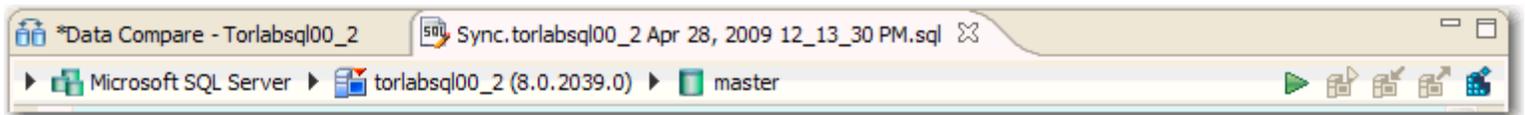

BEGIN TRANSACTION

USE [msdb]
go
ALTER TABLE dbo.backupfile
    DROP CONSTRAINT FK__backupfil__backu__02FC7413

```

Execute an SQL Synchronization Script

Synchronization scripts are executed via the commands in the **Run** menu or via the command icons located along the top of SQL Editor.

When an SQL file is open in the Workspace, select it and choose a database and an associated catalog on which you want to execute file using the drop down menus in SQL Editor. You can click the execute icon to execute the code on the specified database and catalog, start a transaction or commit a transaction, or modify the SQL session options prior to execution.

To execute code:

Open the SQL file you want to run, ensure it is associated with the correct database and click the **Execute** icon. Change Manager executes the code on the data source you specified. Results are displayed in the same tab or in a new tab.

To execute a transaction:

Open the transaction file you want to run and ensure it is associated with the correct database, and then click the **Start Transaction** icon. Change Manager executes the transaction on the data source you specified.

To commit a transaction:

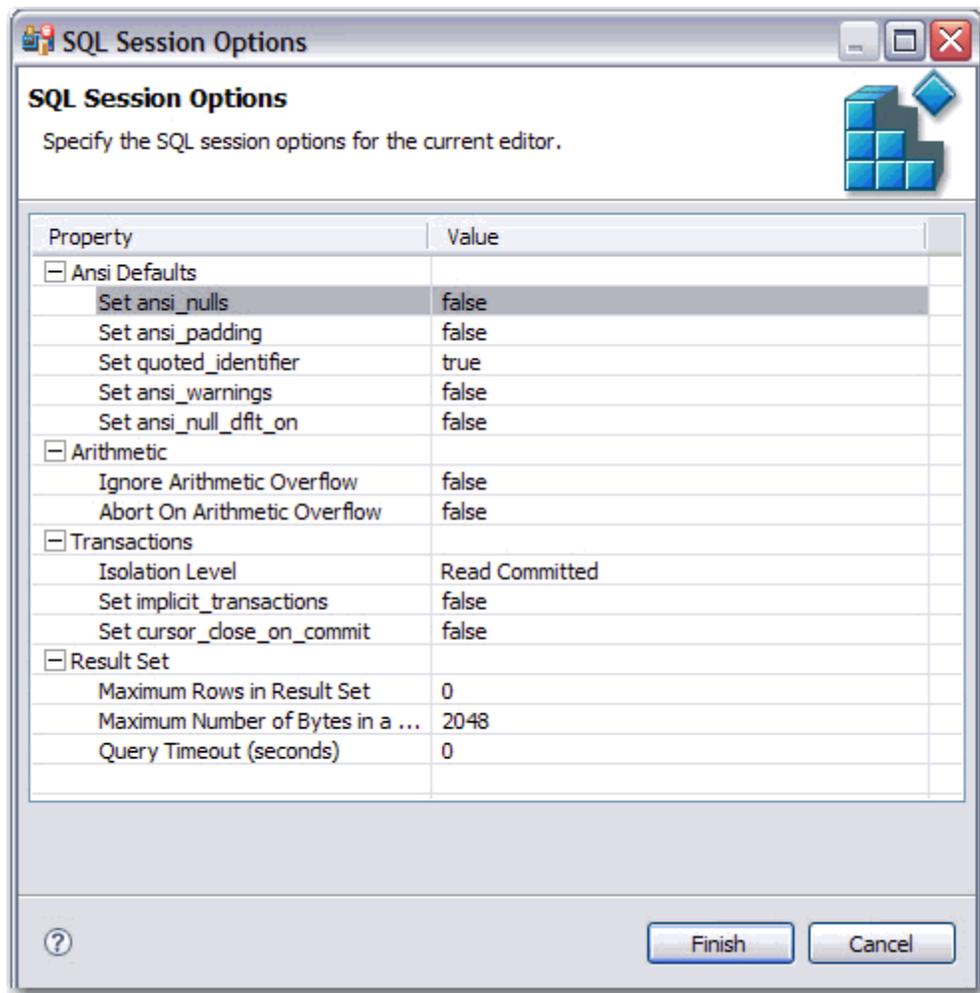

Open the transaction file you want to commit, ensure it is associated with the correct database, and then click the **Commit Transaction** icon. Change Manager commits the transaction on the data source you specified.

You can set transactions to auto-commit prior to execution on the **SQL Execution** node of the **Preferences** panel in Rapid SQL Developer.

NOTE: The synchronization script generation process does not support all object parameters. The following object parameters should be manually added after a synchronization script is generated, as required: **fillfactor**, **consumers**, **allow_dup_row**, and **statistics**.

Configure an SQL Session

The SQL Session Options dialog provides configuration parameters that indicate to Change Manager how to execute code in the development environment.

To modify SQL session options:

- 1 Click the SQL Session Options icon in the Toolbar.
The **SQL Session Options** dialog appears.
- 2 Click on individual parameters in the **Value** column to change the configuration of each property, as specified.

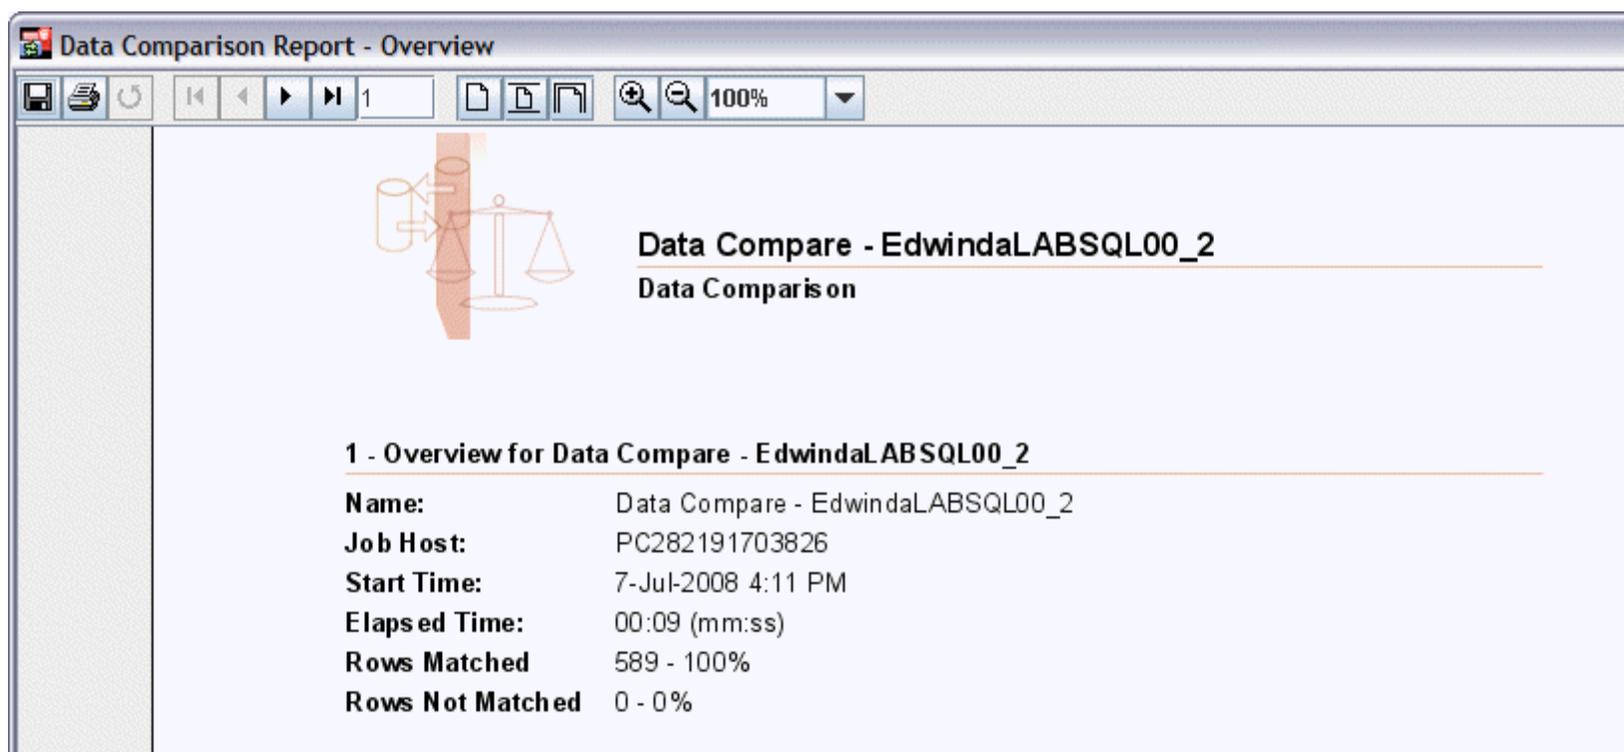

3 Click **Finish**.

The session options will be changed and Change Manager will execute the code as specified when you launch the script.

NOTE: Session options only apply to the corresponding editor and are not retained when executing multiple SQL files.

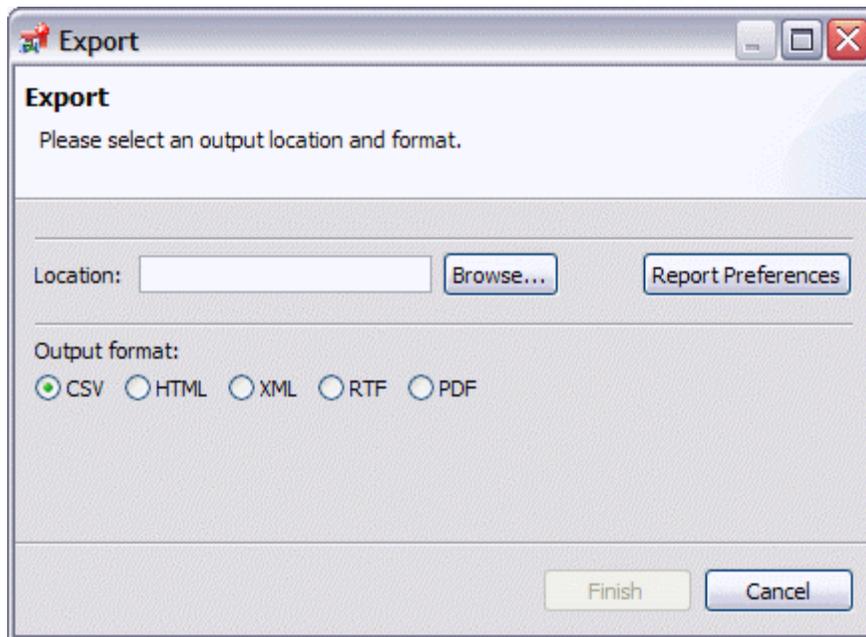

Generate a Job Report

Once you have executed a comparison job, you can generate a job report via the **View Report** command on the **Results** tab.

The report opens in a separate window and can be read on screen, sent to a printer, and saved to disk.

Additionally, the **Export Results** command will produce a report file in a specified format at a directory location of your choosing.

Click **Export Results** on the **Results** tab and fill in the fields, as required. When you click **Finish**, the report is created in the directory specified in the **Location** field, in the format specified in the **Output Format** section.

The **Contents** tab enables you to specify what criteria to include in the report:

- Select **Include Matching Data Fields** to include data fields that matched in rows, for which one value did not match. If this option is not checked, only comparison key values and values that did not match will be included.
- Select **Include Data Detail Reports in Notifiers** to include information for all data fields selected in a comparison job.

Masking Data

Data masking is a way of securing sensitive data during the development or testing phases of a database development project. It is often performed as a security or compliance measure that protects important information. By masking valid production data, you can provide a copy of the data that is “scrambled” but still represents your production environment.

Change Manager lets you specify masking rules for moving data between a source and a target in a data comparison job. You can set rules for individual columns, tables, and entire databases. When you run a data comparison with the Automatically Synchronize option on, the data on the target is replaced with data from the source and any items configured with a masking rule will be masked. You can then use the masked data in your development and testing environments.

The following tasks describe how to create masked data:

[Create a New Masking Job](#)

[Specify a Masking Job Name](#)

[Specify Source and Target Data Sources](#)

[Set to Automatically Synchronize](#)

[Specify Mapping Options](#)

[Specify Masking Rules for Individual Columns](#)

[Run the Database Masking Job](#)

[See the Masked Data](#)

Create a New Masking Job

Use the **Data Comparison Job Editor** to define a masking job.

To start creating a new Data Masking Job:

- Select **File > New > Data Comparison Job**.

Specify a Masking Job Name

The name of the job distinguishes it between other jobs in the application environment.

To name a masked data job:

Type the name of the job in the **Name** field of the **Data Masking Job Editor**.

Job Name and Description

<p>Name</p> <input style="width: 90%;" type="text" value="MyDataMaskingJob"/> <p>Project: Change Management</p> <p><input type="checkbox"/> Track results in Compliance Explorer</p>	<p>Notes</p> <div style="border: 1px solid #ccc; height: 100px; width: 95%;"></div>
--	---

Specify Source and Target Data Sources

The **Job Sources** section of the **Data Comparison Job Editor** contains the **Data Comparison Source** box, which identifies the original data source, and **Target Data Source** box, which identifies the data source where the data will be altered.

To specify source and target data sources:

- 1 Click and drag a data source to be masked from the **Data Source Explorer** to the **Data Comparison Source** box. Drag and drop a target data source, where the mask will be applied, from the **Data Source Explorer** to the **Data Comparison Target** box.
- 2 Use the drop down Database menu to specify the database to be masked for the **Data Comparison Source**, and the database to which you want to apply masking definitions on the **Data Comparison Target**.

The screenshot displays the 'Job Sources' section of the Data Comparison Job Editor. It contains two main panels:

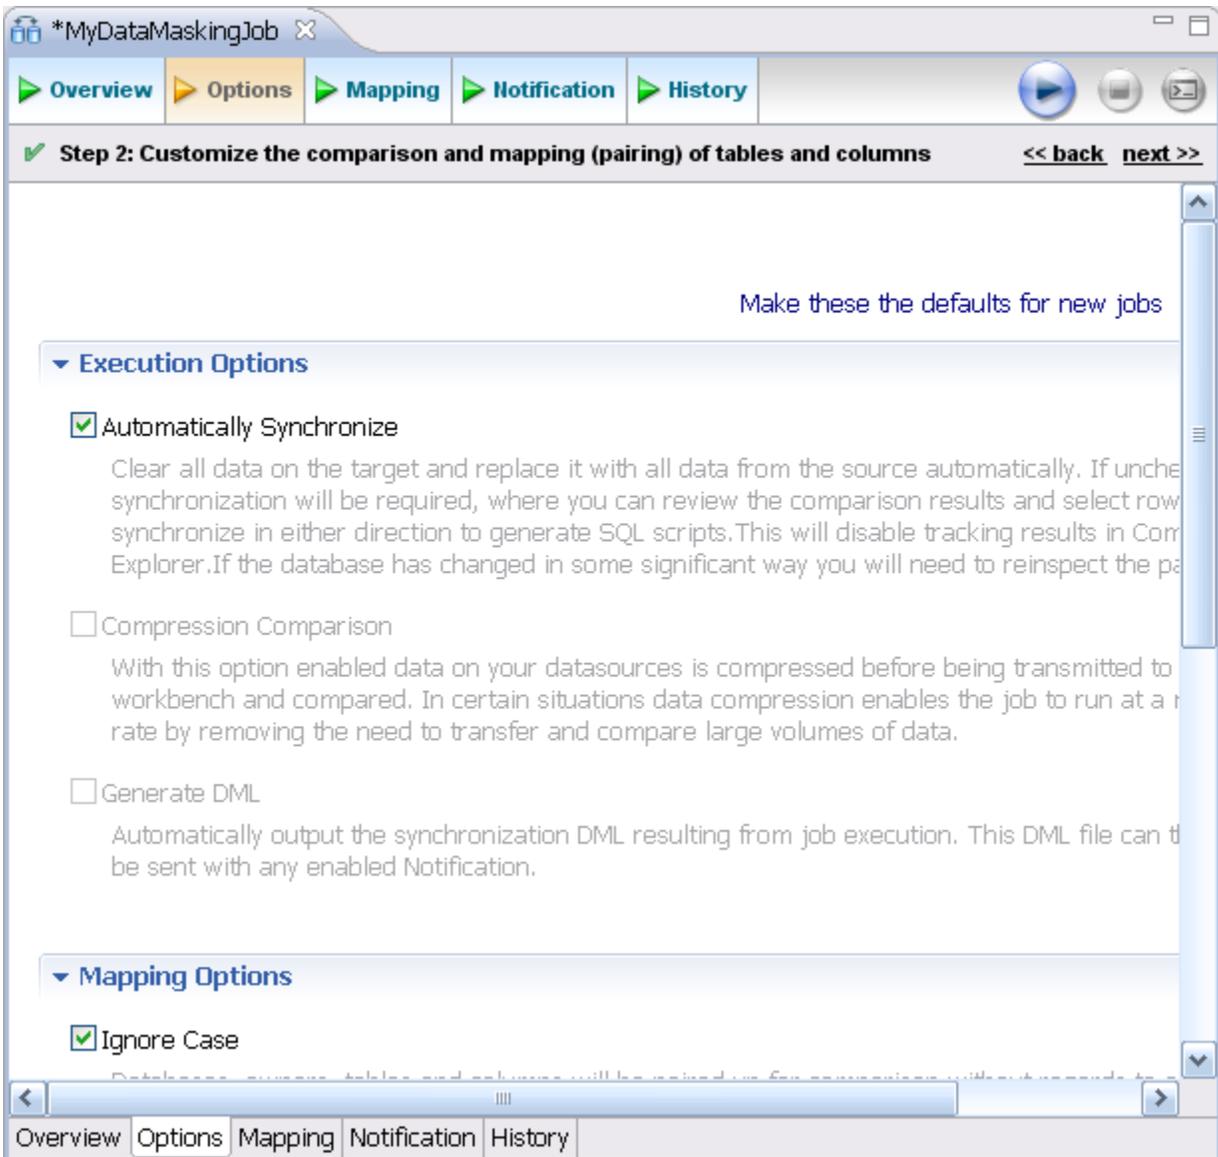

- Data Comparison Source:** This panel includes fields for 'Name:', 'Type:', and 'Host:'. Below these fields is a 'Select Datasource' button with a green checkmark icon. At the bottom of the panel is a dropdown menu.
- Data Comparison Target:** This panel is identical in structure to the Source panel, with fields for 'Name:', 'Type:', and 'Host:', a 'Select Datasource' button, and a dropdown menu.

Set to Automatically Synchronize

Prior to running a masking job, set it to automatically clear all the data on the target and replace it with new, masked data.

To set synchronization:

- 1 Click on the **Options** tab.
- 2 Select the **Automatically Synchronize** check box.

Specify Mapping Options

Use the **Mappings** tab to specify the tables to mask.

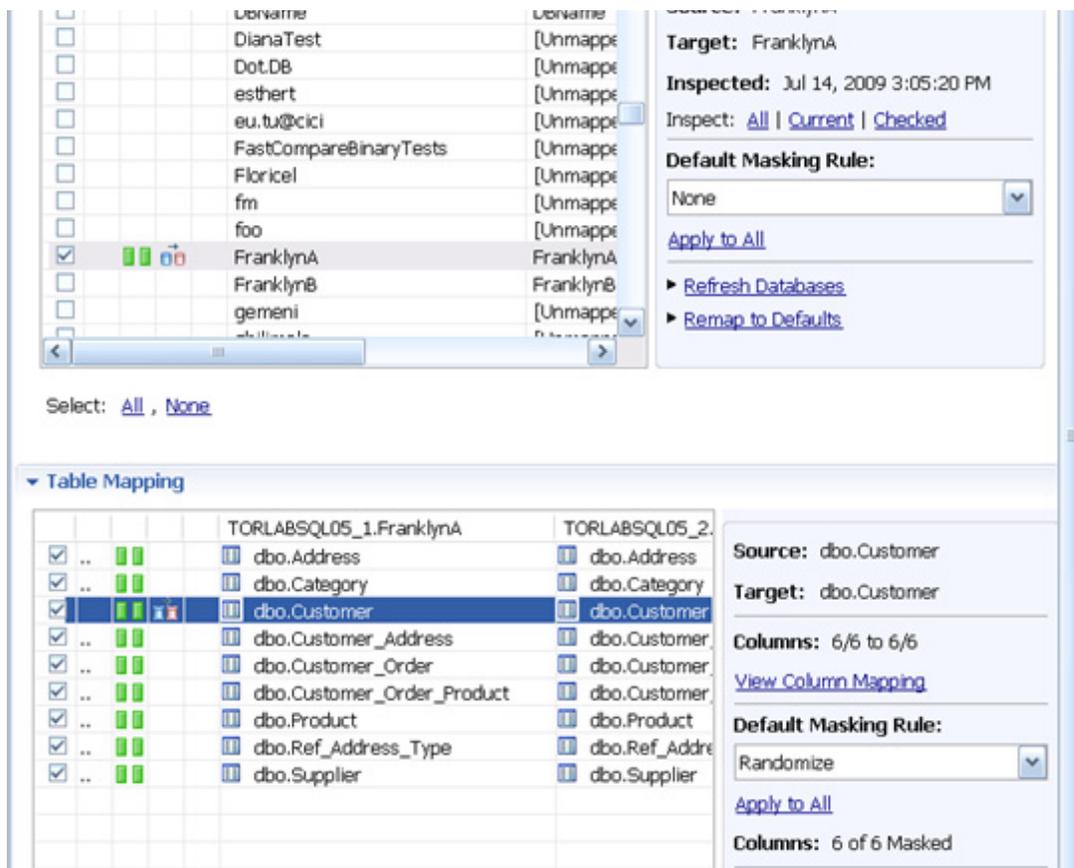

You can apply a **Default Masking Rule** to selected columns using the pulldown menus. The options are:

- **Use Default:** The default masking rule as set in the **Database Mapping** box.
- **None:** No masking will be applied.
- **Randomize:** Replaces characters with random other characters.
- **Shuffle:** Reorders the values in different rows; for example, in a First Name column Bob, Ted, and Alice can change to Alice, Bob, and Ted.

Use the check boxes in the left-hand column to de-select any columns that you do not want to include in the data masking job process.

To specify mapping options:

- 1 Click on the **Mappings** tab.
- 2 Select check box of the database you want to mask.
- 3 Click on the **Yes, retrieve the objects in the pair** button to inspect the tables and columns. The **Table Mapping** section opens.
- 4 Select a **Default Masking Rule** for the in the **Database Mapping** box.
- 5 Select a **Default Masking Rule** in the **Table Mapping** box.

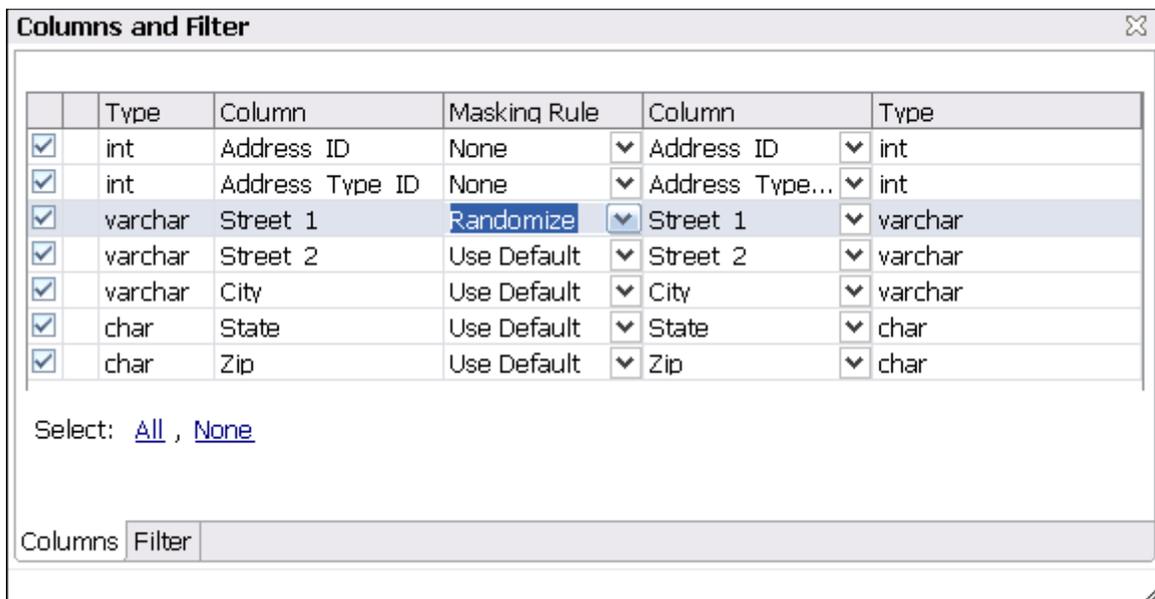

Specify Masking Rules for Individual Columns

You can specify different masking rules for different columns.

To specify a masking rule for a column:

- 1 In the **Table Mapping** box, click **View Column Mapping**.
- 2 Click on the data **Masking Rule** option for the column and select from the pulldown menu one of the following:
 - **Use Default:** The default masking rule as set in the **Database Mapping** box.
 - **None:** No masking will be applied.
 - **Randomize:** Replaces characters with random other characters.
 - **Shuffle:** Reorders the values in different rows; for example, in a First Name column Bob, Ted, and Alice can change to Alice, Bob, and Ted.
- 3 Close the window.

Run the Database Masking Job

To execute the data masking job:

- 1 Click **File > Save** to save the job.
- 2 Click the **Run Job** icon in the upper right-hand corner of the screen.
- 3 Click **OK** in the Confirmation dialog box to agree that you want to overwrite the target data.

The **Results** tab displays the progression of the masking job as it executes, and the **Rows Written** column indicates how many rows of data have been masked by the job.

The screenshot shows a software window titled '*Untitled-Data-Comparison-Job-1'. The 'Results' tab is active, displaying the following information:

Auto Synchronization Summary

Progress bar: 58%

FranklynA.Ref_Address_Type - FranklynA.Ref_Address_Type
 Data Movement Progress: 5002 Rows
 Elapsed Time: 00:40 (mm:ss)

Auto Synchronization Results

EXTOVMGL1501	EXTOVMGL1502	Progress	Results	Migration Status
FranklynA	FranklynA	77%		✓ 2 rows moved
Contacts	Contacts	0%		✓ 5000 rows moved

The interface includes a navigation bar at the top with tabs for Overview, Options, Mapping, Notification, History, and Results. A 'Close results' button is located in the top right corner. The bottom of the window also features a navigation bar with the same tabs.

See the Masked Data

You can see the masked data by running a new **Data Comparison** job and looking at the changes.

- See [Comparing Data](#) for instructions on running a **Data Comparison** job.

For rows that do not have masking applied, you should see “0” in the **Different** column of the **Results Overview** box. For rows that are masked, you should see the number of rows that changed.

In the **Selected Table** box, you can see the masked data in the Target table. For example, the First and Last Name data shown below was masked using the **Randomize** setting.

The screenshot shows the 'Database Results' tab of the Data Comparison tool. It displays a 'Results Overview' table and a 'Selected Table' section with two side-by-side table views.

Results Overview - FranklynA

Source: Fran...	Target: Fra...	Matched	Only in TORL...	Only in TORL...	Different
dbo.Category	dbo.Category	16	0	0	0
dbo.Customer	dbo.Customer	0	0	0	348

Selected Table

Left Table: TORLABSQL05_1.FranklynA.dbo.Customer

Customer ID	First Name	Last Name
734	James	Battiste
735	Samual	Philpott
736	Noel	Arra
737	Gaston	Amesqui

Right Table: TORLABSQL05_2.FranklynA.dbo.Customer

Customer ID	First Name	Last Name
734	Gxibk	Yxssfms
735	Jaciqb	Fvwzfiac
736	Nqel	Eaee
737	Qkeybx	Oaseqfw

Comparing Configurations

Configuration comparison jobs enable you to compare the configuration settings between two registered data sources. They are used to ensure consistency between the settings of two data sources in order to meet guidelines regarding the storage and retention of data.

Comparison job results are viewed as an overall “percentage matched” between two data sources. Comparison jobs also provides a list of individual configuration properties and other, more granular details regarding both data source’s configuration settings. Additionally, the job determines the total properties matched, total properties that do not match, the properties available on only one data source, and the overall total properties compared in the job.

The following tasks provide a high-level overview of the configuration comparison job process:

[Create a New Configuration Comparison Job](#)

[Specify a Comparison Job Name](#)

[Specify Source and Target Data Sources](#)

[Specify Job Options](#)

[Refine Property Comparisons](#)

[Execute Comparison Job](#)

[View Results](#)

[Execute an SQL Synchronization Script](#)

[Generate a Job Report](#)

In addition to comparing two registered data sources, you can create a Standard -- a configuration comparison object that contains a customized list of configuration parameters, values, and comparison operators, or an Archive -- the older, stored configuration properties of an existing registered data source. Archives and Standards can then be used in comparison jobs in the same manner as registered data sources.

[Creating a Configuration Standard](#)

[Creating a Configuration Archive](#)

Finally, all comparison jobs, archives, and standards provide version information with regards to each data source platform. Each version parameter and description is available via the link below.

[Understanding Version Information](#)

Create a New Configuration Comparison Job

Configuration comparison jobs are defined in the **Configuration Comparison Job Editor**.

To start a new comparison job:

- Select **File > New > Configuration Comparison Job** in the Menu Bar.

The **Configuration Comparison Job Editor** opens.

You can now proceed to define the parameters of the new job.

Untitled-Config-Comparison-Job-1

Specify a Comparison Job Name

A job name is used to distinguish between configuration comparison jobs composed of specific data sources. A name is defined when a new job is started and is used to save jobs for later use or repeated comparisons of the same pair of data sources.

Under the **Name** field, the location of the **Project** where the job is stored in **Project Explorer** appears. Click **Details** to view the directory location of the specified project.

Click **Track Results in Compliance Editor** if you want the job added to the [Compliance](#) view.

Job Name and Description

Name: Configuration Compare - TORLABSQL00_3

Notes:

Project: **Change Management** Details...

Track results in Compliance Explorer

To name a configuration comparison job:

- Type the name of the job in the **Name** field of the **Configuration Comparison Job Editor**.

Specify Source and Target Data Sources

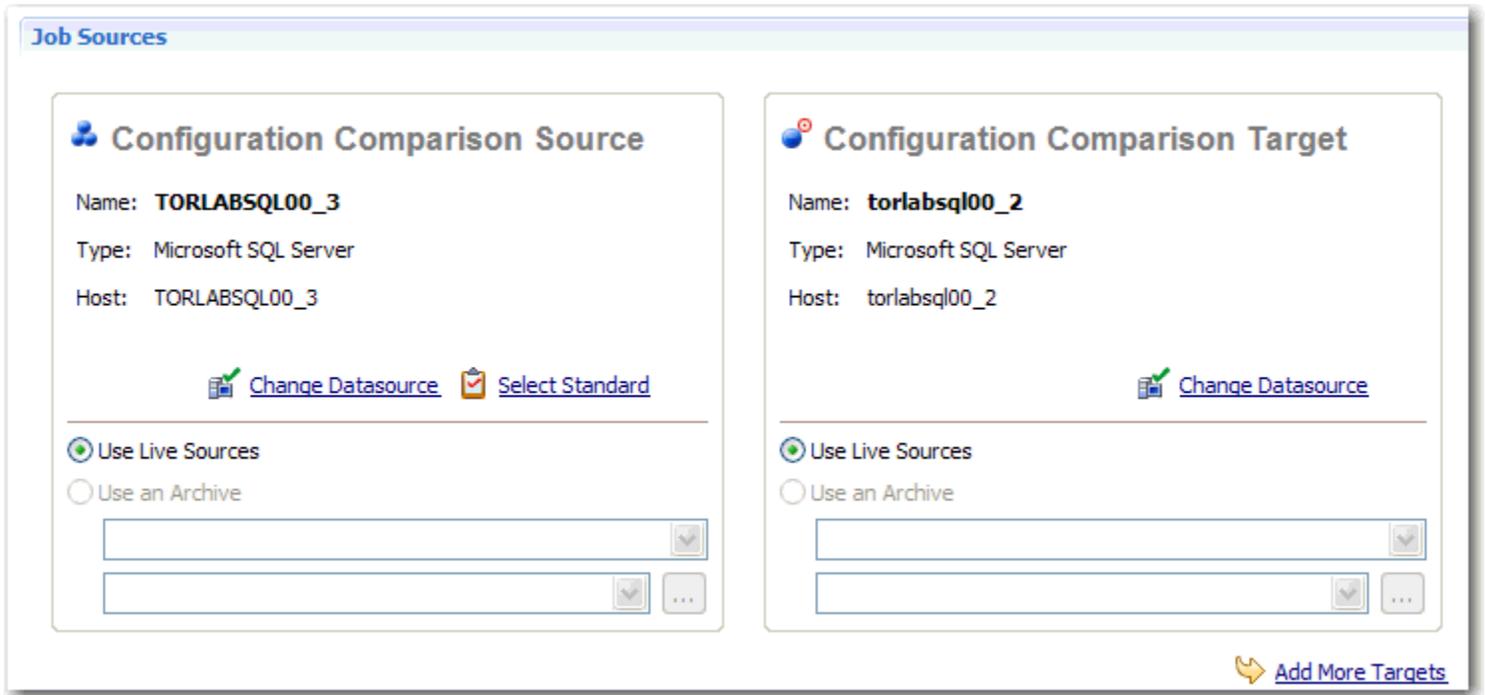

The **Job Sources** section of the Configuration Comparison Job Editor contains two boxes labeled **Comparison Source** and **Comparison Target**. These boxes identify the Data Sources, Archives, and Standards to be used in the job.

To add a data source to the job:

- Click and drag a data source from **Data Source Explorer** to the Configuration Comparison Source or Configuration Comparison Target box, or click **Select Data Source** in the appropriate box and choose a data source from the dialog provided.

To add a Standard to the job:

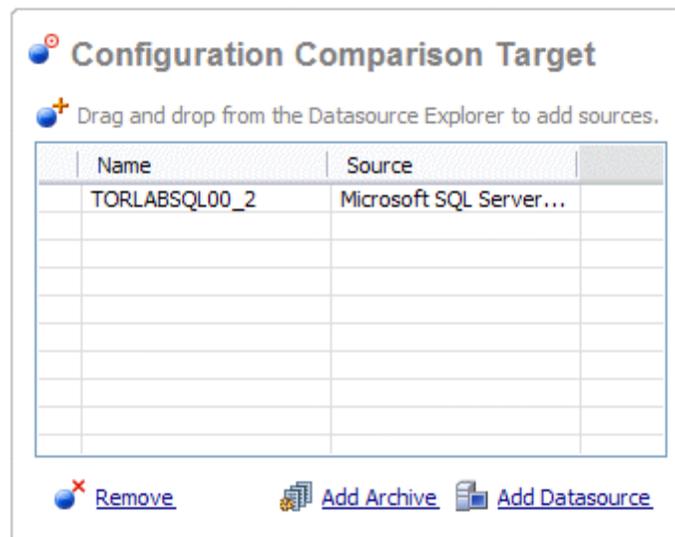

- Click and drag a Standard from **Data Source Explorer** to the **Comparison Source** box, or click **Select Standard** and choose a data source from the dialog provided.

When a data source is added to a job, it is displayed by **Name**, **Type**, and **Host**. You can change a data source by clicking **Change Data Source** in the appropriate box and selecting a new data source from the dialog, or by dragging a different data source to the box from data source Explorer.

The **Configuration Comparison Source** and **Configuration Comparison Target** boxes must contain data sources, Archives, or Standards before the job can be executed.

To add multiple Comparison Targets, click **Add More Targets** to enable a **One-to-Many** comparison.

To add multiple targets to the comparison job

- Drag and drop additional data sources or Archives from **Data Source Explorer** to the **Configuration Comparison Target** box, or click the **Add Archive** or **Add Data Source** commands beneath the table and select the appropriate target from the dialog provided.

Additionally, you can specify whether you want to compare the current properties of the live data source, or an archived set of properties previously stored in Change Manager using the radio buttons beneath each box.

- Select **Use Live Sources** to compare the current properties of the data source when the job is executed.
- Select **Use an Archive** and select the Archive and version to use in the job.

NOTE: You can drag and drop data sources, Archive Jobs, Archive Versions, and Standards into the Comparison Source and Comparison Target cells. A Standard can only be the Source of a Configuration Comparison Job.

Refine Property Comparisons

Configuration property refinement involves choosing specific configuration properties to compare and specific configuration properties to omit prior to executing a comparison job.

By default, when you specify a data source as a comparison job Source or Target, you can refine the properties to be compared prior to executing the job on the **Refinements** tab of the **Configuration Comparison Job Editor**.

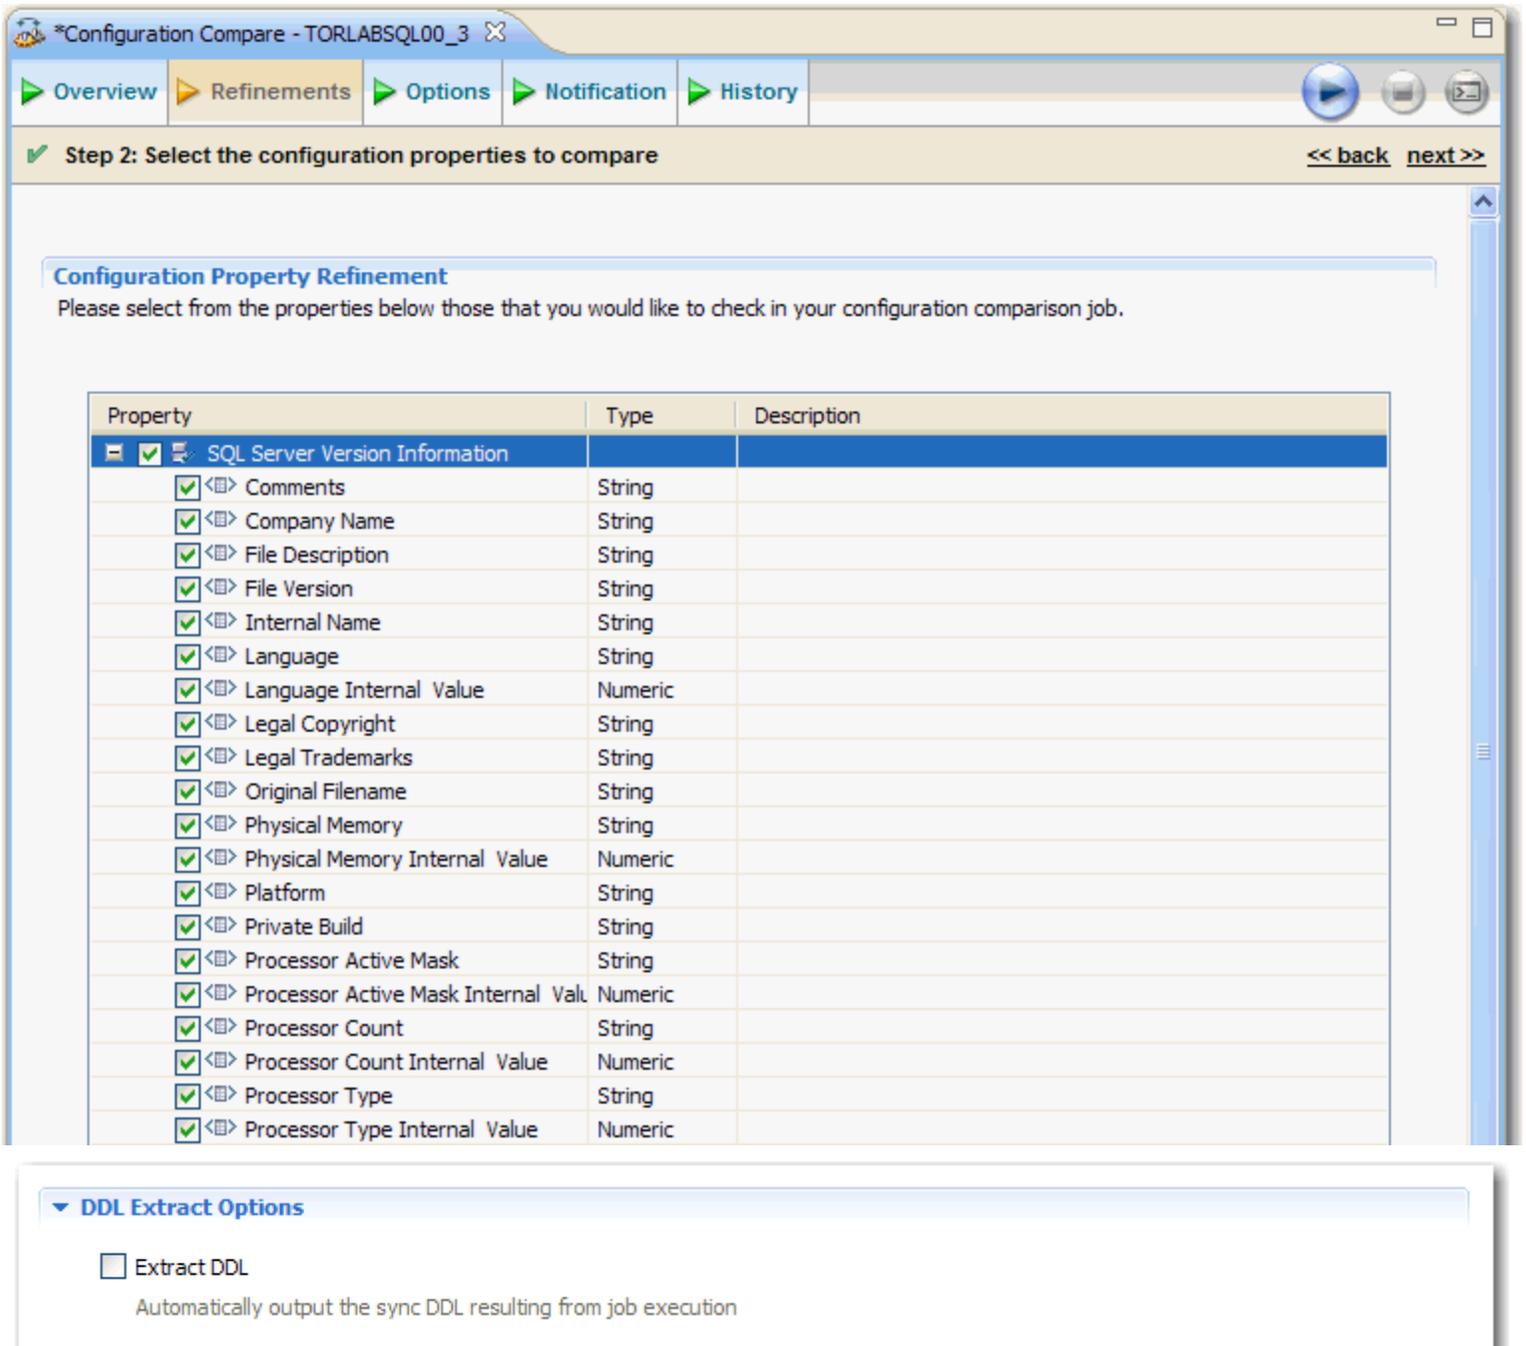

Configuration properties are organized by tree and listed by **Property** name, **Description**, **Data Source Location**, and **Source**.

To specify the properties used in the comparison job:

Navigate to the **Refinements** tab and select or deselect the configuration properties in the table, as required. Selected properties are included in the comparison job, and de-selected properties are ignored during job execution.

Specify Job Options

Prior to the execution of a job, parameters can be set to control aspects of the execution process itself. These options can be set prior to job execution on the **Options** tab.

The **Extract DDL** option enables you to indicate to Change Manager that the synchronization code produced by the job comparison is automatically output to a separate Editor window once the comparison process has executed.

Additionally, there are default commands located in the upper-right hand corner of the interface:

- Select **Make These the Defaults for New Jobs** to save your settings and retain job option selections whenever you create a new job.
- Select **Restore Defaults** to return the option page selections to the original selection format.

Execute Comparison Job

The configuration comparison job runs when you click **Run Job** on any tab in the Configuration Comparison Job Editor.

When the process executes, the **Comparison Results** tab appears and displays the progress of the job and a summary of the comparison job results.

View Results

When a job is complete, results are displayed on the **Comparison Results** tab.

Job results are displayed by property with an overview of the matching and non-matching properties located at the top of the page. Individual details about each property are listed in the **Comparison Results** table.

- The column on the right-hand side of the table contains a check mark or X icon depending on whether the corresponding property value matched between the **Source** and **Target** data sources. It also displays values that represent the differences between the source and target configuration values.
- The **Source** column contains the value of the property on the **Source**.
- The **Op** column provides the operator used in the job comparison that defines what constitutes a match. (This can only be specified when a **Standard** is used in the job. Otherwise, the operator is always **equals**.)

When you are ready to resolve the data sources, click **Generate a SQL Script**. A synchronization script based on your modifications appears in a separate window.

Overview Refinements Options Notification History Comparison Results

Execute an SQL Synchronization Script

Synchronization scripts are executed via the commands in the **Run** menu or via the command icons located along the top of SQL Editor.

When an SQL file is open in the Workspace, select it and choose a database and an associated catalog on which you want to execute file using the drop down menus in SQL Editor. You can click the execute icon to execute the code on the specified database and catalog, start a transaction or commit a transaction, or modify the SQL session options prior to execution.

To execute code:

Open the SQL file you want to run, ensure it is associated with the correct database and click the **Execute** icon. Change Manager executes the code on the data source you specified. Results are displayed in the same tab or in a new tab.

To execute a transaction:

Open the transaction file you want to run and ensure it is associated with the correct database, and then click the **Start Transaction** icon. Change Manager executes the transaction on the data source you specified.

To commit a transaction:

Open the transaction file you want to commit, ensure it is associated with the correct database, and then click the **Commit Transaction** icon. Change Manager commits the transaction on the data source you specified.

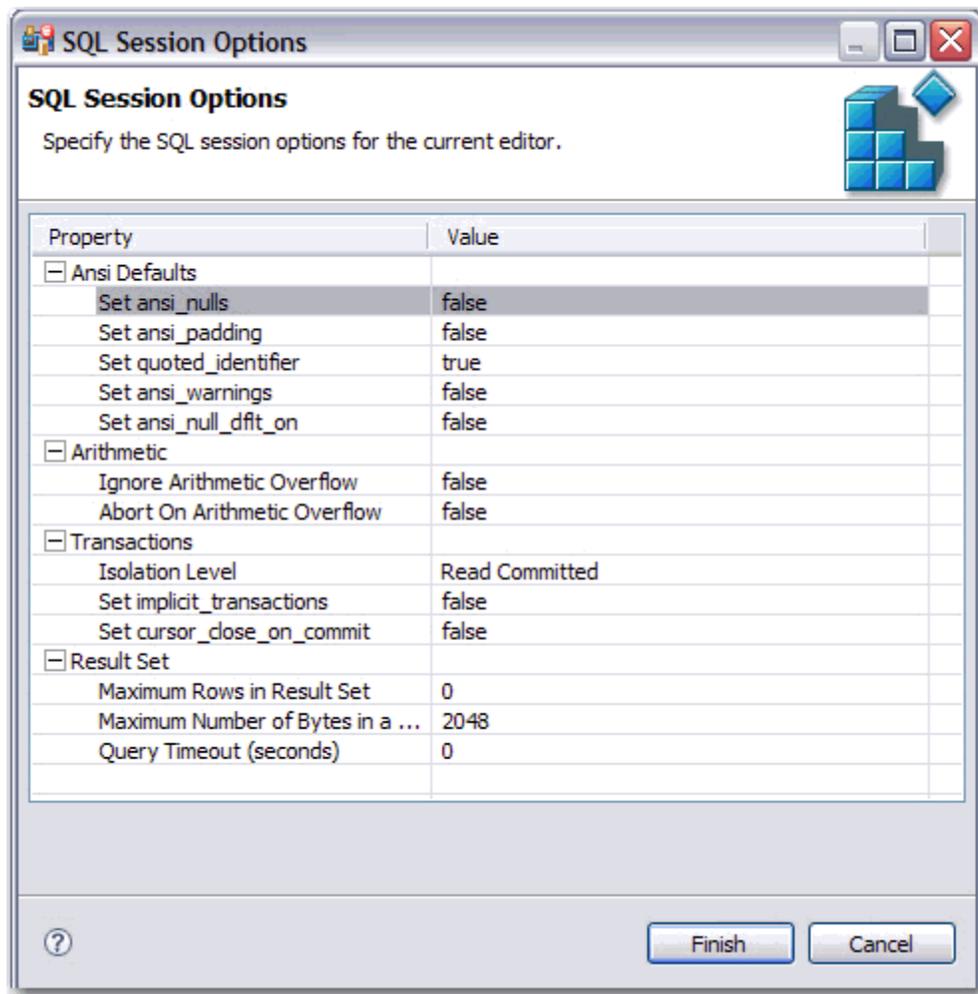

You can set transactions to auto-commit prior to execution on the **SQL Execution** node of the **Preferences** panel in Rapid SQL Developer.

NOTE: The synchronization script generation process does not support all object parameters. The following object parameters should be manually added after a synchronization script is generated, as required: **fillfactor**, **consumers**, **allow_dup_row**, and **statistics**.

You can set transactions to auto-commit prior to execution on the **SQL Execution** node of the **Preferences** panel in Change Manager.

Configure an SQL Session

The SQL Session Options dialog provides configuration parameters that indicate to Change Manager how to execute code in the development environment.

To modify SQL session options:

- 1 Click the SQL Session Options icon in the Toolbar.

The **SQL Session Options** dialog appears.

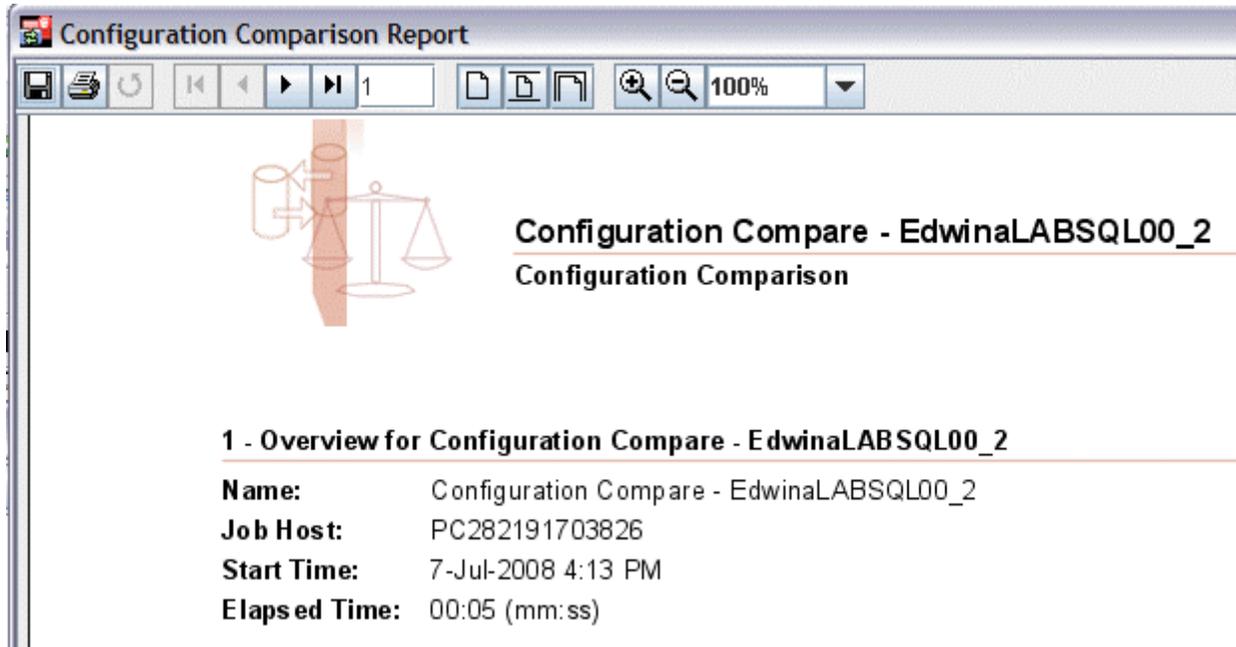

- 2 Click on individual parameters in the **Value** column to change the configuration of each property, as specified.
- 3 Click **Finish**.

The session options will be changed and Change Manager will execute the code as specified when you launch the script.

NOTE: Session options only apply to the corresponding editor and are not retained when executing multiple SQL files.

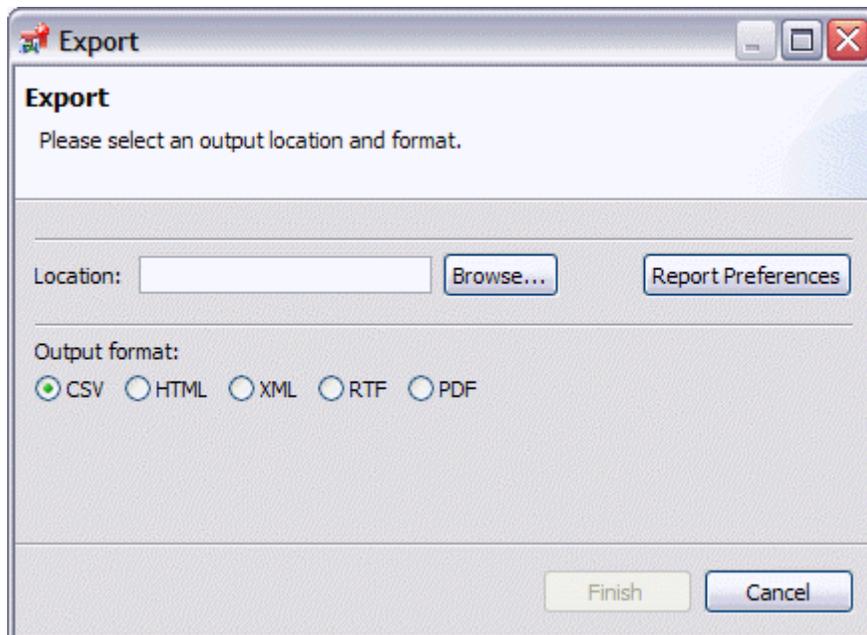

Generate a Job Report

Once you have run an archive job, you can generate a job report that summarizes the archived configuration information. You can also generate job reports for any archive versions that exist in the system. Click **View Report** on the **Comparison Results** tab.

The report opens in a separate window and can be read on screen, sent to a printer, and saved to disk.

Additionally, the **Export Results** command will produce a report file in a specified format at a directory location of your choosing.

Click **Export Results** on the **Results** tab and fill in the fields, as required. When you click **Finish**, the report is created in the directory specified in the **Location** field, in the format specified in the **Output Format** section.

The **Contents** tab enables you to specify what criteria to include in the report:

- Select **Include Matching Configuration Parameters** to include configuration parameters and values that matched when the job was run.

Creating a Configuration Standard

A Standard is an object specific to configuration comparison jobs that contains a custom set of stored data source configuration properties. Standards are used in configuration comparison jobs against registered data sources and Archives and provide a means of defining and retaining a specific set of configuration parameter values and thresholds to 'check' against your enterprise and ensure all network systems meet data complacency measures.

All Standards are composed of a name, description, and a list of properties that are assigned set values. Properties are derived from live data sources, Archives, or other Standards. Additionally, each property value is assigned an operator that asserts if the same value on an opposing data source/Archive in a comparison job falls within a specific range, is the member of a set, is greater than a value, etc.

The following tasks provide a high-level overview of the Standard definition process:

[Create a New Standard](#)

[Specify a Standard Name](#)

[Add Property Sources](#)

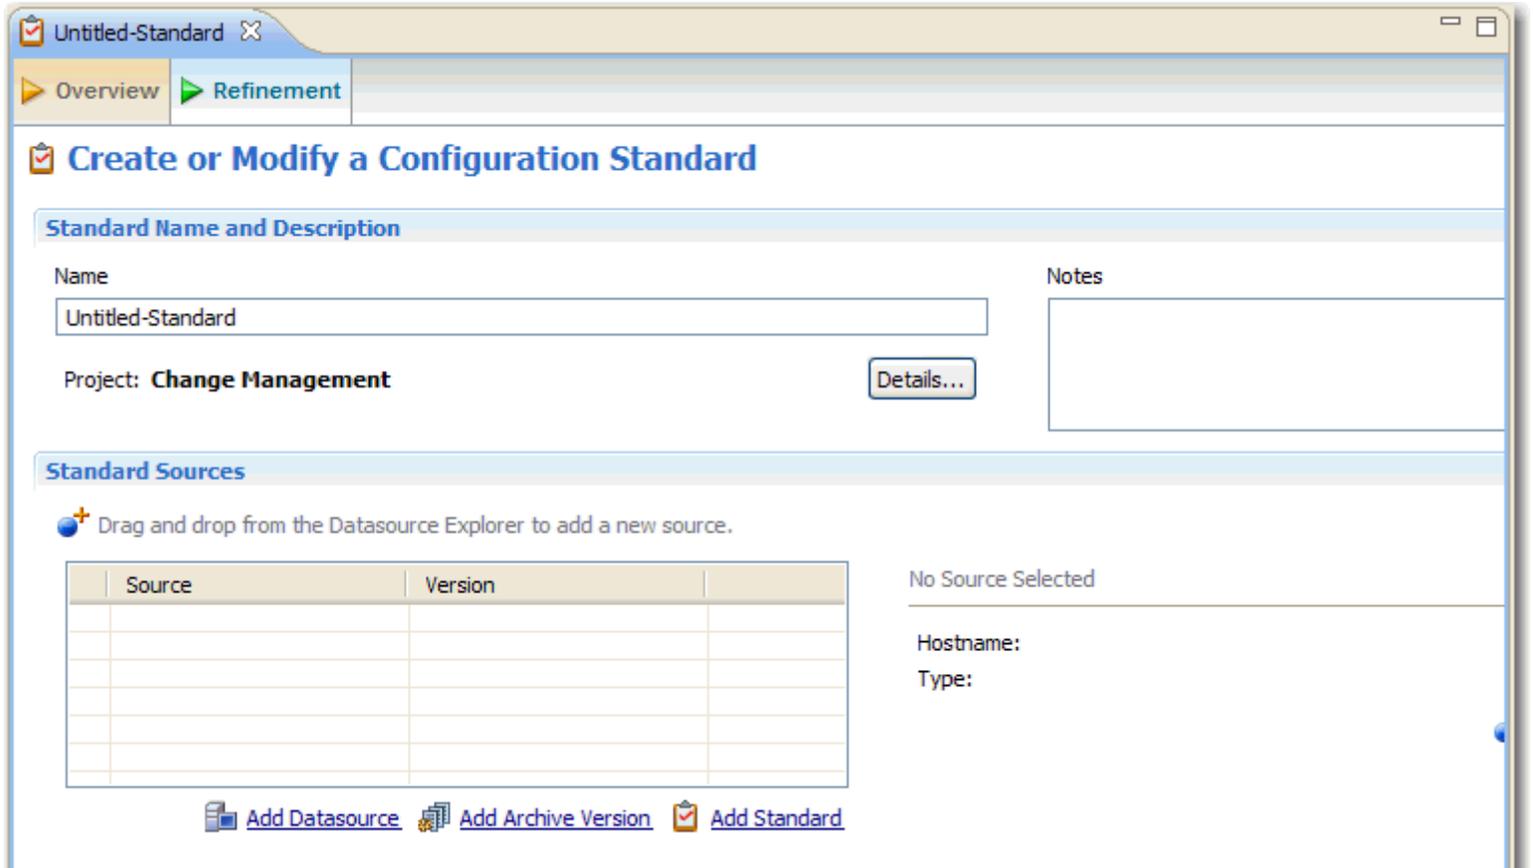

[Refine Properties](#)

[Save Standard](#)

[Use Standard in Configuration Comparison Jobs](#)

Create a New Standard

Standards are defined in **Standards Editor**.

To create a new Standard

- Select **File > New > Configuration Standard** in the Menu Bar. The Standard Editor opens.

If you want to add the properties of an existing data source or Archive to a new Standard, click and drag the appropriate object from **Data Source Explorer** to the **Standard Sources** table in **Standard Editor**. All of the properties of the selected data source or Archive populate the new Standard.

You can now proceed to define the parameters of the new Standard.

Specify a Standard Name

A name must be defined when a new Standard is created. It is used to distinguish between Standards and other objects in Change Manager.

Standard Name and Description

Name Notes

Project: **Change Management**

Ensure you specify a meaningful name that identifies the Standard in other views and dialogs later on. The **Project** field indicates the project location where the Standard will be stored. Click **Details** to view the directory location where the job data will be saved.

To name a Standard

- Enter the name of the Standard in the **Name** field of the **Standard Editor**.

You can now proceed to define the parameters of the new Standard.

Add Property Sources

The **Standard Sources** table specifies the amalgamation of registered data sources, Archives, and other Standards from which the new Standard properties are derived.

Standard Sources

Drag and drop from the Datasource Explorer to add a new source.

Source	Version
TORLABSQL00_2	Microsoft SQL Server 8.0....
Configuration Archive Job...	Microsoft SQL Server 7.0....

Configuration Archive Job (Version 1)

Version: 1
Type: Linked

[Add Datasource](#) [Add Archive Version](#) [Add Standard](#)

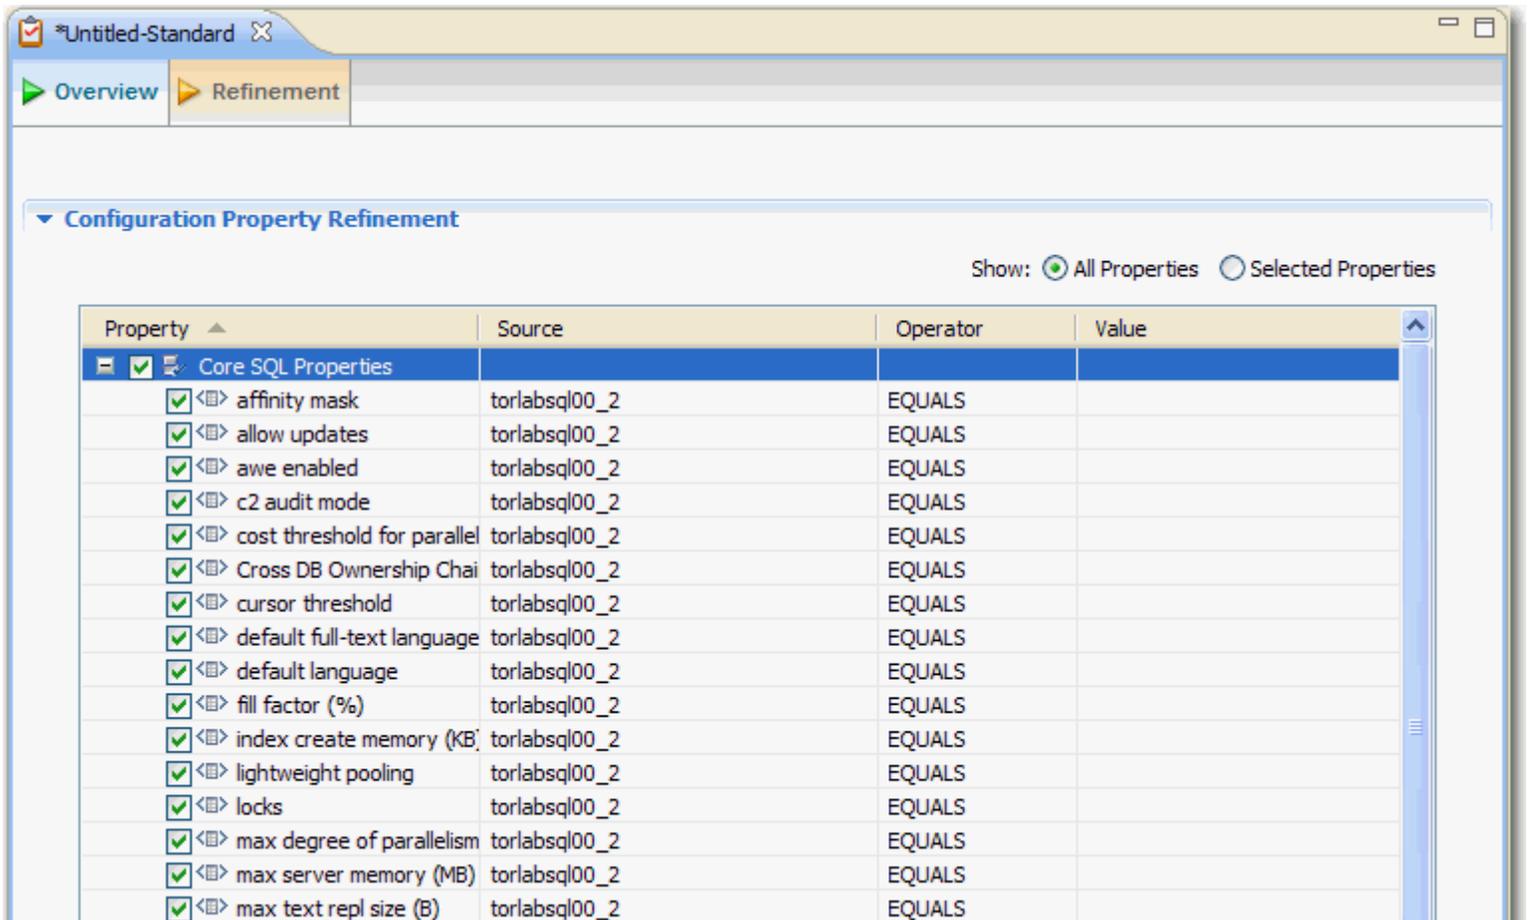

By default, Change Manager automatically adds all properties of a selected source to the Standard definition. You need to manually refine property selections on the Refinements tab once sources have been added. See [Refine Properties](#) for more information.

To add properties to a Standard:

Drag and drop a data source, Archive, or Standard from **Data Source Explorer** to the **Standard Sources** table. Alternatively, use the **Select Standard**, **Select Data Source**, and **Select Archive Version** commands beneath the table to add properties to the Standard definition.

Refine Properties

The **Standard Refinement** tab displays all sources and corresponding properties applied to the Standard. All properties are listed by **Property**, **Source**, **Type**, **Operator**, and **Value**.

You can choose to include or exclude properties in the Standard on the **Standard Refinement** tab, as well as set thresholds and otherwise specify what constitutes a 'pass' or a 'fail' when a comparison job is run per individual property value, via the **Operator** column.

The following Operators can be applied to properties in a Standard:

- Less Than
- Greater Than
- Greater Than Equal To
- Equals
- Less Than or Equal To
- Not Equals

The **Value** column indicates the value that the **Operator** definition must match.

The **Type** column indicates if individual properties are linked or static:

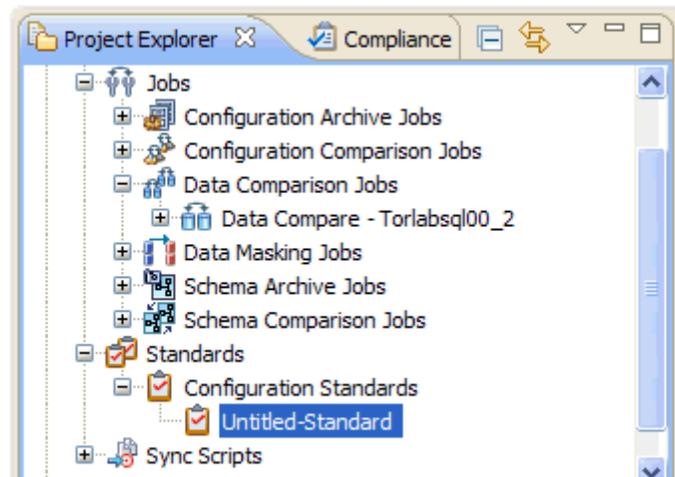

- Linked property values refresh with the latest source values each time the Standard is run in a job.
- Static property values remain fixed and do not updated based on source values. When you have multiple sources selected, select the source name in this column to specify which value the standard updates from.

To refine Standard properties

- 1 Define each property as **Linked** or **Static** by clicking the appropriate row value in the **Type** column and choosing a selection from the drop down menu.
- 2 Define the operator used to determine the conditions of a matching result when the job runs by clicking the appropriate row value in the **Operator** column and choosing a selection from the drop down menu. If you choose the **Pattern Match** operator, remember to include a regular expression in the corresponding **Value** column.

Save Standard

Once you have defined the Standard, it can be saved via the **File > Save**, **File > Save As**, or **File > Save All** commands in the Menu Bar.

Change Manager saves the Standard under the name you specified in the **Name** field in Project Explorer. You can use the Standard in configuration comparison jobs as you would a data source or Archive.

Use Standard in Configuration Comparison Jobs

Standards are used in configuration comparison jobs the same way as registered data sources or Archives, with the noted exception that they may only be designated as Sources due to the unique property operator values they contain.

To add a Standard to a configuration comparison job:

Drag and drop the Standard from **Project Explorer** to the **Comparison Source** box in the **Configuration Comparison Job Editor**. You can now proceed to run the job using the Standard's properties as you would a normal data source.

Creating a Configuration Archive

An Archive is an object related to configuration comparison jobs that contains a snapshot of the configuration parameters of a registered data source. A Configuration Archive is used in configuration comparisons against other data sources, standards, and archives to monitor property value slippage, provide backup settings, or otherwise enable the use of preserved data source configuration settings in configuration comparison jobs.

All Archives are composed of a name, description, and a list of configuration properties derived from a single live data source at a specific point in time. Additionally, Archives have Versioning functionality and can be periodically updated with the current values of an associated data source. Older Versions are retained within an Archive and can be recalled as needed.

Archives are located in data source Explorer on the Configuration Archive Jobs node of the corresponding data source.

The following tasks provide a high-level overview of the Archive definition process:

[Create a New Configuration Archive](#)

[Specify an Archive Name](#)

[Specify an Archive Source](#)

[Refine Properties](#)

[Specify Notification Options](#)

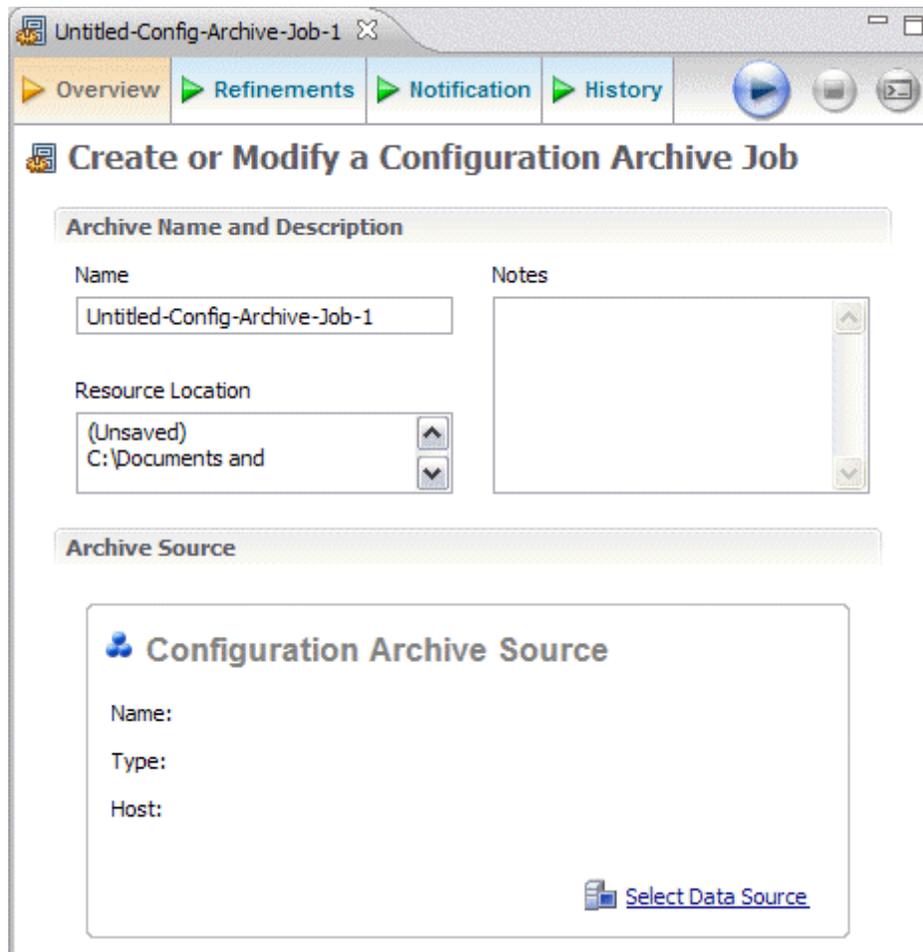

[Save the Archive/Manage Versioning](#)

[Generating a Job Report](#)

[Use Archive in Configuration Comparison Jobs](#)

Create a New Configuration Archive

Archives are defined in the **Configuration Archive Job Editor**.

When an archive is initially created it is in an unsaved state and versionless. Once you define the archive and refine its properties, you need to issue the **Run Job** command to create a Version and save the archive in the Change Manager environment. Unsaved Archives cannot be used in comparison jobs and do not appear in data source Explorer. More information regarding the process of refining and saving a new Archive are located in the other steps of this section.

To create a Configuration Archive:

Select **File > New > Configuration Archive Job** from the menu. The Configuration Archive Editor opens.

Specify an Archive Name

A name must be defined when a new Archive is created. The name is used to distinguish between Archives and other objects in Change Manager, and is used in Versioning functionality later in the process.

Archive Name and Description

<p>Name</p> <input style="width: 95%;" type="text" value="Archive - TORLABSQL00_2"/>	<p>Notes</p> <div style="border: 1px solid #ccc; height: 80px; width: 100%;"></div>
<p>Resource Location</p> <input style="width: 95%;" type="text" value="C:\Documents and Settings\MRC\change_workbench_5_0"/>	

Ensure you specify a meaningful name that identifies the Archive in other views and dialogs later.

The **Project** field below the **Name** field indicates the project under which the new job will be saved. Click **Details** to view the directory location where the job data will be stored.

To name a Configuration Archive

Enter the name of the Archive in the **Name** field of the Archive Job Editor.

Specify an Archive Source

The **Configuration Archive Source** table specifies the data source from which the archive is derived.

Archive Source

 **Configuration Archive Source**

Name: Datoedwina

Type: Microsoft SQL Server

Host: Datoedwina1

 [Change Data Source](#)

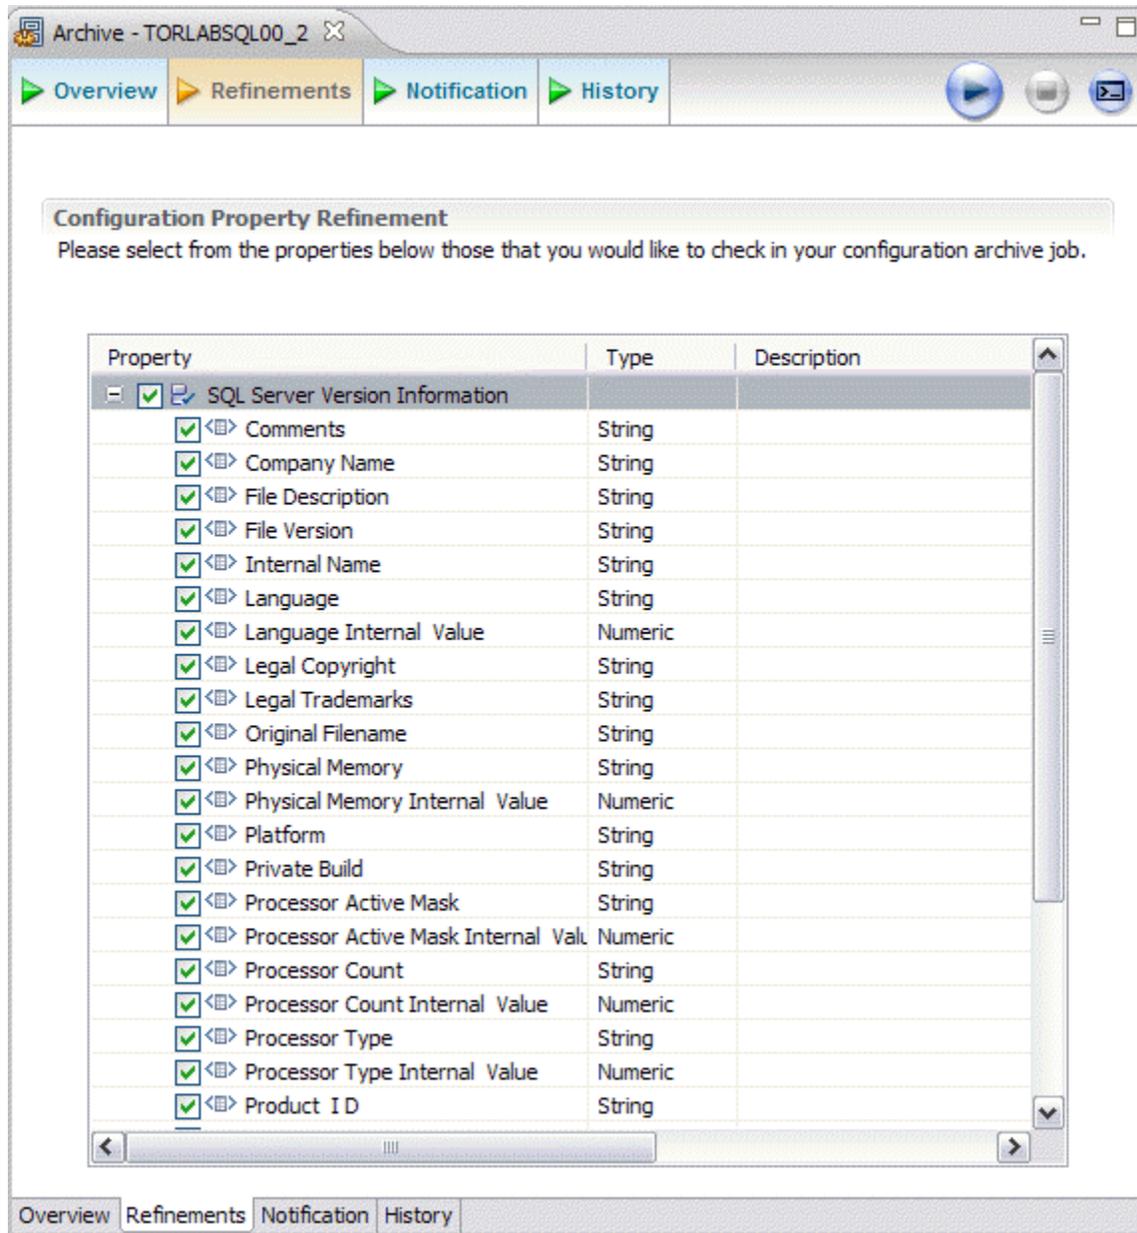

To specify the archive source:

Drag and drop the data source to be archived from **Data Source Explorer** to the **Configuration Archive Source** box. The data source is listed by name, DBMS type, and host.

Refine Properties

By default, when you create a new archive, all data source properties are included. However, you may only want or need to archive a specific group of properties per archive defined. For example, you may want to define an archive that retains only the security properties of the associated data source. Other archives can be created (and likewise refined) for the same data source, but maintaining a different group of selected properties, such as an archive that displays only performance settings.

Archive configuration properties are located on the **Refinements** tab of the **Archive Job Editor**, where they are listed by name.

To refine Configuration Archive properties:

Use the check boxes to select or de-select properties as needed. Selected properties are included in the Archive when comparison jobs are run, while de-selected properties are ignored altogether.

When you have finished selecting the properties to include in the Archive, you will need to save the archive by creating a version (discussed in the following topic). Within the same Archive, property refinements are retained across Versions unless new refinements are specified. However, each time you create a new Archive, Change Manager includes all properties of the specified data source and you must again specify property refinements, if any.

Specify Notification Options

Notification options provide parameters for enabling and setting up various notifications regarding executed configuration archive comparison jobs. This includes:

[Email Notifications](#)

[File System Notifications](#)

[System Tray Notifications](#)

Notification options provide parameters for enabling and setting up email notification and report mailing for executed schema comparison jobs. The notification options tab enables you to specify the email addresses to which you want to send notifications, the email message format, and the conditions under which a notification should be sent.

Email Notifications

Email notification options provide parameters for configuring and enabling email notification and report mailing on executed comparison jobs.

Email Notifier

Enable Email Notifier

Report:

None CSV XML HTML PDF RTF

Log Files:

Always Only on Error

These parameters enable you to specify the email addresses to which you want to send notifications, the email message format, the conditions under which a notification email should be sent, and other, similar options.

Click **Enable Email Notifier** to enable email notification. When you select this check box, a list of notification parameters appear.

Enter the email addresses to which the notification will be sent in the **To** field. You can specify an email format template in the **Template Field**.

The **Send Notification** options specify when a notification email should be sent based on the results of a comparison job:

- The **When Run From** options enable you to indicate that email notifications should only be sent if a job is executed from the **Workbench**, **Command Line**, or **Both**.
- The **Job Outcome** options enable you to indicate that email notifications should be sent **Only on Success**, **Only on Error**, or **Both**.
- The **For Threshold** options enable you to specify the threshold level for which email notifications are sent, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

The **Attachments** section enables you to specify the file format of an attached report that will display job results with the notification email. Choose **None** (does not attach a report), **CSV**, **XML**, **HTML**, **PDF**, or **RTF** to specify the file format of the report. The **Log Files** indicates when to log the notification file results to the Change Manager log file. You can choose **Always** or **Only on Error**.

File System Notifications

File system notification options provide parameters for configuring and enabling logging options for executed comparison jobs.

File System Notifier

Enable File System Notifier

Script Directory:

[Show File System Notification Preferences](#)

Send Notification

When Run From:

Workbench Command Line Both

Job Outcome:

Only on Success Only on Error Both

For Threshold:

Pass Warn Fail [Open Compliance Page...](#)

Attachments

Report:

None CSV XML HTML PDF RTF

Log Files:

Always Only on Error

Click **Enable File System Notifier** to enable comparison job logging. When you select this check box, a list of notification parameters appear.

Specify the directory location of each of the output files that are produced by the notification function in the **Report Directory**, **Log Directory**, and **Script Directory**, respectively. Additionally, you can click the **Show File System Notification Preferences** link if you want to change the directory locations at the application level rather than just the job level.

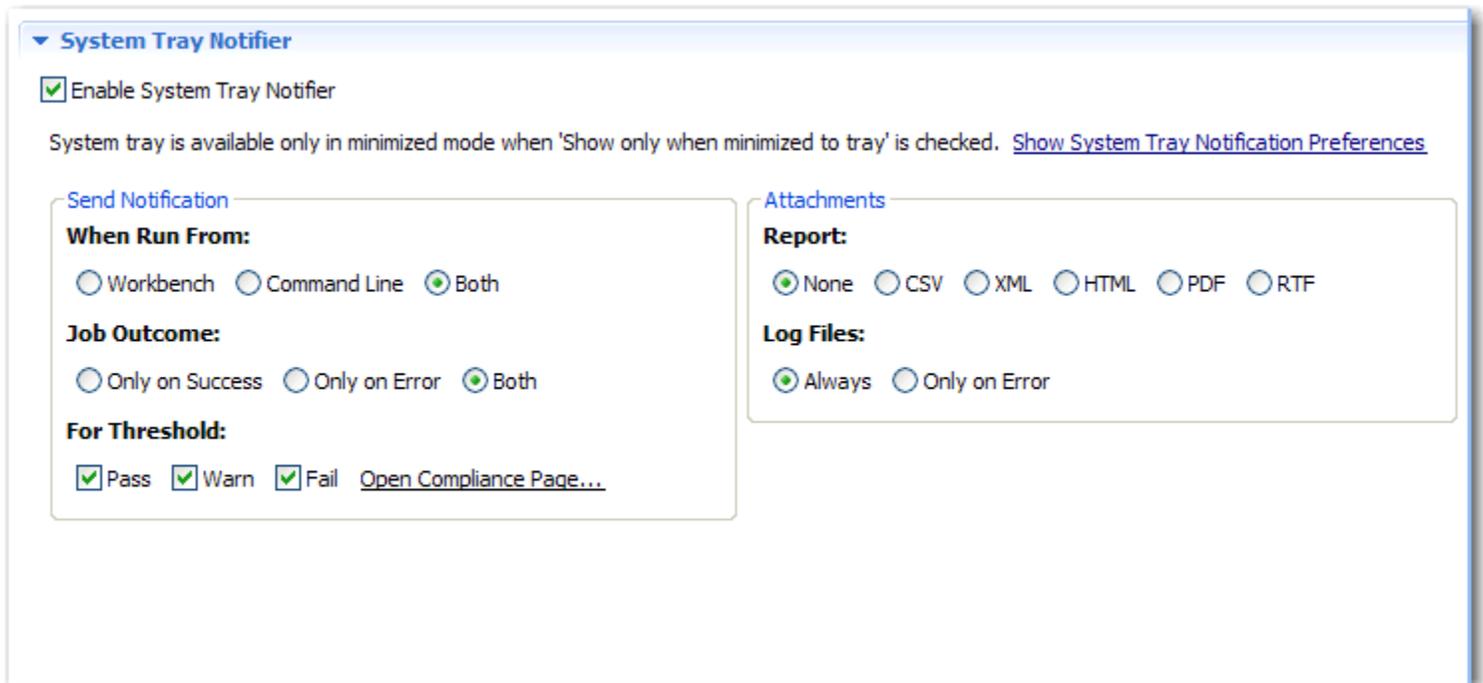

The **Send Notification** options specify when job results are output to the specified file directories:

- The **When Run From** options enable you to indicate that results should only be sent to file if a job is executed from the **Workbench**, **Command Line**, or **Both**.
- The **Job Outcome** options enable you to indicate that results should be sent to file **Only on Success**, **Only on Error**, or **Both**.
- The **For Threshold** options enable you to specify the threshold level for which results are sent to file, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

The **Attachments** section enables you to specify the file format of the output results. Choose **None** (does not produce a file), **CSV**, **XML**, **HTML**, **PDF**, or **RTF** to specify the file format. The **Log Files** indicates when to log the notification file results to the Change Manager log file. You can choose **Always** or **Only on Error**.

System Tray Notifications

System Tray notification parameters enable pop-up window notifications on your Desktop when Change Manager is minimized, but running jobs.

Click **Enable System Tray Notifier** to enable system tray notifications. When you select this check box, a list of notification parameters appear.

Click **Show System Tray Notifications** to specify global parameters with regards to the appearance and behavior of the specific pop-up windows.

The **Send Notification** options specify when a pop-up notification will appear.

- The **When Run From** options enable you to indicate that a pop-up notification should only appear if a job is executed from the **Workbench**, **Command Line**, or **Both**.
- The **Job Outcome** options enable you to indicate that a pop-up notification should appear **Only on Success**, **Only on Error**, or **Both**.
- The **For Threshold** options enable you to specify the threshold level for which a pop-up notification will appear, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

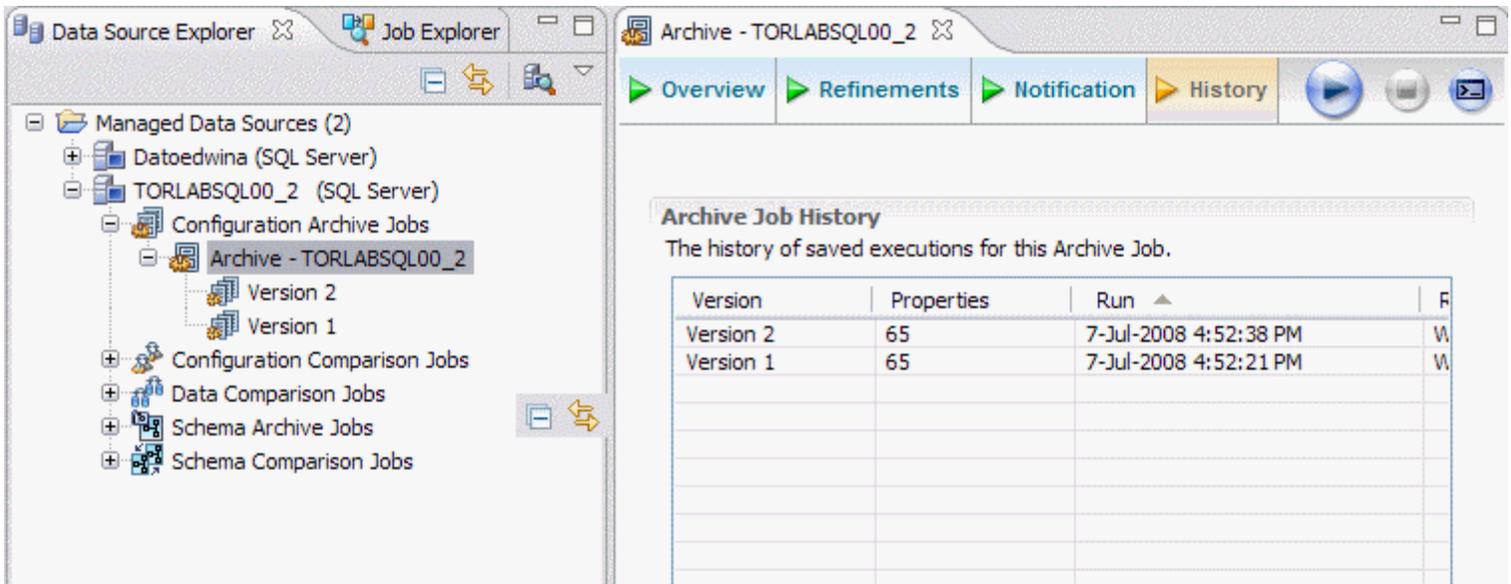

NOTE: The **Attachments** section enables you to specify the file format of a report that can be accessed via the pop-up notification. Choose **None** (does not produce a file), **CSV**, **XML**, **HTML**, **PDF**, or **RTF** to specify the file format of the report. The **Log Files** indicates when to log the notification to the Change Manager log file. You can choose **Always** or **Only on Error**.

Save the Archive/Manage Versioning

A version is a specific set of configuration values associated with an **Archive** and is used to store older snapshots of the same archive for backup or tracking comparison purposes. Initially, you must create and save a version for the **Archive** to become valid within the system.

A version is created when you click the **Run** icon located in the lower right-hand corner of any tab in the **Archive Job Editor**.

When the process executes, the **New Unsaved Version** tab appears and lists the properties of the Archive by **Name**, **Operator**, and **Value** of the property as captured when the Archive was created. In order to create a version, highlight the tab and select **File > Save** or **File > Save All** from the Menu Bar. The system retains an older archive named **Version 1** that appears in the **Archive Job History** table on the **History** tab as well as in the **Data Source Explorer** tree under the **Configuration Archive Jobs** node.

To create a version and save the archive job

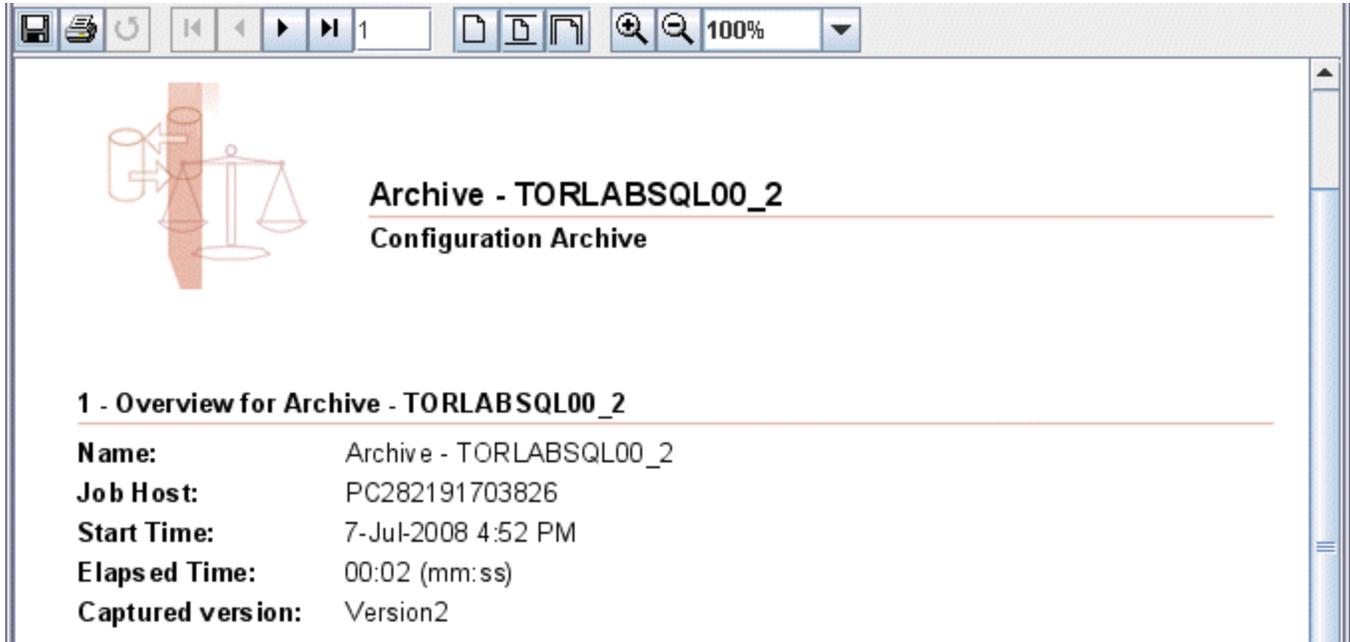

- Click **Run Job**. A version appears in the **Archive Job History** table on the **History** tab containing the name of the **Archive**, the number of properties retained by the version, a time stamp, and where the archive job was run from. (Workbench for manual job execution, or command line, if automated.)

You create additional versions within the same archive job each time you click **Run Job**. The new version contains the latest values for the archive job properties as specified on the Refinements tab. Versions are listed on the Overview tab in a table that displays them in ascending order. A version can be accessed for viewing by double-clicking the appropriate Version in the table. The selected version opens in a new tab of the Archive Job Editor.

Additionally, Versions are listed as child nodes of the archive job to which they belong in Data Source Explorer. To view a Version, double-click the appropriate node.

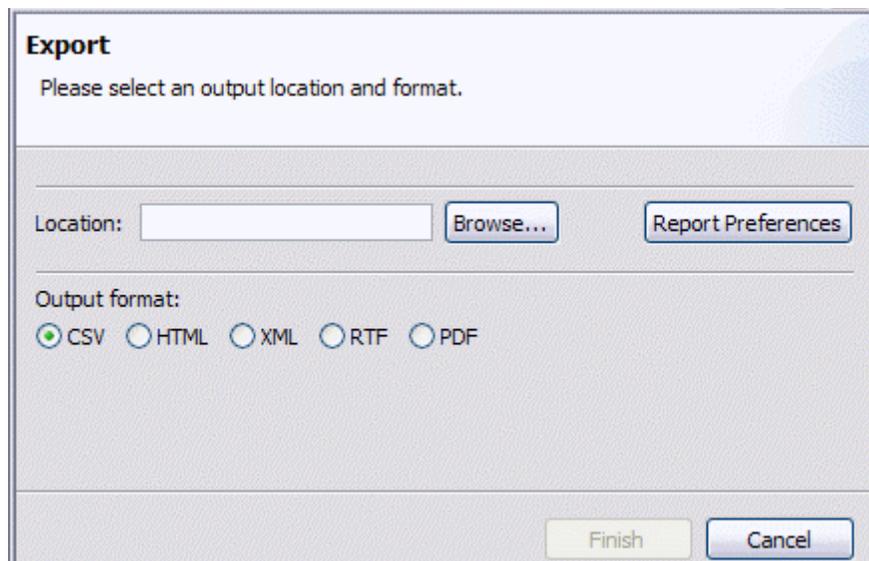

Generating a Job Report

Once you have run an archive job, you can generate a job report that summarizes the archived configuration information. You can also generate job reports for any archive versions that exist in the system. Click **View Report** on the **Comparison Results** tab.

The report can be read on screen, sent to a printer, and saved to disk via the command icons located in the report window toolbar.

Additionally, the right-click menu contains a command named **Generate Report**. This will produce a report file in a specified format at a directory location of your choosing.

Fill in the fields, as required. When you click **Finish**, the report is created in the directory specified in the **Location** field, in the format specified in the **Output Format** section.

Use Archive in Configuration Comparison Jobs

Archives are used in configuration comparison jobs the same way as registered data sources or Standards.

To add an Archive to a configuration comparison job:

Drag and drop an Archive version from **Data Source Explorer** to the **Comparison Source** or **Comparison Target** boxes in the **Configuration Comparison Job Editor**. Alternatively, if a data source is selected as the **Source** or **Target**, select **Use an Archive** in the respective box and use the drop down menu to choose an associated archive from the list provided.

Comparing Schemas

Change Manager provides the ability to capture, compare, and synchronize schemas in databases and provide reports on schema comparison jobs that enable you to distribute information throughout your environment.

The following tasks provide a high-level overview of the schema comparison process:

[Create a New Schema Comparison Job](#)

[Specify a Job Name](#)

[Specify Source and Target Data Sources](#)

[Refine Schema Comparisons](#)

[Customize Schema Mapping](#)

[Specify Job Options](#)

[Specify Notification Options](#)

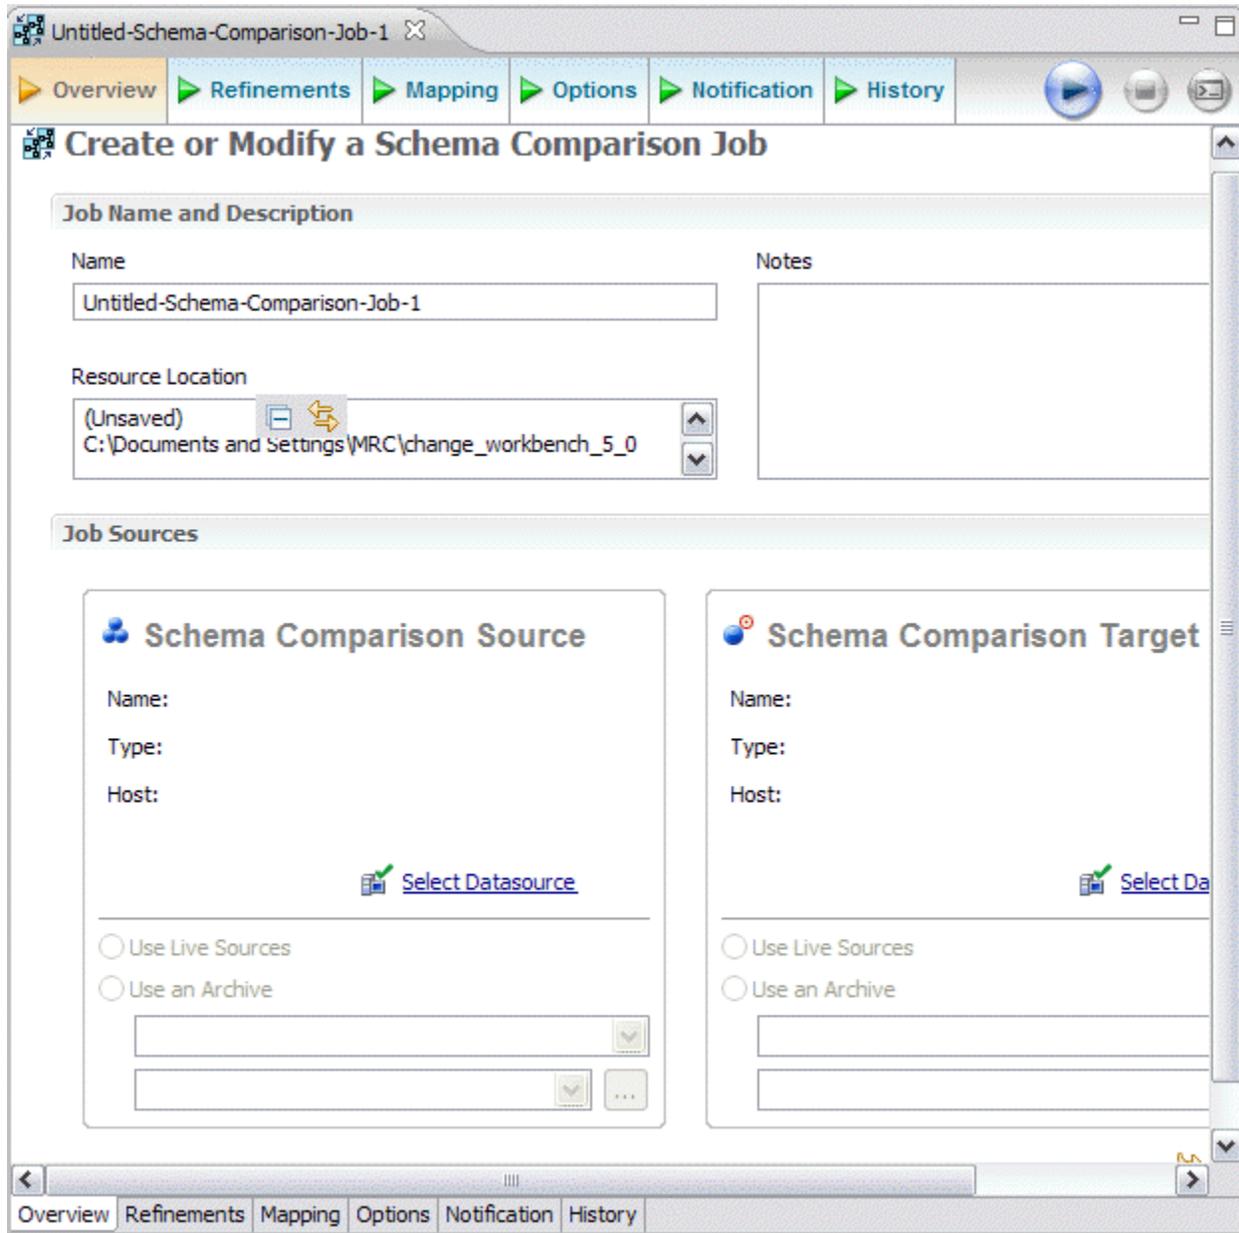

[Execute the Schema Comparison Job](#)

[Generating a Job Report](#)

[Resolve Schema via a Generated SQL Script](#)

Create a New Schema Comparison Job

Schema comparison jobs are defined in the **Schema Comparison Job Editor**.

To start a new schema comparison job

- Select **File > New > Schema Comparison Job** in the Menu Bar.

The Schema Comparison Job Editor opens.

You can now proceed to define the parameters of the new job.

Specify a Job Name

A job name identifies the job in the application and should be specified with this in mind.

Specify a meaningful name that clearly identifies the job in the views and dialogs of the working environment.

Create or Modify a Schema Comparison Job

Job Name and Description		Notes
Name	<input type="text" value="Untitled-Schema-Comparison-Job-1"/>	
Resource Location	(Unsaved) C:\Documents and Settings\MRC\change_manager_5	
	<input type="checkbox"/> Track results in Compliance Explorer	

To name a job

- Type the name of the job in the **Name** field of the Schema Comparison Editor.

Ensure that you specify a meaningful name that identifies the job in other views and dialogs. You can save the job by selecting **File > Save** from the Menu Bar, or highlight the editor and press **Ctrl + S**.

NOTE: Click **Track Results in Compliance Editor** to enable this job in the **Compliance** view.

Specify Source and Target Data Sources

The **Schema Comparison Source** and **Schema Comparison Target** boxes identify what data sources are compared when the job executes. Both boxes must contain the sources before the job can be executed. When a data source is added to a job, it is displayed by **Name**, **Type**, and **Host**.

Job Sources

Schema Comparison Source

Name: **Datoedwina**
 Type: Microsoft SQL Server
 Host: Datoedwina1

[Change Datasource](#)

Use Live Sources
 Use an Archive

▼

▼ ⋮

Schema Comparison Target

Name: **TORLABSQL00_2**
 Type: Microsoft SQL Server
 Host: TORLABSQL00_2

[Change Datasource](#)

Use Live Sources
 Use an Archive

▼

▼ ⋮

Change Manager supports cross-platform schema comparisons. However, such jobs are limited to the following DBMS combinations and data source objects:

DBMS Source/Target	Objects Compared
Sybase/SQL Server	Tables, Unique Keys, Check Constraints, Foreign Keys, Indexes, Primary Keys, Views
Oracle/SQL Server	Tables, Unique Keys, Check Constraints, Foreign Keys, Indexes, Primary Keys, Views

If you attempt to compare two data sources that are not compatible, Schema Job Editor will not enable you to place the inappropriate DBMS objects in the Source and Target boxes.

Additionally, Schema Archives can be used in schema comparison jobs in place of live data sources. See [Creating a Schema Archive](#) for more information on this process.

To add a data source to the job

- Click and drag a data source from **Data Source Explorer** to the Schema Comparison Source or Schema Comparison Target box, or click **Select Data Source** in the appropriate box and choose a data source from the dialog provided.

To add an archive to the job

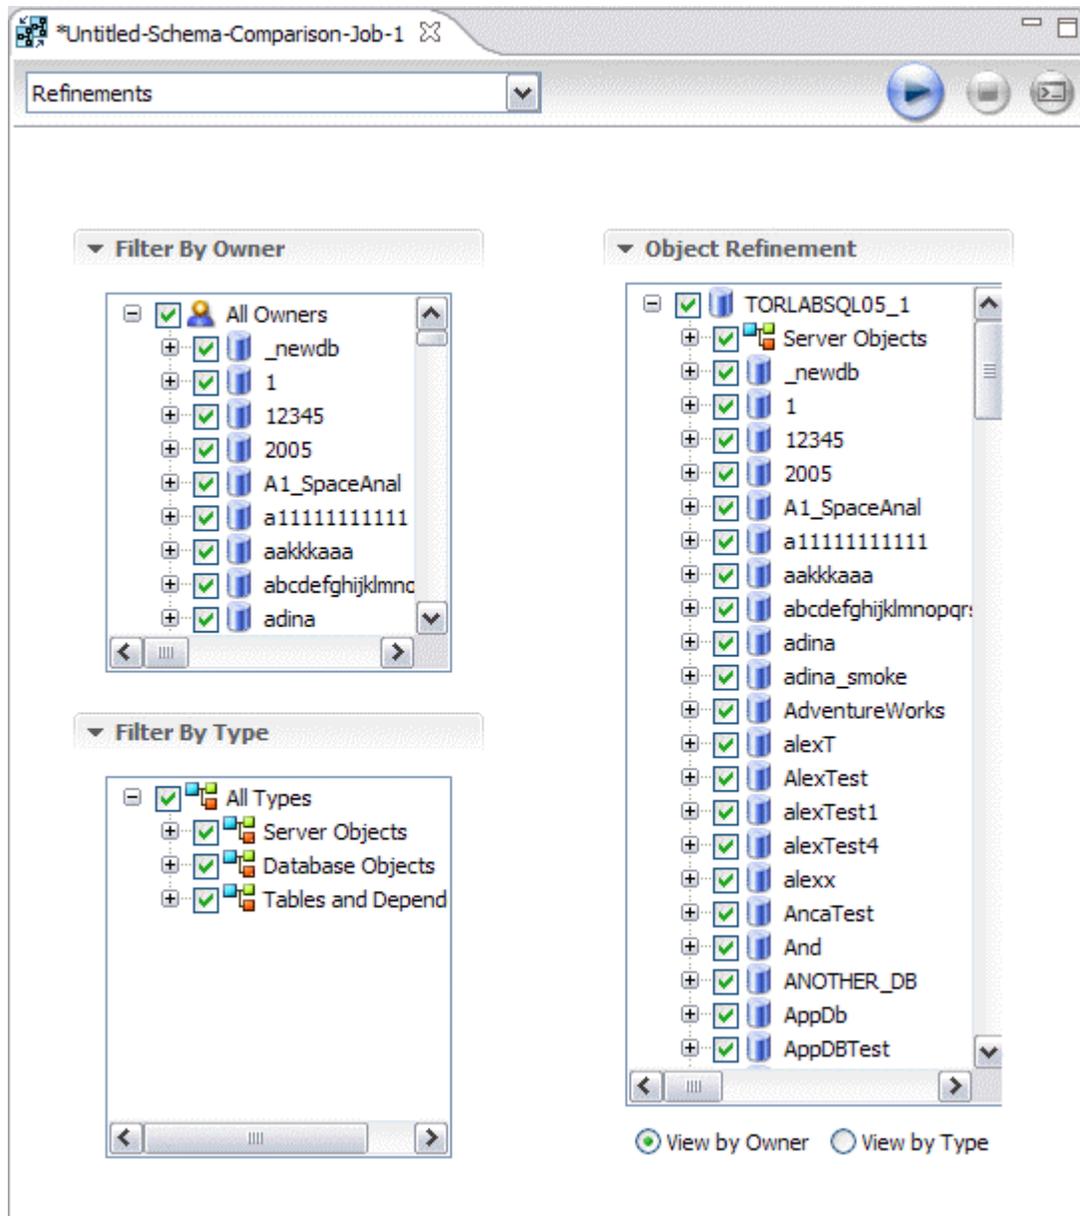

- Click and drag a Schema Archive from **Data Source Explorer** to the **Schema Comparison Source** or **Schema Comparison Target** box.

Refine Schema Comparisons

Schema comparison refinement involves selecting the schema objects you want to include and exclude in the comparison process. All refinement is performed on the **Refinements** tab in the **Schema Comparison Editor**.

The **Object Refinement** window provides a view of the databases and corresponding objects of the comparison source. Use the check boxes beside each database or object to choose if they will be included or excluded in the comparison process. Objects are organized by tree and can be listed by owner or by object type.

The **Filter by Owner** and **Filter by Type** windows enable you to add or remove objects from the Object Refinement window by owner or by type, respectively.

To specify the properties used in the comparison job:

Navigate to the Refinements tab and select or de-select the objects in the table, as required. Selected objects are included in the comparison job, and de-selected properties are ignored during job execution.

Customize Schema Mapping

Mapping is the process of pairing objects between the source and target of the job to pair high level containers so the objects inside can be compared. Mapping details are viewed and modified on the **Mapping** tab of the editor.

Change Manager automatically maps schema objects based on its interpretation of both schemas. Elements that do not match are excluded initially, unless manually paired prior to running the job.

The **Refinements Mapping** table provides a list of both schema elements for the source and targets of the job.

The screenshot shows the 'Refinements mapping' window. At the top, there is a 'Select target:' dropdown menu set to 'TORLABSQL00_2'. To the right of this are three checkboxes: 'Ignore Case' (checked), 'Ignore Spaces' (checked), and 'Ignore Underscores' (unchecked). Below this is a table with two columns: 'Datoedwina' and 'TORLABSQL00_2'. The table lists various database objects and their mapping status. Below the table are two buttons: 'Refresh Databases and Owners' and 'Restore Default Mappings'.

Datoedwina	TORLABSQL00_2
aaa	[Unmapped]
anmari	[Unmapped]
AppDb	AppDb
dt_issues	[Unmapped]
Extreme	[Unmapped]
licenseDB	licenseDB
master	master
model	model
msdb	msdb
Northwind	Northwind
PCenter	[Unmapped]
PERFCNTR	[Unmapped]
PERFCNTR_REPO	[Unmapped]
PERFCNTR_REPO2	[Unmapped]
PERFCNTR_REPO_suri	[Unmapped]
pman	[Unmapped]

[Refresh Databases and Owners](#) [Restore Default Mappings](#)

You can customize schema mapping parameters by choosing to redefine these pairings on an individual basis once the automatic mapping process is complete.

Object pairings are redefined via the drop down menu that appears when the corresponding object in the target column is selected. The menu contains a list of all schema objects that reside on the target data source.

To restore the schema mapping table to its original settings, click **Restore Default Mappings**. All settings revert to the original object mappings as determined by Change Manager.

To redefine object pairings:

Navigate to the **Mapping** tab and then click the target of the pair you want to change. You can use the drop down menu to redefine the schema object pairing as needed.

Specify Job Options

Prior to running a job, various options can be set to control aspects of the comparison process. These options are set prior to execution on the **Options** tab, and are grouped into categories:

[Synchronization Options](#)

[Include Object Options](#)

[Compare Options](#)

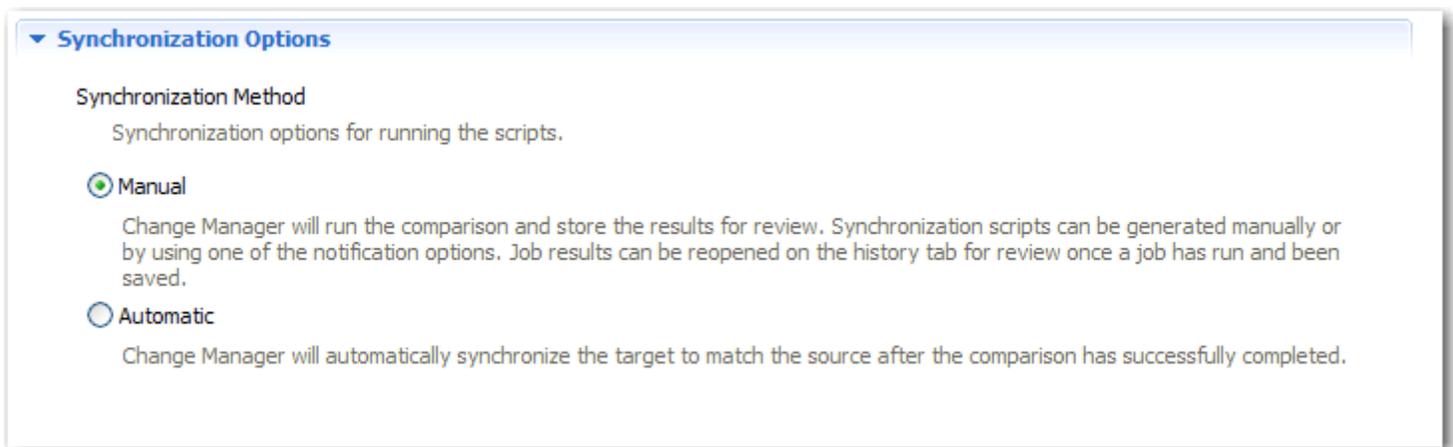

[Identifier Options](#)

[DDL Extract Options](#)

Options differ based on the DMBS of the source and target data sources. Additionally, they are affected by refined objects as well. For example, **Ignore Constraint Name Differences** won't appear if constants are excluded from the job during the filter process.

Synchronization Options

The **Synchronization Options** section enables you to specify how you want Change Manager to handle the comparison synchronization script once the job has executed.

- Select **Manual** if you want Change Manager to display the results of the comparison, but not automatically attempt to “fix” any synchronization issues that the process detects. If you choose this option, you will be able to generate a synchronization script for any issues after the job execution process has completed.
- Select **Automatic** if you want Change Manager to automatically generate and execute a synchronization script immediately following the job comparison process.

Compare Options

The **Compare Options** section provides settings that determine what elements of the source and target of a job will be omitted when running a schema comparison job.

▼ Compare Options

- Ignore Storage**
Ignore storage comparison
- Ignore Column Order**
Ignore table column order differences
- Ignore Text Case**
Ignore case in text object comparison -ie. view, procedure, trigger
- Ignore Text Comments**
Ignore comments in text object comparison (ie. procedures, triggers, views)
- Ignore Text Whitespace**
Ignore white space in text comparison
- Ignore Tablespace File Name**
Ignore tablespace file name
- Ignore Password Differences**
Ignore differences in object passwords (ie. group, login, role, user, etc.)
- Ignore object permissions**
Ignores the permissions on objects

Compare Options differ depending on the DBMS of the **Source** data source:

[SQL Server Compare Options](#)

[Oracle Compare Options](#)

[Sybase Compare Options](#)

[IBM DB2 LUW Compare Options](#)

SQL Server Compare Options

Option	Description
Ignore Storage	Ignores storage comparison when processing the job.
Ignore Column Order	Ignores column order when processing the job.
Ignore Text Case	Ignores text case when processing the job.

Option	Description
Ignore Text Comments	Ignores text comments when processing the job.
Ignore Text Whitespace	Ignores text whitespace when processing the job.
Ignore Tablespace File Name	Ignores the database file name when processing the job on DB2 and Oracle platforms. If this option is selected for SQL platforms, it ignores database names. If this option is selected for Sybase platforms, it ignores database device names.
Ignore Password Differences	Ignores password differences when processing the job.
Ignore Object Permissions	Ignores object permissions when processing the job.

Oracle Compare Options

Option	Description
Ignore Storage	Ignores storage comparison when processing the job.
Ignore Partition Differences	Ignores partition differences when processing the job.
Ignore Column Order	Ignores table column order differences when processing the job.
Ignore Check Constraints Quotes	Ignores quotes in check constraints when processing the job.
Ignore Table Comment	Ignores table comments when processing the job.
Ignore Text Case	Ignores syntax case in text object comparisons when processing the job. (views, procedures, trigger, etc.)
Ignore Text Comments	Ignores comments in text objects when processing the job.
Ignore Text Whitespace	Ignores white space when processing the job.
Ignore Tablespace File Name	Ignores tablespace file names when processing the job.
Ignore Password Differences	Ignores differences in object passwords when processing the job. (group, login, role, user, etc.)
Ignore Tablespace	Ignores tablespaces for table, index, cluster, etc.
Ignore Object Permissions	Ignores the permissions on objects when processing a job.

Option	Description
Ignore Logging/No Logging Differences	Ignores object differences where one is set to Logging and the other is set to No Logging.

Sybase Compare Options

Option	Description
Ignore Storage	Ignores storage comparison when processing the job.
Ignore Column Order	Ignores table column order differences when processing the job.
Ignore Check Constraint Quotes	Ignores quotes in check constraints when processing the job.
Ignore Text Case	Ignores syntax case in text object comparisons when processing the job. (views, procedures, trigger, etc.)
Ignore Text Comments	Ignores comments in text objects when processing the job.
Ignore Text Whitespace	Ignores white space when processing the job.
Ignore Tablespace File Name	Ignores the physical device name for database devices when processing the job.
Ignore Password Differences	Ignores differences in object passwords when processing the job. (group, login, role, user, etc.)
Ignore Object Permissions	Ignores the permissions on objects when processing a job.

IBM DB2 LUW Compare Options

Option	Description
Ignore Column Order	Ignores table column order differences when processing the job.
Ignore Check Constraint Quotes	Ignores quotes in check constraints when processing the job.
Ignore Table Comment	Ignores table comments when processing the job.
Ignore Data Capture	
Ignore Text Case	Ignores syntax case in text object comparisons when processing the job. (views, procedures, trigger, etc.)

Option	Description
Ignore Text Comments	Ignores comments in text objects when processing the job.
Ignore Text Whitespace	Ignores white space when processing the job.
Ignore Tablespace File Name	Ignores tablespace file names when processing the job.
Ignore Password Differences	Ignores differences in object passwords when processing the job. (group, login, role, user, etc.)
Ignore Tablespace	Ignores tablespaces for table, index, cluster, etc.
Ignore Object Permissions	Ignores the permissions on objects when processing a job.

Include Object Options

The **Include Object Options** section contains parameters that affect how objects are treated in the comparison process. These parameters enable you to include or exclude specific object types in the job, as well as affect the generation behavior of synchronization scripts and other job processes.

▼ Include Objects Options

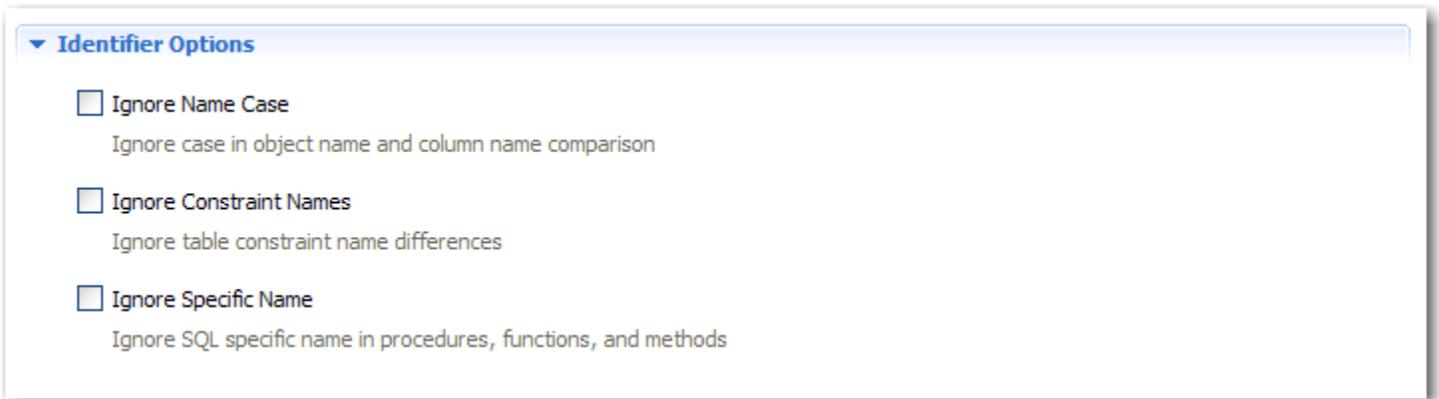

- Exist in Source Only (Create)**
Include objects that only exist on the source in the comparison results
- Exist in Source and Target and Don't Match (Alter)**
Include objects that differ in the comparison results
- Force Extended Alter**
Always drop and recreate objects that do not match instead of using an alter script
- Exist in Target Only (Drop)**
Include objects that only exist on the target in the comparison results
- Generate Data Copy DDL**
Generate data copy ddl on extended alters

- The **Exist in Source Only (Create)** options specifies that objects only existing on the **Source** will appear in the job results after the process has executed.
- The **Exist in Source and Target and Don't Match (Alter)** option specifies that objects that differ between the **Source** and the **Target** will appear in the job results after the process has executed.
- The **Force Extended Alter** option specifies that the automatic synchronization process will always drop and recreate objects that don't match instead of using an ALTER statement on existing objects.
- The **Exist in Target Only (Drop)** option specifies that objects only existing on the **Target** will appear in the job results after the process has executed.

- The **Generate Data Copy DDL** indicates that data copy DDL will be generated on extended ALTER statements in the automated synchronization script produced after the process has executed.

Identifier Options

The **Identifier Options** panel contains parameters that determine what elements of the source and target data source will be ignored during the schema comparison process.

Identifier Options differ depending on the DBMS of the **Source** data source:

[SQL Server Identifier Options](#)

[Oracle Identifier Options](#)

[Sybase Identifier Options](#)

[IBM DB2 LUW Identifier Options](#)

SQL Server Identifier Options

Option	Description
Ignore Name Case	Ignores the syntax case when performing object name and column name comparisons.
Ignore Constraint Names	Ignores table constraint name differences.

Oracle Identifier Options

Option	Description
Ignore Name Case	Ignores the syntax case when performing object name and column name comparisons.

Option	Description
Ignore Constraint Names	Ignores table constraint name differences.

Sybase Identifier Options

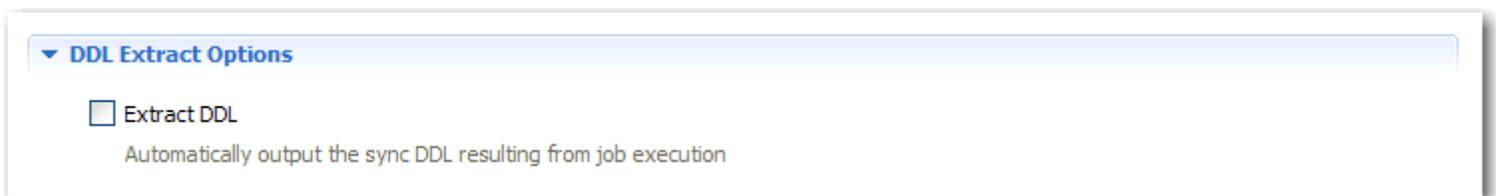

Option	Description
Ignore Name Case	Ignores the syntax case when performing object name and column name comparisons.
Ignore Constraint Names	Ignores table constraint name differences.

IBM DB2 LUW Identifier Options

Option	Description
Ignore Name Case	Ignores the syntax case when performing object name and column name comparisons.
Ignore Constraint Names	Ignores table constraint name differences.
Ignore Specific Name	Ignores SQL specific names in procedures, functions, and methods.

DDL Extract Options

The **DDL Extract Options** section contains the **Extract DDL** parameter.

This parameter enables you to indicate to Change Manager that the synchronization code produced by the job comparison is automatically output to a separate Editor window once the comparison process has executed.

Specify Notification Options

Notification options provide parameters for enabling and setting up various notifications regarding executed schema comparison jobs. This includes:

[Email Notifications](#)

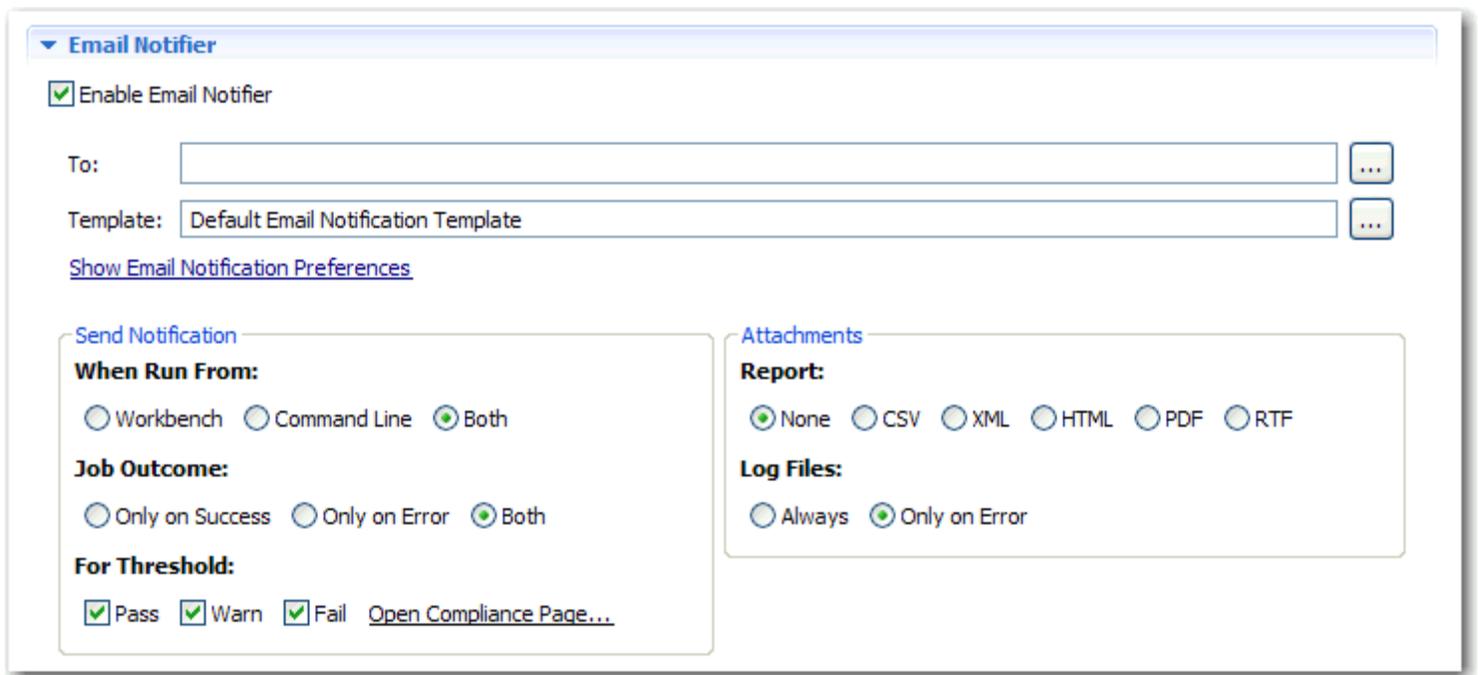

[File System Notifications](#)

[System Tray Notifications](#)

Notification options provide parameters for enabling and setting up email notification and report mailing for executed schema comparison jobs. The notification options tab enables you to specify the email addresses to which you want to send notifications, the email message format, and the conditions under which a notification should be sent.

Email Notifications

Email notification options provide parameters for configuring and enabling email notification and report mailing on executed comparison jobs.

These parameters enable you to specify the email addresses to which you want to send notifications, the email message format, the conditions under which a notification email should be sent, and other, similar options.

Click **Enable Email Notifier** to enable email notification. When you select this check box, a list of notification parameters appear.

Enter the email addresses to which the notification will be sent in the **To** field. You can specify an email format template in the **Template Field**.

The **Send Notification** options specify when a notification email should be sent based on the results of a comparison job:

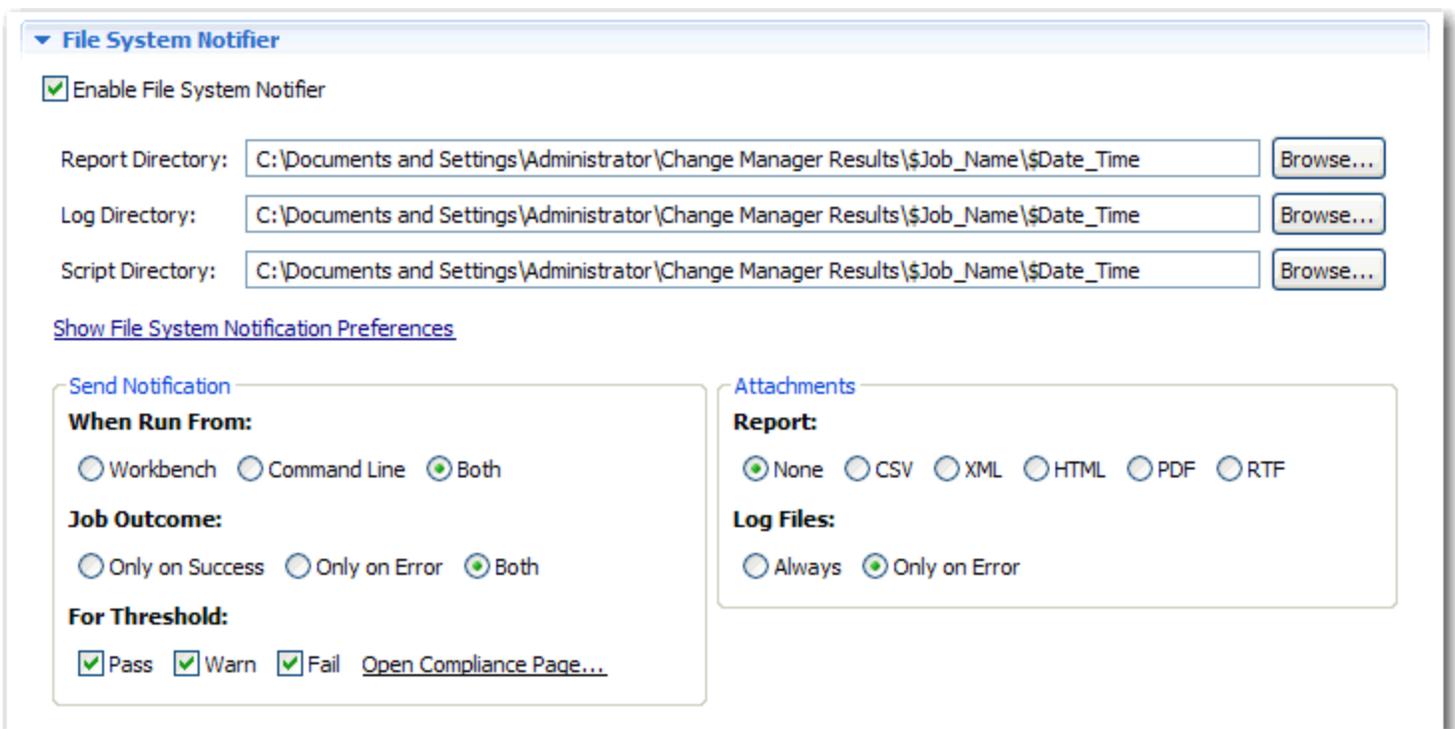

- The **When Run From** options enable you to indicate that email notifications should only be sent if a job is executed from the **Workbench**, **Command Line**, or **Both**.
- The **Job Outcome** options enable you to indicate that email notifications should be sent **Only on Success**, **Only on Error**, or **Both**.

- The **For Threshold** options enable you to specify the threshold level for which email notifications are sent, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

The **Attachments** section enables you to specify the file format of an attached report that will display job results with the notification email. Choose **None** (does not attach a report), **CSV**, **XML**, **HTML**, **PDF**, or **RTF** to specify the file format of the report. The **Log Files** indicates when to log the notification file results to the Change Manager log file. You can choose **Always** or **Only on Error**.

File System Notifications

File system notification options provide parameters for configuring and enabling logging options for executed comparison jobs.

Click **Enable File System Notifier** to enable comparison job logging. When you select this check box, a list of notification parameters appear.

Specify the directory location of each of the output files that are produced by the notification function in the **Report Directory**, **Log Directory**, and **Script Directory**, respectively. Additionally, you can click the **Show File System Notification Preferences** link if you want to change the directory locations at the application level rather than just the job level.

The **Send Notification** options specify when job results are output to the specified file directories:

- The **When Run From** options enable you to indicate that results should only be sent to file if a job is executed from the **Workbench**, **Command Line**, or **Both**.
- The **Job Outcome** options enable you to indicate that results should be sent to file **Only on Success**, **Only on Error**, or **Both**.

- The **For Threshold** options enable you to specify the threshold level for which results are sent to file, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

The **Attachments** section enables you to specify the file format of the output results. Choose **None** (does not produce a file), **CSV**, **XML**, **HTML**, **PDF**, or **RTF** to specify the file format. The **Log Files** indicates when to log the notification file results to the Change Manager log file. You can choose **Always** or **Only on Error**.

System Tray Notifications

System Tray notification parameters enable pop-up window notifications on your Desktop when Change Manager is minimized, but running jobs.

System Tray Notifier

Enable System Tray Notifier

System tray is available only in minimized mode when 'Show only when minimized to tray' is checked. [Show System Tray Notification Preferences](#)

Report:

None CSV XML HTML PDF RTF

Log Files:

Always Only on Error

Click **Enable System Tray Notifier** to enable system tray notifications. When you select this check box, a list of notification parameters appear.

Click **Show System Tray Notifications** to specify global parameters with regards to the appearance and behavior of the specific pop-up windows.

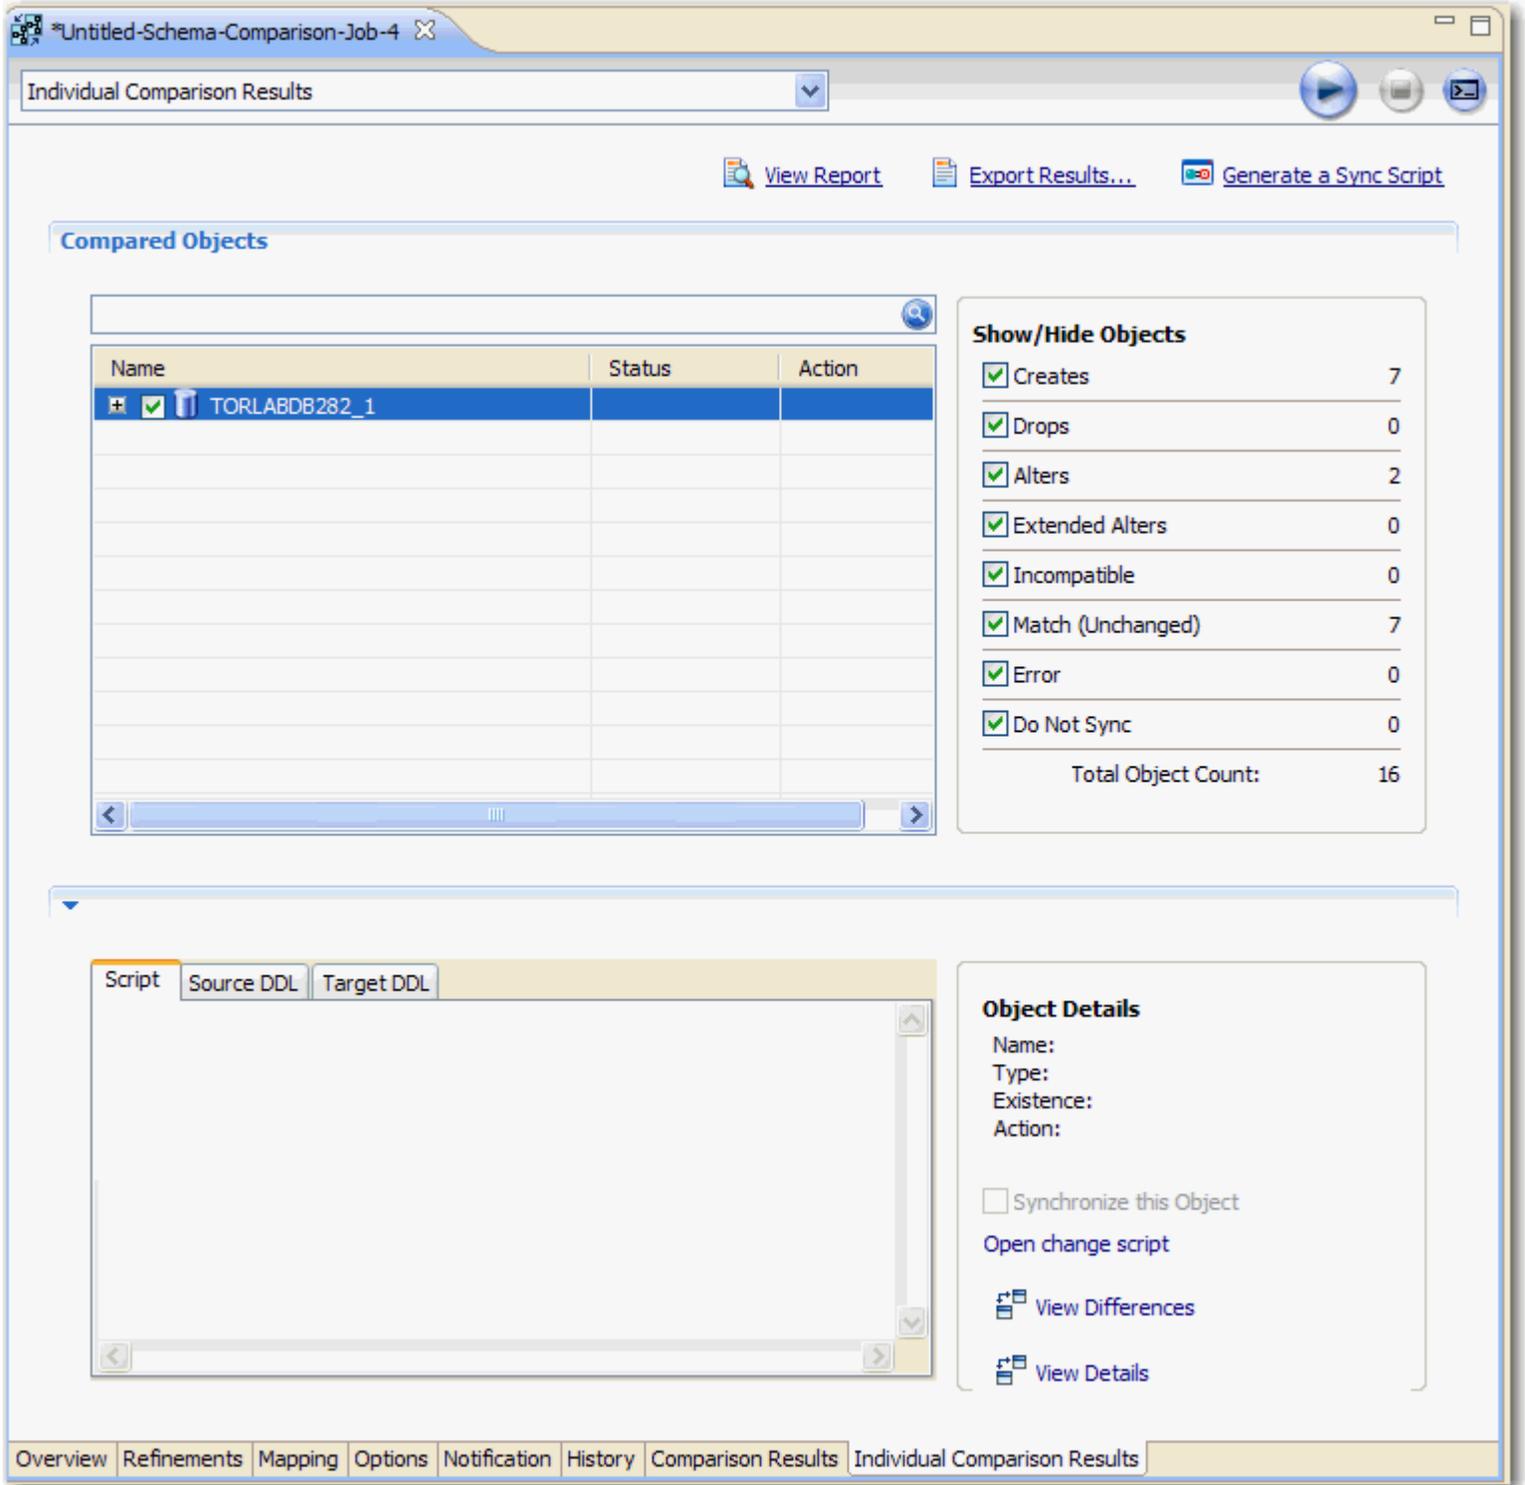

The **Send Notification** options specify when a pop-up notification will appear.

- The **When Run From** options enable you to indicate that a pop-up notification should only appear if a job is executed from the **Workbench**, **Command Line**, or **Both**.
- The **Job Outcome** options enable you to indicate that a pop-up notification should appear **Only on Success**, **Only on Error**, or **Both**.
- The **For Threshold** options enable you to specify the threshold level for which a pop-up notification will appear, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

- The **Resolution** column provides a command that produces a synchronization script that, when executed, will automatically synchronizes the compared schema. For more information on generating a synchronization script, see [Resolve Schema via a Generated SQL Script](#).
- The **Errors** column indicates how many errors were encountered during the comparison process, and provides a link to view them in a separate dialog window.

Viewing Individual Results

The **Individual Results** window appears when you click **Show Individual Results** in the **Comparison Results** table of the schema comparison job after execution.

- Click **View Differences** to view
- Click **View Details** to view the DDL between two results.
- You can save the individual results data to a .txt file by clicking **Export to File**.

Generating a Job Report

Once you have run an archive job, you can generate a job report that summarizes the archived configuration information. You can also generate job reports for any archive versions that exist in the system. Click **View Report** on the **Comparison Results** tab.

Configuration Archive Report

Archive - TORLABSQL00_2
Configuration Archive

1 - Overview for Archive - TORLABSQL00_2

Name: Archive - TORLABSQL00_2
Job Host: PC282191703826
Start Time: 7-Jul-2008 4:52 PM
Elapsed Time: 00:02 (mm:ss)
Captured version: Version2

2 - Source

Name: TORLABSQL00_2
Type: Live Database
Platform: Microsoft SQL Server 8.0.2039.0
Host/Instance: TORLABSQL00_2
Port: 1433
User: sa
Protocol: TCP/IP

3 - Configuration Values

Core SQL Properties	3
SQL Server Version Information	2

3.1 - Core SQL Properties

Page 1 of 4

The report can be read on screen, sent to a printer, and saved to disk via the command icons located in the report window toolbar.

Additionally, the right-click menu contains a command named **Generate Report**. This will produce a report file in a specified format at a directory location of your choosing.

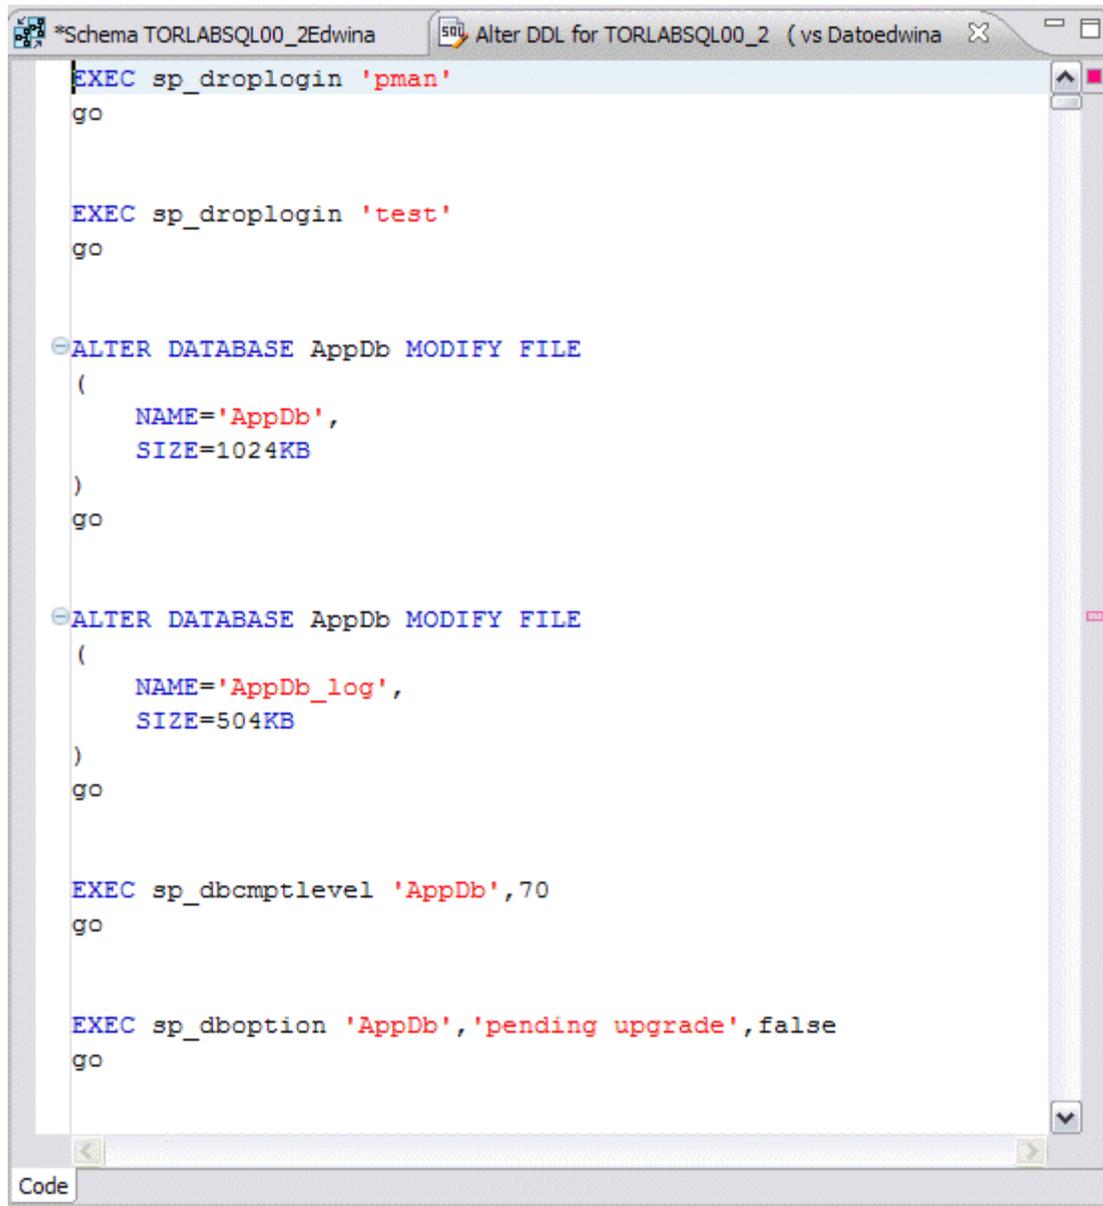

Fill in the fields, as required. When you click **Finish**, the report is created in the directory specified in the **Location** field, in the format specified in the **Output Format** section.

Resolve Schema via a Generated SQL Script

Once a schema comparison job has completed, synchronization commands are used to even the data so it matches. The synchronization process automates generation of CREATE, DROP, ALTER statements, and stored procedures on the source and target data sources, as required.

On the **Results** tab, click **Sync All** in the Resolution column of the Comparison Results table. A synchronizing script is produced in another window.

The script can be modified manually, executed as needed, and saved at any time.

```

EXEC sp_droplogin 'pman'
go

EXEC sp_droplogin 'test'
go

ALTER DATABASE AppDb MODIFY FILE
(
    NAME='AppDb',
    SIZE=1024KB
)
go

ALTER DATABASE AppDb MODIFY FILE
(
    NAME='AppDb_log',
    SIZE=504KB
)
go

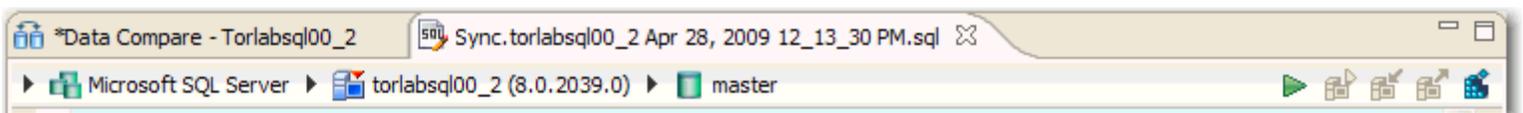

EXEC sp_dbcmplevel 'AppDb',70
go

EXEC sp_dboption 'AppDb','pending upgrade',false
go

```

Execute a SQL Synchronization Script

Synchronization scripts are executed via the commands in the **Run** menu or via the command icons located along the top of SQL Editor.

When an SQL file is open in the Workspace, select it and choose a database and an associated catalog on which you want to execute file using the drop down menus in SQL Editor. You can click the execute icon to execute the code on the specified database and catalog, start a transaction or commit a transaction, or modify the SQL session options prior to execution.

To execute code:

Open the SQL file you want to run, ensure it is associated with the correct database and click the **Execute** icon. Change Manager executes the code on the data source you specified. Results are displayed in the same tab or in a new tab.

To execute a transaction:

Open the transaction file you want to run and ensure it is associated with the correct database, and then click the **Start Transaction** icon. Change Manager executes the transaction on the data source you specified.

To commit a transaction:

Open the transaction file you want to commit, ensure it is associated with the correct database, and then click the **Commit Transaction** icon. Change Manager commits the transaction on the data source you specified.

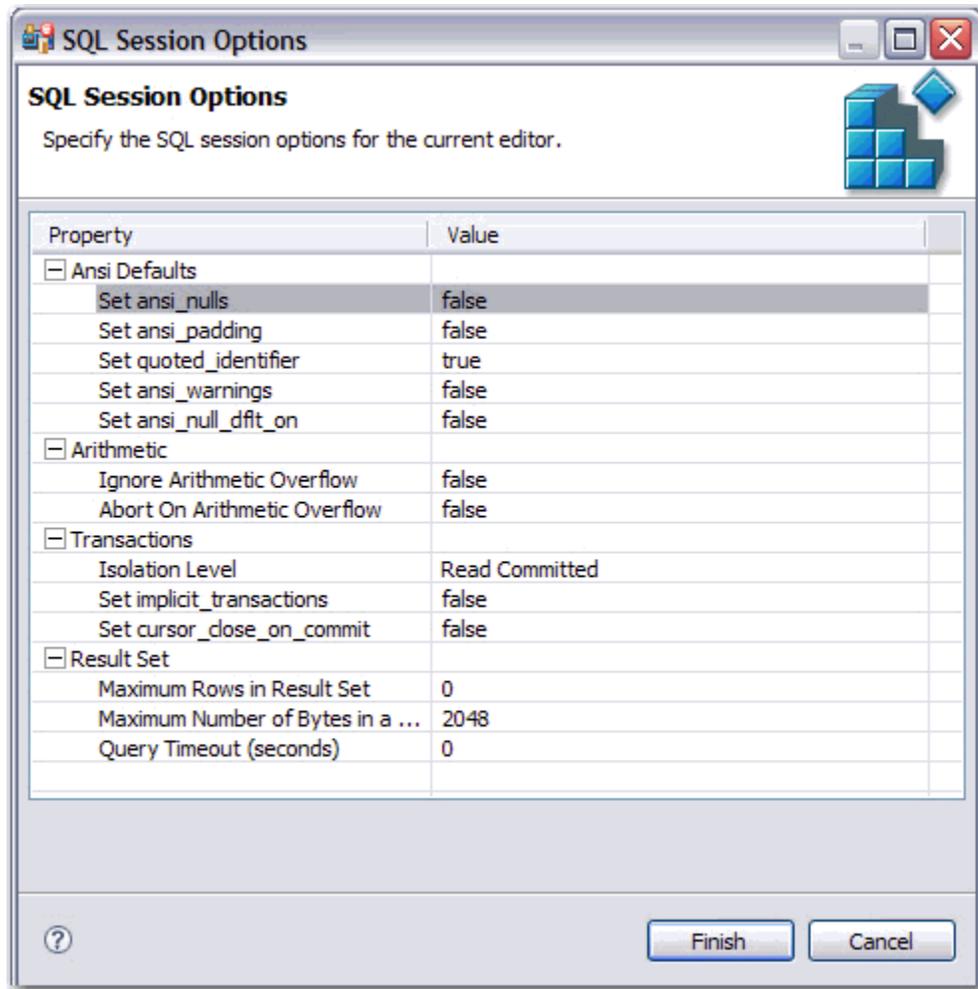

You can set transactions to auto-commit prior to execution on the **SQL Execution** node of the **Preferences** panel in Rapid SQL Developer.

NOTE: The synchronization script generation process does not support all object parameters. The following object parameters should be manually added after a synchronization script is generated, as required: **fillfactor**, **consumers**, **allow_dup_row**, and **statistics**.

You can set transactions to auto-commit prior to execution on the **SQL Execution** node of the **Preferences** panel in Change Manager.

Configure an SQL Session

The SQL Session Options dialog provides configuration parameters that indicate to Change Manager how to execute code in the development environment.

To modify SQL session options:

- 1 Click the SQL Session Options icon in the Toolbar.

The **SQL Session Options** dialog appears.

- 2 Click on individual parameters in the **Value** column to change the configuration of each property, as specified.
- 3 Click **Finish**.

The session options will be changed and Change Manager will execute the code as specified when you launch the script.

NOTE: Session options only apply to the corresponding editor and are not retained when executing multiple SQL files.

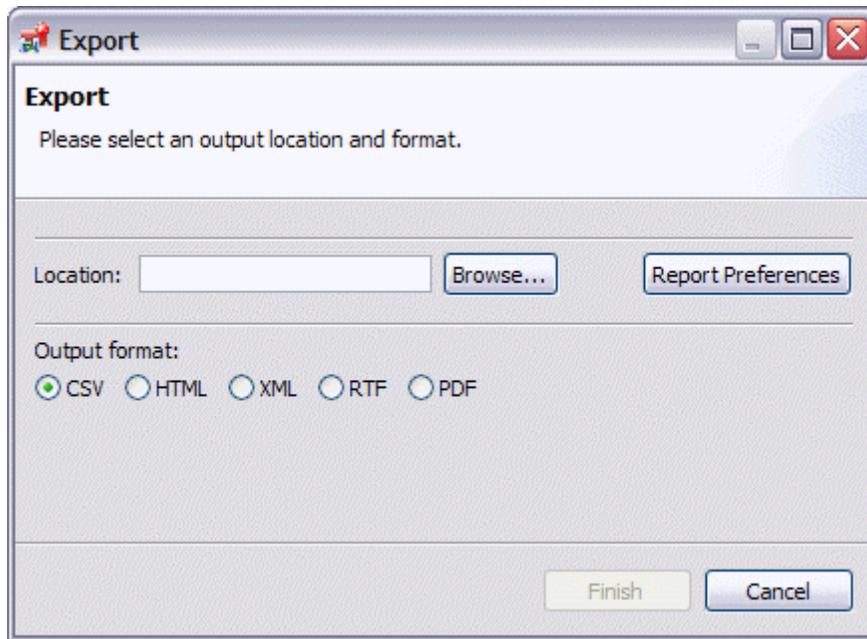

Generate a Job Report

Once you have run an archive job, you can generate a job report that summarizes the archived configuration information. You can also generate job reports for any archive versions that exist in the system. Click **View Report** on the **Comparison Results** tab.

The report opens in a separate window and can be read on screen, sent to a printer, and saved to disk.

Additionally, the **Export Results** command will produce a report file in a specified format at a directory location of your choosing.

Click **Export Results** on the **Results** tab and fill in the fields, as required. When you click **Finish**, the report is created in the directory specified in the **Location** field, in the format specified in the **Output Format** section.

The **Contents** tab enables you to specify what criteria to include in the report:

- Select **Include Matching Schema Objects** to include information about the objects that matched when the job was run.

Creating a Schema Archive

An archive job is an object related to schema comparison jobs, in that it contains a snapshot of the schema of a registered data source. A Schema Archive is used in schema comparisons against other data sources and archive jobs as a baseline to monitor data loss and inconsistencies when moving between testing and production environments.

All archive jobs are composed of a name, description, and schema derived from a single live data source at a specific point in time. Additionally, archive jobs have versioning functionality and can be periodically updated with the current values of an associated data source. Older versions are retained within an Archive and can be recalled as needed.

Archive jobs are located in Data Source Explorer on the Schema Archive Jobs node of the corresponding data source.

The following tasks provide a high-level overview of the Archive definition process:

[Create a New Schema Archive](#)

[Specify an Archive Name](#)

[Specify an Archive Job Source](#)

[Refine Properties](#)

[Specify Extraction Options](#)

[Specify Notification Options](#)

[Save the Archive Job/Manage Versioning](#)

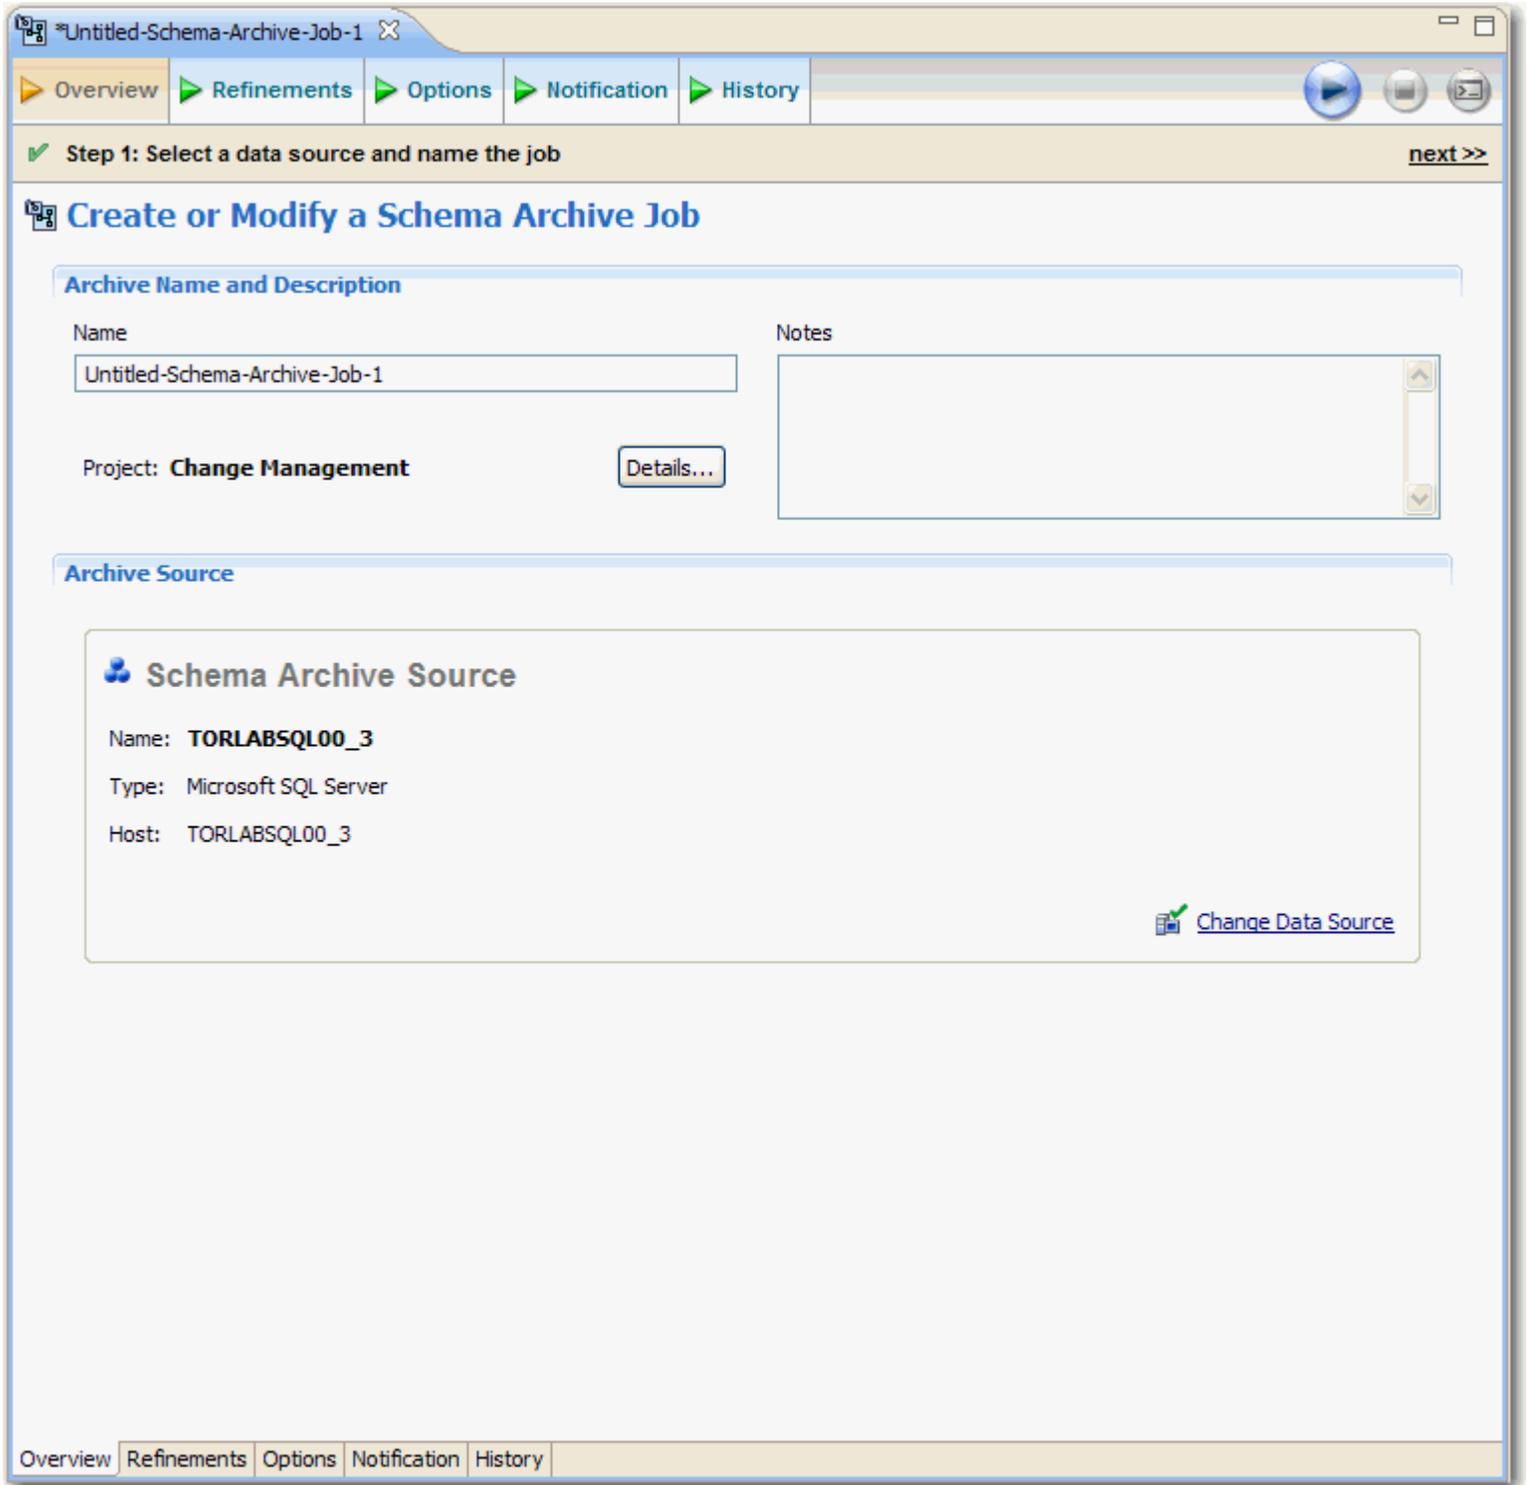

[Compare Archive Contents and Extract DDL](#)

[Generating a Job Report](#)

[Use Archive in Schema Comparison Jobs](#)

Create a New Schema Archive

Archives are defined in the **Schema Archive Job Editor**.

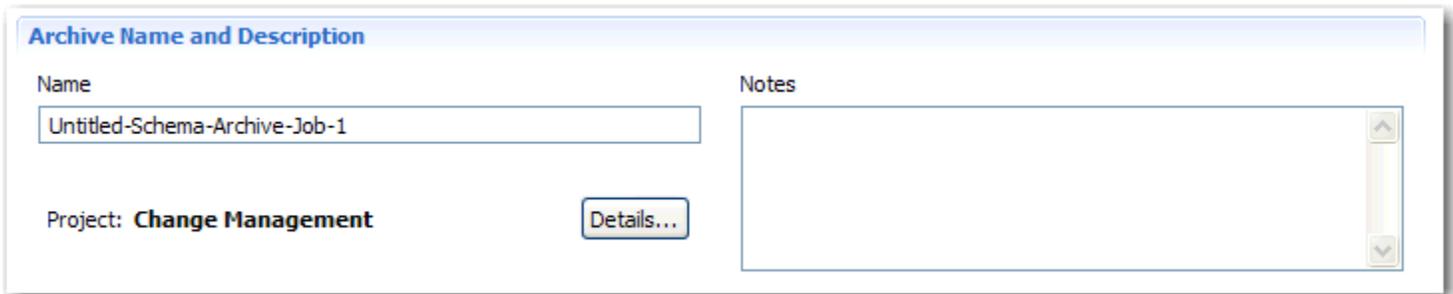

When an archive is initially created it is in an unsaved state and versionless. Once you define the archive job and refine its properties, you need to issue the **Run Job** command to create a version and save the archive job in the schema comparison environment. Unsaved Archives cannot be used in comparison jobs and do not appear in Data Source Explorer. More information regarding the process of refining and saving a new archive job are located in the other steps of this section.

To create a Schema Archive Job

Select **File > New > Schema Archive Job** from the menu. The Schema Archive Job Editor opens.

Specify an Archive Name

A name must be defined when a new archive job is created. The name is used to distinguish between archive jobs and other objects in Change Manager, and is used in versioning functionality later in the process.

The screenshot shows a dialog box titled "Archive Name and Description". It has two main sections: "Name" and "Notes". The "Name" section contains a text input field with the text "Untitled-Schema-Archive-Job-1". Below the input field, it says "Project: **Change Management**". To the right of the project name is a button labeled "Details...". The "Notes" section is a large empty text area with a vertical scrollbar on the right side.

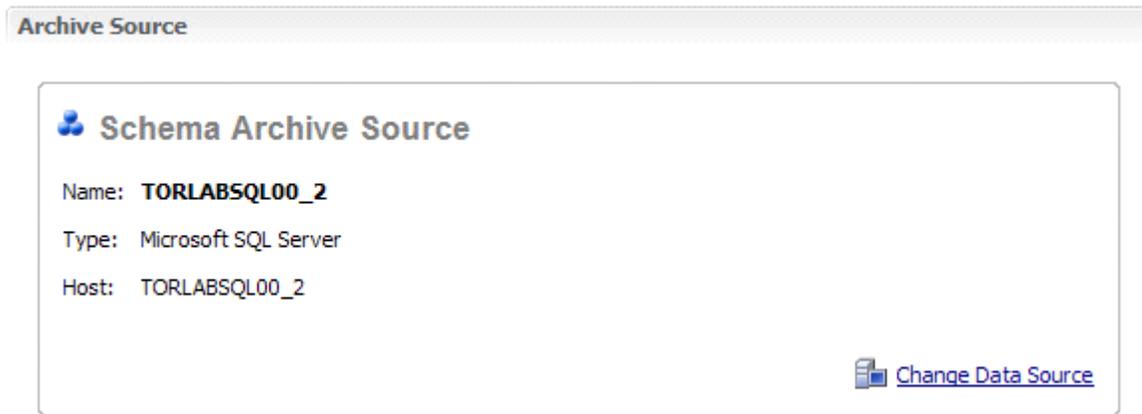

Ensure you specify a meaningful name that identifies the archive job in other views and dialogs later.

To name a Schema Archive Job

Enter the name of the archive job in the **Name** field of the Archive Job Editor.

Specify an Archive Job Source

The **Schema Archive Source** table specifies the data source from which the archive job is derived.

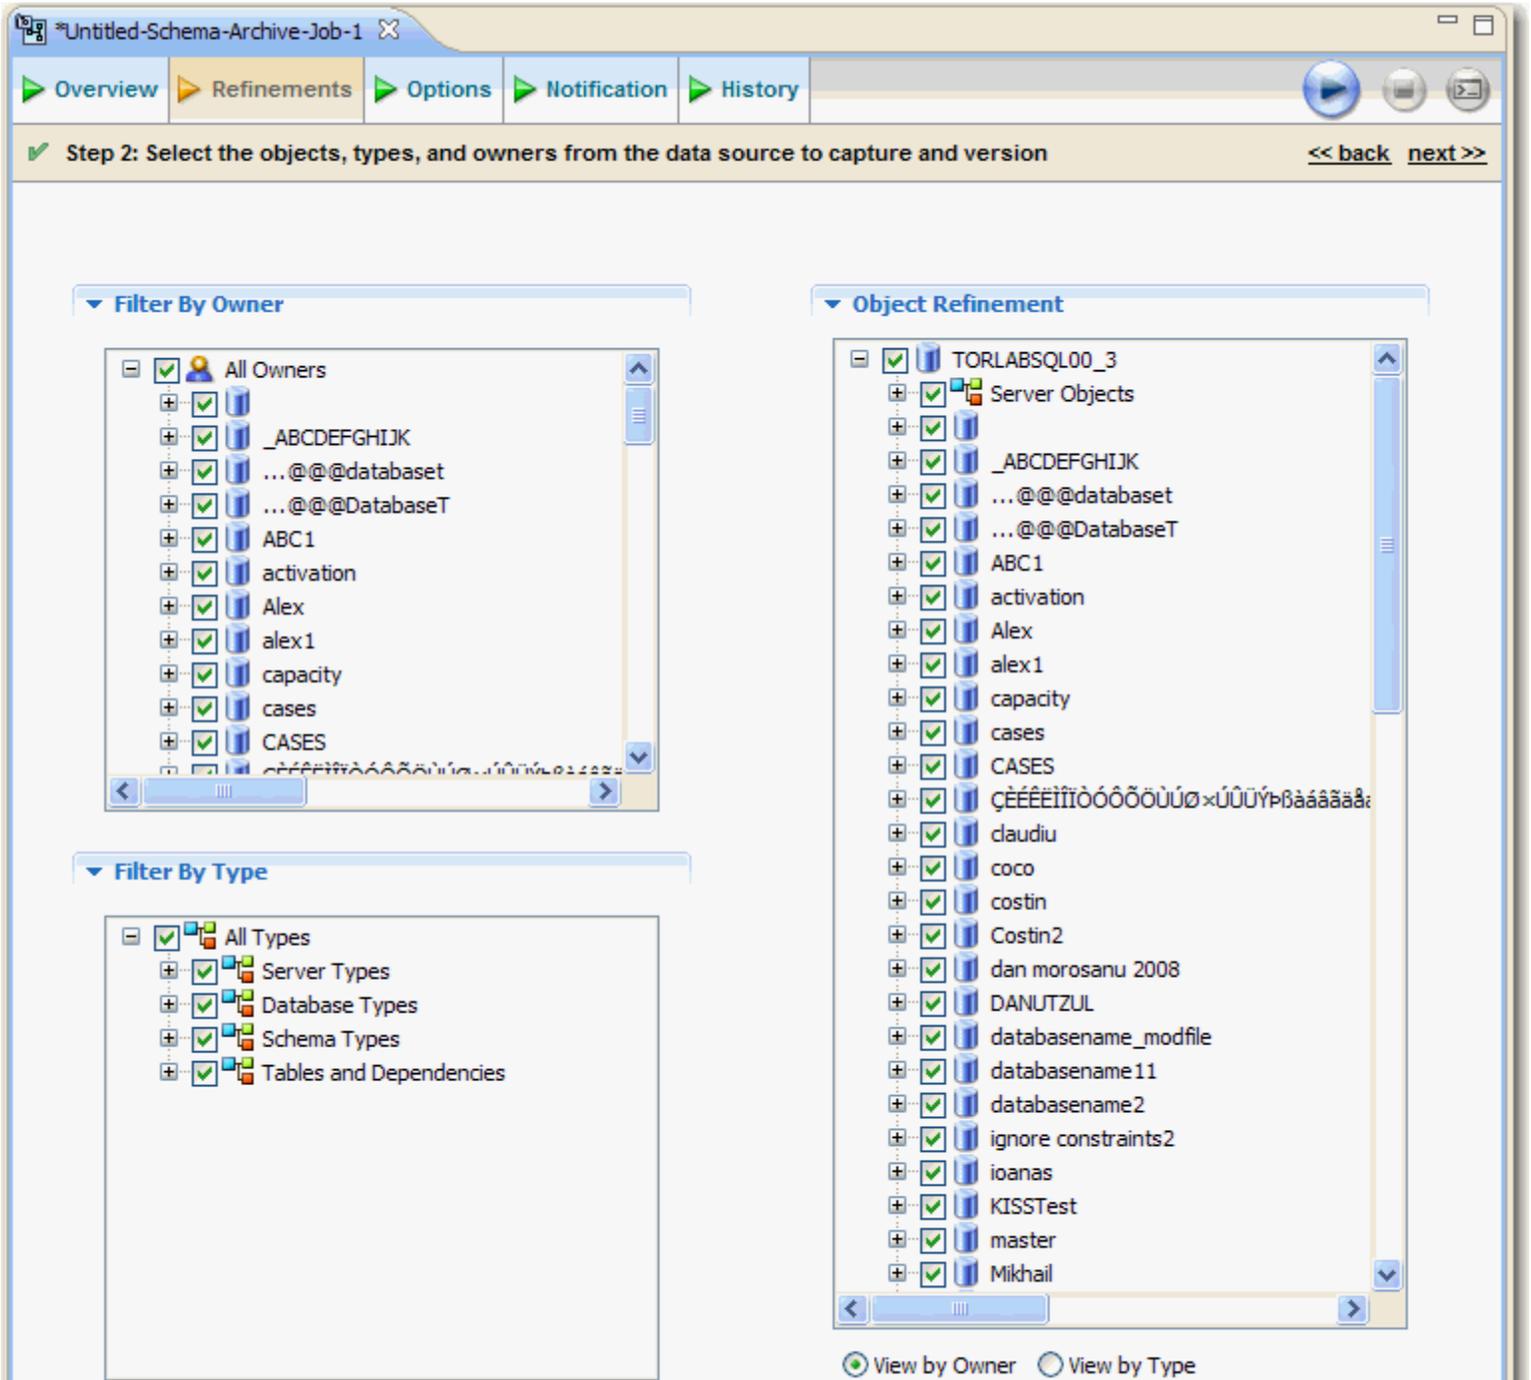

To specify the archive job source

Drag and drop the data source to be archived from **Data Source Explorer** to the **Schema Archive Source** box. The data source is listed by name, DBMS type, and host.

Refine Properties

By default, when you create a new archive job, all schema is included. However, you may only want or need to archive a specific group of objects per archive defined. Other archive jobs can be created (and likewise refined) for the same data source, but can maintain a different group of selected schema objects.

Archive job properties are located on the **Refinements** tab of the **Schema Archive Job Editor**, where they are listed by object name, owner, and type.

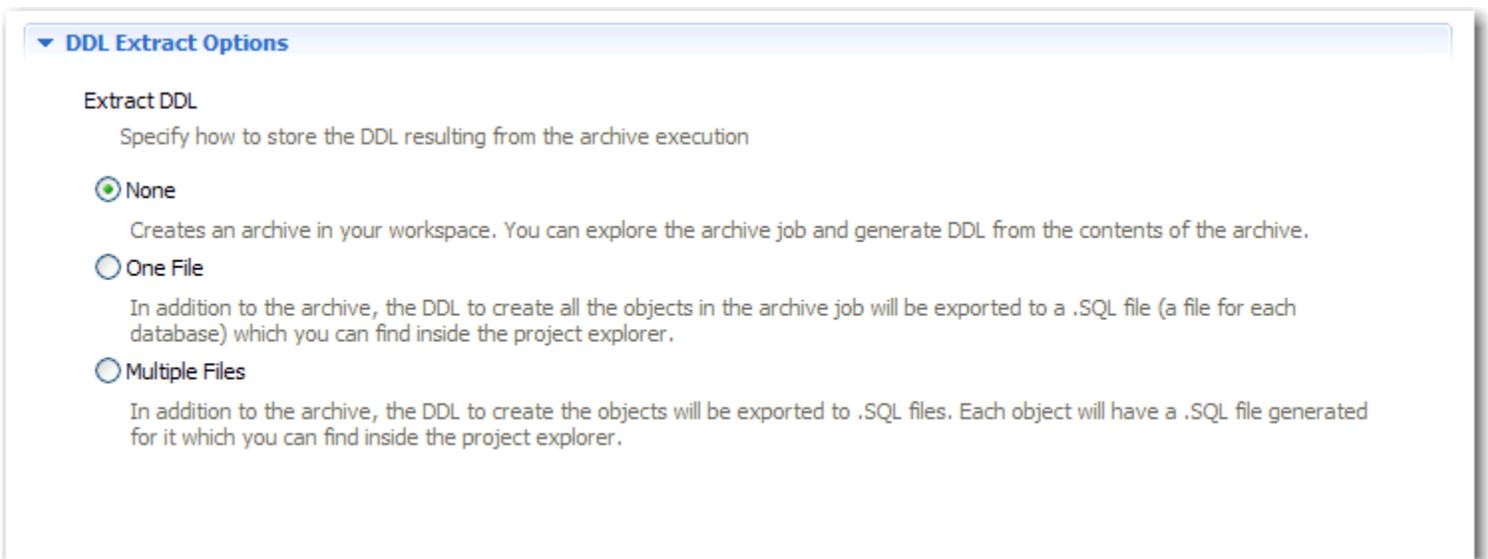

To refine schema archive job properties

Use the check boxes to select or de-select schema objects as needed. Selected objects are included in the archive job when comparison jobs are run, while de-selected properties are ignored altogether.

When you have finished selecting the properties to include in the archive job, you will need to save the Archive by creating a version (see [Save the Archive Job/Manage Versioning](#)). Within the same job, refinements are retained across versions unless new refinements are specified. However, each time you create a new archive job, Change Manager includes all schema of the specified data source and you must again specify refinements, if any.

Specify Extraction Options

The **Options** tab contains the **DDL Extraction Options** setting, which enables you to define how DDL is extracted and stored in Change Manager during the archive process. By default, this option is set to **None**, which indicates that the process does not retain extracted DDL when building the schema archive, although it can be extracted from the archive after the job has been executed.

If you choose to store extracted DDL, the directory location of the saved files can be viewed on the **History** tab of the editor when archive versions are created. Files can also be viewed from **Project Explorer** and the **Navigator** under the appropriate nodes. For more information on creating archive versions, see [Save the Archive Job/Manage Versioning](#).

To define the DDL Extraction process:

Use the drop down menu to specify **None**, **One File**, or **Multiple Files** to indicate how DDL extraction occurs, if at all, during the archive execution process.

Specify Notification Options

Notification options provide parameters for enabling and setting up various notifications regarding executed schema archive comparison jobs. This includes:

[Email Notifications](#)

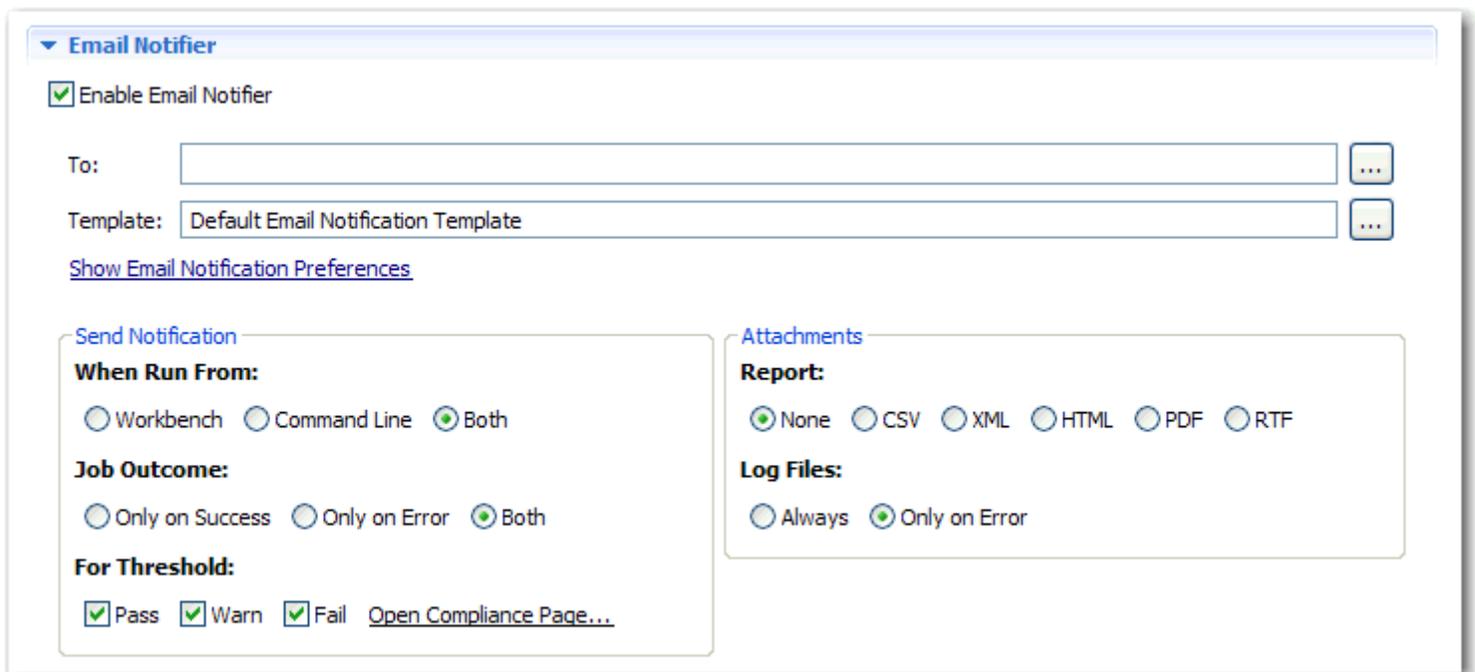

[File System Notifications](#)

[System Tray Notifications](#)

Notification options provide parameters for enabling and setting up email notification and report mailing for executed schema comparison jobs. The notification options tab enables you to specify the email addresses to which you want to send notifications, the email message format, and the conditions under which a notification should be sent.

Email Notifications

Email notification options provide parameters for configuring and enabling email notification and report mailing on executed comparison jobs.

Email Notifier

Enable Email Notifier

To:

Template:

[Show Email Notification Preferences](#)

Send Notification

When Run From:

Workbench Command Line Both

Job Outcome:

Only on Success Only on Error Both

For Threshold:

Attachments

Report:

None CSV XML HTML PDF RTF

Log Files:

Always Only on Error

These parameters enable you to specify the email addresses to which you want to send notifications, the email message format, the conditions under which a notification email should be sent, and other, similar options.

Click **Enable Email Notifier** to enable email notification. When you select this check box, a list of notification parameters appear.

Enter the email addresses to which the notification will be sent in the **To** field. You can specify an email format template in the **Template Field**.

The **Send Notification** options specify when a notification email should be sent based on the results of a comparison job:

- The **When Run From** options enable you to indicate that email notifications should only be sent if a job is executed from the **Workbench**, **Command Line**, or **Both**.

- The **Job Outcome** options enable you to indicate that email notifications should be sent **Only on Success**, **Only on Error**, or **Both**.
- The **For Threshold** options enable you to specify the threshold level for which email notifications are sent, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

The **Attachments** section enables you to specify the file format of an attached report that will display job results with the notification email. Choose **None** (does not attach a report), **CSV**, **XML**, **HTML**, **PDF**, or **RTF** to specify the file format of the report. The **Log Files** indicates when to log the notification file results to the Change Manager log file. You can choose **Always** or **Only on Error**.

File System Notifications

File system notification options provide parameters for configuring and enabling logging options for executed comparison jobs.

File System Notifier

Enable File System Notifier

Report Directory:

Log Directory:

Script Directory:

[Show File System Notification Preferences](#)

Send Notification

When Run From:

Workbench Command Line Both

Job Outcome:

Only on Success Only on Error Both

For Threshold:

Pass Warn Fail [Open Compliance Page...](#)

Attachments

Report:

None CSV XML HTML PDF RTF

Log Files:

Always Only on Error

Click **Enable File System Notifier** to enable comparison job logging. When you select this check box, a list of notification parameters appear.

Specify the directory location of each of the output files that are produced by the notification function in the **Report Directory**, **Log Directory**, and **Script Directory**, respectively. Additionally, you can click the **Show File System Notification Preferences** link if you want to change the directory locations at the application level rather than just the job level.

The **Send Notification** options specify when job results are output to the specified file directories:

- The **When Run From** options enable you to indicate that results should only be sent to file if a job is executed from the **Workbench**, **Command Line**, or **Both**.

- The **Job Outcome** options enable you to indicate that results should be sent to file **Only on Success**, **Only on Error**, or **Both**.
- The **For Threshold** options enable you to specify the threshold level for which results are sent to file, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

The **Attachments** section enables you to specify the file format of the output results. Choose **None** (does not produce a file), **CSV**, **XML**, **HTML**, **PDF**, or **RTF** to specify the file format. The **Log Files** indicates when to log the notification file results to the Change Manager log file. You can choose **Always** or **Only on Error**.

System Tray Notifications

System Tray notification parameters enable pop-up window notifications on your Desktop when Change Manager is minimized, but running jobs.

System Tray Notifier

Enable System Tray Notifier

Send Notification

When Run From:

Workbench Command Line Both

Job Outcome:

Only on Success Only on Error Both

For Threshold:

Pass Warn Fail [Open Compliance Page...](#)

Attachments

Report:

None CSV XML HTML PDF RTF

Log Files:

Always Only on Error

Click **Enable System Tray Notifier** to enable system tray notifications. When you select this check box, a list of notification parameters appear.

Click **Show System Tray Notifications** to specify global parameters with regards to the appearance and behavior of the specific pop-up windows.

The **Send Notification** options specify when a pop-up notification will appear.

- The **When Run From** options enable you to indicate that a pop-up notification should only appear if a job is executed from the **Workbench**, **Command Line**, or **Both**.
- The **Job Outcome** options enable you to indicate that a pop-up notification should appear **Only on Success**, **Only on Error**, or **Both**.

- The **For Threshold** options enable you to specify the threshold level for which a pop-up notification will appear, based on job results. Choose **Pass**, **Warn**, or **Fail**. You can also click **Open Compliance Page** to specify the percentage value of each of the threshold warning levels. These values are based on the percent match results of a given comparison job.

NOTE: The **Attachments** section enables you to specify the file format of a report that can be accessed via the pop-up notification. Choose **None** (does not produce a file), **CSV**, **XML**, **HTML**, **PDF**, or **RTF** to specify the file format of the report. The **Log Files** indicates when to log the notification to the Change Manager log file. You can choose **Always** or **Only on Error**.

Save the Archive Job/Manage Versioning

A version is a set of schema objects captured by an archive job, and is used to store older snapshots of the same job for backup or tracking comparison purposes. Initially, you must create and save a version for the job to become valid within the system.

A version is created when you click the **Run** icon located in the upper right-hand corner of any tab in the **Schema Archive Job Editor**.

When the process executes, the **New Unsaved Version** tab appears and lists information related to the archive job, including the full archive contents and any extracted DDL.

In order to create a version, highlight the tab and select **File > Save** or **File > Save All** from the Menu Bar. The system retains an older archive job named **Version 1** that appears in the **Archive Job History** table on the **History** tab as well as in the **Data Source Explorer** tree under the **Schema Archive Jobs** node.

To create a version and save the archive job

- Click the **Run Job** icon. When you have saved the executed job, a version appears in the **Archive Job History** table on the **History** tab containing the name of the archive job, the number of properties retained by the version, a time stamp, where the archive job was run from, and the number of errors. (Workbench for manual job execution, or command line, if automated.)

You create additional versions within the same archive job each time you click **Run Job**. The new version contains the latest values for the captured schema archive job, as specified on the **Refinements** tab. Versions are listed on the **Overview** tab in a table that displays them in ascending order. A version can be accessed for viewing by double-clicking the appropriate version in the table. The selected version opens in a new tab of the **Archive Job Editor**.

Additionally, versions are listed as child nodes of the archive job to which they belong in **Data Source Explorer**. To view a version, double-click the appropriate node.

Compare Archive Contents and Extract DDL

On an open version tab, the Schema Archive Editor enables you to compare that archive version with the live source by right-clicking on the **Archive Contents** table and selecting **Compare**.

Schema Comparison Job Editor opens immediately, and designates the archive version and the original source as its source and target data sources, respectively.

Additionally, you can select **Extract** from the **Archive Contents** menu to extract the DDL of the archived contents. The code opens in the **DDL Extract** window, and can be viewed, saved, or otherwise modified via the **Open Editor** command.

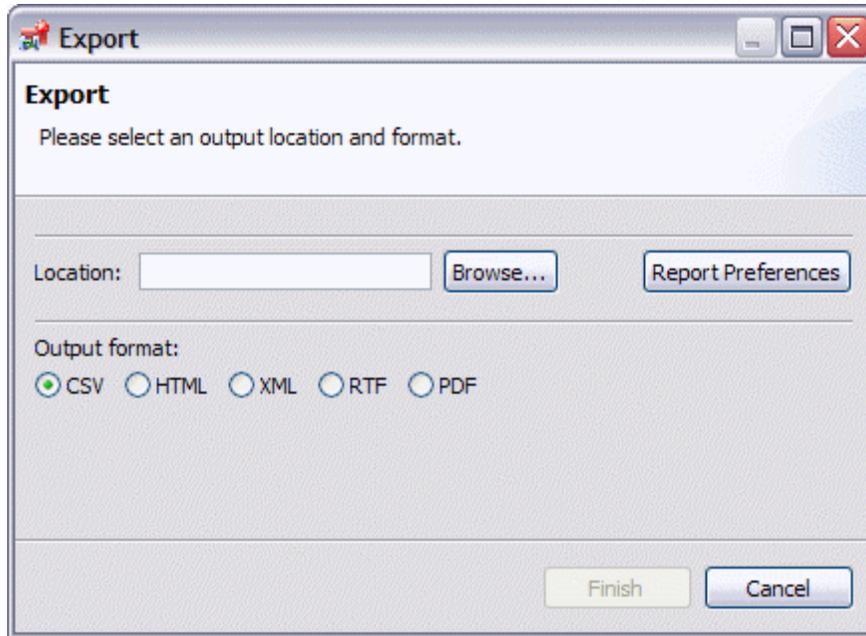

NOTE: Options to compare archive contents and extract DDL are also available via **Data Source Explorer**, under the appropriate archive node.

Generating a Job Report

Once you have run an archive job, you can generate a job report that summarizes the archived configuration information. You can also generate job reports for any archive versions that exist in the system. Click **View Report** on the **Comparison Results** tab.

The report can be read on screen, sent to a printer, and saved to disk via the command icons located in the report window toolbar.

Additionally, the right-click menu contains a command named **Generate Report**. This will produce a report file in a specified format at a directory location of your choosing.

Fill in the fields, as required. When you click **Finish**, the report is created in the directory specified in the **Location** field, in the format specified in the **Output Format** section.

Use Archive in Schema Comparison Jobs

Archives are used in schema comparison jobs the same way as registered data sources.

To add an archive to a schema comparison job

- Drag and drop an Archive version from **Data Source Explorer** to the **Comparison Source** or **Comparison Target** boxes in the **Schema Comparison Job Editor**.

Configuring Change Manager

This section contains information regarding the general configuration and management of the Change Manager environment.

The following topics can be found in this section:

[Register Data Sources](#)

[Extending Change Manager Functionality with Eclipse Plug-Ins](#)

[Customizing Change Manager \(Preferences\)](#)

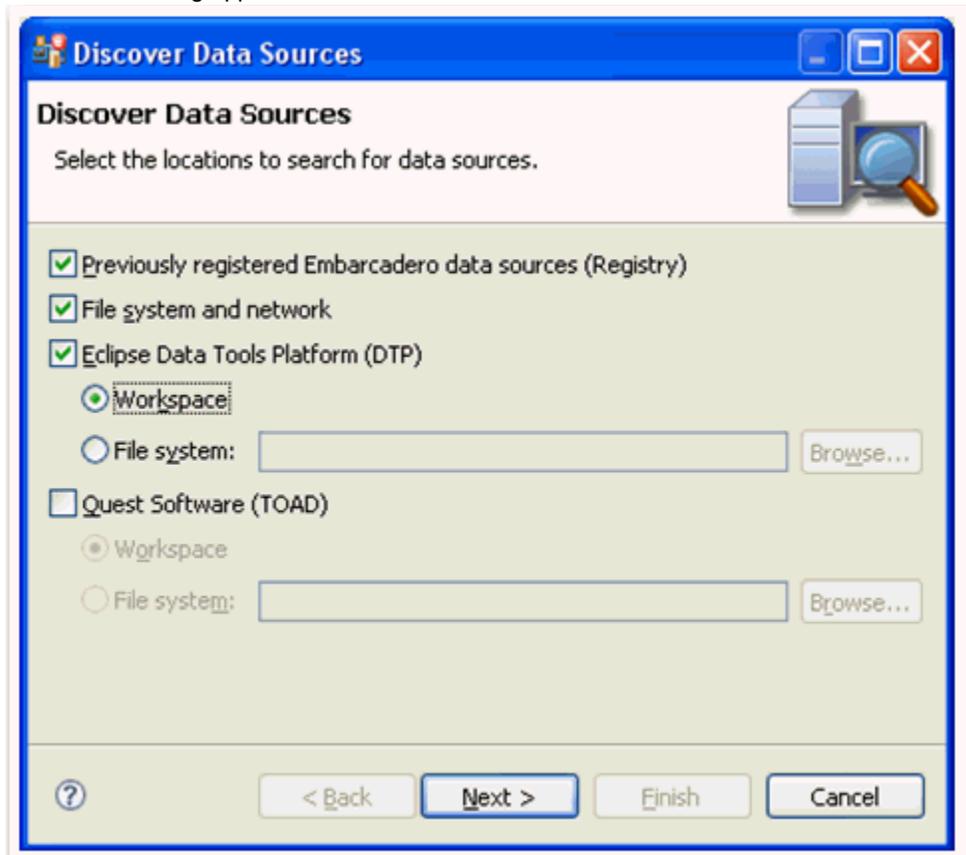

[Using Source Control Systems](#)

Register Data Sources

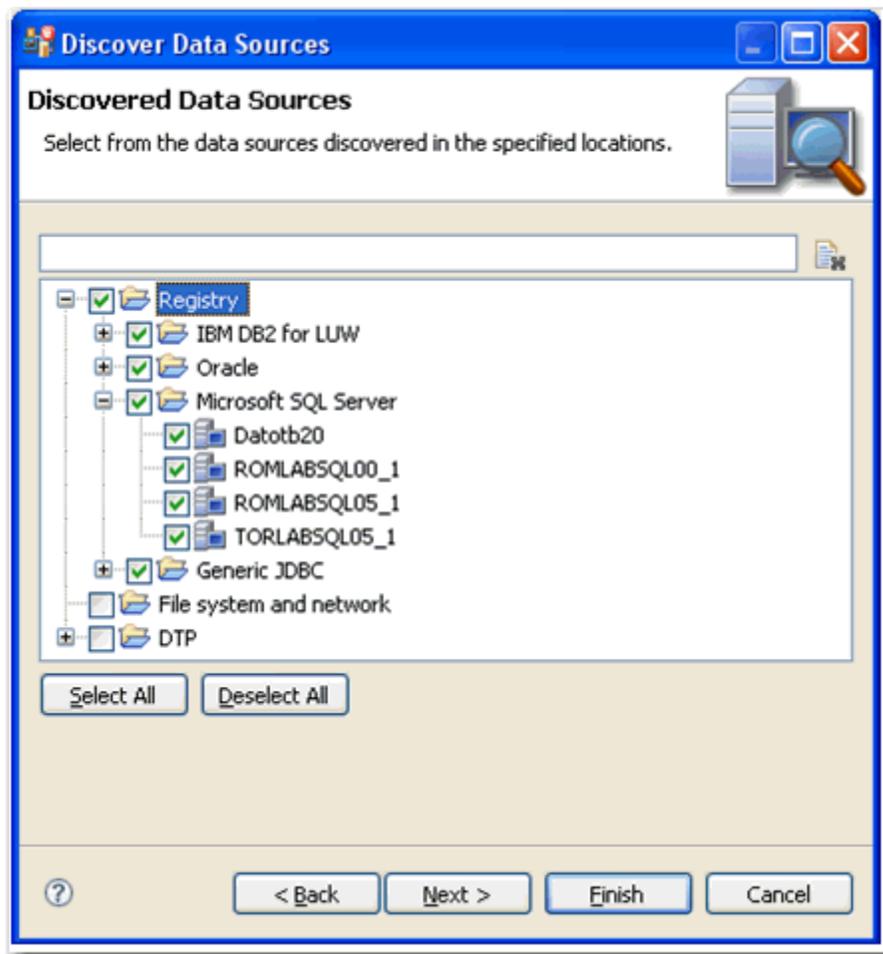

When Change Manager is started, it prompts you to discover data source catalogs that have been created by any previously installed Embarcadero products (DBArtisan, Rapid SQL, DB Optimizer), or other instances of Change Manager.

Additionally, the system scans your machine for the client software of all supported third-party DBMS platforms (TOAD, Eclipse Data Tools Platform, etc.). These data sources are automatically added to the data source catalog.

To manually initiate the scan later, click the **Discover Data Sources** icon at the top of Data Source Explorer. The **Discover Data Sources** dialog appears.

- 1 Choose the type of data sources you want to scan for and click **Next**. The wizard automatically returns all data sources it finds on your machine based on the criteria you specified.

- 2 Choose the data sources you want to add to the Change Manager environment and click **Finish**. Data Source Explorer automatically populates with the new data source selections.

To add data sources manually, right-click **Managed Data Sources** in the Data Source Explorer tree, select **New > Data Source**, and enter the connectivity parameters as prompted.

Once registered, the data source appears in the **Data Source Explorer** view. If you have created more than one workspace, they all share the same data source catalog.

Once a data source has been registered, the connection parameters are stored locally. In some cases, a user ID and password are required to connect to a registered data source. Rapid SQL Developer can encrypt and save user IDs and passwords to connect automatically.

Note: If you are experiencing difficulties with the import of data sources from other Embarcadero products, you can import the old data sources via your system's Windows registry by selecting **File > Import... > Embarcadero > Data Sources > Previously Registered Embarcadero Data Sources (Registry)**.

- 3 For more information on importing and exporting data sources, see [Importing and Exporting Data Sources](#).

Importing and Exporting Data Sources

Some Embarcadero products contain data source catalogs that are shared with Change Manager. In other words, instead of manually adding data sources to the environment, you can import an existing data source catalog from other Embarcadero products or third-party DBMS sources.

You import Data Sources via the **File > Import** command in the Main Menu, expanding the **Embarcadero** folder in the Data Source Selection tree, and choosing **Data Sources**.

The following types of sources can be imported to Data Source Explorer:

- Eclipse Data Tools Platform (DTP)
- Previously Registered Embarcadero Data Sources (File)
- Previously Registered Embarcadero Data Sources (Registry)
- Quest Software (TOAD)

Once a data source is registered, it automatically appears in Data Source Explorer. Connection parameters are stored locally, and Change Manager can be set to connect automatically each time you select the data source from the tree.

Conversely, you can also **Export** your current data source catalog to a file, which can then be imported into other instances of Change Manager via the **Previously Registered Embarcadero Data Sources (File)** option. This is performed using the **File > Export** command in the Main Menu, and then selecting **Embarcadero > Data Sources** from the tree view in the **Export Data Sources** dialog.

To import data sources:

- 1 Select **File > Import** . The **Import Data Sources** dialog appears.
- 2 Choose **Embarcadero > Data Sources** from the tree and click **Next**.
- 3 Choose a source from which you want to import the data sources. You can choose to import data sources from the DTP, TOAD, or an existing Embarcadero data source catalog stored in the Windows registry or as a file (created via the **Export** command). Click **Next**.
- 4 Specify the location of the import source and click **Finish**. Data Source Explorer is automatically populated with the new data sources.

To export data sources:

- 1 Select **File > Export**. The **Export Data Sources** dialog appears.
- 2 Choose **Embarcadero > Data Sources** from the export tree and click **Next**.
- 3 Use the check boxes beside each listed data source to indicate which data sources you want to export. Click **Next**.
- 4 Click **Finish**.
- 5 The data sources are automatically exported in the form of an XML file. You can import this file to other instances of Change Manager via the **Import** command.

Extending Change Manager Functionality with Eclipse Plug-Ins

Change Manager publishes two extensions that can be implemented via plug-ins to customize the application.

The two feature extensions are:

- **Notifications:** enable you to code a plug-in for Change Manager that implements any type of job execution notification required for your organization. Change Manager includes email notification by default, but other plug-ins can be coded in Java and added to Change Manager, as needed.
- **Configuration Parameters:** enable you to code a plug-in for Change Manager that adds additional configuration parameters and values for configuration standards, archive jobs, and comparisons. Change Manager includes plug-ins for standard configuration properties and version information, but other plug-ins can query data sources via Java JDBC for additional or environment-specific information.

In order to utilize the functionality of these features, you will need to build a plug-in and specify the parameters of the notification and custom configuration extensions. The following sections provide examples that demonstrate the possibilities regarding this feature.

[Creating and Implementing a Notification Plug-In](#)

[Creating and Implementing a Custom Configuration Plug-In](#)

Creating and Implementing a Notification Plug-In

The job notification plug-in is built on the Eclipse platform and some knowledge regarding java coding and Eclipse plug-in development is required.

Notifications can be set to alert you if a job is successful, unsuccessful, or either result. Additionally, a notification can also indicate if a job was launched from the workbench or from a command line, and can produce a report in a number of different file formats.

The following options and option parameters may be selected via the job notification plug-in:

Notification Option	Option Parameters
Notify When Run From	Workbench, Command Line, Both
Attached Report	None, CSV, XML, HTML, PDF, RTF
Send Notification	Always, Only on Success, Only on Failure

Notification parameters are set independently on each job configured in Change Manager. Additionally, each set of notification options apply individually per job selected.

The notification plug-in must be defined in Eclipse and then activated in Change Manager.

The following tasks provide a high-level overview of defining and implementing the notification plug-in:

[Creating a Plug-In Project](#)

[Configuring the Target Platform](#)

[Defining Plug-In Dependencies](#)

[Implementing a Notifier Class](#)

[Implementing a Viewer Contribution](#)

[Specifying Setup Constants](#)

[Implementing the DirectoryNotifier Class](#)

[Implementing the DirectoryNotifierViewerContribution Class](#)

[Registering the Extensions](#)

[Deploying the Notifier Plug-In](#)

Creating a Plug-In Project

In order to start building a plug-in, you need to create a new plug-in platform in Eclipse.

To create a plug-in project

- 1 Select **File > New > Other**.

The **Select a Wizard** dialog appears.

- 2 Select **Plug-In Project** and click **Next**.

- 3 Type a name for the plug-in in the appropriate field, and leave the remainder of the parameters as they appear. Click **Next**.

- 4 Retain the default parameters on the next dialog and click **Finish**.

The new plug-in project is created in Eclipse and is ready for plug-in development.

Configuring the Target Platform

The target platform for the plug-in development process needs to be identified in Change Manager. This will indicate to the new plug-in for what product it extends, and will grant the plug-in access to the system.

- 1 Select **Window > Preferences**.

The Preferences dialog appears.

- 2 Choose the **Plug-In Development > Target Platform** node and click **Browse**.

- 3 Navigate to the install directory for Change Manager.

- 4 Click **Apply** and **OK**.

The Preferences dialog closes and the target platform of the plug-in is now indicated.

Defining Plug-In Dependencies

The new plug-in requires a pair of dependency definitions on the Change Manager Notification Plug-In:

- **com.embarcadero.change.notifications**
- **org.eclipse.ui.forms**

- 1 Navigate to the **META-INF** folder in your project and double-click **MANIFEST.MF**.

The **MANIFEST.MF** file opens in Eclipse.

- 2 Select the **Dependencies** tab and click **Add...**

- 3 Choose **com.embarcadero.change.notifications** and click **OK**.

The dependency is added.

- 4 Choose **org.eclipse.ui.forms** and click **OK**.

The dependency is added.

- 5 Press **Ctrl+S** to save the changes, or choose **File>Save** from the menu to retain the new dependencies and close the editor.

Implementing a Notifier Class

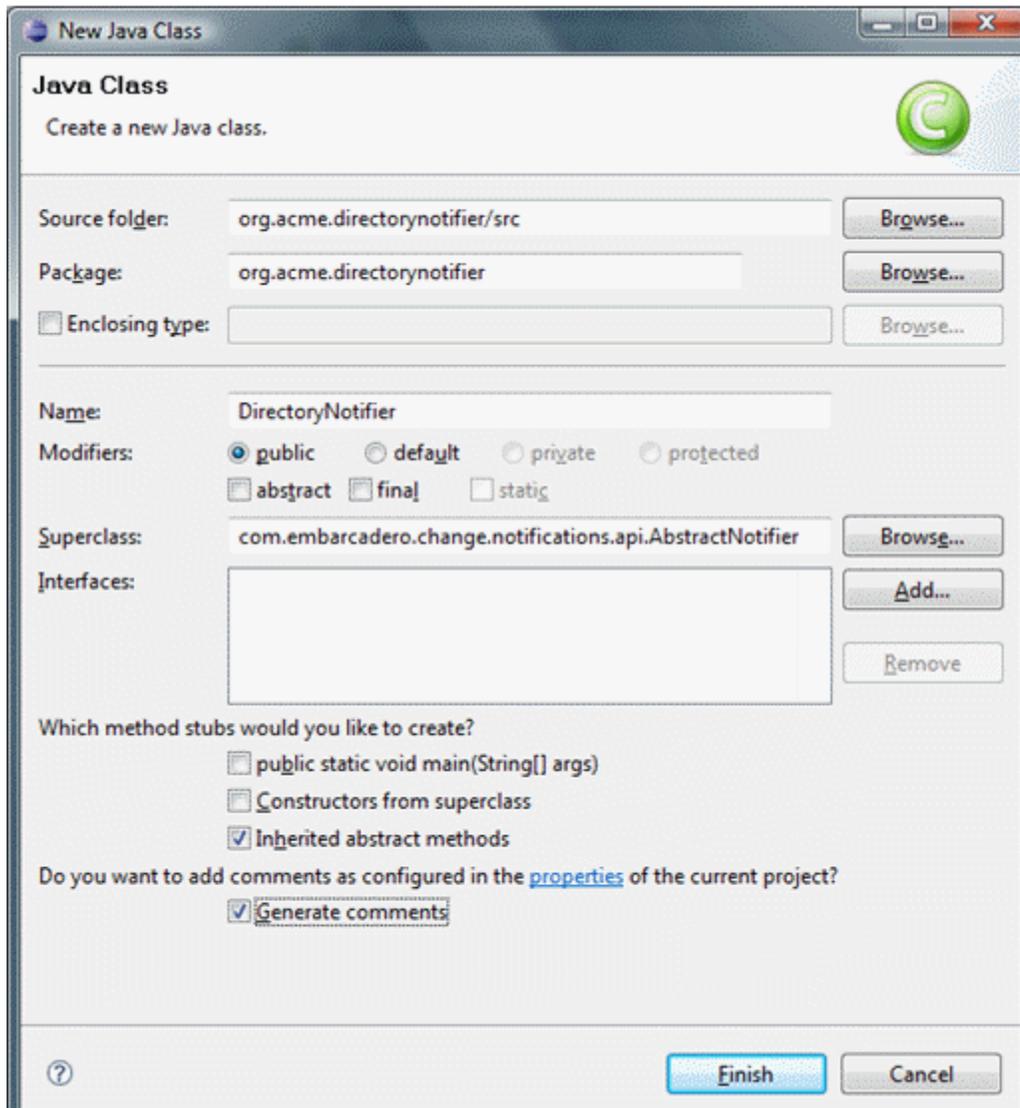

Each notification plug-in requires a Notifier class that must implement the interface **com.embarcadero.change.notifications.api.INotifier**.

To do this, you subclass **com.embarcadero.change.notifications.api.AbstractNotifier** and customize it.

NOTE: If AbstractNotifier or INotifier cannot be found in Eclipse, the target platform or plug-in dependencies have not been configured properly. Ensure that you have configured these prerequisites and then search again for the notifier classes.

- 1 Right-click on your project and select **New > Class**.

The **New Java Class** dialog appears.

- 2 Enter the appropriate information in the fields provided to define the new Java class:
 - In the **Name** field, type “DirectoryNotifier”.
 - In the **Package** field, type “org.acme.directorynotifier”.
 - In the **Superclass** field, type “com.embarcadero.change.notifications.api.AbstractNotifier”.
- 3 Click **Finish** to create the new class.

Once you have defined the DirectoryNotifier class, two methods require implementation:

- **isReportSupported** returns a Boolean value indicating if the notification can include a report. The directory notifier will return true, since reports can be replaced in a directory, but a notification may not support reports. This method is called when creating job editors to determine if the reporting section will be shown for this type of notification.
- **sendNotification** is called after a job runs and is responsible for the notification. The three parameters are as follows:

Parameter	Type	Description
notifierData	INotifierData	This instance contains the configuration for the notification of the job just run.
jobMetaData	Map<String,String>	This map contains information about the job execution. The keys in the map correspond to entries in the NotificationPropertyEnum. For example, to get the data and time of the execution, you would code: "jobMetaData.get(NotificationPropertyEnum.DATE_TIME.getTag())" Note: The keys are the tag of the enum entries, so ensure that getTag() is called when accessing jobMetaData.
notificationInfo	IReportGenerator	Used to generate the report and access any DDL or sync script output.

Implementing a Viewer Contribution

Each notifier can be configured for a job in Change Manager.

The notifier will enable a user to select a target directory in which to put results. The email notifier that is supplied with the application enables users to select the email template that will be used to generate the message as well as the addresses of those who will receive it.

In order to add a directory field to the job editor, a class needs to be written that implements the interface named **com.embarcadero.change.notifications.api.INotifierViewerContribution**.

- Create a new class named "DirectoryNotifierViewerContribution" and follow the same steps you used to create the DirectoryNotifier class. The exception to this process is that you need to leave the Superclass parameter set to "java.lang.Object", as well as adding the interface "INotifierViewerContribution" to the list of implemented interfaces.

Specifying Setup Constants

The notifier only allows users to select a directory in which reports and outcomes are written whenever jobs are executed.

The **DirectoryNotifierConstants** class is a small constants class that stores the property name for storage and retrieval purposes.

- 1 Create a new class named **DirectoryNotifierConstants**.
- 2 Enter the following code for the class definition:

```
/**
 * Constants for this network share notifier
 */
public final class DirectoryNotifierConstants
{
    // Overview file name
    public static final String OVERVIEW_FILE_NAME = "outcome.txt";

    // Persisted Job Settings Key
    public static final String TARGET_DIRECTORY = "directorynotifier.targetdir";

    /**
     * Constant utility class cannot be instantiated
     */
    private DirectoryNotifierConstants()
    {
    }
}
```

Implementing the DirectoryNotifier Class

The DirectoryNotifier class can be coded with two return methods:

- **isReportSupported**
- **SendNotification**

To implement the isReportSupported method

Enter the following code:

```
public boolean isReportSupported()
{
    return true;
}
```

To implement the SendNotification method

- 1 To add the notifierProperties and assign the targetDirectory to a variable to provide a directory that the user selected for the executed job, add the following code:

```
public void sendNotification ( INotifierData notifierData,
                             Map<String, String> jobMetaData,
                             notificationInfo

    Map<String, String> notifierProperties = notifierData.getNotificationProperties();

    String targetDirectory = notifierProperties.get (
        DirectoryNotifierConstants.TARGET_DIRECTORY );
```

- 2 Enter the following code to define that the report and output file need to be placed in a directory whose name will be composed of the job execution date and time.

NOTE: If a directory cannot be created, the code below also includes a RuntimeException.

```
//Create a new directory named by the execution date and time
String dateTime = jobMetaData.get ( NotificationPropertyEnum.DATE_TIME.getTag() );
File dir = new File (targetDirectory +
                    File.seperatorChar +
                    dateTime.replace ( ':', '-' ) );
boolean createdDirectory = dir.mkdir();
if ( !createdDirectory )
{
    throw new RuntimeException ( "Create Failed: " +
dir.getAbsolutePath ( ) );
}
```

3 Enter the following code to define the outcome file, which includes each of the job execution parameters:

```

try
{
    //Write the results to an output file
    File f = new File ( dir.getAbsolutePath() +
        File.separatorChar +
        DirectoryNotifierConstants.OVERVIEW_FILE_NAME );
    f.createNewFile();

    BufferedWriter writer = new BufferedWriter ( new FileWriter ( f ) );

    String newLine = System.getProperty ( "line.separator" );

    writer.write ( "Outcome: " +
        jobMetaData.get (
            NotificationPropertyEnum.JOB_OUTCOME.getTag() ) +
        newLine );
    writer.write ( newLine );
    writer.write ( "Date & Time: " +
        jobMetaData.get (
            NotificationPropertyEnum.DATE_TIME.getTag() ) +
        newLine );
    writer.write ( "Elapsed Time: " +
        jobMetaData.get (
            NotificationPropertyEnum.ELAPSED_TIME.getTag() ) +
        newLine );
    writer.write ( newLine );
    writer.write ( "Name: " +
        jobMetaData.get (
            NotificationPropertyEnum.JOB_NAME.getTag() ) +
        newLine );
    writer.write ( newLine );
    writer.write ( "Host: " +
        jobMetaData.get (
            NotificationPropertyEnum.JOB_HOST.getTag() ) +
        newLine );
    writer.write ( "Job Type: " +
        jobMetaData.get (
            NotificationPropertyEnum.JOB_TYPE.getTag() ) +
        newLine );
    writer.write ( "Module: " +
        jobMetaData.get (
            NotificationPropertyEnum.MODULE.getTag() ) +
        newLine );
    writer.write ( newLine );
    writer.write ( "Sources: " +
        jobMetaData.get (
            NotificationPropertyEnum.JOB_SOURCES.getTag() ) +
        newLine );
    writer.write ( "Targets: " +
        jobMetaData.get (
            NotificationPropertyEnum.JOB_TARGETS.getTag() ) +
        newLine );
    writer.write ( newLine );
    writer.write ( "Job Notes: " +
        jobMetaData.get (
            NotificationPropertyEnum.JOB_NOTES.getTag() ) +
        newLine );

    writer.flush();
    writer.close();
}

catch (Throwable t )
{
    throw new RuntimeException ( t );
}

```

- 4 Enter the following code to generate the report. This code also provides a null report if the report type is set to none at execution time.

```
//Create the report if required
File reportFile = notificationInfo.getReport() ;

if ( reportFile !=null )
{
    File destinationReportFile = new File
        dir.getAbsolutePath() +
        File.separatorChar +
        reportFile.getName() );
    reportFile.renameTo ( destinationReportFile );
}
```

Finally, output any DDL or synchronization SQL:

```
//Write the script
File scriptFile=notificationInfo.getScript();

if ( scriptFile !=null)

    File DestinationScriptFile = new File (
        dir.getAbsolutePath() +
        File.separatorChar +
        scriptFile.getName ( ) );
    scriptFile.renameTo (destinationScriptFile);
```

Implementing the DirectoryNotifierViewerContribution Class

Add the code below to the **DirectoryNotifierViewerContribution** class to provide functionality for the interface:

- 1 The **DirectoryNotifierViewerContribution** class requires a three class-level private attributes. These store notification data, which will be the composite on which any options will then be placed, as well as the **folderField**, which is used to enter a file directory address.

```
private INotifierData notificationData;
private Composite body;
private Text folderField;
```

- 2 The **createFormContent** attribute creates a new composite and provides a lay out template for options and entry fields. The code below adds a label and a text field to the interface:

```
public Composite createFormContent ( Composite parent, FormToolkit toolkit )
    body = toolkit.createComposite ( parent );
    body.setLayout ( new GridLayout ( ) );

    toolkit.createLabel ( parent, "Target Directory:" );

    String folder = notificationData == null ? " " :
        notificationData.getNotificationProperties().get (
            DirectoryNotifierConstants.TARGET_DIRECTORY );

    folderField = toolkit.createText ( parent, folder, SWT.SINGLE | SWT.BORDER );
    folderField.setLayoutData ( new GridData ( SWT.FILL, SWT.CENTER, true, false ) );
    folderField.addModifyListener ( new ModifyListener ( ) {
        public void modifyText ( ModifyEvent e )
        {
            notificationData.setNotificationPropert (
                DirectoryNotifierConstants.TARGET_DIRECTORY,
                folderField.getText().trim() );
        }
    });

return body;
```

The above code:

- Creates a new composite body, and sets it to have a grid lay out.
 - Creates a label for the target directory field.
 - Retrieves the folder from the job, if the job is new or unsaved, or defaults to an empty string if the result is null.
 - Initializes the folderField text element and sets it to justify.
 - Adds a listener for changes on the folderField element that updates the notificationData, thus enabling save actions.
 - Returns the body to be added to the Change Manager job editor to which this class applies.
- 3 Add the setData method by entering the following code, which is called to update the user interface with job information. This method accepts and stores the new instance of INotifierData containing job specific data for the notifier. If the folderField has already had something entered, the notification properties will be initialized and store the value that was previously entered.

```
public void setData ( INotifierData notificationData )
{
    this.notificationData = notificationData;

    if ( folderField !=null && !folderField.isDisposed() &&
        folderField.getText().trim().length() > 0 ) )
    {
        if ( notificationData !=null )
        {
            Map<String, String> propMap
            = notificationData.getNotificationProperties();

            if ( propMap == null )
            {
                notificationData.setNotificationProperties(
                    new HashMap<String, String>() );

                propMap = notificationData.getNotificationProperties();
            }

            notificationData.setNotificationProperty (
                DirectoryNotifierConstants.TARGET_DIRECTORY,
                folderField.getText() );
        }
    }
}
```

The following code should be used to implement the **setEnabled** method:

```
public void setEnabled ( boolean enabled )
{
    folderField.setEnabled( enabled );
}
```

The following code should be used to implement the **dispose** method:

```
public void dispose()
{
    if ( body !=null && !body.isDisposed() )
    {
        body.dispose();
        body = null;
    }
}
```

Registering the Extensions

Once the plug-in has been coded, and the notifier and user interface implemented, definitions must be included that explain how Change Manager should interact with the plug-in.

This is performed by registering extensions that define to Change Manager the Notifier and NotifierViewerContribution. When the plug-in is added to Change Manager, the extensions are registered and Change Manager understands the purpose of the plug-in.

- 1 Open the **MANIFEST.MF** file.
- 2 Navigate to the **plugin.xml** tab and display the source.
- 3 Add the following code:

```
<extension
  point="com.embarcadero.change.notifications.notifier">

  notifier
    id="org.acme.directorynotifier"
    name="Directory Notifier"
    notifier="org.acme.directorynotifier.DirectoryNotifier"
    viewContribution=
      "org.acme.directorynotifier.DirectoryNotifierViewerContribution">
  </notifier>
</extension>
```

- 4 Save the file by pressing **Ctrl+S** or selecting **File>Save** from the menu.

When the `org.acme.directorynotifier` is found, the notification extension point will be registered. The `notifier` and `viewContribution` attributes are the class names for two implementations and Eclipse will reflectively register these objects for use in Change Manager.

Deploying the Notifier Plug-In

Once the plug-in has been defined, you need to deploy the plug-in in Change Manager.

- 1 Stop Change Manager if it is currently running and select **File > Export**.
The **Export** dialog appears.
- 2 Choose **Deployable Plug-Ins and Fragments** from the **Plug-In Development** group.
- 3 Click **Next**.
- 4 Select **org.acme.directorynotifier** and ensure that the target directory is attribute to the Change Manager installation folder.
- 5 Click **Finish**.
- 6 Start Change Manager and create a new Data Comparison job. Define a Source and Target data source and then navigate to the **Notification** tab.
The **Directory Notifier** has been added as a section to the tab.
- 7 Choose **Enable Directory Notifier** to enable the feature.
- 8 Specify the **Target Directory**. For example, **C:\ChangeManagerNotifications**, and choose **PDF** in the **Attached Report** section.
- 9 Execute the job and open the target folder. A new folder is created containing two output files from the job.

Creating and Implementing a Custom Configuration Plug-In

[Creating a Project Plug-In](#)

[Configuring the Target Platform](#)

[Implementing a Property Source](#)

[Determining Support](#)

[Defining Properties](#)

[Gathering Results](#)

[Synchronizing the Job](#)

[Registering Extensions](#)

[Deploying the Custom Configuration Plug-In](#)

Creating a Project Plug-In

In order to start building a plug-in, you need to create a new plug-in platform in Eclipse.

To create a plug-in project

- 1 Select **File > New > Other**.
The **Select a Wizard** dialog appears.
- 2 Select **Plug-In Project** and click **Next**.
- 3 Type a name for the plug-in in the appropriate field, and leave the remainder of the parameters as they appear. Click **Next**.
- 4 Leave the parameters on the next screen as they appear and click **Finish**.

The new plug-in project is created in Eclipse and is ready for plug-in development.

Configuring the Target Platform

The target platform for the plug-in development process needs to be identified in Change Manager. This will indicate to the new plug-in for what product it extends, and will grant the plug-in access to the system.

- 1 Select **Window > Preferences**.
The Preferences dialog appears.
- 2 Choose the **Plug-In Development > Target Platform** node and click **Browse**.
- 3 Navigate to the install directory for Change Manager.
- 4 Click **Apply** and **OK**.

The Preferences dialog closes and the target platform of the plug-in is now indicated.

Defining Plug-In Dependencies

The plug-in requires a dependency for configuration comparison jobs in Change Manager. This dependency can be set by opening the **MANIFEST.MF** file located in the **META-INF** directory of your project.

- 1 Select the **Dependencies** tab and click **Add...**
- 2 Choose **com.embarcadero.change.config.propertysource** and click **OK**.

The dependency is added to the plug-in and appears in the Dependencies list.

- 3 Press **CTRL-S**, or Select **File>Save** from the menu to save your changes.

Once the dependency definition has been saved, you can close the editor and the system will retain your selection.

Implementing a Property Source

Each configuration property source plug-in must contain a class that extends **com.embarcadero.change.config.propertysource.api.ConfigurationPropertySource**.

NOTE: If **ConfigurationPropertySource** cannot be found in Eclipse, it means you have misconfigured the target platform or target dependencies.

- 1 Right-click on the project and select **New>Class**.

The **New Java Class** dialog appears.

- 2 Name the class **JDBCVersionInformation**, set the package to **org.acme.versioninformation**, and set the superclass to **com.embarcadero.change.config.propertysource.api.ConfigurationPropertySource**.

- 3 Click **Finish**.

The new class is generated.

Determining Support

Each class that subclasses **ConfigurationPropertySource** contributes properties to configuration comparison job functionality.

The implementation is indicated via the **isSupported** method, which determines if there are attributes available for a specific data source.

For example, if a user added the Sybase @@Version tag as a configuration property, it would be pointless to run the code for Oracle, SQL Server, or DB2 for LUW data sources.

The method has the following signature:

```
boolean isSupported ( IDatasourceIdentifier dataSourceIdentifier )
```

This method is called by Change Manager, for any registered content plug-in when a data source is used in a Configuration Archive job, a Standard, or a comparison job. When it encounters a data source identifier, it returns true or false and indicates if the property source provides parameters for the data source, or not.

Implement the following code to define this method:

```
public boolean isSupported ( IDatasourceIdentifier dataSourceIdentifier )
{
    return dataSourceIdentifier.getDatabaseVersion().getDBMSType() !=DBMSType.DB2;
}
```

Defining Properties

The **getAvailableProperties** function returns a set of instances of **IConfigurationProperty** instances.

There are several utility methods to help instantiate these instances, named of the form, **createConfigurationProperty**.

Implement the following code to define the **getAvailableProperties** method:

```
public Set(IConfigurationProperty> getAvailableProperties (
    IDatasourceIdentifier identifier )
{
    Set<IConfigurationProperty> results = new HashSet<IConfigurationProperty>();

    for (EVersionProperties prop : EVersionProperties.values() )
    {
        results.add ( createCOnfigurationProperty ( prop.getDisplayName(),
                                                    prop.name(),
                                                    "",
                                                    prop.getType(),
                                                    "" ) );
    }
}

return results;
}
```

Because the `EVersionProperties` code cannot be resolved, you can add a Java enum to define the properties provided by the plug-in. Create a new file named **`EVersionProperties.java`** and implement the following code:

```
package org.acme.versioninformation;

import java.sql.Connection;
import java.sql.SQLException;

import com.embarcadero.change.config.propertysource.api.ConfigurationPropertyType;

/**
 * An enumeration of version properties
 */
public enum EVersionProperties
{
    PRODUCT_NAME ( ConfigurationPropertyType.STRING, "Product Name" )
    {
        /**
         * @returns the JDBC metadata's information for product name
         * @throws SQLException if there eis a JDBC error
         */
        public String getValue ( Connection connection ) throws SQLException
        {
            return connection.getMetaData().getDatabaseProductName();
        }
    },
    PRODUCT_VERSION ( ConfigurationPropertyType.STRING, "Product Version" )
    {
        /**
         * @returns the JDBC metadata's information for product version
         * @throws SQLException if there is a JDBC error
         */
        public String getVAlue ( Connection connection ) throws SQLException
        {
            return connection.getMetaData().getDAtabaseProductVersion();
        }
    },
    MAJOR_VERSION ( ConfigurationPropertyType.NUMERIC, "Major Version" )
    {
        /**
         * @returns the JDBC metadata's information for major version
         * @throws SQLException if there is a JDBC error
         */
        public String getValue ( Connection connection ) throws SQLException
        {
            return " " + connection.getMetaData().getDataMajorVersion();
        }
    }
};

//Attributes
private ConfigurationPropertyType type;
private String name;

/**
 * Constructor to set entry attributes
 * @param type the type
 * @param name
 */
private EVersionProperties ( ConfigurationPropertyType type,
    String name)
{
    this.type = type;
    this.name = name;
}

/**
 * Given a JDBC connection return the parameter's value
 * @param connection the database connection
 * @throws SQLException if there is a JDBC error
 */
abstract String getValue ( Connection connection ) throws SQLException;
```

```

/**
 * @return the display name of the parameter
 */
public String getDisplayName()
{
    return name;
}

/**
 * @return the type of the parameter
 */
public ConfigurationPropertyType getType()
{
    return type;
}

/**
 * Finds a property of a name and returns it
 * @param name the name of the property
 * @return the property
 */
public static EVersionProperties getProperty ( String name )
{
    for ( EVersionProperties p : values() )
    {
        if ( p.name().equals ( name ) )
        {
            return p;
        }
    }

    throw new RuntimeException ( EVersionProperties.class.getName() + " not found for
    \" + name + "\" );
}
}

```

In the above code, the four entries that capture from JDBC the product name, version, minor version, and major version have been added to the enum.

Gathering Results

Change Manager gathers results when it collects all of the properties and values for display purposes or to store in an archive. The extraction method is called when a data source is indicated in a Standard, or when an archive or comparison job is executed.

```

public Set<IConfigurationPropertyResult> extract( Set<IConfigurationProperty>
properties, IDatasourceIdentifier dataSourceIdentifier )

```

A set of `IConfigurationPropertyResult` instances that correspond to the properties must be returned, and values need to be added for the properties returned from the data source, as follows:

```
public Set<IConfigurationPropertyResult> extract ( Set<IConfigurationProperty>
properties, IDatasourceIdentifier dataSourceIdentifier)
{
    try
    {
        Set<IConfigurationPropertyResult> results = new
HashSet<IConfigurationPropertyResult> ();

        Connection connection = getConnection (dataSourceIdentifier );

        for (IConfigurationProperty configProp : properties )
        {
            EVersionProperties prop = EVersionProperties.getProperty (
                configProp.getPropertyIdentifier() );
            String value = prop.getValue ( connection );

            results.add( createConfigurationPropertyResult( configProp, true, value )
);
        }
        return results;
    }
    catch ( SQLException sql )
    {
        throw new RuntimeException ( sql );
    }
}
```

In the above implementation, the code creates an empty set to hold the results and then retrieves the JDBC connection to the data source. For each retrieval, the enum constant `EVersionProperties` on which the `getValue` is called to retrieve each property value from JDBC metadata. Finally, `createConfigurationPropertyResult` is called to create the result instance.

Synchronizing the Job

The synchronization method returns an empty array because users cannot synchronize version information.

```
public List<IPropertyResultsSynchronization> sync (
    IDatasourceIdentifier dataSourceIdentifier,
    List<IConfigurationPropertyResult> sourcePropertyValues,
    List<IConfigurationPropertyResult> targetPropertyValues )
{
    return new ArrayList<IPropertyResultsSynchronization>();
}
```

Registering Extensions

Once you have completed coding the plug-in, you will need to register it with Change Manager. This is achieved by implementing an Eclipse extension. When the plug-in is added to Change Manager, the extensions are registered and Change Manager understands that the plug-in adds a new type of notification to the module.

- 1 Open the **Manifest.MF** file and navigate to the **Extensions** tab.
- 2 Click **Add** to register an extension.

The **New Extension** dialog appears.

- 3 Choose **com.embarcadero.change.config.propertysource.contribution**.
- 4 Click **Finish** and close the dialog.

The extension is added to the **All Extensions** list.

5 Select the (source) entry on the right-hand side of the screen and enter the following details:

- **display-name:** JDBC Metadata Version Information
- **source-identifier:** org.acme.jdbc.versioninformation.source
- **class:** org.acme.jdbcversioninformation.JDBCVersionInformation

NOTE: The class name is used to enable Change Manager to instantiate the new class, while the display-name is the group under which the four JDBC metadata version properties will show.

6 Save the file by pressing **CTRL-S** or choose **File>Save** from the menu.

The class notification is complete, and Change Manager and Eclipse are informed about the property source. When the plug-in is added to Change Manager, it will add your properties to configuration comparison and Standard jobs.

Deploying the Custom Configuration Plug-In

To deploy the plug-in, perform the following steps:

- 1 Shut down Change Manager if it is running.
- 2 Choose **File>Export**.

The **Export** dialog appears.

- 3 Select **Deployable Plug-ins and Fragments** from the **Plug-In Development** group and click **Next**.
- 4 Select **org.acme.jdbcversioninformation** and ensure the target directory is the same as the Change Manager installation folder.
- 5 Click **Finish**.

The new plug-in is deployed.

Start up Change Manager and create a new configuration archive job. When you select an Oracle, Sybase, or SQL Server data source, the **Refinements** and the **Results** tab now contain the four version properties you defined in the new plug-in.

Customizing Change Manager (Preferences)

To customize aspects of Change Manager, select **Window > Preferences**. a dialog appears with a preferences tree that enables you to select the category of application preferences you want to change. Preferences specific to Change Manager appear in the **Change Manager** node.

The following sections outline preferences specific to Change Manager:

[Compliance](#)

[Comparison Options](#)

[Data Result Options](#)

[Script Execution Options](#)

[Script Generation Options](#)

[Jobs](#)

[Command Line](#)

[Mapping](#)

[Notification](#)

[Reports](#)

[Data Sources](#)

[SQL Editor](#)

[Code Assist](#)

[Code Formatter](#)

[Results Viewer](#)

[Syntax Coloring](#)

[SQL Filters](#)

Compliance

This node is located on the **Preferences** panel, under the **Configuration Comparison** sub-node, under **Change Manager**.

The **Compliance** setting provides percentage amount parameters that specify when to **Pass**, **Warn**, or **Fail** a configuration comparison job in the [Compliance](#) view.

Adjust the **Pass**, **Warn**, and **Fail** values as needed. The symbols beside each value will appear beside a job in the view, depending on the percentage amount that results from the comparison job.

Comparison Options

This node is located on the **Preferences** panel, under the **Data Comparison** sub-node, under **Change Manager**.

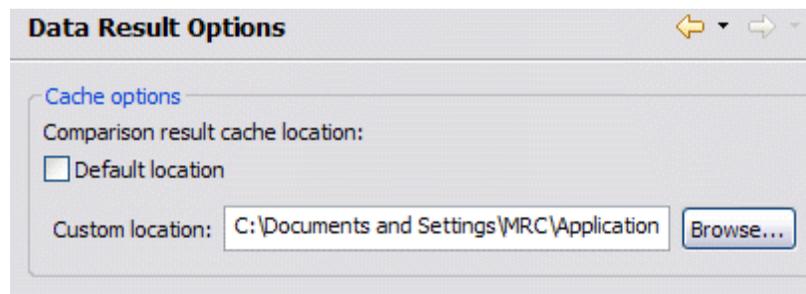

The **Comparison Options** setting enables you to specify when compression comparison is automatically initiated during a data comparison job, based on the total size of the rows in a given table.

Select **Optimize Comparison Based on Row Length** and then adjust the value (in bytes) in the box below. The value determines when compression is automatically enabled on a table during the data comparison process, based total size of all of the rows. If the size of the rows is greater than the this value, then compression is automatically enabled.

Data Result Options

This node is located on the **Preferences** panel, under the **Data Comparison** sub-node, under **Change Manager**.

The **Data Result Options** setting enables you to specify the directory location where the results of data comparison jobs are stored.

By default, results are cached locally in the system **Application** directory.

To change this location, de-select **Default Location** and enter the new directory address in the **Custom Location** field.

NOTE: This is a temporary cache, and during large data comparison jobs may use up much of the system resources.

Script Execution Options

This node is located on the **Preferences** panel, under the **Data Comparison** sub-node, under **Change Manager**.

The **Script Execution Options** setting enables you to indicate that auto commit is always applied when executing synchronization scripts for data comparison jobs.

Script Generation Options

This node is located on the **Preferences** panel, under the **Data Comparison** sub-node, under **Change Manager**.

The **Script Generation Options** setting specifies how Change Manager handles duplicate rows when generating a SQL synchronization script for data comparison jobs.

- Select **Warn About Duplicate Rows** to prompt a user when the data comparison synchronization script generation process encounters them.
- Select **Exclude Duplicate Rows** to indicate that the data comparison synchronization script generation process should ignore any duplicate rows that it encounters.

These options are useful if the match key for a table in a data comparison job does not reflect uniqueness. For example, if a match is performed on **last_name**, and there are several values of **Smith** in a table, the synchronization of data may have unexpected results.

Jobs

This node is located on the **Preferences** panel, under the **Schema Comparison** sub-node, under **Change Manager**.

The **Jobs** setting specifies how schema comparison jobs launch in the development environment.

- Select **Do Not Ask About Running the Created Jobs** if you want to ignore the system prompt when running schema comparison jobs.
- Select **Automatically Launch Jobs Created from Selected Objects** if you want the system to automatically execute a schema comparison job upon creation.

Command Line

This node is located on the **Preferences** panel, under the **Change Manager** node.

The **Command Line** node provides the **Default Script Output** setting, which enables you to define the operating system/file type by which command line scripts are stored as during the batch file creation process. (See [Building Command Line Syntax and Creating Bulk Job Files](#) for details of this process.)

- Select **Windows (*.bat)** (for scripts to be run on Windows), **Linux (*.sh)** (for scripts to be run on Linux), or **Ant (*.xml)** as appropriate.

Mapping

This node is located on the **Preferences** panel, under the **Change Manager** node.

The **Mapping** node is used to specify how the system handles syntax nuances between objects during comparison job mapping processes.

- Select **Ignore Case**, **Ignore Spaces**, and/or **Ignore Underscores**, as needed.

Notification

This node is located on the **Preferences** panel, under the **Change Manager** node.

The **Notification** node is composed of the **Email Notification** subnode and its associated branches. These settings are used to modify and set up how Change Manager handles job notifications for its various modules.

- The **Email Notification** node contains the **Host Settings** and **User Information** fields that the system will use to send email notifications.
- The **Advanced Settings** node contains JavaMail key-value pair definitions that the system uses to send email notifications. Refer to <https://java.sun.com/products/javamail/downloads/index.html> for more information. An FAQ is also available here: <https://java.sun.com/products/javamail/FAQ.html>, and SMTP properties are listed here: <http://java.sun.com/products/javamail/javadocs/com/sun/mail/smtp/package-summary.html>.
- The **Contacts** node enables you to create a list of address contacts to whom email notifications will be sent.
- The **Templates** node enables you to define and save email notification templates, which control the format in which notification emails are sent.

NOTE: Pressing **Ctrl-Space** on the **Notification** screen opens a list of tags that Change Manager replaces with job-specific content.

Reports

This node is located on the **Preferences** panel, under the **Change Manager** node.

The **Reports** node provides settings and parameters that enable you to customize the look, feel, and format of reports issued when you generate a job report for comparison jobs.

- The **Report Style** tab enables you to change the logo and accent color of a report.
- The **Paper Setup** tab enables you to modify printer settings for paper reports.

Data Sources

This node is located on the **Preferences** panel, under the **Change Manager** node.

The **Data Sources** node contains a directory location field that specifies where registered data source definitions are stored.

SQL Editor

This node is located on the **Preferences** panel, under the **SQL Development** node.

- 1 Select **Window > Preferences > SQL Development > SQL Editor**.
- 2 Change the settings as appropriate in each section and then click **Apply**.
 - **Enable SQL Parser** indicates that the parser that provides code development features in SQL Editor is enabled. If this option is disabled, functions such as code formatting, auto completion, semantic validation, hyperlinks, etc. will not be available. The options below the check box enable you to limit (by file size) when the parser is enabled when dealing with code on a file-by-file basis.
 - **Parsing Delay** specifies the amount of time that the parser delays prior to activating features after a keystroke.
 - **Severity Level for Semantic Validation Problems** determines how semantic code errors are flagged in the editor and the **Problems** view.

Clearing **Enable SQL Parser** will disable many of the “smart” SQL editor features, including code formatting, auto completion, semantic validation, and hyperlinks. For better performance, you may disable the parser for files above a specified size.

Code Assist

The **Code Assist** panel is used to specify configuration parameters that determine how code completion features in SQL Editor behave.

Select **Window > Preferences > SQL Development > Code Assist**.

- **Enable Auto Activation** enables or disables code assist functionality.
- **Insert Single Proposals Automatically** specifies if only a single code completion suggestion is returned, it is inserted automatically.
- **Fully Qualified Completions Automatically** specifies if code completion results are returned specific (fully qualified), rather than the minimum required to identify the object.

Code Assist Color Options specifies the color formatting of code completion proposals. Select background or foreground options from the menu and modify them as appropriate.

Code Formatter

The **Code Formatter** pane provides configuration options for code formatting functionality in SQL Editor.

Select **Window > Preferences > SQL Development > Code Formatter**.

The panel provides a drop down list of formatting profiles and a preview window that displays how each profile formats code.

Results Viewer

The **Results Viewer** pane provides configuration options that specify how the **Results** view displays results.

Select **Window > Preferences > SQL Development > Results Viewer**.

- **Grid Refresh Interval** indicates the speed in milliseconds that the Results view refreshes.
- **Stripe the Rows of the Results Table** adds intermittent highlighted bars in the Results view.

Display Results in Separate Tab in SQL Editor opens the Results view in a separate window on the Workbench.

Syntax Coloring

The **Syntax Coloring** panel provides configuration options that change the look and feel of code syntax in SQL Editor.

Select **Window > Preferences > SQL Development > Syntax Coloring**.

Use the tree view provided in the **Element** window to select the comment type or code element you want to modify. Select the options to the right-hand side of the window to modify it. The **Preview** window shows a piece of sample code that updates according to the changes you made.

SQL Filters

See [Filtering Data Source Objects](#) for instructions.

Using Source Control Systems

Change Manager can be integrated with source control systems such as Concurrent Versions System (CVS) and Visual Source Safe (VSS).

Source control systems provide a repository for project files and are aimed specifically at team programming environments where developers can work on the same code simultaneously and merge it as needed. Most source control systems provide versioning as well, which provides backup instances of code when development regression is required.

Typically, a source control system repository and its associated files are updated by individual members of a development team as they add and modify files in the project. Work is shared in this manner as the project evolves, and the latest work is always available in a given project as individuals can update files from the specified Change Manager directory to the branch repository and vice-versa.

The [Navigator](#) provides an interface for accessing these files in the Change Manager development environment. Job files and archive versions are stored as XML files and synchronization scripts are stored as text, in a specified directory for the purpose of sharing them in some manner of third-party source control system.

For more information regarding the implementation of source control systems, as well as the client and tool application software and how it integrates with Change Manager (built on the Eclipse platform framework for source sharing and version control systems), consult the third-party documentation provided with these plug-ins and/or applications.

All source code control actions must be manually performed.

NOTE: Change Manager is built on the Eclipse 3.3 framework. Consequently, any source code control plug-in designed to work with Eclipse 3.3 can also be implemented in Change Manager.

Setting Up Concurrent Versions System

Concurrent Versions System (CVS) can be downloaded from the following Web site: <http://ximbiot.com/cvs/cvshome>. By default, Change Manager framework supports a plug-in for CVS.

Once you have installed CVS on your machine and have created a repository system (consult the CVS documentation for details regarding these tasks), you need to enable it in Change Manager.

To set up CVS in Change Manager:

- 1 Choose **Help > Software Updates > Find and Install** and choose **Search for New Features to Install**. Click **Next**.
- 2 Select **Eclipse 3.3 Update Site** or add it by selecting **New Remote Site...** and entering the following URL: http://update.eclipse.org/updates/3.3*
- 3 Choose **Automatically Select Mirrors** and click **Finish**. A tree appears.
- 4 Choose the CVS plug-ins from the tree and install them. You may need to include dependencies as well.
- 5 Click **Finish** and restart Change Manager.
- 6 Right-click in the **CVS Repositories** view and choose **New > Repository Location...**
- 7 Enter the server and directory in the fields provided. The connection type should be **pserver**.
- 8 Enter your Windows credentials and specify the default port.
- 9 Click **Apply** and then save the connection. It appears in the Repository view.

Using Concurrent Versions System

To connect a project to the repository

- 1 Highlight the **Navigator** view and right-click on the project you want to associate with CVS.
- 2 Select **Team > Share Project...** The **Share Project** dialog appears.
- 3 Select **CVS** and click **Next**.
- 4 Choose the existing repository and click **Next**.
- 5 Specify the default for **Enter Module Name** and click **Next**.
- 6 Complete the wizard as needed to check the files into the CVS repository. The project is added to CVS.

NOTE: If prompted, change any current job files and synchronization scripts from Binary to ASCII format.

To check in files

- Jobs and scripts that are not up to date in the CVS repository appear in the **Navigator** with a > prefix beside the file name. You can update files in the source control by right clicking on the file name and choosing **Team > Commit**. The > prefix will disappear. When you make new changes to the specified file, the prefix will appear again, indicating that it differs from the file stored in CVS.

To view version history

- To view the version history of a file, right-click on it in the **Navigator** and choose **Team > Show History**.

Setting Up Microsoft Visual Source Safe

In order to use VSS with Change Manager, you will need to download and install a plug-in that makes the two products compatible. You can download a VSS plug-in via the following link: <http://sourceforge.net/projects/vssplugin>.

Additionally, you will need to install Java Development Tools (JDT), which can be accessed via the **Find and Install** command in the Change Manager Main Menu.

To install JDT

- 1 Choose **Help > Software Updates > Find and Install....** The **Find and Install** dialog appears.
- 2 Select **Search for New Features to Install** and click **Next**.
- 3 Choose **Eclipse 3.3 Update Site** or add it by clicking **New Remote Site** and entering the following URL:
http://update.eclipse.org/updates/3.3*
- 4 Choose **Automatically Select Mirrors** and click **Finish**. Change Manager searches for the JDT and adds it to the system.
- 5 Choose **JDT (Java Development Tools)** and install it, then restart Change Manager.

To install the VSS plug-in

- Once you have downloaded the plug-in, close Change Manager and extract the plug-in zip file to Change Manager's **plugins** directory. When you restart Change Manager it will automatically be added to the application.

Using Microsoft Visual Source Safe

To connect a project to the repository

- 1 In the **Navigator**, right-click on the project you want to connect and choose **Team > Share Project...**
- 2 Select **VSS Configuration Wizard** and click **Next**.
- 1 Enter the VSS connection information as applicable and click **Finish**. The project is associated with VSS.

To check in files

- 1 In the **Navigator**, right-click on the file you want to add to VSS and select **Team > Commit Changes**. The **Commit Changes** dialog appears.
- 2 Click **OK**. The file is added to VSS.

To check out files

- In the **Navigator**, right-click on the file you want to check out of VSS and select **Team > Check Out**. The job is checked out of VSS and can be modified. Conversely, you can check in files via the **Team > Check In** command.

Viewing file differences against the repository version

- In the **Navigator**, right-click on the file you want to compare and choose **Compare With > Latest from VSS Repository...** The differences will be displayed, based on the description you specified the last time you checked out the file.

Reference

This section contains reference material you may find helpful when working in Change Manager. It is composed of the following topics:

- [Change Manager Operations/DBMS Permissions Table](#)
- [Understanding Version Information](#)

Change Manager Operations/DBMS Permissions Table

When Change Manager performs operations based on data source comparisons, there are minimal permissions required in some cases, dependent on data source platform and the action itself.

The following matrix describes common actions that the application might perform and lists the minimum requirements per DBMS, as necessary, for Change Manager to complete the given operation:

Operation Type	Oracle	DB2	Sybase	SQL Server
Schema Archive and Compare				
User's own and granted objects	No special permissions required	No special permissions required *	No special permissions required	No special permissions required **
Any User Object	SELECT_CATALOG_ROLE role	No special permissions required *	No special permissions required	No special permissions required **
Systems Objects	"DBA" role	No special permissions required*	No special permissions required	No special permissions required**
Settings	"DBA" role	No special permissions required	No special permissions required	No special permissions required
Alter Schema				
User's Own & Granted Objects			No special permissions required	No special permissions required
Any user object (regardless of owner)			dbo or alias to dbo	dbo
System objects	"DBA" role		sa_role and sp_configure "allow updates"	sysadmin and sp_configure "allow updates" and not allowed in 2005
Settings	"DBA" role		sa_role	sysadmin
Compare data	Select privilege on table or view	Select privilege on table or view or ownership *	Select privilege on table or view or ownership *	Select privilege on table or view or ownership **

Operation Type	Oracle	DB2	Sybase	SQL Server
Synchronize data	Insert/Update/Delete privilege on table or view	Insert/Update/Delete privilege on table or view	Insert/Update/Delete privilege on table or view or object ownership	Insert/Update/Delete privilege on table or view or object ownership
Compression compare				
Enabling compression compare	Create or Drop function, Create table, Java enabled on database	Create or Drop function, Create table, Java enabled on database	n/a ***	Create or Drop function, Create table, CLR enabled in database
Executing compression compare	As compare plus Execute function and needs to run as the same user who first executed the compression compare		n/a ***	

* On Sybase, stored procedures cannot be hidden, and syscomment.text read must be allowed in order to compare or archive stored procedures.

** On Microsoft SQL Server, encrypted stored procedures cannot be viewed.

*** The compression comparison function is unavailable for Sybase at this time.

Understanding Version Information

The following section contains tables that outline the version information provided by Change Manager during the comparison, archive, or standard creation process.

- DB2
- Oracle
- SQL Server
- Sybase

The following version information is provided for DB2 data sources.

Parameter	Description
INST_NAME	Name of the current instance.
IS_INST_PARTITIONABLE	Indicates if the current instance is a partitionable database server instance. Possible return values are 0 if it is not a partitionable database server instance, and 1 if it is a partitionable database server instance.
NUM_DBPARTITIONS	The number of database partitions. If it is not a partitioned database environment, this value is 1.

Parameter	Description
INST_PTR_SIZE	The bit size of the current instance (32 or 64).
RELEASE_NUM	The internal release number, as returned by the db2level command. For example, 03030106.
SERVICE_LEVEL	The service level, as returned by the db2level command. For example, DB2 v8.1.1.80.
BLD_LEVEL	The build level, as returned by the db2level command. For example, n041021.
PTF	The program temporary fix (PTF) identifier, as returned by the db2level command. For example U498350.
FIXPACK_NUM	The FixPak number, as returned by the db2level command. For example, 9.

On Oracle platforms, Change Manager provides a list of all products installed on the Oracle instance and their versions.

On SQL Server, the following parameters of note are included:

- Product Version (e.g. 9.00.3042.00)
- Platform (e.g. NT INTEL X86)
- Language
- Physical Memory
- Processor Count
- Processor Type
- Windows Version

NOTE: For entries that contain internal values, the numeric attribute is also available for standard comparisons. For example, the Product Version attribute has a character and an internal value of “8.00.2039” and 524288, respectively. Change Manager supplies the Product Version as “8.00.2039”, and the Product Version Internal Value as 524288.

On Sybase platforms, two groups of configuration parameters are supplied:

- The **Server Information** group displays the results of executing **sp_server_info**, where the attribute name is the configuration parameter and the value is its value.

- The **Version Information** group, which contains the following parameters:
 - Build Number
 - Build Type
 - Compilation Date & Time
 - Compilation Kernel
 - Compilation OS Bit Size
 - Compilation OS Platform
 - EBF Version
 - Post Build Type
 - Product
 - Product Code
 - Version

Appendix A: Change Manager Cheat Sheets

This section provides a complete list of the Change Manager cheat sheets. Cheat sheets are available from the Workbench, and provide a series of step-by-step, task-based instructions on how to perform key tasks within the application.

In Change Manager, you can access cheat sheets by selecting **Help > Cheat Sheets**, and then selecting the cheat sheet you want to view.

This section of the help guide reproduces the cheat sheets provided in the application to enable hard copy printing and provide a higher level of user comprehension while working with Change Manager features and functionality.

The following cheat sheets are reproduced in this section:

Configuration Comparison Cheat Sheets

[Cheat Sheet 1A: Creating a New Configuration Comparison Job](#)

[Cheat Sheet 1B: Creating a New Configuration Archive](#)

[Cheat Sheet 1C: Creating a New Configuration Standard](#)

Data Comparison Cheat Sheets

[Cheat Sheet 2A: Creating a New Data Comparison Job](#)

Schema Comparison Cheat Sheets

[Cheat Sheet 3A: Creating a New Schema Comparison Job](#)

[Cheat Sheet 3B: Creating a New Schema Archive](#)

Cheat Sheet 1A: Creating a New Configuration Comparison Job

Configuration comparison jobs enable you to compare the configuration settings between two registered data sources. They are used to ensure consistency between the configuration settings of one or more data sources, Standards, or Archives, in order to maintain database availability, security, and performance and to troubleshoot problems in these areas.

Use the table below to review the task and its individual steps prior to creating a new configuration comparison job:

1. Create a New Job
2. Specify a Job Name
3. Specify Source and Target Data Sources
4. Specify Job Options
5. Refine Property Comparisons
6. Execute Comparison Job
7. View Results
8. Execute an SQL Synchronization Script
9. Generate a Job Report

1. Create a New Job

Configuration comparison jobs are defined in the **Configuration Comparison Editor**.

To begin a new comparison:

- Select **File>New>Configuration Comparison Job**. The Configuration Comparison Job Editor opens.

You can now proceed to define the parameters of the new job.

2. Specify a Job Name

A job name is used to distinguish between configuration comparison jobs composed of specific sources and refinements. A name is defined when a new job is started and is used to save jobs for later use or repeated comparison of the sources.

To name a job:

- Type the name of the job in the **Name** field of the **Configuration Comparison Job Editor**.

3. Specify Source and Target Data Sources

The **Job Sources** section of the Configuration Comparison Job Editor contains two boxes labeled **Comparison Source** and **Comparison Target**. These boxes identify the data sources to be used in the job.

To add a data source to the job:

- Click and drag a data source from **Data Source Explorer** to the Comparison Source or Comparison Target box, or click **Select Data Source** in the appropriate box and choose a data source from the dialog.

When a data source is added to a job, it is displayed by **Name**, **Type**, and **Host**. You can change a data source by clicking **Change Data Source** in the appropriate box and selecting a new data source from the dialog, or by dragging a different data source to the box from Data Source Explorer.

The **Comparison Source** and **Comparison Target** boxes must contain data sources, archives, and standards before the job can be executed.

To add multiple comparison targets, click **Add More Targets** to enable a **One-to-Many** comparison.

Additionally, you can specify whether you want to compare the current properties of the live data source, or an archived set of properties previously stored by Change Manager using the radio buttons beneath each box:

- Select **Use Live Sources** to compare the current properties of the data source when the job is executed.
- Select **Use an Archive** and select the archive and version to use in the job.

Note: You can drag and drop data sources, archive jobs, archive versions, and standards into the Comparison Source and Comparison Target boxes. A Standard can only be the Source in a Configuration Comparison Job.

4. Specify Job Options

Prior to the execution of a job, parameters can be set to control aspects of the execution process itself. These options are set on the **Options** tab.

Presently, the **Options** tab contains only the **Extract DDL** option. When selected, this function automatically outputs the synchronization code produced by the job comparison into a separate editor window once the process has executed.

To specify job options:

- Navigate to the **Options** tab and select or de-select the **Extract DDL** check box to turn this function on or off, respectively.

5. Refine Property Comparisons

Configuration property refinement involves choosing specific configuration properties to compare, and specific configuration properties to omit, prior to executing a comparison job.

By default, when you specify a data source as a comparison job Source or Target, you can refine the properties to be compared prior to executing the job on the Refinements tab of the Configuration Comparison Job Editor.

Configuration properties are organized by tree and listed by Property Name, Description, Location, and Source.

To specify the properties used in the comparison job:

- Navigate to the Refinements tab and select or de-select the configuration properties in the table, as required. Selected properties are included in the comparison job, and de-selected properties are ignored during job execution.

6. Execute Comparison Job

The configuration comparison job runs when you click the **Run Job** icon on any tab in the Configuration Comparison Job Editor. It's located in the upper right-hand corner of your screen.

When the process executes, the Comparison Results tab appears and displays the progress of the job and a summary of the comparison job results.

7. View Results

When a job is complete, results are displayed on the **Comparison Results** tab.

Job results are displayed by property with an overview of the matching and non-matching properties located at the top of the page display. Individual details regarding the data source properties are listed in the Comparison Results table:

- The Result column for each Target contains a check mark or X icon, depending on if the corresponding property value matches between the Source and Target data sources.

- The Source Value column contains the value of the property on the Source.
- The Op column provides the operator used in the job comparison that defines what constitutes a match.

8. Execute an SQL Synchronization Script

Change Manager will build a SQL synchronization script to correct any discrepancies it discovers between the source and the target during the job execution process.

You execute a synchronization script via the **Run** menu or via the commands located along the top of the editor window where the script opened.

To execute the code:

Click the **Execute** icon. Change Manager executes the code on the specified data source. Results of the execution are displayed in the same tab or in a new tab.

9. Generate a Job Report

Once you have executed a job, you can generate a job report via the **View Report** command, located on the **Results** tab.

The report opens in a separate window where additional report options are available, such as sending the report to the printer, saving it to disk, or exporting the report in a specified file format to a directory or network location.

To generate a job report:

- Click the **View Report** command on the **Results** tab. The report opens in a new window and enables you to customize and perform other operations on it.

Cheat Sheet 1B: Creating a New Configuration Archive

A configuration archive is an object in a configuration comparison job that represents a snapshot of the configuration parameters of a data source. Archives are used in configuration comparison jobs against data sources, standards, and other archives, for the purposes of monitoring property value slippage, preserving backup settings, or otherwise enabling the use of older data source settings in configuration comparison jobs.

Use the table below to review the task and its individual steps prior to creating a new configuration archive:

1. Create a New Configuration Archive Job
2. Specify a Configuration Archive Name
3. Specify an Archive Source
4. Refine Properties
5. Specify Notifications
6. Save Configuration Archive and Manage Versioning
7. Generate a Job Report
8. Use Configuration Archive in Configuration Comparison Jobs

1. Create a New Configuration Archive Job

Archives are defined in Configuration Archive Job Editor.

To create a configuration archive:

- Right-click on the data source and select **Archive > Configuration** from the menu, or select **File > New > Configuration Archive Job**. The Configuration Archive Job Editor opens.

When the archive is first created, it is in an unsaved state and versionless. To create a version and “save” the archive, you need to issue the **Run Job** command. Unsaved archives cannot be used in comparison jobs.

2. Specify a Configuration Archive Name

A name must be defined when a new archive is created to distinguish between archives and other objects in the application environment. Ensure you specify a meaningful name that identifies the archive in other views and dialogs later on.

To name a configuration archive:

- Enter the name of the archive in the **Name** field of Configuration Archive Job Editor.

3. Specify an Archive Source

The **Configuration Archive Source** table specifies the data source from which the archive is derived. Drag and drop the data source to be archived from **Data Source Explorer** to the **Configuration Archive Source** box, where it is listed by name, DBMS type, and host.

4. Refine Properties

When a new configuration archive is created, all data source properties are included in the archive definition by default. However, you may only need to archive a specific group of properties. For example, you may want to define an archive that retains only the security properties of the associated data source.

To refine archive properties:

Use the check boxes to select or de-select properties as needed. Selected properties are included in the archive when configuration comparison jobs run, while de-selected properties are ignored.

5. Specify Notifications

Notification options provide parameters for enabling and setting up various notifications regarding executed configuration archive comparison jobs.

You can specify email, file system, or system tray notifications on the **Notification** tab of the Configuration Archive Editor:

- Email notification options provide parameters for configuring and enabling email notification and report mailing on executed comparison jobs.
- File system notification options provide parameters for configuring and enabling logging options for executed comparison jobs.
- System tray notification parameters enable pop-up window notifications on your Desktop when Change Manager is minimized, but running jobs.

To set notifications:

- Navigate to the **Notifications** tab and modify the settings, as appropriate. Email, file system, and system tray notification options are labeled and contained in separate sections on the interface.

6. Save Configuration Archive and Manage Versioning

Once you have completed property refinement, you need to save the archive by creating a version. A version is a specific set of configuration property values associated with an archive and used to store older snapshots of the same archive for backup or tracking comparison purposes.

Versions are created by clicking the **Run Job** icon located in the lower right-hand corner of each tab on the Editor. When you define a new archive, no versions exist. This indicates the archive is not yet saved to the system, and cannot be used in comparison jobs.

To create a version and save the archive:

- Click **Run Job**. A new tab appears named **Unsaved Version** that displays the current values of the specified database.

Additionally versions are created in the same archive each time you click **Run Job**. The new version will contain the latest values for the properties, as specified on the Refinements tab.

Versions are listed on the Overview tab, (displayed in ascending order), and can be accessed by double-clicking the appropriate version in the table. The selected version opens in a new tab of the Editor. Additionally, versions are listed in the Data Source Explorer as the child nodes of the archive to which they represent.

7. Generate a Job Report

Once you have executed a job, you can generate a job report via the **View Report** command, located on the **Results** tab.

The report opens in a separate window where additional report options are available, such as sending the report to the printer, saving it to disk, or exporting the report in a specified file format to a directory or network location.

To generate a job report:

- Click the **View Report** command on the **Results** tab. The report opens in a new window and enables you to customize and perform other operations on it.

8. Use Configuration Archive in Configuration Comparison Jobs

Archives are used in configuration comparison jobs in the same manner as registered Data Sources or Standards.

To use an archive in a configuration comparison job:

- Click and drag the appropriate version from Data Source Explorer to the Source or Target box in Configuration Comparison Editor.

Cheat Sheet 1C: Creating a New Configuration Standard

A Configuration Standard is an object associated with configuration comparison feature. It provides customized data source configuration properties that are used in configuration comparison jobs, against data sources and archives to provide a specific set of values and threshold operators that “check” enterprise settings and ensure all network configuration values fall within acceptable ranges.

Use the table below to review the task and its individual steps prior to creating a new configuration standard:

1. Create a New Configuration Standard
2. Specify a Configuration Standard Name
3. Add Property Sources
4. Refine Properties
5. Save Configuration Standard
6. Use Configuration Standard in Configuration Comparison Jobs

1. Create a New Configuration Standard

Standards are defined in the Configuration Standards Editor.

To create a new configuration standard:

- Select **File > New > Configuration Standard**. The Standard Editor opens.

If you want to add the configuration properties of an existing data source or archive to the new standard, click and drag the appropriate object from Data Source Explorer or Standards Explorer to the **Standard Sources** table in the editor. The properties of the selected data source/archive populate the new standard.

2. Specify a Configuration Standard Name

A name must be defined when a new standard is created to distinguish between standards and other objects in the Change Manager environment. Ensure you specify a meaningful name that identifies the standard in other views and dialogs later on.

To name a configuration standard:

- Enter the name of the standard in the **Name** field of the Configuration Standards Editor.

3. Add Property Sources

The Standard Sources table specifies the amalgamation of data sources, archives, and other standards from which new standard properties are derived.

By default, Change manager automatically adds all properties of a selected source to the standard definition. You need to manually refine property selections on the Refinements tab once sources have been added. See the **Refine Properties** step below for more information.

To add properties to a standard:

- Drag and drop a data source, archive, or standard, from Data Source Explorer or Standards Explorer, respectively, to the Standard Sources table. Alternatively, use the Select Standard, Select Data Source, and Select Archive Version commands to add properties to the Standards definition.

4. Refine Properties

The **Standard Refinement** tab displays all sources and corresponding properties applied to the Standard. Properties are listed by Property Name, Source, Type of Property, Operator, and Type, and are organized in a tree as the children of the original source.

The Standard Refinement tab is used to customize property selections. You can choose to include or exclude properties via the check boxes located beside each property. Additionally, Operator values can be customized to set threshold or otherwise specify what constitutes a “pass” or a “fail” when a comparison job runs using the standard.

The following operators can be applied to properties:

- Less Than
- Greater Than
- Greater Than or Equal To
- Equals
- Less Than or Equal To
- Not Equal

The **Value** column indicates the value or the **Operator** definition must match.

The Type column indicates if individual properties are Linked or Static:

Linked property values refresh with the latest source values whenever the standard is used in a job. Static property values remain affixed at the value the property contained at the time it was added to the standard definition.

To refine standard properties:

- 1 Define each property as Linked or Static by clicking the appropriate row value in the Type column and choosing a selection from the drop down menu.
- 2 Define the operator used to determine the conditions of the matching result when the job runs. Click the appropriate row value in the Operator column and choose a selection from the drop down menu. Ensure you include a condition value in the corresponding Value column.

5. Save Configuration Standard

When a standard is saved, it appears in Standards Explorer as the name you defined in the **Name** field of the Editor.

To save a standard:

- Select **File > Save** or **File > Save All**. The standard appears in Project Explorer.

6. Use Configuration Standard in Configuration Comparison Jobs

Standards are used in configuration comparison jobs in the same manner as data sources and archives, with the noted exception that they may only be designated as Sources due to the unique property operator values they contain.

Cheat Sheet 2A: Creating a New Data Comparison Job

Data comparison jobs are used to compare the repositories of two data sources. Job features enable you to specify execution options and mapping refinement parameters and synchronize any discrepancies discovered by the job, once it has been executed.

Use the table below to review the task and its individual steps prior to creating a new data comparison job:

1. Create a New Job
2. Specify a Job Name
3. Specify Source and Target Data Sources
4. Specify Job Options
5. View Data Source Mapping Details
6. Customize Database Mapping
7. Customize Table Mapping
8. Specify Notification Options
9. Execute Job
10. View Results
11. Customize Data Resolution
12. Resolve Data Repositories via an SQL Script
13. Generate a Job Report

1. Create a New Job

Data comparison jobs are performed in the **Data Comparison Job Editor**. You create a new comparison job by opening the editor and defining job parameters, as needed.

To create a new comparison job:

- Select **File > New > Data Comparison Job**. The Data Comparison Job Editor opens.

Note: If any jobs already exist, they can be opened by selecting **File > Open Comparison**, and choosing the name from the list of available jobs.

2. Specify a Job Name

A job name identifies the job in the application and should be specified with this in mind.

Specify a meaningful name that clearly identifies the job in the views and dialogs of the working environment.

To name a job:

- Enter the name of the job in the **Name** field of the **Data Comparison Job Editor**.

3. Specify Source and Target Data Sources

The **Source** and **Target** boxes identify what data sources will be compared when the job executes. Both boxes must contain data sources before the job can be executed. When a data source is added to a job, it is displayed by **Name**, **Type**, and **Host**.

To add a data source:

- Click and drag a data source from **Data Source Explorer** to the Source or Target box. If no data sources have been registered in Change Manager, click **Select Data Source** in the appropriate box and then click **New Data Source** to add the data source. Data sources added in this way are automatically registered and added to Data Source Explorer.

Note: You can change a data source selection by clicking **Change Data Source** in the appropriate box, or by dragging a different data source to the box from Data Source Explorer.

4. Specify Job Options

Prior to the execution of a job, parameters can be set to control aspects of the execution process itself. These options are set on the **Options** tab.

The following option groups are available:

- Execution options control aspects of the job process execution.
- Mapping options control how the data sources in the job are mapped by the process.
- Comparison options specify the parameters of how the job treats the comparison in terms of naming conventions.
- Resolution options determine how the job resolves any discrepancies discovered during the comparison process.

Additionally, the Execution Options section contains the Compression Comparison setting.

The comparison of large repositories with many databases, tables, and rows can be a time consuming and tedious process, especially when you are required to check at the row level to ensure complete accuracy between a data source and its backup, or during migration procedures from testing to production that require optimum levels of accuracy.

The Compression Comparison option enables an algorithm during the execution process of a job. The algorithm provides Change Manager with the ability to compare at the table level instead of the row level, initially.

Each table in a pair is assigned a value and if the values match, the comparison process moves to the next pair of tables. If the values do not match, the process performs a more detailed comparison at the row level. This feature allows for a faster comparison process in general, without losing any accuracy during the process.

The Compression Comparison option is enabled on the Options tab of the Data Comparison Job Editor. It is available on SQL Server 2005, DB2, and Oracle platforms, and requires that CLR is enabled to function correctly.

To set job options:

- Navigate to the **Options** tab and modify the options, as needed. Options are grouped into execution, mapping, comparison, and resolution sections.

To enable Fast Compare:

- Before executing a job in the Data Comparison Job Editor, navigate to the Options tab and select Compression Comparison in the Execution Options section. Fast Compare is enabled and when the job is executed, the system performs the comparison, as appropriate.

5. View Data Source Mapping Details

Mapping is the process of pairing data source elements between the source and target of a job. These elements (databases, tables, and rows) are compared when the job executes to determine matches and mismatches between the two sources. Mapping details are viewed on the Mapping tab of the editor.

Change Manager automatically maps data source elements based on its interpretation of both schemas. Elements that do not match are excluded from the job when it executes, unless manually paired prior to running the job.

The Database Mapping table displays the paired databases or owners on the Source and Target. The % Mapped column indicates how much of the database or owner (a percentage value of total tables and rows) is mapped. Unpaired databases appear in this table as well, but are excluded from the execution process unless manually mapped to a corresponding database.

In order to view the table and view mappings of database pairs, you need to initiate the inspection process by clicking Inspect Checked Pairs. Once Change Manager has analyzed the selected pairs, to view the table mappings of a specified pair, click a row. The Table Mapping table populates with the paired tables and views of the selected pair. You can view the row mappings of a table or view pair by clicking Edit in the rightmost column of the appropriate row. The row pairings and corresponding values appear in the new window.

Individual owner and database pairs can be examined by selecting the appropriate icon in the **Inspect Now** column.

6. Customize Database Mapping

You can customize job database mapping parameters manually by choosing to exclude certain paired rows, or redefining objects after the automatic mapping process is completed.

The check boxes beside each paired object displayed in the Database Mapping Source column indicate if a pair is included or excluded when the job runs.

To include or exclude a database pair from the job:

- Select or de-select the check box beside each database pair, as needed. Use the **All** and **None** commands at the bottom of the table to select all or none of the rows in the table, respectively.

Database pairings can also be redefined via the drop down menu that appears when the corresponding item in the **Target** data source column is selected. The menu contains a list of all databases or owners that reside on the **Target** data source.

Databases or owners that are already paired appear in the drop down menu with an asterisk to denote them. Additionally, using the same method, unpaired databases can be assigned a matching database on the Source.

On Microsoft SQL Server and Sybase, you can pair up owners independently of databases by right-clicking on a row and selecting Show Database Parts, Show Source Database Parts, or Show Target Database Parts to decompose the database into its owner components. These components can be individually mapped and explored.

To recompose the database, right-click on and select Hide Database Parts. To restore the Database Mapping table to its original settings, click **Restore Default Mappings**. All settings revert to the original object mappings as determined by Change Manager based on the selected Mapping Options.

7. Customize Table Mapping

You can manually map databases, tables, and rows between the Source and Target data sources. Tables are displayed by name and contain mapping refinement column values (Columns, Comparison Key, and Filter).

You can manually map unpaired tables between the database by clicking the corresponding item in the Target data source column and define it via the drop down menu that appears, as with database mapping.

Additionally, if you click Edit in the appropriate pairing, the Columns, Comparison Key, and Filter dialog enables you to further detail mapping refinements in terms of defining table roles in the execution of the job.

- The Columns and Comparison Key tab enables the mapping of columns to compare between the paired tables. Select or de-select the columns, as needed, in the dialog provided and use the drop down menu to change the comparison key if multiple keys are available.
- The Comparison Filter enables you to manually insert a WHERE clause for execution when the job runs. Click the ellipsis button and enter the WHERE clause into the text box provided. If you want to create a different WHERE clause per table in the pair, select the Separate WHERE Clause radio button. The dialog adds an additional text box for a second WHERE clause.

Note: When entering selective WHERE clauses, do not include the WHERE keyword. (E.g. use “AGE>12” not “WHERE AGE>12”).

8. Specify Notification Options

Notification options provide parameters for enabling and setting up various notifications regarding executed jobs.

You can specify email, file system, or system tray notifications on the **Notification** tab of the Configuration Archive Editor:

- Email notification options provide parameters for configuring and enabling email notification and report mailing on executed comparison jobs.
- File system notification options provide parameters for configuring and enabling logging options for executed comparison jobs.
- System tray notification parameters enable pop-up window notifications on your Desktop when Change Manager is minimized, but running jobs.

To set notifications:

Navigate to the **Notifications** tab and modify the settings, as appropriate. Email, file system, and system tray notification options are labeled and contained in separate sections on the interface.

9. Execute Job

The job runs when you click the Run icon located in the lower right-hand corner of the Options or Mapping tab in the Data Comparison Editor.

When the process executes, the Results tab appears and displays the progress of the job via the Overall Progress bar at the top of the tab.

In the Comparison Results table, the database pairs are displayed along with Progress, Compare Index, Results, and Resolution columns.

- The Progress column indicates, per database pair, the progress of the job. When the job is finished comparing the database row, a result of Done (should the comparison be successful), Failed (should the comparison be unsuccessful), or Nothing to Compare (if pairs were not specified) will display in the column.
- The Compare Index column indicates the percentage value of data per database pair that Change Manager matched. Failed rows and rows in which the progress is not completed do not display results.

10. View Results

When a job is complete, you can view its details by clicking the View command in the Results column if the pair succeeded, or the Show Errors command if the pair failed. The Show Errors command opens a SQL error dialog that displays the error encountered by Change Manager during the job and the time that it occurred.

If a data comparison job is successful, the View command displays database or owner pair results in the Database Results tab:

- The first two columns of the Database Results are labeled with the names of the data sources that were compared. Rows are populated with the names of the tables residing on each database.
- The Matched column indicates how many row values between the specified pair of tables matched in the comparison job.
- The Only in [Source Name] column indicates the number of extra rows that were found in the specified source table.
- The Only in [Target Name] column indicates the number of extra rows that were found in the specified target table.
- The Different column indicates the number of rows different between the two tables.

When a table row is selected, the Selected Table panel populates with the rows and columns of both tables. All values that are out-of-sync between the two tables are highlighted in red. Rows that matched are not displayed.

Double-click on a mismatched row pair to open the Data Diff View. The view contains row synchronization commands and the specific data values of the selected pair.

11. Customize Data Resolution

You can specify how data is resolved in the Data Diff View by selecting one of the appropriate icons beside the Synchronization prompt. By row, you can choose to **Make Target Match Source for Selected Row**, **Make Source Match Target for Selected Row**, or **Do Not Resolve Selected Row**, respectively.

12. Resolve Data Repositories via an SQL Script

Once a data comparison job has completed, synchronization commands are used to even data in the repositories so they match.

To resolve data repositories:

- 1 On the **Results** tab, click **View** in the row you want to resolve. The **Database Results** tab appears.
- 2 The table in the **Results Overview - Activation** section displays the pairings in the selected tables, and includes the Matched, Only In, and Different columns that indicate any discrepancies between the two pairings. Select a pair from the table, the **Selected Table** populates with information regarding the specified pair.
- 3 Specify the type of **Resolution** by clicking **All**, **Mismatched**, **Source**, **Only Source**, **Target**, or **Only Target** radio buttons, respectively.
- 4 Click **Generate an SQL Script**. The script appears in SQL Editor, and can be modified manually, as needed, prior to its execution.

13. Generate a Job Report

Once you have executed a job, you can generate a job report via the **View Report** command, located on the **Results** tab.

The report opens in a separate window where additional report options are available, such as sending the report to the printer, saving it to disk, or exporting the report in a specified file format to a directory or network location.

To generate a job report:

Click the **View Report** command on the **Results** tab. The report opens in a new window and enables you to customize and perform other operations on it.

Cheat Sheet 3A: Creating a New Schema Comparison Job

Schema comparison jobs are used to capture, compare, and synchronize schema in databases and provide reports on comparison jobs that enable you to distribute information throughout your environment.

Use the table below to review the task and its individual steps prior to creating a new schema comparison job:

1. Create a New Job
2. Specify a Job Name
3. Specify Source and Target Data Sources
4. Refine Schema Comparisons
5. Customize Schema Mapping
6. Specify Job Options
7. Specify Notification Options
8. Execute the Job
9. Generate Job Report
10. Resolve Schema

1. Create a New Job

Schema comparison jobs are defined in the Schema Comparison Job Editor.

To create a new schema comparison job:

- Select File > New > Schema Comparison Job in the Menu Bar.

The Schema Comparison Job Editor opens and you can now proceed to define the parameters of the new job.

2. Specify a Job Name

A job name identifies the job in the application and should be specified with this in mind. Specify a meaningful name that clearly identifies the job in the views and dialogs of the working environment.

To name a job:

- Enter the name of the job in the Name field of the Data Comparison Job Editor.

3. Specify Source and Target Data Sources

The Schema Comparison Source and Schema Comparison Target boxes identify what data sources are compared when the job executes. Both boxes must contain the sources before the job can be executed. When a source is added to a job, it is displayed by Name, Type, and Host.

To add a data source:

- Click and drag a data source from Data Source Explorer to the Schema Comparison Source or Schema Comparison Target box. If no data sources have been registered in Change Manager, click Select Data Source in the appropriate box and then click New Data Source to add it. Data Sources added in this way are automatically registered and added to Data Source Explorer.

4. Refine Schema Comparisons

Schema comparison refinement involves selecting the schema objects that you want to include and exclude in the comparison process. All refinement is performed on the Refinements tab in the Schema Comparison Editor.

To specify the properties used in the comparison job:

- Navigate to the Refinements tab and select or de-select the objects in the table, as required. Selected objects are included in the comparison job, and de-selected properties are ignored during job execution.

5. Customize Schema Mapping

Mapping is the process of pairing objects between the source and target of the job for parallel comparison purposes. Mapping details are viewed and modified on the Mapping tab of the editor.

Change Manager automatically maps schema objects based on its interpretation of both schema. Elements that do not match are excluded initially, unless manually paired prior to running the job.

Object pairings are redefined via the drop down menu that appears when the corresponding object in the target column is selected. The menu contains a list of all schema objects that reside on the target data source.

To redefine object pairings:

- Navigate to the Mapping tab and then click the target of the pair you want to change. You can use the drop down menu to redefine the schema object pairing, as needed.

6. Specify Job Options

Prior to the execution of a job, parameters can be set to control aspects of the execution process itself. These options are set on the **Options** tab.

The following option groups are available:

- Synchronization options enables you to specify how Change manager handles the comparison synchronization script once a job has executed.
- Compare options provide settings that determine what elements of the source and target of a job are omitted when running the job.
- Include Objects options determine how objects are treated during the job execution process. For example, including or excluding specific object types.
- Identifier options determine what elements of the source and target data source will be ignored during the comparison process.

To set job options:

Navigate to the **Options** tab and modify the options, as needed. Options are grouped into execution, mapping, comparison, and resolution sections.

7. Specify Notification Options

Notification options provide parameters for enabling and setting up various notifications regarding executed jobs.

You can specify email, file system, or system tray notifications on the **Notification** tab of the Configuration Archive Editor:

- Email notification options provide parameters for configuring and enabling email notification and report mailing on executed comparison jobs.
- File system notification options provide parameters for configuring and enabling logging options for executed comparison jobs.

- System tray notification parameters enable pop-up window notifications on your Desktop when Change Manager is minimized, but running jobs.

To set notification options:

- Navigate to the **Notifications** tab and modify the settings, as appropriate. Email, file system, and system tray notification options are labeled and contained in separate sections on the interface.

8. Execute the Job

The job runs when you click the Run icon located in the upper right-hand corner of Schema Comparison Editor.

When the process executes, the Comparison Results tab appears and displays the progress of the job.

In the Comparison Results table, the schema pairs are displayed along with the Compare Index, Results, and Resolution values of the job.

- The Compare Index column indicates the percentage of schema that matched between the source and target of the job.
- The Results column provides a link that enables you to drill down and view the results between the pairs matched in the job. Click Show Individual Results to open the Individual Comparison Results tab.
- The Resolution column provides a command that produces a synchronization script to automatically synchronize any discrepancies between the compared schema.

9. Generate Job Report

Once you have executed a job, you can generate a job report via the **View Report** command, located on the **Results** tab.

The report opens in a separate window where additional report options are available, such as sending the report to the printer, saving it to disk, or exporting the report in a specified file format to a directory or network location.

To generate a job report:

- Click the **View Report** command on the **Results** tab. The report opens in a new window and enables you to customize and perform other operations on it.

10. Resolve Schema

When a schema comparison job is complete, synchronization commands are used to even the data so it matches. The synchronization process automates the generation of UPDATE, INSERT, and DELETE statements on the source and target data sources, as required.

The script can be manually modified, saved, or executed immediately via the commands in the Run menu, located on the Workbench toolbar. Save scripts are stored in Project Explorer and can be accessed at any time.

To resolve schema via a synchronization script:

- 1 On the Results tab, click Sync All in the Resolution column of the Comparison Results table. A synchronization script is produced in another window.
- 2 Modify the script as needed in the window, save the script via the File > Save command, or use the commands in the Run menu on the Workbench toolbar to execute the script, as needed.

Cheat Sheet 3B: Creating a New Schema Archive

A schema archive contains a snapshot of the schema of a registered data source, for a given point in time. Schema archives are used in schema comparison jobs against other data sources and archives as a baseline to monitor data loss and inconsistencies when moving between testing and production environments.

Use the table below to review the task and its individual steps prior to creating a new schema archive:

1. Create a New Schema Archive Job
2. Specify an Archive Name
3. Specify a Source
4. Refine Properties
5. Specify Extraction Options
6. Specify Notification Options
7. Save Schema Archive and Manage Versioning
8. Compare Archive Contents and Extract DDL
9. Generating a Job Report
10. Use Archive in Schema Comparison Jobs

1. Create a New Schema Archive Job

Archives are defined in Schema Archive Job Editor.

To create a Schema Archive:

- Select File > New > Schema Archive from the Main Menu. The Archive Job Editor opens.

When a schema archive is first created, it is in an unsaved state and versionless. To create a version, thereby “saving” the archive, you need to issue the Run Job command. Unsaved archives cannot be used in comparison jobs.

2. Specify an Archive Name

A name must be defined when a new archive is created. The name is used to distinguish between archives and other objects in Change Manager, and is used in versioning functionality later in the process.

Ensure that you specify a meaningful name that identifies the archive in other views and dialogs later.

To name a schema archive:

- Enter the name of the archive in the Name field of the Schema Archive Job Editor.

3. Specify a Source

The Schema Archive Source table specifies the data source from which the archive is derived.

To specify the archive source:

- Drag and drop the data source to be archived from Data Source Explorer to the Schema Archive Source box. The data source is listed by name, DBMS type, and host.

4. Refine Properties

By default, when you create a new archive, all schema is included. However, you may only want or need to archive a specific group of objects per archive defined. Other archives can be created, and likewise refined, for the same data source, but can maintain a different group of selected schema objects.

Archive properties are located on the Refinements tab of the Schema Archive Job Editor, where they are listed by object name, owner, and type.

To refine schema archive properties:

- Use the check boxes to select or de-select schema objects as needed. Selected objects are included in the archive when comparison jobs are run, while de-selected properties are ignored altogether.

5. Specify Extraction Options

The Options tab contains the DDL Extraction Options setting, which enables you to define how DDL is extracted and stored in Change Manager during the schema archive process. By default, the option is set to None, which indicates that the process does not retain extracted DDL when building the schema archive (although it can be extracted from the archive afterwards.)

If you choose to store extracted DDL, the directory location of the saved files can be viewed on the History tab of the editor when archive versions are created.

To define DDL extraction processes:

- Use the drop down menu to specify None, One File, or Multiple Files to indicate how DDL extraction occurs, if at all, during the archive execution process.

6. Specify Notification Options

Notification options provide parameters for enabling and setting up various notifications regarding executed jobs.

You can specify email, file system, or system tray notifications on the **Notification** tab of the Configuration Archive Editor:

- Email notification options provide parameters for configuring and enabling email notification and report mailing on executed comparison jobs.
- File system notification options provide parameters for configuring and enabling logging options for executed comparison jobs.
- System tray notification parameters enable pop-up window notifications on your Desktop when Change Manager is minimized, but running jobs.

To set notifications:

- Navigate to the **Notifications** tab and modify the settings, as appropriate. Email, file system, and system tray notification options are labeled and contained in separate sections on the interface.

7. Save Schema Archive and Manage Versioning

A version is a specific set of values associated with an archive, and is used to store older snapshots of the same archive for backup and tracking comparison purposes. Initially, you must create and save a version for the archive to become valid within Change Manager.

A version is created when you click the Run icon located in the upper right-hand corner of any tab in the Schema Job Editor.

When the process executes, the New Unsaved Version tab appears and lists information related to the archive, including its contents and any extracted DDL.

To create a version and save the archive:

- Click the Run Job icon. After saving a version, it appears in the Job History table on the History tab containing various information, such as version number, timestamp, DDL location, where the archive was run (Workbench or command line), host name, and number of errors.

Additional versions are created in the same archive each time you click Run Job. The new version contains the latest values for the archive properties specified on the Refinements tab.

8. Compare Archive Contents and Extract DDL

On an open version tab, the Schema Archive Editor enables you to compare the archive version with its live source by right-clicking the Archive Contents table and selecting Compare. When you complete this action, Schema Comparison Job Editor opens immediately and designates the archive version and the original source as its source and target data sources, respectively.

Additionally, you can select Extract from the menu to extract the DDL of the archived contents. The code opens in the DDL Extract window, and can be viewed, saved, or otherwise modified via the Open Editor command beneath the window.

9. Generating a Job Report

Once you have executed an archive job (by saving it and creating a version), you can generate a job report that summarizes the archived schema information.

Click the History tab and then right-click on the version you want to create a report for. From the menu, select View Report. A summary report of the schema archive specific to the selected version appears in a separate window.

The report can be read on screen, sent to a printer, and saved to disk via the command icons located in the port window toolbar.

Additionally, the right-click menu contains a command named Generate Report. This will produce a report file in a specified format at a directory location of your choosing.

10. Use Archive in Schema Comparison Jobs

Archives are used in Schema Comparison jobs the same way as registered data sources.

To use an archive in a schema comparison job:

- Click and drag the appropriate version from Data Source Explorer to the Source or Target box in Schema Comparison Editor prior to executing the job.

Glossary

A

Archive

A set of files, in an Embarcadero Change Manager-specific format, which represent a snapshot image of a database schema at a given point in time.

B

BCP Utility

Bulk Copy Utility. A command-prompt utility that copies data to or from an operating system file into a user-specified format.

C

Capture

The act of generating an archive file. A Capture job can be run on demand or scheduled to run at a later time.

Change Manager

An Eclipse-based application that provides comparison and synchronization functionality for schema, configuration settings, and data repository information between two or more data sources. The application also features archiving and standardization functionality.

Clone

A copy of a data source including all of the properties (thresholds, notifications, etc.) from the original data source.

Command Line Syntax Wizard

A feature that provides a command line interface for manual input of job commands to run Change Manager job functionality. The Command Line Syntax Wizard also provides a means to configure and run batch files for the purpose of running bulk comparison and archive jobs on an automated schedule.

Compare

The facility that identifies similarities and differences between servers, databases, database objects, and archives.

Compare Window

The window that opens after completing a Compare or Monitor job using the user interface (as opposed to a scheduled Compare or Monitor job). Also known as the **Compare Result Grid Window**. Database objects are displayed in grid format showing target and source data sources with the synchronization action required to synchronize the target to the source. From the Compare Window, you can filter the list of displayed objects, launch the [Diff Analysis Window](#), open a Schema Compare Summary Report, generate synchronization scripts, re-compare selected objects, or review the comparison criteria.

Compliance View

A view that displays a history of all configuration comparison jobs. Jobs are listed by the last job that was executed and the last time the job failed.

Configuration Archive Editor

The interface through which configuration archives are captured in Change Manager. Once defined, archives are then used in configuration comparison jobs against live data sources and standards.

Configuration Comparison Job Editor

The interface through which configuration comparison job functionality is executed. The job editor enables the specification of multiple data source targets within a single configuration comparison job against one data source, archive, or standard.

Configuration Standard Editor

The interface through which configuration standards are defined in Change Manager. Once defined, standards are used in configuration comparison jobs against live data sources and archives.

D

Data Comparison Job Editor

The interface through which data comparison functionality is executed. The job editor enables the specification of data source targets in a data comparison job.

Data Diff View

Displays the values of mismatched row pairs as a result of a data comparison job. The view features row synchronization icons and the specific data values of the selected pair.

Data Source

A reusable connection to a specific database on a specific database server. A data source provides connection information, user name, and password to the desired database environment.

Data Source Explorer

Data Source Explorer provides an organizational tree of registered data sources and the comparison jobs and archives associated with them.

Diff Analysis Window

The Diff Analysis Window (also known as the Visual Differences Window or the Diff Window) is launched from the Compare Window after a Compare or Monitor job completes in the UI. The Diff Analysis window shows color-coded differences between each object on the source and target data sources along with the appropriate synchronization script.

E**Editor**

A workbench interface component that enables Change Manager processes. That is, data, configuration, and schema comparison jobs.

Extended ALTER

A change which cannot be handled by a simple ANSI SQL ALTER statement, usually requiring that the database object be copied, dropped, and then re-created.

F**Filter System Objects List**

A list that includes Embarcadero Change Manager's default system objects and any system objects you have added to that list. You have the option of ignoring the items on this list (filtering them out) when you run Capture, Compare or Monitor jobs.

G**Group**

A folder used to organize registered data sources in Data Source Explorer. Groups provide an additional level of organization when maintaining a large quantity of data sources.

H

There are no entries for this letter.

I**Imported Archives**

Archives created on a different machine (and possibly by a different user) that you have copied into your Embarcadero Change Manger environment.

J

Job

An application process that involves the creation of an object or element, or the comparison of an object or element. In some cases, such as data comparison jobs, a comparison is made (the data repositories of two or more data sources), and an object is created (the job definition is retained in Change Manager for reuse.)

Job Explorer

Provides a tree that lists all jobs defined and saved in Change Manager. Jobs are organized by date created, source and target platform type, last modified, last executed, job name, data source name, and job type.

Jobs Window

The Jobs Window presents an overview of all Compare, Capture, Monitor, and Migrate jobs in an expandable grid format.

K

There are no entries for this letter.

L

Login

A login is an form of identification that lets you connect to a data source. Permissions within specific databases are controlled by user accounts. The database administrator maps your login account to a user account in any database you are authorized to access.

Logins are one of the fundamental security mechanisms of Embarcadero Change Manager. Users who connect to a server must identify themselves using a specific login identifier (ID). Users can then only see the tables and views they are authorized to see.

M

Migrate

The facility that allows you to move schema archives and database object definitions to one or more databases.

Monitor

The facility that combines the capture and compare operations into a single job. Monitor jobs create an archive for a data source, and then compares the last archive against the next-to-last archive (latest version -1).

N

Navigator View

A view that provides a tree of all data comparison job synchronization scripts that are generated in the Data Comparison Job Editor. Scripts are launched directly from the view for execution and modification purposes.

Notification

Notifications are Job monitoring messages sent through email to the addresses you identify in the Options Editor.

O

There are no entries for this letter.

P

There are no entries for this letter.

Q

There are no entries for this letter.

R

There are no entries for this letter.

S

Schema

The definition or structure of data or database objects.

Shell Data Source

An empty data source with only the name and DBMS type defined. A shell data source is created during the import archive function when the data source specified in the imported archive does not exist. The connection information, user name, and password is intentionally missing from the shell data source for security and data integrity purposes.

SQL Editor

An interface that provides a means to view and modify the SQL synchronization scripts generated by the Data Comparison Editor after a data comparison job has been executed.

SQL Errors View

Displays any errors encountered while executing synchronization scripts in Change Manager.

Standard

Used to provide customized data source configuration properties and are used in configuration comparison jobs against data sources and archives to provide a specific set of values and threshold operators that check enterprise settings and ensure all system configuration values fall within acceptable ranges.

Synchronization Script

Synchronization scripts are automatically generated by the data comparison job editor when a data comparison job is executed and, when run, synchronize the data repositories of two or more data sources where disparities are discovered by the job process.

Synchronization Script Navigator

A view that provides a tree of all synchronization scripts generated during the execution process of comparison jobs. Scripts can be modified and executed from the Synchronization Script Navigator as required.

T

There are no entries for this letter.

U

There are no entries for this letter.

V**View**

A workbench interface component that is used to navigate a hierarchy of information, open editors, or display properties.

W**Welcome Page**

Provides a series of links and icons that are clicked to access tutorials, cheat sheets, and other information. The Welcome page is intended to provide access to information regarding Change Manager tasks and processes, and its design is aimed particularly towards orientating new users.

Wizard

A series of User Interface panels that lead you through a task.

Workbench

The Change Manager development environment. It provides the interface to create, manage, and navigate comparison jobs via an array of views, editors, and menus.
