© 2015 Embarcadero Technologies, Inc. Embarcadero, the Embarcadero Technologies logos, and all other Embarcadero Technologies product or service names are trademarks or registered trademarks of Embarcadero Technologies, Inc. All other trademarks are property of their respective owners.

Embarcadero Technologies, Inc. is a leading provider of award-winning tools for application developers and database professionals so they can design systems right, build them faster and run them better, regardless of their platform or programming language. Ninety of the Fortune 100 and an active community of more than three million users worldwide rely on Embarcadero products to increase productivity, reduce costs, simplify change management and compliance, and accelerate innovation. The company's flagship tools include: Embarcadero® Change Manager™, Embarcadero® RAD Studio, DBArtisan®, Delphi®, ER/Studio®, JBuilder®, and Rapid SQL®. Founded in 1993, Embarcadero is headquartered in San Francisco, with offices located around the world. Embarcadero is online at www.embarcadero.com.

September, 2015
CONTENTS

Welcome to DBArtisan ................................................................. 90
  Additional Product Information ........................................... 91
Prerequisites and Preliminary Tasks ........................................ 92
Introducing DBArtisan ............................................................ 93
  About DBArtisan ............................................................... 93
Technical Requirements ......................................................... 95
  Browser Requirements ....................................................... 95
  Hardware Requirements ..................................................... 95
  Operating System Requirements ........................................... 95
    XP Support Notes .......................................................... 95
    Vista and Windows 7 Support Notes .................................... 96
  32-bit versus 64-bit Application Considerations and Restrictions .... 96
DBMS Support and Connectivity Options ................................. 97
  Dedicated Support Connectivity Options ............................... 97
Embarcadero Team Server 2016 Support .................................... 99
Generic JDBC/ODBC Connectivity .......................................... 99
IBM DB2 for Z/OS Stored Procedure Requirements ....................... 99
Specifically-tested JDBC/ODBC Connectivity Products: Apache Hive/Hadoop .... 100
DBMS Versions no Longer Supported ...................................... 100
Installing and Licensing DBArtisan ......................................... 101
Installing DBArtisan ............................................................. 102
Licensing Your Product .......................................................... 103
Licensing Overview .............................................................. 104
  Viewing Your License Type and Modules ............................... 104
  Understanding Trial, Workstation, and Networked Licenses .......... 104
DBArtisan License Modules, DBMS Support, and Feature Availability ... 104
DBArtisan XE License Modules, DBMS Support, and Feature Availability ... 105
Directing Queries Regarding Licenses ...................................... 105
Licensing Your Application .................................................... 106
  Registering a Trial or Workstation License during Installation .... 106
  Registering a Workstation License After Application Startup ...... 106
  Registering By Phone ....................................................... 107
  Registering a Networked License ....................................... 108
Selecting a License Category During Startup ............................. 109
Online/Offline Mode and Concurrent License Checkout .................. 110
Quick Start Setup ................................................................ 111
  Performance IQ Installation/Connection ............................... 111
  Datasource Registration .................................................... 111
More Information on Using this Document ................................ 113
Accessing Third Party Documentation .................................... 114
Shorthand for Third Party Product References ............................ 115
  DB2 LUW ................................................................. 115
  DB2 z/OS ............................................................... 115
What's New in DBArtisan 2016 ................................................................. 117
  PostgreSQL Object Management ....................................................... 117
    Object Wizards/Editors ................................................................ 117
  Analyst Explorer Node ....................................................................... 117
  Performance IQ .................................................................................... 117
    Top Instances .................................................................................. 118
    Top Waits ...................................................................................... 119
    Top I/O ............................................................................................ 119
  Missing Indexes .................................................................................. 120
  ISQL Performance .............................................................................. 120
    Performance window ....................................................................... 121
    ISQL Performance listed in Error Pane ............................................ 121
  Team Server 2016 Support ................................................................. 121
    Team Server 2016 as the Data Source Catalog .................................. 122
    New Data Source Search Button ................................................... 123
  Topics .................................................................................................. 124
Release Notes for DBArtisan 2016 ....................................................... 125
  Important Advisory Notes ................................................................. 125
  Team Server 2016 Installation and Configuration ............................... 125
  Known Issues .................................................................................... 125
  Bug Fixes .......................................................................................... 127
    Bugs Fixed in DBArtisan 2016 ....................................................... 127
What Was New in Past Releases .......................................................... 128
What's New in DBArtisan XE6 Patch .................................................... 129
  PostgreSQL Object Management ....................................................... 129
  PostgreSQL Utilities .......................................................................... 130
  PostgreSQL Tools Menu Updates ...................................................... 131
  PostgreSQL Updates to the SQL Editor ............................................. 132
  Welcome Window ................................................................................ 132
  Project Management, Version Control, and Script Library .................. 132
  Datasource Registration Updates ...................................................... 134
  Trace File Logging Options ............................................................... 135
  DBMS Platform Updates .................................................................... 136
  Explorer and Database Monitor Updates .......................................... 136
  ISQL Windows Backup ...................................................................... 136
  Connectivity Improvement .................................................................. 136
  Performance Analyst for SQL Server Improvements ......................... 136
  Java Update ....................................................................................... 136
  Improved Multi-Monitor Support ...................................................... 137
Topics .......................................................................................................................... 137
Release Notes for DBArtisan XE6 Patch ................................................................. 138
  Important Advisory Notes .................................................................................. 138
  Known Issues .................................................................................................... 138
  Bug Fixes ........................................................................................................... 141
    Bugs Fixed in DBArtisan 9.7.5/XE6 Patch ....................................................... 141
What's New in DBArtisan XE6 ............................................................................. 146
  Version Support and Connectivity Options ...................................................... 146
  Command Line Startup Against Postgres Datasources ..................................... 146
  Standard Datasource Registration and Connectivity ......................................... 146
  Datasource Explorer/Navigator Object Node Availability .................................. 147
  SQL Editor ......................................................................................................... 148
What's New in DBArtisan XE5 ............................................................................. 149
  Team Server 2016 ............................................................................................... 149
  64-bit Installation ............................................................................................... 149
  Windows 8 Support ........................................................................................... 150
  Teradata ............................................................................................................. 150
  Other New DBMS Version Support ................................................................... 151
  SQL Server Updates .......................................................................................... 151
  DB2 LUW Updates ............................................................................................ 153
  Sybase ASE Updates .......................................................................................... 153
  Oracle Updates .................................................................................................. 153
  Database Monitor .............................................................................................. 154
  Query Builder .................................................................................................... 154
What's New in DBArtisan XE4 ............................................................................. 155
  Data Governance ............................................................................................... 155
  Other Datasource Registration Updates ............................................................ 159
  User Interface and Navigator/Explorer Updates ................................................ 160
  SQL Server Updates .......................................................................................... 160
  Oracle Updates .................................................................................................. 161
What's New in DBArtisan XE3.5 ......................................................................... 165
  Feature Lockdown .............................................................................................. 165
  Command Line Startup ...................................................................................... 165
  Connectivity Updates .......................................................................................... 166
  Explorer Updates ............................................................................................... 168
  SQL Editor Updates ............................................................................................ 170
  Oracle Feature Support ...................................................................................... 172
  Sybase IQ Support ............................................................................................... 174
  SQL Server Feature Support .............................................................................. 177
  DB2 LUW and DB2 z/OS Feature Support .......................................................... 179
  DB2 LUW Feature Support ................................................................................. 181
Getting Started .................................................................................................... 184
Starting DBArtisan ............................................................................................... 185
  Staring an Installed version of DBArtisan from the Start Menu ....................... 186
  Staring an Installed version of DBArtisan from the Command Line ................ 187

Warnings Options ............................................................................................................................... 345
Locking Down Features Using the Registry ........................................................................................ 346
Datasource and Server Management ................................................................................................. 348
Registering Datasources ...................................................................................................................... 349
Specifying a Datasource Catalog Storage Option .............................................................................. 350
Manually Registering or Editing Datasources .................................................................................... 352
Selecting Database Type/Connectivity Options When Registering Datasources ......................... 353
Providing Connection Information When Registering Datasources .............................................. 355
  Providing DB2 Connection Information When Registering Datasources ........................................ 355
  Providing MySQL Connection Information When Registering Datasources .................................. 356
  Providing Oracle Connection Information When Registering Datasources .................................... 357
  Providing PostgreSQL Connection Information When Registering Datasources ......................... 359
  Providing SQL Server Connection Information When Registering Datasources ........................... 359
  Providing Sybase ASE Connection Information When Registering Datasources ............................ 360
  Providing Sybase IQ Connection Information When Registering Datasources ............................... 361
  Providing Teradata Connection Information When Registering Datasources ................................ 362
  Providing Connection Information When Registering a Generic JDBC Datasource .................... 362
  Providing details for a new custom JDBC driver .............................................................................. 363
  Providing Connection Information When Registering a Generic ODBC Datasource .................... 364
Providing Security Parameters When Registering Datasources ....................................................... 365
Providing Custom Driver Properties When Registering Datasources ............................................ 366
Specifying Datasource Properties When Registering Datasources ................................................. 367
Specifying Oracle Views Configuration When Registering Datasources ....................................... 368
Specifying Group and Category Details When Registering Datasources ....................................... 369
Automatically Discovering Datasources ............................................................................................ 370
Setting up to Automatically Discover Datasources ........................................................................ 371
Discovering Datasources on First Application Startup .................................................................... 372
Manually Discovering Datasources .................................................................................................... 373
Importing and Exporting Datasource Definitions ............................................................................ 374
Viewing Datasource Properties ......................................................................................................... 377
Unregistering Datasources .................................................................................................................. 378
  Topics .............................................................................................................................................. 378
Connecting to Datasources .................................................................................................................. 379
  Topics .............................................................................................................................................. 379
Connecting to a Datasource From the Navigator/Explorer ................................................................. 380
  Connecting with Team Server 2016 Credentials ............................................................................ 380
Connecting to Datasources from an Alphabetical Listing ................................................................. 381
Disconnecting from a Datasource ......................................................................................................... 382
Trouble-shooting Client Setup ........................................................................................................... 383
  Trouble-shooting Sybase Connectivity ............................................................................................ 383
Trouble-shooting Oracle Connectivity .......................................................... 384
Trouble-shooting DB2 LUW and DB2 z/OS Connectivity .................................. 385
Trouble-shooting SQL Server Connectivity .................................................... 385
Using the Datasource Navigator/Explorer ..................................................... 386
  Connected to Team Server 2016 ................................................................. 387
  Topics ........................................................................................................... 388
Hiding and Displaying the Datasource Navigator/Explorer ............................. 389
  Connected/Selected Datasource options ...................................................... 390
Navigating the Datasource Explorer and Displaying Nodes or Objects ............. 392
Filtering columns in Database Object Displays ............................................. 393
Working with Bookmarks ............................................................................ 394
Initiating Object Actions in the Navigator/Explorer ........................................ 395
  Topics ........................................................................................................... 396
Understanding the Explorer Tree Hierarchy ................................................... 397

Welcome to DBArtisan

Welcome to DBArtisan, the database administration and development solution that lets you manage IBM DB2 for Linux, Unix, and Windows, IBM DB2 for z/OS and OS/390, Interbase/Firebird, Microsoft SQL Server, MySQL, Oracle, PostgreSQL, Sybase IQ, and Sybase ASE databases.

The list below describes the major sections of this document.

- **Getting Started**: Provides an introduction for new users and helps you set up DBArtisan. Included is an investigation of the major user interface elements, detailed tutorial exercises, instructions on configuring DBArtisan features, and additional information on using this document and third-party documentation.

- **Datasource and Server Management**: Shows you how to register the datasources that DBArtisan will work against. This chapter also describes the extensive datasource management facilities.

- **Team Server 2016 Support**: Shows you how to make use of datasource definitions and ER/Studio model data in a Team Server 2016 Repository.

- **Database Object Management**: Describes how to create new database objects, edit existing objects, and provides details on the operations you can perform against database objects.

- **Coding Environments/Editors**: Describes the development/execution/testing environments offered.

- **Data, Schema, and Miscellaneous Utilities**: Provides detailed information about the extraction, migration and publication of your schema, the loading and unloading of data, database searching, the use of the Script Execution Facility and Query Builder, the scheduling of processes, the backing up and restoration of databases, the use of the Database Monitor, Database Manager, Resource Limits, and Logfile.

- **Tools**: Tools provide search, script and file execution, scheduling, visual difference, a visual query builder, data import, a data editor, and an auto-replace tool for the scripting environment.

- **Project Management**: DBArtisan provides project support and version control system integration.

- **Add-on tools**: License-dependent add-ons include:
  - **Debuggers**: DBArtisan provides debugging environments for DB2 LUW, SQL Server, Oracle, and Sybase ASE.
  - **Oracle PL/SQL Profiler**: captures metrics of various PL/SQL programmable objects as they are executed
  - **Capacity Analyst**: collects storage and performance metrics and provides visual analysis and reporting for historical trend analysis and forecasting.
Welcome to DBArtisan

- **Performance Analyst**: presents a complete picture of a database's performance and lets you investigate performance bottlenecks.

- **Space Analyst**: helps you effectively locate and troubleshoot bottlenecks and performance inefficiencies that result from space management issues.

- **Code Analyst**: helps you identify time-consuming lines of code.

*Note:* For information on access to third party documentation and descriptions of conventions used in this document, see [More Information on Using this Document](#).

### Additional Product Information

The Embarcadero Web site provides access to information and resources useful through the life of your product. This includes access to:

- Technical Support
- Case studies, video presentations, webinars and white papers
- Product communities through the Embarcadero Developer Network
- Free trials of related products

See [www.embarcadero.com/support](http://www.embarcadero.com/support).

You can find general information about system requirements, licensing information, and details on DBMS product support in [Prerequisites and Preliminary Tasks](#).
Prerequisites and Preliminary Tasks

You can find general information about system requirements, licensing information, and details on DBMS product support in:

- Introducing DBArtisan
- Technical Requirements
- DBMS Support and Connectivity Options
- Installing and Licensing DBArtisan
- Quick Start Setup
- More Information on Using this Document

For more information, you can also see the Read Me and Quick Start at http://docs.embarcadero.com/products/dbartisan/.
Introducing DBArtisan

DBArtisan is an industry-leading database administration solution for managing Oracle, Microsoft SQL Server, Sybase, PostgreSQL, IBM DB2, and MySQL databases. Its cross-platform capability allows users to efficiently manage heterogeneous database platforms easily using a single front-end tool. Using DBArtisan, users boost their productivity by using a single tool for all their databases, regardless of the vendor.

About DBArtisan

Your new application provides tools that can be used by a number of functions within an organization using DBMS from multiple vendors, in testing, development, or production environments.

Datasource and Server Management: Datasources must be registered. Datasources can be registered manually or semi-automatically. Storage can be registry-based or file-based, and a network storage option facilitates shared use of datasource catalogs.

Object management tools: Your application supports a wide range of database objects and related elements for each DBMS. You can create new objects, edit existing objects, and use a range of object operations that support common, general or DBMS-specific actions.

Coding Environments/Editors: Fully-featured environments dedicated to SQL, DDL and Active Script development are provided. Execution options are available as appropriate, and environment-specific related features, such as rollback/commit and query plan options, are provided. Related coding aids include on-the-fly semantic and syntactic validation, text substitution shortcuts, and visual query building tools. Related execution tools include script and file execution facilities.

Schema and data utilities (DBArtisan only): Schema extraction, migration, and publication wizards let you quickly extract and move schema and data across environments and even across DBMS types. DBMS-specific import/export, load/unload, and backup/restore utilities are also available. A Data Editor lets you edit your tables in real-time, supports all editable datatypes, and provides Unicode options. Table data can also be imported from formats such as spreadsheets.

Project Management, Version Control, and Script Library: Database project management facilities help you organize, alter, and keep track of changes to database objects or SQL scripts. The project management facilities act as a repository to maintain all source code for a database project. DBArtisan also incorporates version control functions and build management facilities to help you manage and build projects.

Other Time-savers and Productivity Tools: Working within the DBArtisan environment, you have access to database and file search facilities, use the visual difference to compare files or database objects, and access the Microsoft Windows task scheduler.

License-specific Add-ons: Depending on the licenses you purchased, you have access to the following tools:
Introducing DBArtisan

- The DBArtisan Analyst Series includes advanced space, capacity, performance and backup management capabilities. They let you predict and prevent storage-related problems, trend data and object growth over time, and pinpoint performance bottlenecks.

- Debuggers, available for IBM DB2 for Linux, Unix, and Windows, Oracle, Sybase, and SQL Server, let you test functions and procedures. A Profiler is available for Oracle datasources.
Technical Requirements

Before using DBArtisan, please verify that your environment meets the requirements listed below:

**Note:** Users need full registry privileges during the installation and access to the keys under HKEY_CURRENT_USER in the registry after installation.

Browser Requirements

DBArtisan requires Microsoft Internet Explorer 11 or later.

Hardware Requirements

Embarcadero Technologies recommends the following minimum hardware requirements:

- Pentium 4-level processor
- 1 GB of memory
- 1 GB of disk space
- 1024 x 768 display

Operating System Requirements

DBArtisan supports the following operating systems:

- Windows XP SP" (32-bit and 64-bit)
- Windows Vista (32-bit and 64-bit)
- Windows 7 (32-bit and 64-bit)
- Windows 8 (32-bit and 64-bit)

**XP Support Notes**

Windows XP has two user security groups: Users and Power Users. Microsoft intentionally does not grant members of the Users Group the authority to install applications or make global changes to the system. Restricted Users are members of the Users Group. Standard users belong to the Power Users Group. Microsoft grants members of the Power Users Group the authority to install programs. You must be a member of the Administrators Group to install and use Embarcadero Technologies applications. Because Restricted Users are members of the Users Group, they cannot install and run Embarcadero Technologies applications.

Use the Group Membership tab to determine your group and review the Microsoft security guidelines. On the Control Panel, open User Accounts. On the Users tab, select a user and then click the Properties button. Click the Group Membership tab.
Vista and Windows 7 Support Notes

Windows Vista UAC and Windows 7 provide two user types: Standard users and Administrators. DBArtisan can be installed or uninstalled by an administrator or by a standard user using an administrator token. Standard users can run DBArtisan. For the purpose of running DBArtisan, default standard user token privileges should not be modified. Modifying standard user token privileges can result in licensing issues that will prevent DBArtisan from operating correctly.

32-bit versus 64-bit Application Considerations and Restrictions

If you install the 64-bit version of DBArtisan, and you are using custom drivers, you must be using 64-bit versions of those drivers when using the 64-bit version of DBArtisan. Similarly, 32-bit versions of custom drivers must be used with the 32-bit DBArtisan installation.

For version control integration, if you install the 64-bit version of DBArtisan, you can work with either a 32-bit or 64-bit MSSCCI provider. The feature is controlled from the Options Editor's Version Control tab (File > Options > General > Version Control).
DBMS Support and Connectivity Options

Dedicated Support Connectivity Options

DBArtisan provides dedicated connectivity to a specific version range of IBM DB2 for Linux, Unix, and Windows, IBM DB2 for z/OS, Microsoft SQL Server, MySQL, PostgreSQL, Oracle, Sybase, and Teradata databases. The following connectivity options are provided:

- **Native Embarcadero drivers**: DBArtisan is packaged with a set of native drivers, each requiring a DBMS-specific client to be installed.

- **JDBC drivers**: DBArtisan can connect to a datasource more directly using one of the packaged, third-party JDBC drivers. No additional connectivity components need to be installed. One or more third-party drivers, tested against DBArtisan, are installed with DBArtisan.

The following table provides a summary of resources/requirements for connectivity to dedicated DBMS platforms. For each platform, it lists supported versions, the client software that must be installed if using native Embarcadero clients, and the third-party, Type 4 JDBC drivers packaged with DBArtisan.

Teradata 13.10, 14.0, 14.10, and Teradata ODBC driver for Teradata JDBC -
(Technical 15.0 Windows (version 15 Driver
Preview)*
recommended)

*About Technical Previews* - Technical previews are intended to introduce a new DBMS platform only. The available functionality is typically minimal. For example, command Line startup, standard datasource registration and connection features, limited Datasource Navigator/Explorer tree functionality, a minimal set of object actions, as well as SQL Editor execution and related, common SQL Editor functionality such as Query Options, Paste SQL Syntax, and Paste SQL Statement. Access may not be covered under SE or trial licenses. Contact Oz.Basarir@embarcadero.com to obtain a separate license for a platform designated as a Technical Preview.

Embarcadero Team Server 2016 Support

DBArtisan can make use of datasource definitions stored on an Embarcadero Team Server 2016.

Generic JDBC/ODBC Connectivity

Generic JDBC/ODBC connectivity to non-dedicated DBMS systems or non-database datasources is also provided. DBArtisan can connect to a datasource using a customer-provided, third-party JDBC version 4.0 or ODBC version 3.0 driver. Minimal DBArtisan functionality is provided, including a basic Explorer tree and SQL querying.

IBM DB2 for Z/OS Stored Procedure Requirements

When working against an IBM DB2 for z/OS data source, DBArtisan relies on the following stored procedures, provided as an optional installation step in setting up the DB2 subsystem:

- DSNWZP
- DSNUTILS
- ADMIN_COMMAND_DSN
- ADMIN_COMMAND_DB2

Prior to using DBArtisan against an IBM DB2 for z/OS data source, ensure that these components are installed on the server. See IBM DB2 for z/OS documentation for more information.
Specifically-tested JDBC/ODBC Connectivity Products: Apache Hive/Hadoop

DBArtisan has been successfully tested against Apache Hive/Hadoop datasources using the Hortonworks ODBC driver. Similarly, Cloudera Impala datasources have been tested using the Cloudera JDBC driver. In both cases, SQL querying and a Datasource Navigator/Explorer tree are available.

DBMS Versions no Longer Supported

As of this release, DBArtisan is no longer being tested against Sybase ASE versions before 15.7.
Installing and Licensing DBArtisan

Before you can register any Embarcadero Technologies application, you must meet the minimum technical requirements. If you meet all the minimum technical requirements, you can install DBArtisan. After installation, you must license the application.

The following topics walk you through this process:

- Technical Requirements
- DBMS Support and Connectivity Options
- Installing DBArtisan
- Licensing Your Product
Installing DBArtisan

To install the application successfully, you must complete each panel of the installation wizard. 64-bit and 32-bit versions of DBArtisan are available with the trial version, which can be downloaded from http://www.embarcadero.com/products.

The DBArtisan installation wizard installs all corresponding files on your machine. The installer offers common options such as license agreement, file and folder selections, and shortcut options. An application-specific option lets you associate file suffixes of elements such as SQL scripts with DBArtisan.

**NOTE:** Before installing DBArtisan from Embarcadero ToolCloud, see http://docs.embarcadero.com/products/xe/ for additional requirements or revised instructions.

The panels presented by the wizard vary depending on whether you are upgrading or performing an initial installation.

**Caution:** If you have not registered a license when you start a DBArtisan installation, you will be prompted to register a license. For more information, see Licensing Your Product.

After the installation is complete, we recommend that you reboot your machine before using DBArtisan.
Licensing Your Product

Each Embarcadero client application requires one or more licenses to run. An Embarcadero product, such as DBArtisan, has a baseline license that provides basic feature support for that product. Also, incremental licenses may be required to support specific DBMS platforms, product add-ons, or other functions.

For more information, see the following topics:

- Licensing Overview
- Licensing Your Application
- Selecting a License Category During Startup
- Online/Offline Mode and Concurrent License Checkout
Licensing Overview

The following topics provide a high-level discussion of key licensing topics and directs you to sources of more detailed information.

- Viewing Your License Type and Modules
- Understanding Trial, Workstation, and Networked Licenses
- DBArtisan License Modules, DBMS Support, and Feature Availability
- DBArtisan XE License Modules, DBMS Support, and Feature Availability
- Directing Queries Regarding Licenses

Viewing Your License Type and Modules

The About... dialog, available from the Help menu, displays your license type and each license module currently registered.

Understanding Trial, Workstation, and Networked Licenses

Three kinds of licenses are available: Trial, Workstation, and Networked.

- **Trial licenses**: A license for a 14-day, full-featured trial version of the product. The trial license must be registered before you can use the product.

- **Workstation licensing**: A license or set of licenses is tied to a particular workstation. The product can only be used on that workstation.

- **Networked licensing**: Networked licenses are administered and distributed by a central License Server (Embarcadero License Center or Acresso FLEXnet Publisher). There are two types of networked licenses: Concurrent and Networked Named User. With Concurrent licensing, users on different machines take turns using licenses from a shared pool. With Networked Named User licensing, licenses are pre-assigned to specific users setup on the license server’s user list. Those users are guaranteed to have licenses available any time. **NOTE**: Concurrent licenses can be borrowed for use without a network connection. For details, see Online/Offline Mode and Concurrent License Checkout.

For a detailed description of licensing options, see http://www.embarcadero.com/software-licensing-solutions.

DBArtisan License Modules, DBMS Support, and Feature Availability

Individual license modules correspond to the DBMS platforms you are licensed to use. Also, each DBMS license module corresponds to a product edition. Feature availability for each license module edition is as follows:
Licensing Overview

- **Standard**: Provides baseline support including datasource management, object management, SQL editing and execution, and standard tools and utilities.

- **Professional (DBArtisan)**: Standard Edition features plus SQL Debugger and SQL Profiler.

**DBArtisan XE License Modules, DBMS Support, and Feature Availability**

An XE license provides access to all supported DBMS platforms. XE module and feature availability are as follows:

- **XE Pro (DBArtisan)**: Provides baseline support including datasource management, object management, SQL editing and execution, and standard tools and utilities, SQL Debugger and SQL Profiler.

- **Analyst Pack (DBArtisan)**: Provides access to Performance Analyst, Space Analyst, and Capacity Analyst.

**Directing Queries Regarding Licenses**

Questions regarding license availability, feature availability, and client or server licensing, should be directed as follows:

- If you work in an organization that uses networked licensing, direct any questions to your site’s DBArtisan administrator.

- If you are using workstation licensing, direct licensing questions to your Embarcadero Technologies representative.
Licensing Your Application

See the following topics for details on registering your product:

- Registering a Trial or Workstation License during Installation
- Registering a Workstation License After Application Startup
- Registering By Phone
- Registering a Networked License

Registering a Trial or Workstation License during Installation

Shortly after initiating the download of a trial version of an Embarcadero product, you should receive an email with a serial number you must register during installation. Similarly, if you purchase an Embarcadero product while no trial version is active, you will receive a serial number that must be registered during installation.

1. Start the installation. An Embarcadero License Registration dialog appears.

2. Copy the serial number from the email and paste it in the Serial Number field.

3. Enter your Embarcadero Developer Network account credentials in the Login or Email and Password fields. If you have not previously created an EDN account or have forgotten your password, click I need to create ... or I’ve lost my password.

4. Click Register.

Your activation file should be downloaded and installed automatically. If this does not happen, click the Trouble Connecting? Try Web Registration link and follow the prompts. If you still have problems, see Registering By Phone.

Registering a Workstation License After Application Startup

The following instructions assume that you have received a workstation license by email and that you currently have a valid trial license. If you did not install a trial version or the trial period has expired, follow the instructions in Registering a Trial or Workstation License during Installation instead.

1. On the Help menu, select About, and then on the dialog that opens, click Manage to open a license manager dialog.

2. On the Serial menu, select Add.

3. Copy the serial number from the email and paste it in the Add Serial Number dialog, and then click OK.
4. Right-click on the serial number you added, and then select **Register** from the context menu. A registration dialog opens.

**Note:** The **Registration Code** box shows a machine-specific identifier required with other registration methods.

5. Ensure that the **Register using Online Registration** radio box is selected.

6. Provide Developer Network credentials in the **DN Login name or Email** and **DN Password** boxes. If you have not previously created an EDN account or have forgotten your password, click **I need to create ...** or **I've lost my password.**

7. Click **Register**.

8. If prompted to restart the application, click **Yes**.

Your activation file should be downloaded and installed automatically. If this does not happen, click the **Trouble Connecting? Try Web Registration** link and follow the prompts. If you still have problems, **Registering By Phone**.

### Registering By Phone

If you have problems with either of the above procedures, you can register licenses by phone. You will have to provide:

- Developer Network credentials
- The registration code displayed in the Embarcadero License Registration dialog that appears when you start an unlicensed application
- The product base license serial number
- The license serial numbers for any additional features you have purchased.

For North America, Latin America, and Asia Pacific, call (415) 834-3131 option 2 and then follow the prompts. The hours are Monday through Friday, 6:00 A.M. to 6:00 P.M. Pacific time.

For Europe, Africa, and the Middle East, call +44 (0)1628-684 494. The hours are Monday through Friday, 9 A.M. to 5:30 P.M. U.K. time.

Shortly after phoning in, you will receive an email containing an activation file. Then do the following:

1. Save the file to the desktop or a scratch directory such as `c:\temp`.

2. On the **Help** menu select **About** and then on the dialog that opens, click **Register**. A registration dialog opens.

3. Select the **I have received an activation file (*.slip or reg*.txt)** radio box.

4. Click the **Browse** button and use the **Select License Activation File** dialog to locate and select the activation file you installed.
Licensing Your Application

5. Click the **Import** button to import the activation file and when complete, click the **Finish** button.

6. If prompted to restart the application, click **Yes**.

Registering a Networked License

If you work in an organization using Networked licensing, an administrator, department head, or someone performing a similar function will provide you with an activation file.

Once you receive the file, save it to the license subfolder of your product’s main installation folder (typically `C:\Program Files\Embarcadero\<product><version>\license\`), then restart the application.

No additional steps are necessary.
Selecting a License Category During Startup

During startup, if multiple concurrent license categories are available, you are prompted to select a category to use for this DBArtisan session. Multiple license categories can be set up to provide differing feature access or access to different DBMS versions. Feature and DBMS version access are typically distributed across multiple license categories to optimize the use of a site’s purchased licenses.

Note: This dialog also includes the option to remember your selection on subsequent startups. If you select that option, you can subsequently use the Select Licenses button on the About... dialog (Help > About) to select a different license.

Contact your License Administrator for details on individual license categories or requests for additional feature or DBMS support.
Online/Offline Mode and Concurrent License Checkout

Concurrent licenses can be used in both online and offline modes. In online mode, you must have a continuous network connection to your License Center. Licenses are checked out on startup and checked back in on shutdown.

You can also use a license in offline mode. When you explicitly check out a license for offline use, you can use the license without a connection to your License Center for a specified duration. This lets you work while travelling or commuting, work away from your primary work area, or use the license when a network connection is unavailable or not required.

**Note:** Contact your site administrator for information on offline license availability, the maximum duration, offline license policy at your site, or any other issues arising from online license usage.

**To check out a license for offline use:**

1. On the **Help** menu, select **Checkout License**. The **Check Out Licenses For Offline Use** dialog opens.
2. Select the check box associated with each individual license you want to check out.
3. In the **Checkout Duration** box, type the number of hours that you can use the offline license without a network connection to the License Center.
4. Click **OK**.

You can work offline for the specified duration. The duration period begins immediately.

If you subsequently establish a network connection to the License Center before the license duration expires, you can indicate to the License Center that the offline license is no longer required.

**To indicate that an offline license is no longer required:**

1. On the **Help** menu, select **Checkin License**.

There is no interruption in DBArtisan usage. The license is not actually checked in until you shut down DBArtisan.
Quick Start Setup

After Installing and Licensing DBArtisan, the first time you launch the product, two dialogs are displayed for configuring/installing Performance IQ and for registering data sources.

Performance IQ Installation/Connection

This dialog lets you either Download and Install or Connect to Team Server 2016. If you click Connect the Embarcadero Team Server - Log In wizard opens, where you must add URL, User and Password. Click Later in case you do not want to connect to Team Server 2016 Performance IQ.

Datasource Registration

Once you have installed Team Server 2016 or configured DBArtisan to connect to Team Server 2016 Performance IQ, a new dialog is displayed for registering data sources.
This dialog includes the options described in the table below:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manually set up an initial data source</td>
<td><strong>Registering Cross-Platform Datasources to DBArtisan</strong></td>
</tr>
<tr>
<td>Automatically discover and register data sources</td>
<td>The <strong>Automatically Discovering Datasources</strong> features is launched.</td>
</tr>
<tr>
<td>Use Team Server as the data source catalog</td>
<td>Data sources in the configured Team Server will be registered in DBArtisan.</td>
</tr>
<tr>
<td>Import data sources</td>
<td>The <strong>Import Data Sources</strong> wizard is launched.</td>
</tr>
<tr>
<td>Setup data sources at a later time</td>
<td>DBArtisan opens without registered data sources.</td>
</tr>
</tbody>
</table>
More Information on Using this Document

The following topics provide additional information that is useful when working with product documentation:

- Accessing Third Party Documentation
- Shorthand for Third Party Product References
Accessing Third Party Documentation

Many DBArtisan features provide support for functionality available in the supported third party DBMS platforms. In object management for example, properties available when creating or editing objects and actions available against object types, are direct equivalents of clauses, options, or keywords available for use with the third party equivalent.

In such cases, no attempt is made to duplicate detailed documentation by third parties. Casual descriptions are provided, noting the third party equivalent. You can consult the third party documentation for details or clarifications. The following links provide access to online documentation for supported DBMS platforms:

- IBM DB2 for Linux, Unix, and Windows documentation
- IBM DB2 for z/OS documentation
- InterBase/Firebird documentation
- Microsoft SQL Server documentation
- MySQL documentation
- Oracle documentation
- PostgreSQL documentation
- Sybase ASE and Sybase IQ documentation
Shorthand for Third Party Product References

To save space in headings and table columns, shorthand is used to represent versions and variations of the DBMS platforms supported.

- **DB2 LUW**
- **DB2 z/OS**
- **MySQL**
- **ORCL**
- **PSTGRS ***
- **SQL SVR**
- **SYB ASE**
- **SYB IQ**

For specific DBMS version support for DBArtisan, see the **Read Me** at [http://docs.embarcadero.com/products/dbartisan/](http://docs.embarcadero.com/products/dbartisan/).

**DB2 LUW**

DB2 LUW is used as shorthand for IBM DB2 for Linux, Unix, and Windows.

**DB2 z/OS**

DB2 z/OS is used as shorthand for IBM DB2 for z/OS.

**MySQL**

MySQL is used as shorthand for the MySQL RDBMS.

**ORCL**

ORCL is used as shorthand for Oracle.

**PSTGRS ***

PSTGRS is used as shorthand for PostgreSQL.

Specifically-supported PostgreSQL-based database products include Greenplum, Pivotal HAWQ, and BigSQL.
Shorthand for Third Party Product References

SQL SVR
SQL SVR is used as shorthand for Microsoft SQL Server.

SYB ASE
SYB ASE is used as shorthand for Sybase Adaptive Server.

SYB IQ
SYB IQ is used as shorthand for Sybase IQ.
What's New in DBArtisan 2016

- PostgreSQL Object Management
- Analyst Explorer Node
- Performance IQ
- Missing Indexes
- ISQL Performance
- Team Server 2016 Support

PostgreSQL Object Management

Object Wizards/Editors

A Wizard and an Editor for **Types** have been added for PostgreSQL: [Types Wizard](#) and [Types Editor](#).

Analyst Explorer Node

The Analyst Node of the Explorer provides shortcuts to the License-specific Analyst Series tools. These shortcuts are:

- Capacity Analyst
- Performance Analyst
- Space Analyst

Performance IQ

**Performance IQ** is a feature which gives you statistics about the performance of a dbms. This feature measures different valuable statistics for the users, providing them with a tool to locate and diagnose problematic SQL code and event-based bottlenecks. **Performance IQ** is based in Team Server 2016 and it includes four main windows which displays relevant information:

- **Performance IQ - Top Instances Window**: Gives you statistical information about **Wait Time** per day for different dbms. It helps you to locate and diagnose problematic SQL code and event-based bottleneck.
What's New in DBArtisan 2016

- **Performance IQ - Top Waits Window**: Samples a data source and builds a statistical model of the load on the database based on the **Wait Time**.

- **Performance IQ - Top I/O Window**: Presents I/O information based on the Sankey diagram and **Throughput vs Response Time** graph.

- **Performance IQ - Monitoring Alerts Window**: Lists the **Triggered Alerts** which have been defined before in Team Server 2016.

**Performance IQ** needs Team Server 2016 to be configured for monitoring datasources. You can find all the information for installing Team Server 2016 in Install and Configure Team Server 2016 and Repository.

**Note**: In this release, **Performance IQ** only available for **SQL Server** and **Oracle**.

**Top Instances**

![Top Instances](image-url)
What's New in DBArtisan 2016

Top Waits

Top I/O
**Missing Indexes**

The **Missing Indexes** feature analyze the system looking for **Missing Indexes** which, once added, would improve the performance.

DBArtisan proposes you some **Indexes** that can be created after analyzing the system. You can create these **Indexes** by launching the **Indexes Wizard (SQL Server)** and directly double-clicking the selected **Missing Index**.

Description about how to use and access **Missing Indexes** is in **Missing Indexes (SQL Server)**.

**Note:** **Missing Indexes** is only available for **SQL Server**.

**ISQL Performance**

SQL Editor includes new functionalities for SQL Server. In this new release, SQL editor provides information about the SQL statements while you are writing in the **SQL Editor**. This information is included in a new window as well as listed in the **Error Pane**. Information like **Missing Indexes, Statistics, Overlapping Statistics** and **Recommendations** are displayed in this new window. You can find more information in **ISQL Performance**
What's New in DBArtisan 2016

Performance window

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Cost</td>
<td>1549</td>
</tr>
<tr>
<td>avg_user_impact</td>
<td>63.13</td>
</tr>
</tbody>
</table>

Recommendation

CREATE INDEX [missing_index_103_102_testmissingindexes2] ON [SILK_TEST].[dbo].[testmissingindexes2] (([Codigo2], [Codigo3]) INCLUDE ([Field1], [Field2], [Field3], [Field4]))

ISQL Performance listed in Error Pane

Note: ISQL Performance only available for SQL Server.

Team Server 2016 Support

Integration of Team Server 2016 in DBArtisan has been improved. The old TeamServer Navigator has been fully integrated into the Datasource Navigator/Explorer as well as all the features only accessible from the TeamServer Navigator. For more information, see Using the Datasource Navigator/Explorer and Basic Viewing Options in the Navigator/Explorer. Notice that when logged in Team Server 2016 using Performance IQ, three new nodes are added:
What's New in DBArtisan 2016

- Monitored Instances
- Triggered Alerts
- Saved Searches

Team Server 2016 as the Data Source Catalog

DBArtisan 2016 adds the option of registering datasources from the Team Server 2016 Repository. To allow that, new options have been added to Quick Start Setup, and in Tools > Options > Datasources.

In Quick Start Setup, the import of datasources using Team Server 2016 as a catalog has been added.
What's New in DBArtisan 2016

In **Tools > Options > Datasources** the possibility of selecting Team Server 2016 as the source of the catalog has also been added. For more information, see [Working with Team Server 2016 as Datasource Catalog](#).

![New Data Source Search Button](#)

**New Data Source Search Button**

A new button for TeamServer datasource search has been added. This button is located on top of the **Datasource Navigator/Explorer** and it appears only when you are logged in Team Server 2016 and the **Saved Searches** node is selected.

For more information about how to use the **New Data Source Search** see [Searching Team Server 2016 for Datasources](#).

Topics

- Release Notes for DBArtisan 2016
- What Was New in Past Releases
Release Notes for DBArtisan 2016

Important Advisory Notes

- If you want to run DBArtisan on Microsoft Windows 8.1, verify that third-party DBMS native drivers install properly. Consider using a JDBC connection.

Team Server 2016 Installation and Configuration

Team Server 2016 must be installed and Configured in order to get Performance IQ information in DBArtisan.

You can find all the information for installing Team Server 2016 in Install and Configure Team Server 2016.

Team Server URL must be also configured in DBArtisan, see Performance IQ.

Known Issues

- The current version of DBArtisan does not support the MySQL ODBC client that shipped with previous versions of DBArtisan. If DBArtisan crashes after connecting to a MySQL data source:
  1. Close DBArtisan.
  2. Uninstall the older MySQL ODBC client.
  3. Restart DBArtisan and try connecting to a MySQL datasource. You are prompted to install the MySQL client drivers.
  4. Follow the installation instructions to install the new driver.

- Note that when debugging a procedure against an Oracle data source, DBArtisan performs a compilation before debugging. During a compilation, Oracle invalidates referencing objects. For example, if procedures A2 and A3 both reference procedure A1, debugging procedure A1 in DBArtisan, will result in procedures A2 and A3 being invalidated.

- In some situations the Database Monitor may prompt to connect to an already connected datasource if auto-connect is not enabled for that datasource.

- DBArtisan installs the incorrect stored procedures for Capacity Analyst for a Sybase 15 database. Please refer to this Knowledge Base article: www.embarcadero.com/jive/entry.jspa?externalID=1030&caID=2

- For servers running on Sybase version 12.5.3a, the CREATE ENCRYPTION KEY and DECRYPT permissions do not display properly—they'll be shown as null. See Sybase's document CR392544 ("sp_helpprotect does not show privileges related to encryption keys."). This has been fixed in ASE version 12.5.3a/ESD #1 (now available as a download) and ASE version 12.5.4.
The SQL Server Agent failing problem is caused by the lack of permission to enumerate the status of the server service. To determine the status of the server, the user must have permission to check the status of the server service. If the user running DBArtisan on the client machine is a not a local user who can be authenticated on the server machine, the Server Agent jobs will fail.

**Workaround:**

1. If the user running DBArtisan is not a domain user, create the same user with the same password on the server.
2. If the user is a domain user, make sure that the user can log on to the server.

When you are using the Debugger:

- The Debugger windows (Variables, Watch, CallStack, Dependency) cannot be undocked. This behavior is deliberate and is true only for the Debugger windows. The Output window can be undocked.
- When running Windows XP SP2, SQL Server 2000 SP4 is required on both the client and the server.
- When running the Debugger on SQL Server 2005 CLIENTS:
  1. Check that the file ssdebugps.dll is registered on the client machine. This file is REQUIRED for debugging and Microsoft only installs it on the server machine and not as a part of a client-only install.
  2. Follow the instructions under the "Configure DCOM on the computer that is running Visual Studio. NET" heading from Microsoft to reconfigure the DCOM settings on your client machine: [http://support.microsoft.com/default.aspx?kbid=833977](http://support.microsoft.com/default.aspx?kbid=833977).
  3. On the Default Properties tab of the My Computer dialog box, make sure the Default Authentication Level is set to None and that the Default Impersonation Level is set to Impersonate.

When using the Embarcadero Sybase debugger against a Sybase database with multiple temporary databases (supported in Sybase ASE 12.5.0.3 and above), either the user or the debugger application must be bound to a specific temporary database.

- To bind the Embarcadero Sybase Debugger:
  `sp_tempdb "bind", "ap", "Sybase Debugger", "DB", "<tempdb name>"`

- To bind the user:
  `sp_tempdb "bind", "lg", "<login id>", "DB", "<tempdb name>"`

- The BCP (bulk copy) data movement option is disabled for cross-platform migration. In addition, to use the BCP in a Sybase-to-Sybase migration, the user must be logged in as System Administrator *or* the "select
Release Notes for DBArtisan 2016

into/bulkcopy/pllsort" database option must be true on the target catalog. If this option is "false" on the target catalog, BCP will not appear as a data movement option for non-system users.

- Schema migration jobs created in earlier versions of DBArtisan that were saved with a .migrate file extension must be re-created in DBArtisan 8.1 or later. Only migration jobs with a .sav extension can be reused.
- DBArtisan is currently unable to create table names, column names, and check constraint names longer than 18 characters on an OS390 mainframe database.
- On SQL Server 2005, the Browser component is disabled by default. With this service disabled, in DBArtisan you cannot reference SQL Server instances by name, only by port number. If you want the ability to reference SQL Server instances by name, you must enable this service on the server.

- What's New in DBArtisan XE6
- What's New in DBArtisan XE5
- What's New in DBArtisan XE4
- What's New in DBArtisan XE3.5
What's New in DBArtisan XE6 Patch

New features for this release fall into the following categories:

- PostgreSQL Object Management
- PostgreSQL Utilities
- PostgreSQL Tools Menu Updates
- PostgreSQL Updates to the SQL Editor
- Welcome Window
- Project Management, Version Control, and Script Library
- Datasource Registration Updates
- Trace File Logging Options
- DBMS Platform Updates
- Explorer and Database Monitor Updates
- ISQL Windows Backup
- Connectivity Improvement
- Performance Analyst for SQL Server Improvements
- Java Update
- Improved Multi-Monitor Support

PostgreSQL Object Management

The following topics describe PostgreSQL object management updates for this release.

Object Wizards/Editors

You can now create and edit objects of the following types: check constraints, domains, exclusion constraints, foreign keys, functions, indexes, primary keys, roles, rules, schemas, tables, tablespaces, triggers, unique keys, and views.

Refresh Materialized View Object Action

A new Refresh Materialized View action is available against views created using the CREATE MATERIALIZED VIEW statement. It lets you build and submit a REFRESH MATERIALIZED VIEW statement. Simple default behavior replaces the contents of a materialized view. If With No Data is selected, no new data is generated and the materialized view will be in an unscannable state.
Datasource Explorer Performance Node

A Performance node is now available in the Datasource Explorer. As with other DBMS platforms, the PostgreSQL Performance node has Locks and Processes subnodes. A Prepared Transactions subnode provides details on transactions that have been prepared for two-phase commit.

The new Server > Logs node provides access to logfiles. A Rotate Log action signals the log-file manager to immediately switch to use of a new output file.

PostgreSQL Utilities

Data and Schema Utilities

The following Utilities menu features are now available against PostgreSQL datasources:

- Database Monitor provides details on locks, processes, and prepared transactions.
What’s New in DBArtisan XE6 Patch

- **Data Load** lets you load data from a file.
- **Data Unload** lets you generate a pgadmin export data call, dumping database data to a file.
- **Database Backup** generates a pg_dump script, backing up one or more tables or views of a database.
- **Database Restore** generates a pg_restore operation, restoring tables or view data from a previous backup.
- **Schema Extraction** walks you through the process of building an extraction script, executing it for storage of the database or object schema in a file.
- **Schema Migration** migrates schema and table data from one DBMS platform to another.
- **Schema Publication** lets you generate HTML reports documenting the details of your schema, databases, and database objects.
- **Reverse Engineering** lets you analyze, control, and document existing database objects.

Database Monitor

DBArtisan now offers the Database Monitor against PostgreSQL datasources. Similar to Database Monitor for other DBMS platforms, **Locks** and **Processes** tabs are available in the Database Monitor. A new **Prepared Transactions** tab is also available against PostgreSQL datasources. It displays identification details for transactions that have been prepared for two-phase commit. The following `pg_prepared_xacts` table columns are displayed for each transaction: transaction ID, global ID, date and time that the PREPARE TRANSACTION statement was executed, and the owner and database associated with the transaction. When this tab is active, the toolbar lets you **Commit** and **Rollback** a selected transaction.

![Database Monitor Screenshot](image)

PostgreSQL Tools Menu Updates

The following Tools menu features are now available against PostgreSQL datasources:

- **Database Search** lets you search for objects whose DDL contains a specified character string, across multiple databases.
What's New in DBArtisan XE6 Patch

- **Query Builder** lets you construct, structure, and manipulate queries using a graphical interface.
- **Data Editor** lets you edit table data in real time.

**PostgreSQL Updates to the SQL Editor**

The Paste SQL Syntax and Paste SQL Statement features are now available against PostgreSQL datasources.

![Image of SQL Syntax and Paste SQL windows]

**Welcome Window**

The **Welcome Window** helps customers to get information about product features, news and upcoming events. This window also includes direct links to useful DBArtisan features like New Project, Open Project or links to Recent Datasources.

**Project Management, Version Control, and Script Library**

**DBArtisan Project Management Support**

DBArtisan project management facilities act as a repository to maintain all source code for a database project. When you create a new project (File > New > Project), you can initialize the project using one of four methods:

- From an existing database
What's New in DBArtisan XE6 Patch

- From one or more files (SQL/query scripts, DDL files, ER/Studio files, procedures, Java, JavaScript or VB Script files, or text or HTML files)
- From a version control project
- Uninitialized.

A project opens in a dedicated **Project** window.

In addition to basic project operations (**New, Open, Close**), **Project** menu and right-click options provide basic file and folder options. Other key options let you

- Specify a build order for your project scripts
- Execute the build.

**DBArtisan Version Control Support**

The **Project** menu also provides access to version control support, also new for this release of DBArtisan. Basic version control functions are provided: **Get Latest Version**, **Check In**, **Check Out**, **Undo Check Out**, **Add to/Remove From Version Control**, **Show History**, **Show Differences**, **Version Control Properties**, **Share From Version Control**, and **Refresh Status**.
Support is provided for any source control product that uses the MSSCCI plug-in interface.

**Note:** For the 64-bit version of DBArtisan, a 32-bit version of the MSSCCI provider can be used for version control access. The feature is controlled from the Options Editor's *Version Control* tab (`File > Options > General > Version Control`).

**Script Library**

The Script Library (`View > Script Library`) provides a drag-and-drop library interface of all supported DBMS syntax, SQL syntax, built-in functions, optimizer hits, and SQL-conditional syntax. Additionally, it provides the ability to create custom folders to store commonly-used code for quick and efficient access or execution, as needed.

**Datasource Registration Updates**

For connectivity purposes, DBArtisan is packaged with a native driver as well as a set of one or more JDBC drivers for each DBMS platform. In previous releases, the native driver for each platform was the default connection option when registering a datasource.

This release introduces two enhancements:
What's New in DBArtisan XE6 Patch

- You can now designate one of the JDBC drivers as the default connectivity option for a DBMS platform.
- You can universally change the definition for all existing, currently unconnected datasources for a platform to use either the native driver or a JDBC driver as the connection option.

In the Options Editor, the Connections page now has a tab corresponding to each supported DBMS platform. The Default Driver Selection group of settings provides the new functions.

For DBMS platforms with a native driver and one or more JDBC drivers packaged, the Connect using... and JDBC driver to use controls enable selection of a JDBC driver as the default connection option and let you select a JDBC driver. The Assign to all disconnected Datasources control assigns the selected JDBC driver as the connection option for all disconnected datasources for the current platform, if the Connect using... control is selected. Otherwise it assigns the native driver as the connection option for all disconnected datasources for the current DBMS platform.

Trace File Logging Options

As a new diagnostic tool, you can now generate a trace file consisting of the sequence of application event messages. The Options Editor’s Logging page now lets you activate and deactivate, specify a location for, and select a severity level of messages logged.

In descending order of severity (and ascending order of total messages logged), Trace Level options are Fatal Errors, Errors, Warning, Info, Debug, Trace, and Max.
DBMS Platform Updates

The following topics describe DBMS platform and version updates for this release.

- **Sybase IQ 16** - Functionality available for previous Sybase IQ releases is now available against Sybase IQ 16 datasources.

- **Apache Hive** - This release presents a technical preview of Apache Hive support. As with other technical previews, minimal functionality is provided. Features include datasource registration and connection, a minimal Navigator/Explorer tree, and a minimal set of object management features.

Explorer and Database Monitor Updates

Improved numeric column filtering in **Explorer** and **Database Monitor**. Users can now filter numeric columns by using operators (>,=,<,<=,>=). When no operator is used, >= is assumed.

ISQL Windows Backup

For Windows Vista and higher, the auto save feature of DBArtisan is now connected to the Restart Manager. Also, unlike the previous version (o Windows XP) all modified ISQL windows will have a backup saved at a regular interval, even those ISQL windows that do not have a file name associated with them. In the event of a crash, those ISQL windows will automatically open up on the next restart. If the Restart Manager is able to detect the crash, it will attempt to automatically restart the application for you. On Windows XP, this feature will function as it did in past versions.

Connectivity Improvement

Connectivity has been improved to have a central location in the options page to set the driver for all datasources of a certain type to use. An individual datasource can override this setting, but by default all datasources will obey the global setting. No longer will customers have to change each individual datasource if they want to use a particular driver for their system.

Performance Analyst for SQL Server Improvements

Performance Analyst improves the space usage functionalities adding information about the database and object that are taking up the most space on the system.

Java Update

DBArtisan has updated to Java 1.7.
Improved Multi-Monitor Support

Users can now detach any MDI tab from the main application window. They can group these detached tabs together or keep them separate.

Important Advisory Notes

- If you want to run DBArtisan on Microsoft Windows 8.1, verify that third-party DBMS native drivers install properly. Consider using a JDBC connection.

Known Issues

- The current version of DBArtisan does not support the MySQL ODBC client that shipped with previous versions of DBArtisan. If DBArtisan crashes after connecting to a MySQL data source:
  1. Close DBArtisan.
  2. Uninstall the older MySQL ODBC client.
  3. Restart DBArtisan and try connecting to a MySQL datasource. You are prompted to install the MySQL client drivers.
  4. Follow the installation instructions to install the new driver.

- Note that when debugging a procedure against an Oracle data source, DBArtisan performs a compilation before debugging. During a compilation, Oracle invalidates referencing objects. For example, if procedures A2 and A3 both reference procedure A1, debugging procedure A1 in DBArtisan, will result in procedures A2 and A3 being invalidated.

- In some situations the Database Monitor may prompt to connect to an already connected datasource if auto-connect is not enabled for that datasource.

- DBArtisan installs the incorrect stored procedures for Capacity Analyst for a Sybase 15 database. Please refer to this Knowledge Base article: www.embarcadero.com/jive/entry.jspa?externallD=1030&caID=2

- For servers running on Sybase version 12.5.3a, the CREATE ENCRYPTION KEY and DECRYPT permissions do not display properly—they'll be shown as null. See Sybase's document CR392544 ("sp_helpprotect does not show privileges related to encryption keys."). This has been fixed in ASE version 12.5.3a/ESD #1 (now available as a download) and ASE version 12.5.4.

- The SQL Server Agent failing problem is caused by the lack of permission to enumerate the status of the server service. To determine the status of the server, the user must have permission to check the status of the server service. If the user running DBArtisan at the client machine is a not a local user who can be authenticated at the server machine, the Server Agent jobs will fail.

Workaround:
1. If the user that runs DBArtisan is not a domain user, create the same user with the same password on the server.

2. If the user is a domain user, make sure the user can login to the server.
   - When you are using the Debugger:
     - The Debugger windows (Variables, Watch, CallStack, Dependency) cannot be undocked. This behavior is deliberate and is true only for the Debugger windows. The Output window can be undocked.
     - When running Windows XP SP2, SQL Server 2000 SP4 is required on both the client and the server.
   - When running the Debugger on SQL Server 2005 CLIENTS:
     1. Verify that the file ssdebugps.dll is registered on the client machine. This file is REQUIRED for debugging and Microsoft only installs it on the server machine and not as a part of a client-only install.
     2. Follow the instructions under the "Configure DCOM on the computer that is running Visual Studio. NET" heading from Microsoft to reconfigure the DCOM settings on your client machine: http://support.microsoft.com/default.aspx?kbid=833977.
     3. On the Default Properties tab of the My Computer dialog box, make sure the Default Authentication Level is set to None and that the Default Impersonation Level is set to Impersonate.
   - When using the Embarcadero Sybase debugger against a Sybase database with multiple temporary databases (supported in Sybase ASE 12.5.0.3 and above), either the user or the debugger application must be bound to a specific temporary database.
     - To bind the Embarcadero Sybase Debugger:
       `sp_tempdb "bind", "ap", "Sybase Debugger", "DB", "<tempdb name>"`
     - To bind the user:
       `sp_tempdb "bind", "lg", ",<login id>", "DB", "<tempdb name>"`
   - The BCP (bulk copy) data movement option is disabled for cross-platform migration. In addition, to use the BCP in a Sybase-to-Sybase migration, the user must be logged in as System Administrator *or* the "select into/bulkcopy/pllsort" database option must be true on the target catalog. If this option is "false" on the target catalog, BCP will not appear as a data movement option for non-system users.
   - Schema migration jobs created in earlier versions of DBArtisan that were saved with a .migrate file extension must be re-created in DBArtisan 8.1 or later. Only migration jobs with a .sav extension can be reused.
DBArtisan is currently unable to create table names, column names, and check constraint names longer than 18 characters on an OS390 mainframe database.

On SQL Server 2005, the Browser component is disabled by default. With this service disabled, in DBArtisan you cannot reference SQL Server instances by name, only by port number. If you want the ability to reference SQL Server instances by name, you must enable this service on the server.

What's New in DBArtisan XE6

As of this release, support is provided for Postgres datasources. The following topics provide a summary of the new functionality.

Version Support and Connectivity Options

Postgres versions 9.3 and higher are supported. Connectivity is available with the PostgreSQL ODBC Driver (version 9.02 minimum) or with the pre-packaged PostgreSQL JDBC Driver.

Command Line Startup Against Postgres Datasources

As with other platforms, command line startup against Postgres datasources is available. In DBArtisan, you can use the following syntax options:

```
dbart.exe -D datasource -U username [-P password]
```

```
dbart.exe -R connectionstring -D datasource -U username [-P password]
```

The `connectionstring` can take the following form:

```
postgresql://HOST
postgresql://HOST/DB
postgresql://HOST:PORT
postgresql://HOST:PORT/DB
```

**NOTE:** Using `postresqlp` instead of `postgresql` will make the datasource created permanent.

If the Teradata ODBC driver is installed, the connection will be established using that driver. Otherwise, the Teradata JDBC driver will be used.

Standard Datasource Registration and Connectivity

Currently, you can manually register a Postgres datasource, identifying a host and database name, and optionally providing a port number. Basic User ID and Password credentials can be provided.
Similarly, a login dialog, prompting for a user name and password, lets you connect to a Teradata datasource.

Datasource Explorer/Navigator Object Node Availability

In DBArtisan, primary Explorer/Navigator nodes and key secondary nodes for the new platform are as follows:
Object actions Drop and Extract are available for each supported object type. In addition, some object type-specific actions, such as Select * From, Rename, Change Schema, and Change Owner are available.

**SQL Editor**

Execution against Postgres sources is available. Also available are related, common SQL Editor tools such as Query Options, Paste SQL Syntax, and Paste SQL Statement.
What's New in DBArtisan XE5

New features for this release fall into the following categories:

- Team Server 2016
- 64-bit Installation
- Windows 8 Support
- Teradata
- Other New DBMS Version Support
- SQL Server Updates
- DB2 LUW Updates
- Sybase ASE Updates
- Oracle Updates
- Database Monitor
- Query Builder

Team Server 2016

Functionality previously provided by Embarcadero Connect, is now provided by Team Server 2016. Like Connect, Team Server 2016 is a data governance repository that stores an inventory of datasource definitions and ER/Studio data models.

In addition to functionality provided by Connect, the new product also offers the following features:

- An advanced search mechanism lets you locate datasource definitions by a variety of criteria, including DBMS platform, version, and host name. You can also search on operational characteristics such as space statistics and ping time.

- Users can monitor the activity stream associated with their Team Server 2016 account or the activity stream for a datasource definition. Streams include user posts, Likes, and Follows.

64-bit Installation

Rapid SQL and DBArtisan now run as native, 64-bit applications. Separate installers let you choose between 32-bit and 64-bit applications.

64-bit versions of DBMS platform drivers are installed when you select that option. If you are using custom drivers, as of this release, you must be using 64-bit versions of those custom drivers when using the 64-bit version of Rapid SQL or DBArtisan.
What's New in DBArtisan XE5

Windows 8 Support

Rapid SQL and DBArtisan are now fully supported on the Windows 8 operating system.

Teradata

As of this release, Rapid SQL and DBArtisan provide support for Teradata versions 13.10, 14, and 14.10. The following topics provide a summary of the new functionality.

Command line startup against Teradata datasources

As with other platforms, command line startup is available.

DBArtisan offers the following syntax options:

```
dbart.exe -D datasource -U username [-P password]
dbart.exe -R 'connectionstring' -D datasource -U username [-P password]
```

The connectionstring can take the following form:

```
teradata://HOST
teradata://HOST/DB
teradata://HOST:PORT
teradata://HOST:PORT/DB
```

Using `teradatap` will make the datasource created permanent.

If the Teradata ODBC driver is installed, the connection will be established using that driver. Otherwise, the Teradata JDBC driver will be used.

Standard Datasource Registration and Connectivity

Currently, you can manually register a Teradata datasource, identifying a host and optionally providing port and database name information.

<table>
<thead>
<tr>
<th>Database Type</th>
<th>Connection Information</th>
<th>Security Parameters</th>
<th>Custom Driver Properties</th>
<th>Datasource Properties</th>
<th>Datasource Group</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Host:</td>
<td>Port (optional):</td>
<td>Database (optional):</td>
<td>Datasource Name:</td>
<td></td>
</tr>
</tbody>
</table>

Similarly, a login dialog, prompting for a user name and password, lets you connect to a Teradata datasource.

Datasource Explorer/Navigator Node Availability
In DBArtisan, primary Explorer/Navigator nodes and key secondary nodes for the new platform are as follows:

Object actions such as **Object Properties**, **Execute**, **Edit Data**, **Build Query**, **Select * From**, and **Schema** are available, as appropriate to the object type.

**SQL Editor**

Execution against Teradata sources is available. Also available are related, common SQL Editor tools such as **Query Options**, **Paste SQL Syntax**, and **Paste SQL Statement**.

**Other New DBMS Version Support**

As of this release, Rapid SQL and DBArtisan provide full support for the following DBMS platform versions:

- IBM DB2 LUW version 10
- IBM DB2 z/OS version 10
- Oracle 12c
- Sybase ASE 15.7.

**SQL Server Updates**

The following topics describe SQL Server updates for the current release.

**Sequence Object Type**

The sequence object type, introduced with SQL Server version 12 is now supported. A creation wizard, editor, and a basic set of object actions are provided.
FileTable and FileStream updates to tables

When creating or editing SQL Server tables, a new set of properties is available. They let you:

- Specify a filegroup for the table by providing a FILESTREAM_ON argument value
- Create the table as a FileTable, with a full set of FileTable arguments.

A new Enable/Disable Filetable(s) action lets you build and submit an ALTER TABLE statement, specifying either an ENABLE FILETABLE_NAMESPACE or DISABLE FILETABLE_NAMESPACE argument. This enables or disables system-defined constraints on a FileTable.
DB2 LUW Updates

The **Update Statistics** object action has been updated to use the ADMIN_CMD system procedure. This eliminates the constraint of having target datasources registered by alias and using the native client. **Update Statistics** can now be used against all datasources, regardless of how they were registered.

Sybase ASE Updates

Against version 15.7 datasources, the Login Wizard/Editor now generates DDL that uses CREATE/ALTER LOGIN syntax. New properties let you work with SUID, LOGIN PROFILE, and EXEMPT INACTIVE LOCK parameters.

Oracle Updates

If the Oracle SQL*Net Client is not installed, Rapid SQL and DBArtisan will attempt to connect to an Oracle datasource using the Oracle Database Instant Client.
Database Monitor

The following customizations can be made on a DBMS platform-by-platform basis.

**Saved column-widths**

When you manually resize a column on a Database Monitor tab, the new size is saved across startups of DBArtisan and Database Monitor.

**Color-coding and Refresh Rate Customization**

The Options Editor now offers a DB Monitor page.

It lets you perform the following tasks: Set foreground and background colors associated with sleeping, blocking, and default processes. Specify the default display refresh rate used after opening a Database Monitor window. Note that you can still modify the refresh rate from the Database Monitor window.

**Query Builder**

As of this release, when you add the same table to the diagram pane multiple times, a new alias is automatically assigned to each instance. Adding a table multiple times can be useful when selecting additional data from the table, based on different join criteria.
What's New in DBArtisan XE4

New features for this release fall into the following categories:

- Data Governance
- Other Datasource Registration Updates
- User Interface and Navigator/Explorer Updates
- SQL Server Updates
- Oracle Updates

Data Governance

DBArtisan now integrates with Embarcadero Connect, Embarcadero’s data governance repository. This lets DBArtisan participate in governance schemes aimed at control and centralization of data-related resources, providing controlled access to those resources, and distributing relevant information on those resources.

Enabling and Connecting to an Embarcadero Connect Server

The Options Editor’s Connect tab lets you configure Embarcadero Connect server usage:

Use Connect enables connections to an Embarcadero Connect server while Connect URL lets you provide an address. A control on the main window’s status bar provides current configuration/status information on the Connect server.

Double-clicking the control initiates an action appropriate to the current status. For example if Connect server usage is enabled and properly configured, but DBArtisan is not currently logged in, then double-clicking the status control opens a login dialog.
Three new HKLM/HKCU registry settings (ConnectURL, UseConnect, and AllowKeepMeSignedIn) let you lock down those features.

**Embarcadero Connect and Datasource Management**

A new Connect Navigator, similar to the existing Navigator/Explorer, lets you work with datasource definitions residing on an Embarcadero Connect server. The Navigator hierarchy shows

- Datasource groups
- Datasource definitions residing on the Embarcadero Connect repository
- Locally datasources that were registered using definitions in the Embarcadero Connect repository
In order to make use of a Connect datasource, you must register it as a local datasource. This creates a local copy of the datasource definition, accessible in the existing Navigator/Explorer. Key connectivity information, the **Connection Information** tab settings (excluding **Datasource Name**) and a custom JDBC driver if supplied, is not editable in the resulting local datasource definition. **Security Parameters** tab information, such as **User ID** and **Password**) is not copied to the local datasource definition. By default, when you register a Connect server datasource as a local datasource, the local definition is “attached” to the Connect version. The local definition’s key connectivity information is synchronized with the Connect server definition on each attempt to connect to the datasource. An attached datasource has a distinctive icon:

You can subsequently detach an attached datasource definition, leaving that definition available as a local datasource. The datasource will no longer be synchronized with the corresponding definition on the Connect server. While the attach and detach operations can be used against individual datasource definition, the Connect Navigator also offers a **Reconcile Datasources** operation that lets you manage multiple Connect datasources simultaneously.
The three lists offer the following options:

- **Matching data sources**: lists Embarcadero Connect server datasource definitions and local datasource definitions with identical connection information details but that are currently not attached. Selecting an entry from this list attaches the local datasource to the Connect datasource, ensuring that any changes to the Connect server definition will be copied to the local datasource definition on the next attempt to connect to the datasource.

- **Unmatched Connect data sources**: lists Embarcadero Connect server datasource definitions for which there are no local datasource definitions with matching connection information. Selecting an entry from this list creates a matching local datasource definition and attaches the local definition to the matching Connect server datasource definition.

- **Unmatched local data sources**: lists local datasource definitions for which there are no Embarcadero Connect server datasource definitions with matching connection information. Selecting an entry from this list creates a matching Connect server datasource definition and attaches the local definition to the Connect server datasource definition.

In addition to local DBArtisan use of Connect datasources, the Connect Navigator lets you create, edit, and delete datasource definitions on the Connect server.

**Embarcadero Connect Model Metadata and the SQL Editor**
DBArtisan integrates with Embarcadero Connect, a product that allows easy distribution of data governance repository metadata to the enterprise. Specifically, if a database or schema has associated model data in Connect, model data such as alerts and attribute/entity descriptions can be displayed/included in the SQL Editor in the following ways:

- Attribute/Entity descriptions can be included in Code Assist proposals
- On explicitly formatting a script, metadata for tables and views referenced in SELECT, CREATE PROCEDURE, CREATE FUNCTION, CREATE TRIGGER, CREATE VIEW statements are added in a single comment block above the referencing statement
- When hovering the mouse over a table column name, table name or view name, a tooltip showing the entity/attribute description is displayed
- Warning icons are displayed in the window gutter beside lines referencing objects whose metadata includes alerts
- On execution of a script referencing objects whose metadata includes alerts, the error pane opens with an entry for each referenced object.

**To use model metadata in the SQL Editor**

1. Ensure that Connect repository usage is enabled and that you are logged in to the Connect Server.
2. Configure the **Metadata** features on the **ISQL > Code Assist** page of the Options editor.

**Other Datasource Registration Updates**

The Datasource Registration Wizard has been simplified so that all connection information is, as in earlier releases, provided on a single page.
What's New in DBArtisan XE4

Additional improvements include:

- When using the Sybase J Connect driver, you now provide the sql.ini alias name as opposed to the host and port.
- When using the Oracle Thin JDBC driver, DBArtisan now lets you provide a tnsnames.ora alias name as opposed to host, port, and SID/service details.

In both cases, if the information in the alias file changes, those changes do not have to be made manually in DBArtisan.

User Interface and Navigator/Explorer Updates

Bookmarks Enhancements

The number of Navigator/Explorer Bookmarks you can create has been increased from 64 to 256. In addition, DBArtisan will no longer allow you to create multiple bookmarks referencing the same Navigator/Explorer node.

SQL Server Updates

SQL Server 12 SQL Features
This release introduces dedicated SQL Editor support for SQL Server 12 Transact SQL. DBArtisan features such as SQL execution, debugging, formatting/editing, and automated error detection and coding assistance, now work seamlessly against SQL Server version 12. Specific updates have been made to accommodate reserved words/keywords, built-in functions, and updates to the ALTER, CREATE, DROP and other statements.

Oracle Updates

DBMS_SCHEDULER Support

In previous releases, DBArtisan supported the DBMS_JOB package through its Oracle Job Queue mechanism. As of this release, DBArtisan provides support for the DBMS_SCHEDULER package. Support includes all DBMS_SCHEDULER action types, Oracle’s calendaring syntax, as well as commonly used attributes. DBMS_SCHEDULER support is implemented in DBArtisan with four new object types, available in the Datasource Navigator/Explorer under a new Scheduler node:

Three new wizards/editors are available:

- **Schedules Wizard**: Builds and submits a call to DBMS_SCHEDULER.CREATE_SCHEDULE call.

- **Programs Wizard**: Builds and submits a call to DBMS_SCHEDULER.CREATE_PROGRAM with optional DBMS_SCHEDULER.DEFINE_PROGRAM_ARGUMENT calls, letting you create a program.
What's New in DBArtisan XE4

Jobs Wizard: Builds and submits a call to DBMS_SCHEDULER.CREATE_JOB with optional DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE, DBMS_SCHEDULER.SET_ATTRIBUTE, and DBMS_SCHEDULER.ENABLE calls.
Against jobs, three DBMS_SCHEDULER-specific object actions are available:

- **Enable/Disable**: Corresponds to DBMS_SCHEDULER.DISABLE or DBMS_SCHEDULER.ENABLE calls.
- **Run Job**: Corresponds to a DBMS_SCHEDULER.RUN_JOB call.
- **Stop Job**: Corresponds to a DBMS_SCHEDULER.STOP_JOB call.

The **Enable/Disable** action is also available against programs.

**Suppression of time component in DATE datatype results**

In the Results window of the ISQL Editor, display of Oracle DATE datatype results can now be configured to suppress display of time components (DD:MM:SS) if the time component is all zeroes. The Options Editor (File > Options > Connection > Oracle) now has a **Hide time portion of DATE datatype if zero** control that controls this feature.
What's New in DBArtisan XE4
What's New in DBArtisan XE3.5

New features for this release fall into the following categories:

- Feature Lockdown
- Command Line Startup
- Connectivity Updates
- Explorer Updates
- SQL Editor Updates
- Oracle Feature Support
- Sybase IQ Support
- SQL Server Feature Support
- DB2 LUW and DB2 z/OS Feature Support
- DB2 LUW Feature Support

Feature Lockdown

Administrators can now restrict certain features using the registry. Registry location HKLM\Software\Embarcadero\DBArtisan\Admin has the following entries:

**RestrictedPlatforms** (REG_SZ) A comma-separated list (db2=0,mssqlserver=1, for example) dictating DBMS platform support on the machine. Valid names for the name=value pairs are `db2`, `os390`, `mssqlserver`, `mysql`, `oracle`, `sybase`, `interbase`, `mssqlazure`, `odbc`, `jdbc`, and `sybaseiq`. Any non-zero value for a name=value pair prevents new datasources for that platform from being registered.

**DisableAutoConnect** (REG_DWORD) When set to any non-zero value, users cannot use the auto-connect feature when registering or logging in to a datasource.

**SharedDatasourceCatalogPath** (REG_SZ) Providing a path to the network shared datasource catalog forces DBArtisan to use that datasource catalog storage option. Registry-based and file-based catalog storage will be unavailable on this machine.

Command Line Startup

This release introduces command line startup of DBArtisan with switches letting you specify a datasource and credentials: `dbart.exe -Ddatasource=Uusername-Ppassword rsql.exe -Ddatasource=Uusername-Ppassword` This is primarily aimed at identity management systems working in conjunction with DBArtisan. Such systems can be configured to start DBArtisan and connect to a specific datasource using credentials.
What's New in DBArtisan XE3.5

that are invisible to the user. Other applications that hide credentials, force connection to a specific datasource, or otherwise automate startup of DBArtisan can make use of this feature.

Connectivity Updates

The following topics describe connectivity updates for this release.

DBMS Version Support updates

DBArtisan now provides support for Microsoft SQL Server 2012. All functionality supported by DBArtisan for previous SQL Server versions is supported for the 2012 version. As of this release, DBArtisan is no longer tested against the following DBMS versions: Microsoft SQL Server 2000 IBM DB2 for Linux, Unix, and Windows version 8.x

Discover Datasources Feature Updated to Detect TOAD Datasources

You can now import definitions from the following Quest Software products:

- Toad for MySQL
- Toad for Oracle
- Toad for SQL Server
- Toad for Sybase (ASE and IQ)

The Discover Datasources feature will automatically search registration files for datasource definitions and offer you the option to register any datasources found.

LDAP connectivity option

DBArtisan now supports LDAP connections to DB2, Oracle, and Sybase ASE datasources. This lets DBArtisan users of those DBMS products take advantage of the centralized access details and authentication provided by an LDAP Server. The Options Editor now lets you enable LDAP lookup, identify an LDAP Server, provide a distinguished name, and provide associated user login details and options.
When registering a datasource against one of the supported DBMS platforms, a new Connection Information tab control lets you designate the registration as being LDAP-based. You can then select from the servers defined on the specified LDAP Server with availability according to the credentials provided on the Options Editor's LDAP Configuration tab. Similarly, with LDAP Server access configured in DBArtisan, the Discover Datasources feature can detect datasources defined on that server.

Driver Connection String Properties/Keywords Availability With Native Drivers

In previous releases, datasource registration allowed basic connection string generation, consisting of server/database identification, security details, and credentials. Other property or keyword specifications could only be provided if you were using a generic JDBC connection. A new Custom Driver Properties panel lets you provide custom driver property specifications when creating or editing a datasource definition that uses one of the DBArtisan native drivers.
For each platform, all connection string parameters/driver properties supported for that driver can be specified. Generic JDBC and ODBC Support DBArtisan now supports generic JDBC/ODBC connectivity to non-dedicated DBMS systems or non-database datasources. DBArtisan can connect to a datasource using a customer-provided, third-party JDBC version 3.0 or ODBC version 3.0 driver. Minimal DBArtisan functionality is provided, including a basic Explorer tree and SQL querying.

Explorer Updates

Column Filtering Using Regular Expressions When database objects are displayed in the right-hand pane of the Explorer, column filtering now lets you qualify displayed objects using regular expressions.

This feature must be enabled. The Options Editor’s Explorer pane has a Column filters use regular expressions by default control that enables regular expression usage when DBArtisan starts or a new Explorer is manually opened.
In addition, a REGEX On/REGEX Off button in the status bar lets you toggle the feature on and off for a particular window. The Datasource Navigator An alternative to the Datasource Explorer is now available. The Datasource Navigator is a single-pane window that, like the Explorer, lets you navigate and drill down into datasources, as well as initiate actions against database objects. Without the second pane (the object type-based landing page used by the Explorer), the Navigator occupies less space.

The Navigator also provides greater control over the active datasource. Disconnecting the Navigator tree from the Select Datasource combo box You can suppress linking of the Datasource Navigator tree to the Select Datasource combo box. A clickable Link button appears at the top of the Navigator pane:

How the currently selected datasource changes depends on the state of the Link button.
What's New in DBArtisan XE3.5

The Explorer is linked to the Select Datasource combo

You can explicitly change the active datasource by selecting a datasource from the Select Datasource dropdown. The active datasource changes automatically as datasource-associated windows, such as object editors, become active in the Workspace or as you select nodes in the Explorer. As a side effect, the associated datasource node in the Explorer tree is selected.

When linking is inactive, you can only explicitly change the active datasource when an SQL Editor window is open. The active datasource still changes automatically as datasource-associated windows, such as object editors, become active in the Workspace. And when linking is inactive, the change in the selected datasource has no effect on the selected node in the Explorer tree.

The Explorer is NOT linked to the Select Datasource combo

Locked/unlocked Login and User Icons Depending on the DBMS platform, the icons associated with logins and users differ according to the account’s locked or unlocked state, when viewed in the Explorer

<table>
<thead>
<tr>
<th>Object/Account Type</th>
<th>DBMS Platform</th>
<th>Icon State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login</td>
<td>SQL Server or Sybase ASE</td>
<td>Locked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Unlocked</td>
</tr>
<tr>
<td>User</td>
<td>Oracle or Sybase IQ</td>
<td>Locked</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Unlocked</td>
</tr>
</tbody>
</table>

SQL Editor Updates

The following topics describe updated support for the DBArtisan SQL Editor environment. Executing the statement at the cursor You can now execute the statement where the cursor is placed. DBArtisan parses SQL and DDL statements according to the position of valid statement delimiters. When you select the new Execute Statement option, DBArtisan executes the current statement.

If the statement returns data, a Results tab opens. As a visual aid, DBArtisan highlights the entire statement that was executed.

```sql
1. SELECT * FROM ADMINISTRATOR.DEPARTMENT;
2. SELECT * FROM ADMINISTRATOR.EMPLOYEE;
3. SELECT * FROM ADMINISTRATOR.CUSTOMER;
```
Bind Variable Parameterization in Prepared Statements

As a step in improving performance, DBArtisan now lets you provide bind variable values when executing scripts containing prepared statements. Bind variables, or parameterized literals, can help optimize explain/exection plan usage by minimizing the requirement to “hard parse” queries or statements that differ by one or more literal values. In scripts, DBArtisan recognizes named or unnamed variables that use the following notation:

**DBMS Platform/Driver Type Notation**

<table>
<thead>
<tr>
<th>DBMS Platform/Driver Type</th>
<th>Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Oracle with native driver</strong></td>
<td><code>&lt;name&gt;</code> or</td>
</tr>
<tr>
<td></td>
<td><code>:number</code></td>
</tr>
<tr>
<td><strong>Oracle with JDBC driver</strong></td>
<td><code>?</code></td>
</tr>
<tr>
<td><strong>All other platforms/drivers</strong></td>
<td><code>?</code></td>
</tr>
</tbody>
</table>

For example: `SELECT * FROM MYTABLE WHERE MYCOLUMN = ? CALL MYPROC (:a, :b, :c)` Support for bind variables is enabled on an editor window-by-editor window basis. When setting Query Options, each platform offers a new Prepare Batch setting.

Prepare Batch

For an enabled SQL Editor window, when using execution options, whenever a statement containing bind variable notation is encountered, a Bind Variables dialog opens.

For each bind variable in the current statement, the dialog lets you specify: A type An IN, OUT, or INOUT designation for elements such as function or procedure parameters or arguments, variables used in INTO clauses of an INSERT statement, and variables used in RETURNING clauses of an Update statement. A value You can then execute, skip the statement, or abort execution for the currently running script.
Oracle Feature Support

The following topics describe updated support for Oracle features. Compound Trigger Support The Oracle Trigger Wizard's Trigger Timing property now offers a COMPOUND option, letting you create compound triggers.

<table>
<thead>
<tr>
<th>Trigger Timing</th>
<th>AFTER</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger Type</td>
<td>BEFORE</td>
</tr>
<tr>
<td>Correlation Names</td>
<td>AFTER</td>
</tr>
<tr>
<td>Old Table Alias</td>
<td>COMPOUND</td>
</tr>
</tbody>
</table>

As an aid, when you select this option, the Action tab is automatically populated with a compound trigger block template.

```
5  BEFORE STATEMENT IS
6  BEGIN
7  END BEFORE STATEMENT;
8  BEFORE EACH ROW IS
9  BEGIN
10 END BEFORE EACH ROW;
11 AFTER EACH ROW IS
12 BEGIN
13 END AFTER EACH ROW;
14 AFTER STATEMENT IS
15 BEGIN
16 END AFTER STATEMENT;
17 END
18 END
19 END
20 END ADINAF.MYCOMPOUNDTRIGGER
```

The CREATE OR REPLACE TRIGGER... DDL generated for the trigger built using these options includes the compound trigger-specific FOR clause. Enable/Disable Trigger Support A new Change Status object action generates ALTER TRIGGER... DISABLE/ENABLE DDL, letting you enable or disable one or more Oracle triggers.
Data Pump Import/Export support You can now make calls to the expdp.exe and impdp.exe utilities from DBArtisan.

The wizard lets you specify a full set of parameters. In addition, you can execute the utilities from the wizard or using a command line call specifying an automatically-generated parameters file.
What's New in DBArtisan XE3.5

Sybase IQ Support

The following topics describe updated support for Sybase IQ features.

- **Schema Extraction/Migration** The Schema Extraction and Schema Migration Wizards are now available against Sybase IQ datasources. All features common to extraction/migration on other platforms are available for the new Sybase IQ Wizards.

- **Additional Tools Menu Support** Some Tools menu commands, formerly only available on other DBMS platforms, are now available against Sybase IQ datasources.

    ![Tools Menu](image)

    The Script Execution Facility and File Execution Facility commands are now available for the Sybase IQ platform. Functionality is the same as for other supported DBMS platforms.

    ![Script Execution Facility](image)

    ![File Execution Facility](image)

You can now use the Database Search command to search for database objects containing a specified text string. Similarly, you can use the Visual Diff... command to compare files.
Lastly, the Import Data command lets you load tables from commonly-delimited files.

Remote Server Object Types Remote Server objects are now available under the Security node for Sybase IQ datasources.

As with other Sybase IQ object types, Drop and Extract object actions are available.

Server Node Parameters The Datasource Explorer now offers Version, Database Configuration, and Engine Configuration nodes for the Sybase IQ DBMS platform.
What's New in DBArtisan XE3.5

The Server subnodes provide access to server, database, and connection properties as well as configuration/initialization parameters. Events and Unique Keys Object Types The Datasource Explorer now offers Sybase IQ Events and Unique Keys object types.

A basic set of Drop, Extract, and Migrate actions are available for Unique Key objects. Those actions, as well as an Object Properties action, are supported against Events. A basic set of Drop and Extract actions are available for Unique Key objects. Those actions, as well as an Object Properties action, are supported against Events. DDL Extract Options You now have more control over Extract operations. The Options Editor now includes a DDL Extract > Sybase IQ panel.
As for other platforms, this panel lets you specify: The object types to include DROP statements for in ad hoc DDL extraction. The default dependent object types for each object type included in extraction/migration operations.

**SQL Server Feature Support**

The following topics describe updated support for SQL Server features. User Permissions Updates: When creating or editing users, the System Permissions tab now offers permissions introduced since SQL Server 2005. Newly available system permissions for users include:
<table>
<thead>
<tr>
<th>Command</th>
<th>Command</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER ANY APPLICATION ROLE</td>
<td>ALTER ANY ASSEMBLY</td>
<td>ALTER ANY ASYMMETRIC KEY</td>
</tr>
<tr>
<td>ALTER ANY CERTIFICATE</td>
<td>ALTER ANY CONTRACT</td>
<td>ALTER ANY DATABASE AUDIT</td>
</tr>
<tr>
<td>ALTER ANY DATABASE DDL TRIGGER</td>
<td>ALTER ANY DATABASE EVENT NOTIFICATION</td>
<td>ALTER ANY DATASPACE</td>
</tr>
<tr>
<td>ALTER ANY FULLTEXT CATALOG</td>
<td>ALTER ANY MESSAGE TYPE</td>
<td>ALTER ANY REMOTE SERVICE BINDING</td>
</tr>
<tr>
<td>ALTER ANY ROLE</td>
<td>ALTER ANY ROUTE</td>
<td>ALTER ANY SCHEMA</td>
</tr>
<tr>
<td>ALTER ANY SERVICE</td>
<td>ALTER ANY SYMMETRIC KEY</td>
<td>ALTER ANY USER</td>
</tr>
<tr>
<td>AUTHENTICATE</td>
<td>CHECKPOINT</td>
<td>CONNECT</td>
</tr>
<tr>
<td>CONNECT REPLICATION</td>
<td>CREATE AGGREGATE</td>
<td>CREATE ASSEMBLY</td>
</tr>
<tr>
<td>CREATE CONTRACT</td>
<td>CREATE DATABASE DDL NOTIFICATION</td>
<td>CREATE FULLTEXT CATALOG</td>
</tr>
<tr>
<td>CREATE MESSAGE TYPE</td>
<td>CREATE QUEUE</td>
<td>CREATE REMOTE SERVICE BINDING</td>
</tr>
<tr>
<td>CREATE ROLE</td>
<td>CREATE ROUTE</td>
<td>CREATE SCHEMA</td>
</tr>
<tr>
<td>CREATE SERVICE</td>
<td>CREATE TYPE</td>
<td>CREATE XML SCHEMA COLLECTION</td>
</tr>
<tr>
<td>DELETE</td>
<td>EXECUTE</td>
<td>INSERT</td>
</tr>
<tr>
<td>REFERENCES</td>
<td>SELECT</td>
<td>SHOWPLAN</td>
</tr>
<tr>
<td>SUBSCRIBE QUERY</td>
<td>TAKE OWNERSHIP</td>
<td>UPDATE</td>
</tr>
<tr>
<td>NOTIFICATIONS</td>
<td>VIEW DATABASE STATE</td>
<td></td>
</tr>
</tbody>
</table>

Similarly, the User Wizard/Editor's Object Permissions tab lets you provide Grant/Revoke/Deny permissions on the following object types, previously unavailable with this functionality in DBArtisan

<table>
<thead>
<tr>
<th>ApplicationRole</th>
<th>Assembly</th>
<th>Contract</th>
<th>FullTextCatalog</th>
</tr>
</thead>
<tbody>
<tr>
<td>FullTextStopList</td>
<td>MessageType</td>
<td>Queue</td>
<td>RemoteServiceBinding</td>
</tr>
<tr>
<td>Role</td>
<td>Route</td>
<td>SearchPropertyList</td>
<td>Sequence</td>
</tr>
<tr>
<td>Service</td>
<td>User</td>
<td>UserDefinedDatatype</td>
<td>XMLSchemaCollection</td>
</tr>
</tbody>
</table>

Login Permission Updates After creating a login, the SQL Server Login Editor now lets you assign permissions. While specific permissions differ by DBMS version, the Login
Editor’s System Permissions tab now lets you assign the following permissions, previously unavailable with DBArtisan:

<table>
<thead>
<tr>
<th>Administer Bulk Operations</th>
<th>Alter Any Availability Group</th>
<th>Alter Any Connection</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alter Any Credential</td>
<td>Alter Any Database</td>
<td>Alter Any Endpoint</td>
</tr>
<tr>
<td>Alter Any Event Notification</td>
<td>Alter Any Event Session</td>
<td>Alter Any Linked Server</td>
</tr>
<tr>
<td>Alter Any Login</td>
<td>Alter Any Server Audit</td>
<td>Alter Any Server Role</td>
</tr>
<tr>
<td>Alter Resources</td>
<td>Alter Server State</td>
<td>Alter Settings</td>
</tr>
<tr>
<td>Alter Trace</td>
<td>Authenticate Server</td>
<td>Connect SQL</td>
</tr>
<tr>
<td>Control Server</td>
<td>Create Any Database</td>
<td>Create Availability Group</td>
</tr>
<tr>
<td>Create DDL Event Notification</td>
<td>Create Endpoint</td>
<td>Create Server Role</td>
</tr>
<tr>
<td>Create TRACE EVENT Notification</td>
<td>External Access Assembly</td>
<td>Shutdown</td>
</tr>
<tr>
<td>Unsafe Assembly</td>
<td>View Any Database</td>
<td>View Any Definition</td>
</tr>
<tr>
<td>View Server State</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Similarly, the new Object Permissions tab lets you assign Grant/Revoke/Deny permissions to EndPoints, Availability Groups, Logins, and Server Roles.

### DB2 LUW and DB2 z/OS Feature Support

Temporal Tables (version 10) The Tables Wizard now lets you include attributes that indicate when data in a row is current and when transactions affected the data. Tables can be designated as system-period or application-period tables. The Columns panel now includes settings that let you properly specify row-begin, row-end, and transaction start ID columns. The new Row Properties settings are available for columns assigned a Type of TIMESTAMP.
What's New in DBArtisan XE3.5

A new Temporal Properties panel lets you: Designate a table as a system-time table or business-time table Select the columns used to define the relevant period Provide additional temporal tables implementation details.

In addition, the Primary Key Wizard and Unique Key Wizard have been updated to facilitate temporal tables. A new Time period policy property lets you create a constraint on a business-time table that can enforce uniqueness of the data for any point in business time.
DB2 LUW Feature Support

The following topics describe updated support for IBM DB2 for Linux, Unix, and Windows features. Command Line Processor Export Support Against 9.7 datasources, an Export utility is now available. It lets you export data to one of several external file formats. The CLP Export Wizard lets you: Select an output file format (IXF, DEL, or WSF) Specify a set of modifiers relevant to each format Provide LOB and XML handling details Select a SELECT/XQUERY, default traversal, or user-specified traversal export The Wizard generates two db2.exe calls: one to connect to the database and one to issue the export directive. Lowering Tablespace High Water Mark A new Lower High Water Mark operation lets you reduce the size of existing containers. Against automatically-managed tablespaces, this action lets you build and submit an ALTER TABLESPACE... REDUCE statement, specifying that existing containers be reduced by a specified size.
Against database-managed tablespaces, the Lower High Water Mark operation builds and submits an ALTER TABLESPACE... LOWER HIGH WATER MARK statement followed by an ALTER TABLESPACE... REDUCE statement, explicitly lowering the high water mark before reducing the size of the tablespace.

Moving Table Data A new Move Table object action builds and submits a SYSPROC.ADMIN_MOVE_TABLE call, letting you move data in an active table into a new, identically-named table, leaving the data online and available for use. This action offers two methods: You can create the table manually and use the action to move data to your newly created table. You can have the action create the table, specifying tablespaces used, and have the data moved as part of the operation. Storage Path and Container-based Tablespace Actions Two new tablespace actions are now available.
Rebalance lets you create containers on recently added storage paths and drop containers from storage paths that are in DROP PENDING state. Drop Automatic Storage Paths removes one or more storage paths with an optional REBALANCE operation. Index Compression The Index Wizard and Index Editor now include a Compress property. This controls whether a COMPRESS clause is added to the generated CREATE/ALTER INDEX statement, enabling or disabling index compression.
Getting Started

The following sets of topics are intended for new users. They provide learning curve material and tell you how to configure your new application:

- **Prerequisites and Preliminary Tasks**: Provides information on installation and licensing as well as general information on using this document.
- **Starting DBArtisan**: Describes the various ways to start the application.
- **DBArtisan Application Basics**: Introduces the major user interface elements.
- **DBArtisan Tutorial exercises**: Tutorial exercises that show the major functional areas of DBArtisan.
- **Specifying Application Preferences and Feature Options**: Tells you how to configure DBArtisan.
Starting DBArtisan

There are three ways to start the application:

- Starting an Installed version of DBArtisan from the Start Menu
- Starting an Installed version of DBArtisan from the Command Line
Staring an Installed version of DBArtisan from the Start Menu

The Start menu sequences for DBArtisan startup are always in the form

- Programs > Embarcadero DBArtisan version identifier > Embarcadero DBArtisan version identifier

where version identifier reflects the version you are running.
Staring an Installed version of DBArtisan from the Command Line

Command line startup is primarily aimed at identity management systems working in conjunction with DBArtisan. Such systems can be configured to start DBArtisan and connect to a specific datasource using credentials that are invisible to the user. Other applications that hide credentials, force connection to a specific datasource, administer usage audits, or otherwise automate startup of DBArtisan can make use of this feature.

Two forms of command line startup are available for each product. Syntax and parameters are as follows:

DBArtisan

- `dbart.exe -D datasource -U username [-P password]`
- `dbart.exe -R connectionstring -D datasource -U username [-P password]`

For example

- `rsql.exe -D torlabsy01 -U myusername -P mypassword`
- `dbart.exe -R "oracle://(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=TORLABORCL10g_2)(PORT=1521))(CONNECT_DATA=(SID=ORASID)))" -D torlabora10g_2 -U sys -P extreme`

**Note:** For a listing of valid connection string values, see [R Switch Values by Platform](#).

Keep the following points in mind when using command line startup:

- Credentials remain valid until the user disconnects from the datasource.
- When you try disconnect, a confirmation message box includes a warning message that the connection has external credentials that will be lost if you choose to proceed with disconnect.
- Once disconnected, a user must connect to the previously disconnected datasource using specified, valid credentials or rely on Auto-connect. For more information, see [Manually Registering or Editing Datasources](#).
- Command line credentials override the default credentials provided if a datasource is registered using the Auto-connect setting.

Regarding the switch specifications:

- The password switch/value pair is optional and the `P` switch can be provided without a value.
- The switches are case-sensitive while the datasource is case-insensitive;

- [R Switch Values by Platform](#)
Staring an Installed version of DBArtisan from the Command Line

- The order of these switches doesn't matter;
- Switches can be specified with the minus sign or with a slash and any combinations are allowed. For example, `DBArt-D ROM LABS Q L08 /U sa /P`.
- Switches can be specified with the minus sign or with a slash and any combinations are allowed. For example, `RSQL-D ROM LABS Q L08 /U sa /P`.
- If you specify a switch multiple times, it's last valid occurrence from left to right is used. We auto-connect a single datasource, no matter the number of times a `-D` switch is specified;
- The `-p` switch (with lower case) prints a file;
- If `-R` is specified then one of the following will occur:
  - If `-D` is also specified, it will check to see if that datasource already exists. If it does exist, it will check to see if its connection information matches the provided `-R` parameter. If it matches, startup behavior will be the same as if `-R` was not specified. If it doesn't match, a modified form of the datasource name is generated using the `-D`-provided name to ensure uniqueness and give it the connection information specified by `-R`. If the datasource doesn't exist, a new datasource is generated using the name provided by `-D` and the remaining connection information provided by `-R`.
  - If `-D` is not specified, the `-R`-provided datasource is checked for a match against existing datasources. If a match is found, that datasource is connected. If no match is found, a new datasource is generated using the `-R`-provided information to create a unique name.

**Note:** If connecting to an existing datasource with auto-connect enabled, if `-U` and `-P` values were provided, then auto-connect will be disabled and the provided `-U` and `-P` values are used.

**-R Switch Values by Platform**

The following table lists the valid connection strings that can be used with the `-R` switch for a command line startup.
Staring an Installed version of DBArtisan from the Command Line

<table>
<thead>
<tr>
<th>Platform</th>
<th>Connect String</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2 LUW</td>
<td>db2://&lt;HOST&gt; &lt;DB&gt;</td>
<td>If the DB2 ODBC/CLI driver is installed on the system, that driver will be used for DB2 connections. Otherwise, the IBM Data Server Driver for JDBC will be used. Using &quot;db2p&quot; will make the datasource created permanent.</td>
</tr>
<tr>
<td></td>
<td>db2://&lt;HOST&gt;:&lt;PORT&gt; &lt;DB&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>db2:}@&lt;ALIAS&gt; where ALIAS is the name from the DB2 client registration</td>
<td></td>
</tr>
<tr>
<td>DB2 z/OS</td>
<td>mysql://&lt;HOST&gt; &lt;DB&gt;</td>
<td>If the MySQL ODBC driver is installed on the system, that driver will be used to make the connection. Otherwise, the MySQL Connector/J JDBC driver will be used. Using &quot;mysqlp&quot; will make the datasource created permanent.</td>
</tr>
<tr>
<td></td>
<td>mysql://&lt;HOST&gt;:&lt;PORT&gt; &lt;DB&gt;</td>
<td></td>
</tr>
<tr>
<td>MySQL</td>
<td>mysql://&lt;HOST&gt; &lt;DB&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>mysql://&lt;HOST&gt;:&lt;PORT&gt; &lt;DB&gt;</td>
<td></td>
</tr>
</tbody>
</table>

Embarcadero Technologies
ODB  odbc://<CONNECT_STRING> where connect string can be the a System DSN name on it's own or the full ODBC connection string containing at least one of the following tags: DSN =, FILEDSN = or DRIVER=

ORCL  oracle://<CONNECT_DESCRIPTOR>
oracle:@<ALIAS>
where CONNECT_DESCRIPTOR is in the same form as in the TNSNames.ora file. i.e.
(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=<HOST>)(PORT=<PORT>))(CONNECT_DATA=(SID=<SID>)))
where ALIAS is the name from the TNSNAMES.ora file

Using "odbcp" will make the datasource created permanent.

If OCI is installed on the system, that driver will be used. Otherwise, the Oracle Instant Client will be used. Using "oraclep" will make the datasource created permanent.
Staring an Installed version of DBArtisan from the Command Line

**PostgreSQL**

postgresql://<HOST> postgresql://<HOST>/<DB>
postgresql://<HOST>:<PORT> postgresql://<HOST>:<PORT>/<DB>

If <HOST> is a IPv6 address, it must be enclosed in square brackets. If the PostgreSQL ODBC driver is installed on the system, that driver will be used. Otherwise, the PostgreSQL JDBC driver will be used.

Using "postgresql" will make the datasource created permanent.

**SQL Server**

sqlserver://<HOST> sqlserver://<HOST>/<DB>
sqlserver://<HOST>:<PORT> sqlserver://<HOST>:<PORT>/<DB>
sqlserver://<HOST>\<INSTANCE> sqlserver://<HOST>\<INSTANCE>/<DB>
sqlserver://<HOST>\<INSTANCE>:<PORT> sqlserver://<HOST>\<INSTANCE>:<PORT>/<DB>

sqlserver://<HOST>\<INSTANCE>:<PORT>/<DB> sqlserver:@<ALIAS> sqlserver:@<ALIAS>/<DB> where ALIAS is the name from the Network Library Configuration

The latest Microsoft ODBC driver for SQL Server installed on the system is used to make the connection. Using "sqlserverp" will make the datasource created permanent.
Staring an Installed version of DBArtisan from the Command Line

**SQL Azure**

sqlserverazure://<HOST>  sqlserverazure://<HOST>/<DB>

The latest Microsoft ODBC driver for SQL Server installed on the system is used to make the connection. Using "sqlserverazurep" will make the datasource created permanent.

**SYBASE**

sybase://<HOST>  sybase://<HOST>/<DB>  sybase://<HOST>:<PORT>

sybase://<HOST>:<PORT>/<DB>  sybase:@<ALIAS>

sybase:@<ALIAS>/ <DB> where ALIAS is the name from the SQL.ini file

If CTLib is installed on the system that driver will be used. Otherwise the Sybase jConnect JDBC driver will be used. Using "sybasep" will make the datasource created permanent.
Staring an Installed version of DBArtisan from the Command Line

If the Sybase IQ ODBC driver is installed on the system it will use that, otherwise it will use the Sybase jConnect JDBC driver. Using "sybaseiqp" will make the datasource created permanent.

The following table lists the valid connection strings that can be used with the -R switch for a command line startup.

<table>
<thead>
<tr>
<th>SYB</th>
<th>sybaseiq://&lt;HOST&gt; sybaseiq://&lt;HOST&gt;/&lt;DB&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>IQ</td>
<td>sybaseiq://&lt;HOST&gt;:&lt;PORT&gt; sybaseiq://&lt;HOST&gt;:&lt;PORT&gt;/&lt;DB&gt;</td>
</tr>
</tbody>
</table>
## Staring an Installed version of DBArtisan from the Command Line

<table>
<thead>
<tr>
<th>Platform</th>
<th>Connect String</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2 LUW and DB2 z/OS</td>
<td>db2://&lt;HOST&gt;/&lt;DB&gt; db2://&lt;HOST&gt;:&lt;PORT&gt;/&lt;DB&gt; db2:@&lt;ALIAS&gt;</td>
<td>If the DB2 ODBC/CLI driver is installed on the system, that driver will be used for DB2 connections. Otherwise the IBM Data Server Driver for JDBC will be used. Using &quot;db2p&quot; will make the datasource created permanent.</td>
</tr>
</tbody>
</table>

Where ALIAS is the name from the DB2 client registration.
If the InterBase ODBC driver is installed on the system, that driver will be used for an InterBase connection. Otherwise, the InterBase JDBC driver will be used. Using "interbase p" will make the datasource created permanent.

If the Firebird ODBC driver is installed on the system, that driver will be used for Firebird connections. Otherwise, the Jaybird JDBC driver will be used. Using "firebirdsql p" will make the datasource created permanent.
Staring an Installed version of DBArtisan from the Command Line

MySQL

If the MySQL ODBC driver is installed on the system, that driver will be used to make the connection. Otherwise, the MySQL Connector/J JDBC driver will be used. Using "mysqlp" will make the datasource created permanent.

ODBC
odbc://<CONNECT_STRING> where connect string can be the a System DSN name on it's own or the full ODBC connection string containing at least one of the following tags: DSN =, FILEDSN = or DRIVER=

Using "odbc_p" will make the datasource created permanent.

ORCL
oracle://<CONNECT_DESCRIPTOR>
oracle:@<ALIAS>

where CONNECT_DESCRIPTOR is in the same form as in the TNSNames.ora file. i.e.
(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=<HOST>)(PORT=<PORT>))(CONNECT_DATA=(SID=<SID>)))

where ALIAS is the name from the TNSNAMES.ora file

If OCI is installed on the system, that driver will be used. Otherwise, the Oracle Instant Client will be used. Using "oraclep" will make the datasource created permanent.
Staring an Installed version of DBArtisan from the Command Line

**PSTG RS**  postgresql://<HOST>  postgresql://<HOST>/<DB>
 postgresql://<HOST>:<PORT>  postgresql://<HOST>:<PORT>/<DB>

If `<HOST>` is a IPv6 address, it must be enclosed in square brackets. If the PostgreSQL ODBC driver is installed on the system, that driver will be used. Otherwise, the PostgreSQL JDBC driver will be used. Using "postgresql" will make the datasource created permanent.

**SQL SVR**  sqlserver://<HOST>  sqlserver://<HOST>/<DB>
 sqlserver://<HOST>:<PORT>  sqlserver://<HOST>:<PORT>/<DB>
 sqlserver://<HOST>\<INSTANCE>  sqlserver://<HOST>\<INSTANCE>/<DB>
 sqlserver://<HOST>\<INSTANCE>:<PORT>  sqlserver://<HOST>\<INSTANCE>:<PORT>/<DB>
 sqlserver://<HOST>\<INSTANCE>/<DB>  sqlserver:@<ALIAS>  sqlserver:@<ALIAS>/<DB> where ALIAS is the name from the Network Library Configuration

Using "sqlserverp" will make the datasource created permanent.

The latest Microsoft ODBC driver for SQL Server installed on the system is used to make the connection. Using "sqlserverp" will make the datasource created permanent.
Staring a Installed version of DBArtisan from the Command Line

SQL Server

```
sqlserverazure://<HOST> sqlserverazure://<HOST>/<DB>
```

The latest Microsoft ODBC driver for SQL Server installed on the system is used to make the connection. Using "sqlserverazurep" will make the datasource created permanent.

Sybase

```
sybase://<HOST> sybase://<HOST>/<DB> sybase://<HOST>:<PORT>
sybase://<HOST>:<PORT>/<DB> sybase:@<ALIAS>
sybase:@<ALIAS>/<DB> where ALIAS is the name from the SQL.ini file
```

If CTLib is installed on the system that driver will be used. Otherwise the Sybase jConnect JDBC driver will be used. Using "sybasep" will make the datasource created permanent.
Staring an Installed version of DBArtisan from the Command Line

SYB
IQ

If the Sybase IQ ODBC driver is installed on the system it will use that, otherwise it will use the Sybase jConnect JDBC driver. Using "sybaseiqp" will make the datasource created permanent.
Application Basics

Application Basics is designed to situate you within the application and to provide information about what DBArtisan offers in the way of design, navigation, and application features. The information presented here is high-level and conceptual.

Application Basics is divided into two sections. The table below describes each section:

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starting DBArtisan</td>
<td>Describes the various ways to start the application.</td>
</tr>
<tr>
<td>DBArtisan Product Design</td>
<td>This section describes key interface elements and concepts, including the Datasource Navigator/Explorer, parallel query execution, and how to navigate and make the most use of DBArtisan's Multiple Document Interface (MDI) environment.</td>
</tr>
<tr>
<td>Specifying Application Preferences and Feature Options</td>
<td>This section describes how you can configure the application to meet your specific needs.</td>
</tr>
</tbody>
</table>
DBArtisan Product Design

This section describes key interface elements and concepts, such as the Datasource Navigator and Datasource Explorer, parallel query execution, and how to navigate and make the most use of DBArtisan's Multiple Document Interface (MDI) environment.

These key interface elements and concepts are:

- Datasource Navigator and Datasource Explorer
- DBArtisan Toolbars and Menus
- DBArtisan Dialog Boxes
- Customizing the DBArtisan Display
- Parallel Query Execution/multithreading
- Describe Window
- DBArtisan Script Library
Datasource Navigator and Datasource Explorer

By default, the first time you start DBArtisan, a single pane window is displayed on the left of the main application window. The Datasource Navigator provides a hierarchy that descends from the datasource level to the level of individual database objects. It provides a visual method for navigating or drilling down through a datasource. From the Navigator, you can connect to and disconnect from datasources as well as browse, filter, and initiate other actions against objects in all supported datasources on your network.

The Datasource Explorer provides an alternative to the Datasource Navigator. It’s a two-pane window. Like the Navigator, it provides a tree-view of your datasources. When you select an object on the Datasource Explorer, you can view corresponding data in the right pane. The Explorer is designed to give you an overall picture of the contents and configuration of your datasources.

You hide and display the Navigator and Explorer using View menu commands. As you progress along your DBArtisan learning curve, you will find the each has it’s own benefits or that you have a preference. For details on the Navigator and Explorer and datasource management, in general, see the following topics:

- Datasource and Server Management
- Using the Datasource Explorer/Navigator
Parallel Query Execution/multithreading

- DBArtisan supports parallel query execution or multithreading.
- DBArtisan accelerates the development process by executing multiple queries simultaneously using separate operating system threads and improving response time because most operations can start immediately and return control to the primary application thread.
- DBArtisan lets you run multiple, concurrent queries against the same datasource.
- DBArtisan employs a database connection pooling technique that dynamically spawns connections as needed and disconnects them when the associated query has completed.
- DBArtisan increases throughput by automatically assigns query threads to separate processors if your system has multiple CPUs. When you execute parallel queries against different database servers using a multi-processor computer, you experience near linear gains in throughput.
Describe Window

The Describe Window is a floating window that lets you view procedures, tables, views, and functions (Oracle and IBM DB2 for Linux, Unix, and Windows only). In the Describe Window you can view columnar information (for tables and views) or input parameter information (for procedures and functions).

Opening the Describe Window

DBArtisan offers three ways to open the Describe window:

1. In an editor, right-click an object and then click Describe.
2. On the View menu, select an object and then click Describe.
3. On the right pane of the Explorer or in an editor, select an object and then press CTRL+D.

Using the Describe Window

In the Describe window:

1. Click the Name list and then click a name to view a list of types of objects in the database.
2. Click the Owner list and then click an owner to view a list of all owners of objects in the database.

Click the Type list and then click a type to view columnar information (for tables and views) or input parameter information (for functions and procedures).
DBArtisan Script Library

The Script Library provides a drag-and-drop library interface of all supported DBMS syntax, SQL syntax, built-in functions, optimizer hints, and SQL-conditional syntax. Additionally, it provides the ability to create custom folders to store commonly-used code for quick and efficient access, as needed.

To open the Script Library:

2. Expand the Microsoft node and then expand the Schema sub-node.
3. Right-click the Procedures node and select Open. The selected code opens in the SQL Editor window and is ready for execution.
4. Right-click in the editor window and select Close from the context menu.

To add a custom folder to the Script Library

1. Right-click the Script Library folder.
2. Select New Folder from the context menu. A new folder is added to the Script Library folder.

To close the Script Library window:

1. Select View > Script Library.
DBArtisan Toolbars and Menus

DBArtisan offers multiple ways to navigate through the application:

- **Main Menu**
- **Toolbars**
- **Shortcut Menus**

For more information on customizing these items, see [Customizing General User Interface Appearance](#).

**Main Menu**

You can access DBArtisan's features from the Main Menu by clicking the menu name, and then selecting the target command on the sub-menu. The menus are context-sensitive, changing as you perform tasks. DBArtisan menu items include:
## DBArtisan Toolbars and Menus

<table>
<thead>
<tr>
<th>Menu Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>File</strong></td>
<td>Create, open, close, print and save script files and result sets. Set application options and defaults. Note: When you open New, you have easy access to a new ISQL window, the DDL Editor, a Java file, or the Active Script.</td>
</tr>
<tr>
<td><strong>Datasource</strong></td>
<td>Create, modify, select, manage, connect to, and disconnect from datasources. Access database object editors. Access session recording for Tivoli integration.</td>
</tr>
<tr>
<td><strong>Utilities</strong></td>
<td>Access utilities to extract schema, migrate schema, export and import data, execute scripts, search databases, monitor process activity and locks, schedule tasks, and restore, manage, and backup databases.</td>
</tr>
<tr>
<td><strong>Logfile</strong></td>
<td>Activate/deactivate, open, flush, and annotate the DBArtisan application log.</td>
</tr>
<tr>
<td><strong>View</strong></td>
<td>Configure DBArtisan to hide or show toolbars, status bars, and windows. Access full screen mode.</td>
</tr>
<tr>
<td><strong>Tools</strong></td>
<td>Access customizable tools menu. Access installed DBMS connectivity utilities and server documentation.</td>
</tr>
<tr>

</tbody>
</table>

## Toolbars

DBArtisan supports two classes of toolbars:

- Feature-specific toolbars appearing at the top of the window or panel of tools such as the Datasource Explorer and Datasource Navigator, Object editors, the ISQL editor, and the Analyst tools:

For information on the functions provided by feature-specific toolbars, see the documentation for the associated feature.
Optional-display toolbars, appearing in one or more rows below the menu bar.

You can hide or display the individual optional-display toolbars and they change to reflect the element of the application you are using. These toolbars contain buttons that are the fastest way to access commonly used features of DBArtisan.

The following topics provide information you need to work with optional-display toolbars:

- Using Toolbar Viewing Options
- Understanding the Shortcuts Available on Specific Toolbars

Note: You can set preferences as to the default toolbars displayed and their appearance. For details, see Customizing General User Interface Appearance.

Using Toolbar Viewing Options

DBArtisan offers standard Windows toolbar options such as docking, floating, and positioning toolbars. The only application-specific viewing option is the hiding or display of the individual toolbars.

To hide or display a toolbar

1. On the View menu, select Toolbars and then select the specific toolbar you want to display or hide.

For information on the toolbars available and the commands available on each, see Understanding the Shortcuts Available on Specific Toolbars.

Understanding the Shortcuts Available on Specific Toolbars

The following optional-display toolbars are available using the Toolbars command on the View menu.

Analyst Series Toolbar

This toolbar offers shortcuts that open the Space Analyst, Capacity Analyst, and Performance Analyst tools.

Datasource Toolbar
DBArtisan Toolbars and Menus

This toolbar offers shortcuts that let you connect to or disconnect from a datasource, select a datasource and for Sybase ASE and SQL Server, select a specific database.

Main Toolbar
This toolbar has common application functions.

It offers the following shortcuts:
- New
- Open
- Save
- Save All
- Print
- Send Mail
- Options
- New Datasource Explorer
- Output
- Describe Window
- Full Screen
- Log SQL
- Session Recording
- Find Object

Registration Toolbar
This toolbar offers shortcuts to registering a datasource, editing a datasource registration, and unregistering a datasource.

SQL Edit Toolbar
This toolbar offers functions used in editing SQL:

It offers the following shortcuts:
- Undo
- Redo
- Cut
- Copy
- Paste
- Insert File
- Paste SQL Syntax
- Paste SQL Statement
- Comment
- Undo Comment
- Upper Case
- Lower Case
- Match Token
- Find
- Repeat
- Replace
- Toggle Bookmark
- Previous Bookmark
- Next Bookmark
- Clear Bookmark
- Increase Indent
- Decrease Indent

SQL Profiler Toolbar
This toolbar offer functions used when working with the Oracle Profiler.
It offers the following shortcuts:
Start Profiler  Flush Profile Run Summary  Run Detail  Unit Summary  Unit Detail  Clear Profile Tables  Stop Profiling

**Tools Toolbar**

This toolbar offers functions otherwise available on the **Tools** menu.

It offers the following shortcuts:
Customize Tools Menu  Find in Files  Database Search  Script Execution Facility  File Execution Facility  Scheduler  Visual Difference  Edit Data  Build Query  Table/Index Size Estimator  SQL*PLUS  Code Workbench  Import Data From File

**Utilities Toolbar**

This toolbar offers functions otherwise available on the **Utilities** menu.

It offers the following shortcuts:
Schema Extraction  Schema Migration  Shema Publication  Data Unload  Data Load  Database Monitor  Server Configuration

**Windows Toolbar**

This toolbar offers functionality for working with windows.

It offers the following shortcuts:
Cascade  Tile Windows Horizontally  Tile Windows Vertically  Next  Previous  Windows

**Customizing General User Interface Appearance**

DBArtisan lets you choose from a set of general visual application styles, dictate hiding or display of particular items, and select preferences for specific user interface elements.
To customize the general look and feel of DBArtisan

2. Click Apply at any time to implement any changes you have made and when finished, click Close. Use the following table as a guide for understanding and setting options on tabs of the Customize dialog:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Toolbars</td>
<td>Select the toolbars you want to display in the application. For information on the toolbars available, see Understanding the Shortcuts Available on Specific Toolbars.</td>
</tr>
<tr>
<td>Application Visual Style</td>
<td>Select a visual style such as Microsoft Windows XP or one of the .NET options from the dropdown. Depending on your selection, the following options may or may not be enabled: Use default Windows XP colors, OneNote style tabs, Docking Tab Colors, Allow MDI Tab Swapping, Enable Smart Docking, Enable Tab Menu, and 3D Rounded Docking Tabs.</td>
</tr>
<tr>
<td>Menu animations</td>
<td>Lets you specify a menu animation style of UNFOLD, SLIDE, or FADE.</td>
</tr>
<tr>
<td>Menu Shadows</td>
<td>Displays shadowed 3D effects.</td>
</tr>
<tr>
<td>Tools</td>
<td>Lets you define external applications to run from the Tools menu of DBArtisan: the text displayed on the Tools menu command (Menu contents), the path and file name of the executable (Command), optional Arguments, and an optional Initial Directory.</td>
</tr>
<tr>
<td>Keyboard</td>
<td>Category: Select a general category for a hot key for the command.</td>
</tr>
<tr>
<td></td>
<td>Commands: Select a hot key command, based on the general category.</td>
</tr>
<tr>
<td></td>
<td>Description: Displays the command description.</td>
</tr>
<tr>
<td></td>
<td>Set Accelerator for: Select application area where you want new hot key to be active.</td>
</tr>
<tr>
<td></td>
<td>Current Keys: Displays current hot key.</td>
</tr>
<tr>
<td></td>
<td>Press New Shortcut Key: Press keyboard key or an unassigned F key.</td>
</tr>
<tr>
<td>Options</td>
<td>Show ScreenTips on toolbars: Select to display a ScreenTip when you hover your mouse over a button. For example, when you hover your mouse over the New button, DBArtisan displays the ScreenTip “New.”</td>
</tr>
<tr>
<td></td>
<td>Show shortcut keys in ScreenTips: Select to display a shortcut key in the ScreenTip when you hover your mouse over a button. For example, when you hover your mouse over the New button, DBArtisan displays the ScreenTip “New (CTRL+N).”</td>
</tr>
</tbody>
</table>
Shortcut Menus

DBArtisan incorporates shortcut menus to give you another way to access object functionality. These menus mirror the functionality that you can access from application toolbars or the main menu.

Accessing Shortcut Menus

1. On Desktop, right-click DBArtisan.
   
   DBArtisan opens the shortcut menu.

2. Click the target shortcut menu command.

Keyboard Commands

DBArtisan provides a number of Keyboard commands that expedite IISQL Editor development. The table below describes the available keyboard commands:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Keyboard shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>General editing</strong></td>
<td>Delete one character to the left</td>
<td>BACKSPACE</td>
</tr>
<tr>
<td></td>
<td>Delete one character to the right</td>
<td>DELETE</td>
</tr>
<tr>
<td></td>
<td>Cut selected text to the Clipboard</td>
<td>CTRL+X</td>
</tr>
<tr>
<td></td>
<td>Undo the last action</td>
<td>CTRL+Z</td>
</tr>
<tr>
<td></td>
<td>Redo the last undo operation</td>
<td>CTRL+Y</td>
</tr>
<tr>
<td></td>
<td>Copy text</td>
<td>CTRL+C</td>
</tr>
<tr>
<td></td>
<td>Paste the Clipboard contents</td>
<td>CTRL+V</td>
</tr>
<tr>
<td><strong>Extending selections</strong></td>
<td>One character to the right</td>
<td>SHIFT+RIGHT ARROW</td>
</tr>
<tr>
<td></td>
<td>One character to the left</td>
<td>SHIFT+LEFT ARROW</td>
</tr>
<tr>
<td></td>
<td>To the end of a word</td>
<td>CTRL+SHIFT+RIGHT ARROW</td>
</tr>
<tr>
<td></td>
<td>To the beginning of a word</td>
<td>CTRL+SHIFT+LEFT ARROW</td>
</tr>
<tr>
<td></td>
<td>To the end of a line</td>
<td>SHIFT+END</td>
</tr>
<tr>
<td></td>
<td>To the beginning of a line</td>
<td>SHIFT+HOME</td>
</tr>
<tr>
<td></td>
<td>One line down</td>
<td>SHIFT+DOWN ARROW</td>
</tr>
<tr>
<td></td>
<td>One screen up</td>
<td>SHIFT+PAGE UP</td>
</tr>
<tr>
<td></td>
<td>To the beginning of a document</td>
<td>CTRL+SHIFT+HOME</td>
</tr>
</tbody>
</table>
Moving the insertion point

- To the end of a document: CTRL+SHIFT+END
- To include the entire document: CTRL+A
- One character to the left: LEFT ARROW
- One character to the right: RIGHT ARROW
- One word to the left: CTRL+LEFT ARROW
- One word to the right: CTRL+RIGHT ARROW
- Up one line: UP ARROW
- Down one line: DOWN ARROW
- To the end of a line: END
- To the beginning of a line: HOME
- Up one screen (scrolling): PAGE UP
- Down one screen (scrolling): PAGE DOWN
- To the end of a document: CTRL+END
- To the beginning of a document: CTRL+HOME

Bookmarks

- Toggle bookmark on/off: CTRL+F2
- Go to next bookmark: F2
- Go to previous bookmark: SHIFT+F2

Splitter windows

- Go to next pane: F6
- Go to previous pane: SHIFT+F6

Debugger operations

- Start Debugging: CTRL+F5
- Stop Debugging: SHIFT+F5
- Step Over: F10
- Step Into: F11
- Run to Cursor: CTRL+F10
- Step Out: SHIFT+F11
- Describe from Cursor: CTRL+D
- Insert or Remove Breakpoint: F9

Customizing the Tools Menu

The Customize Tools Menu dialog lets you add up to sixteen commands to the Tools menu. You can associate any program that running on your local machine. You can use this feature to associate frequently used programs and commands, thereby adding functionality directly to the DBArtisan application. In addition, you can specify arguments for any command that you add to the Tools menu. You can use these arguments to decipher how you want to execute commands. DBArtisan includes many pre-defined arguments that let you customize the application.

During the initial installation, DBArtisan automatically adds the following items (if installed locally) to the Tools menu.

- ODBC Administrator
- Oracle Service Name Manager
- Sybase Open Client/Server Config
- Sybase Directory Service Edit (DSEDIT)
- SQL Server Network Library Config
- SQL Server Books Online
- DB2 Client Configuration Assistant

Customize User Tools Menu Dialog: DBArtisan lets you customize the Tools menu.

The table below describes the options and functionality on the Customize User Tools Menu dialog:
DBArtisan Toolbars and Menus

Option | Description
--- | ---
Menu Contents | In the box, click the target command.
Menu Text | In the box, type the name of the tool as you want to appear on the Tools menu.
Command | In the box, type the path and name of the program for the new tool or click **Browse** to locate the program. For example, `C:\WINDOWS\NOTEPAD.EXE`
Arguments | To pass an argument to the command, in the box, type any argument or click the Arrow, and then click the target argument. NOTE: To display a menu of pre-defined arguments, click the drop-down arrow next to the Argument box, and then select an argument from the list to insert the syntax into the box.
Initial Directory | To specify an initial directory, in the box, type the path and name of the file directory or click **Browse** to locate the file directory.
Add Button | Click to add a new command to Tools menu.
Remove Button | In the Menu Contents box, click the command you want to remove, and then click the button.
Move Up Button | Click to move the command up one position in the menu.
Move Down Button | Click to move the command down one position in the menu.

**Completing the Customize User Tools Menu dialog**

To complete the *Customize User Tools Menu* dialog, do the following:

1. On the **Tools** menu, select **Customize**.

DBArtisan opens the **Customize User Tools** dialog.

2. Select options.

3. Click **OK**.

**Specifying Arguments**

DBArtisan provides a number of pre-defined arguments that you can pass to programs that you have added to the **Tools menu**. You can specify an argument to be passed to a program for newly added commands by choosing one of DBArtisan's pre-defined arguments or typing in your own arguments. The table below describes the pre-defined arguments:
<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$$FilePath$$</td>
<td>The complete filename of the current source (defined as drive+path+filename); blank if a non-source window is active.</td>
</tr>
<tr>
<td>$$FileDir$$</td>
<td>The directory of the current source (defined as drive+path); blank if a nonsource window is active.</td>
</tr>
<tr>
<td>$$FileName$$</td>
<td>The filename of the current source (defined as filename); blank if the nonsource window is active.</td>
</tr>
<tr>
<td>$$FileExt$$</td>
<td>The filename extension of the current source; blank if a nonsource window is active.</td>
</tr>
<tr>
<td>$$CurLine$$</td>
<td>The current pointer line position within the active window.</td>
</tr>
<tr>
<td>$$CurCol$$</td>
<td>The current pointer column position within the active window.</td>
</tr>
<tr>
<td>$$CurText$$</td>
<td>The current text (the word under the current pointer position, or the currently selected text, if there is one.)</td>
</tr>
<tr>
<td>$$CurDir$$</td>
<td>The current working directory (defined as drive+path.)</td>
</tr>
<tr>
<td>$$CurDatasource$$</td>
<td>The name of the current datasource as defined in DBArtisan.</td>
</tr>
<tr>
<td>$$CurUserID$$</td>
<td>The name of the current datasource user.</td>
</tr>
<tr>
<td>$$CurPwd$$</td>
<td>The current datasource password.</td>
</tr>
<tr>
<td>$$CurConString$$</td>
<td>The current connection string or server name.</td>
</tr>
</tbody>
</table>

**Note:** Arguments are case-sensitive.

The table below describes examples for using the pre-defined arguments and command-line arguments:
<table>
<thead>
<tr>
<th>Command</th>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOTEPAD.EXE</td>
<td>$$FilePath$$</td>
<td>Launches Microsoft Notepad displaying the contents of the $$FilePath$$ argument.</td>
</tr>
<tr>
<td>ISQL.EXE</td>
<td>-$$CurUserID$$ -$$CurPwd$$ -$$CurConString$$ -$$FilePath$$</td>
<td>Launches ISQL, automatically connects to the current datasource using the current user name and password, and executes the contents of $$FilePath$$.</td>
</tr>
<tr>
<td>SQLPLUS.EXE</td>
<td>$$CurUserID$$/$$CurPwd$$@$$CurConString$$ $$FilePath$$</td>
<td>Launches SQL*Plus, connects to the current datasource using the current user name and password, and executes the contents of $$FilePath$$.</td>
</tr>
</tbody>
</table>

**Tip:** DBArtisan lets you specify an argument in the DBArtisan opens the [Customizing General User Interface Appearance](#).
DBArtisan Dialog Boxes

DBArtisan offers the following common dialogs.

DBArtisan Wizards

DBArtisan offers several wizards that let you create objects without knowing the underlying SQL commands. DBArtisan also offers wizards to perform common tasks.

Wizards for the supported dbms are listed in Creating objects.

DBArtisan Editors

DBArtisan stores information about server and object types in object editors. An editor is a tabbed dialog box that groups related information together. Each editor contains a context-sensitive Commands menu with pertinent functionality for the object. Many of the object editors contain a DDL tab. This tab displays the underlying target object's SQL.

Note: The Object Editor tool bar has a refresh button, that lets you refresh Object Editor contents, clear the Object Editors, and log SQL if SQL Logging is turned on.

If an objects has dependent objects, such as tables, triggers, procedures and views, you can view and access their dependent objects in the editor.

Editors for the supported dbms are listed in Modifying objects using editors.

Topics

- Creating objects
- Modifying objects using editors
Customizing the DBArtisan Display

DBArtisan lets you customize your display to suit your work habits:

- **Full Screen Mode**
- **Active Windows Dialog Box**
- **Navigating DBArtisan Windows**
- **Output Window**
- **Set Sort Columns Dialog Box**

**Full Screen Mode**

DBArtisan is equipped with Full Screen mode capabilities that let you conceal the application framework and take advantage of the entire monitor area. Full screen mode hides any other applications running on the computer and uses every available pixel for DBArtisan. Main menu functionality is accessible through keyboard commands when you use Full Screen Mode.

**Activating Full Screen Mode**

1. On the **View** menu, select **Full Screen**.

DBArtisan expands the application to fit the entire monitor area, and displays the Full Screen Mode icon as a stand-alone floating toolbar.

**Dismissing Full Screen Mode**

1. Click **Full Screen**.

DBArtisan reduces the size of the application.

**Tip:** If you closed the **Full Screen Mode** toolbar, right-click the top of the DBArtisan desktop to display the full screen.

**Active Windows Dialog Box**

DBArtisan’s multi-tasking environment lets you open multiple active windows. DBArtisan’s **Active Windows** dialog lets you see all the open windows in the application workspace. DBArtisan displays active windows as tabs in the Datasource Explorer. Each tab represents a separate window that lets you execute, create or view the objects or schema in your database.

**Tip:** DBArtisan lets you use a mouse with a wheel to navigate in active windows.

**Opening the Active Windows dialog**

1. On the **Window** menu, select **Windows**.
DBArtisan opens the **Active Windows** dialog and any open windows in the application workspace.

The table below describes the options and functionality on the **Active Windows** dialog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activate</td>
<td>Sets the focus on the selected window and closes the <strong>Active Windows</strong> dialog.</td>
</tr>
<tr>
<td>OK</td>
<td>Closes the <strong>Active Windows</strong> dialog and makes any changes you have made to the windows in the workspace.</td>
</tr>
<tr>
<td>Save</td>
<td>Saves the contents of the selected window. If you are saving a file, DBArtisan prompts you to provide a name and location for the file.</td>
</tr>
<tr>
<td>Close Window</td>
<td>Closes the selected window. If you have not saved the contents of the window, DBArtisan prompts you to do so.</td>
</tr>
<tr>
<td>Help</td>
<td>Initiates and displays this Help topic in the DBArtisan Help.</td>
</tr>
</tbody>
</table>

### Navigating DBArtisan Windows

DBArtisan offers functionality through the Windows toolbar that lets you:

- Tile windows vertically or horizontally.
- Cascade open windows.
- Minimize all windows and move to the next active window.

**Tip:** DBArtisan lets you use a mouse with a wheel to navigate in active windows.

The table below describes the commands available on the **Windows** menu:
Customizing the DBArtisan Display

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>Activates the <strong>Active Windows</strong> dialog.</td>
</tr>
<tr>
<td>Cascade</td>
<td>Layers all active windows on the desktop so that you can view all active windows simultaneously.</td>
</tr>
<tr>
<td>Tile</td>
<td>Tiles all active windows on the desktop horizontally.</td>
</tr>
<tr>
<td>Tile Vertical</td>
<td>Tiles all active windows on the desktop vertically.</td>
</tr>
<tr>
<td>Next</td>
<td>Moves the focus of the application to the next active window.</td>
</tr>
<tr>
<td>Previous</td>
<td>Moves the focus of the application to the previous active window.</td>
</tr>
</tbody>
</table>

**Output Window**

DBArtisan has a separate window that captures all messages returned by the server and to log entries about the progress of operations started by the application.

The Output Window includes the following tabs:

- General
- Find In Files 1
- Find In Files 2

The Output Window lets you do the following to server messages:

- View
- Save
- Print
- Copy
- Flush

**Configuring the Output Window**

Basic Output window options you can configure include:

- [Floating the Output Window (with Smart Docking)](#)
- [Docking the Output Window](#)
- [Undocking the Output Window](#)
- [Hiding the Output Window](#)
- [Displaying the Output Window](#)
Floating the Output Window (with Smart Docking)

This is the default view when you first open DBArtisan.

1. Place your pointer on the Output Window and drag it to another location.

Arrows appear and you can move the window to the top, bottom, or sides of the view within DBArtisan or to another location on your desktop.

2. To change the location of the Output Window, repeat the first step.

3. To disable the feature, right-click and choose Docking or Hide.

Docking the Output Window

1. Place your pointer on the Output Window.

2. Right-click, and then click Docking View.

DBArtisan docks the Output Window to the bottom of the application frame.

Undocking the Output Window

1. Place your pointer on the Output Window.

2. Right-click, and then click Docking View.

DBArtisan floats the Output Window.

Hiding the Output Window

1. On the View menu, select Output.

DBArtisan hides the Output Window.

Displaying the Output Window

1. On the View menu, select Output.

DBArtisan displays the Output Window.

Saving Output Window Messages

DBArtisan lets you save messages in the Output window to a file.

1. Right-click a message in the Output Window, and then click Save.

DBArtisan opens the Save As dialog.

2. In the File Name box, type the location and name of the file.

DBArtisan defaults the file extension to .msg.

3. Click Save.
DBArtisan saves the file.

**Printing Output Window Messages**
DBArtisan lets you print the messages you see in the Output window.
1. Right-click a message in the Output Window, and then click **Print**.
DBArtisan opens the **Print** dialog.
2. Configure your print job.
3. Click **Print**.
DBArtisan prints the file.

**Copying Output Window Messages**
DBArtisan lets you copy all or part of the contents of the Output window to the clipboard.
1. Select the target Server Messages.
2. Right-click, and then click **Copy**.
DBArtisan copies the selected messages to the Windows clipboard.
3. Paste the text into other Windows applications.

**Clearing Output Window Messages**
DBArtisan lets you clear server messages from the Output Window.
1. Right-click a message in the Output Window, and then click **Clear**.
DBArtisan clears the server messages.

**Set Sort Columns Dialog Box**
The **Set Sort Columns** dialog lets you sort multiple columns, and sort column identification.

**Completing the Set Columns dialog**
To complete the **Set Columns** dialog, do the following:
1. In the right pane of the application, right-click a column heading and select **Sort Multiple Columns**.
DBArtisan opens the **Set Sort Columns** dialog.
2. In Column Name select the column(s) to use to sort the information in the right pane of the application.
Customizing the DBArtisan Display

3. Click the right arrow to move the column(s) to the **Column Name** box.
4. Click the up and down arrows to change the order of the sort columns.
DBArtisan Tutorial exercises

The exercises that follow walk you through DBArtisan’s major functional areas. After completing these exercises, you will have the foundation you need to explore the many features and benefits of DBArtisan. You’ll have learned how to competently manage the major database administration disciplines using DBArtisan’s standard cross-platform console. Also, you will have a solid understanding of DBArtisan’s more advanced Space, Performance, and Capacity management capabilities.

This guide is divided into 10 sessions:

- Session 1: Getting Started with DBArtisan
- Session 2: Object and Schema Management
- Session 3: Database Security Management
- Session 4: Space Management
- Session 5: SQL Management
- Session 6: Job Management
- Session 7: Data Management
- Session 8: Performance Management
- Session 9: Capacity Management
- Session 10: General Utilities and Tools
- Session 11: Using Performance IQ

You can use this basic tutorial as a roadmap of product highlights, but also to help you find your own path to explore DBArtisan.

Once you’ve started, you can select Help Topics from the Help menu to find many additional resources that complement and build on many of the activities shown in this tutorial.
Session 1: Getting Started with DBArtisan

Your first tasks in getting familiar with DBArtisan are as follows:

- Starting the DBArtisan Application
- Registering Cross-Platform Datasources to DBArtisan
- Setting up the Datasource Explorer
- Exploring General Usability Features
Starting the DBArtisan Application

How you start DBArtisan depends on the type of application you are evaluating:

- **InstantOn version**: start the application by double-clicking the file you downloaded.

- **Fully-installed version**: The Start menu sequence for DBArtisan is always in the form Programs > Embarcadero DBArtisan version identifier > DBArtisan version identifier, where version identifier reflects the version you are running.

**To get started**

1. Run DBArtisan.

The first time DBArtisan starts, a dialog opens, prompting you to set up datasources. In addition to letting you manually set up individual datasources, a number of more automated methods are available. If you have installed and used other Embarcadero tools, DBArtisan can find any active datasources being used by those tools. Also, DBArtisan provides a Discover Datasources feature that automatically searches the DBMS configuration files on your system for datasources that are not currently registered. Since other Embarcadero tools let you export datasource definitions to file, you also have the option of importing these definitions.

2. For the purpose of this tutorial, click **Cancel**. You will be registering a datasource manually.

Proceed to [Registering Cross-Platform Datasources to DBArtisan](#).
Registering Cross-Platform Datasources to DBArtisan

The Datasource Registration Wizard walks you through the process of registering a datasource for use with DBArtisan.

1. On the Datasource menu, select Register Datasource. DBArtisan opens the wizard, initially prompting you for the DBMS type.

2. Select Oracle as the database type and then click Next. DBArtisan opens the next panel of the Datasource Registration Wizard.

3. Ensure that User defined is selected and provide the Host machine name associated with an Oracle datasource.

4. Type a Port number. The default is 1521, but you can change it to wherever the Oracle listener is set up.

5. Specify a Type of SERVICE_NAME or SID and enter the corresponding value in the SID/Service box.

6. In the Datasource Name text box, type SAMPLE_DATASOURCE for the purpose of this example.

7. Click Next. DBArtisan saves your selections and opens the next panel of the wizard. This is where you enter login credentials.

8. Provide a User ID and Password.

9. To save and encrypt your password so that you do not have to provide credentials each time you connect, select Auto-Connect?

10. Click Datasource Group to display the last panel.
11. In the Managed Datasources tree, select the folder corresponding to the type of DBMS you are registering.

12. Click Finish. DBArtisan prompts you as to whether you want to connect to the datasource.

13. Click Yes.

The same easy-to-use Datasource Registration Wizard is available for directly-supported DBMS platforms as well as JDBC and ODBC datasources. Datasource information is stored in the registry, is editable, and datasources can be deleted. If you run multiple Embarcadero products on the same machine, they can share the same datasource catalog.

A number of datasource catalog storage options are available:

- A local, file-based alternative lets you easily move a datasource catalog between users.
- A remote, file-based alternative lets multiple users share a single catalog. Settings can be changed locally but are not propagated to other users or retained over shutdown/startup.

Another way of centralizing datasource definition maintenance is available if you use Embarcadero Team Server 2016. Datasource definitions can be stored on Team Server 2016 and subsequently registered as local datasources. Local connection details for a datasource are synchronized with the Team Server 2016 version on each attempt to connect to a datasource.

For details on datasource options, refer to the DBArtisan online Help.

Proceed to Setting up the Datasource Explorer.
Setting up the Datasource Explorer

The first time you start DBArtisan, the Datasource Navigator occupies the left side of the main window. It is a single pane window that lets you navigate the datasources that you register and initiate actions against databases and database objects.

For the following set of exercises, you will be using a similar aid.

To prepare for subsequent exercises

1. Dismiss the Navigator by clicking the close button (X) at the top of the Navigator window.

2. Select View > Activate Explorer.

The Datasource Explorer is a two pane window that provides most of the same functions as the Navigator.
One key difference is the right pane of the window. It displays details for the node currently selected in the left pane. This might be individual database objects such as tables or primary keys, configuration parameters, and so on.

Before proceeding, familiarize yourself with the View menu commands for opening the Navigator and Explorer, and the ways to close those windows. As you proceed with DBArtisan, you will develop a preference for either the Navigator or Explorer, or find that each has benefits that are preferable in different situations.

Proceed to Exploring General Usability Features.
Exploring General Usability Features

DBArtisan provides many “user in mind” features that make the product configurable to meet individual needs and preferences. These features are designed to shave time off the tasks that you perform many times on any given working day.

Retaining Datasource Explorer View Settings

1. At the top of the Explorer tree, click to expand the drop-down menu.

2. Select Retain View Settings.

The next time you open DBArtisan, the Explorer appears just as you left it.

Working with Datasource Explorer Bookmarks

1. In the Explorer tree, right-click the datasource you registered and select Add bookmark from the context menu.
DBArtisan opens the Add Friendly Bookmark Name dialog.

2. Click OK.

After Bookmarks are defined you can use them to easily navigate to commonly used datasource resources using the dropdown at the top of the Explorer and selecting the Bookmarks item.

Setting Keyboard Shortcuts and Hotkeys

1. From the Tools menu, select Customize. The Customize dialog opens.
2. In the Customize dialog, open the Keyboard tab.
The **Keyboard** tab can be used to set keyboard shortcut hot keys for all areas of DBArtisan functionality.

3. Click **Close**.

**Datasource Explorer tree filtering**

DBArtisan provides a number of ways to filter the Datasource Explorer tree, easing navigation. During a DBArtisan session, you can use the **Filter** box at the top of the Datasource Explorer to display only those objects whose name contains characters typed in the **Filter** box.
Exploring General Usability Features

If you are interested in a more permanent filtering method, you can create filters at the DBMS or datasource level. Filters are available under the Filters node for each datasource.

Right-clicking in the tree and selecting Filter opens the Filters dialog. It lets you filter out object types at the DBMS platform level. It also lets you create object filters.

Object filters can be object name-based, schema-based, or some combination thereof. A name-based or schema-based filter consists of one or more ANDed conditions. You also specify the object types to which the filter is to apply.

Object filters are created at the DBMS or datasource level and can be enabled and disabled for individual datasources.
The Filters dialog also lets you hide or display nodes based on object type. Node filtering lets you filter out object types for all datasources of the same DBMS type.

In addition to any custom object filters you create, the Filters node also provides access to two default filters: Ignore System Objects and Show Only My Objects. They can be applied at the datasource level and cannot be deleted or modified.

Proceed to Session 2: Object and Schema Management.
Session 2: Object and Schema Management

DBArtisan provides unparalleled database object management capabilities. Its database platform-specific and version-specific graphical object editors and wizards enable you to easily create, drop or alter any of your accessible database objects.

Creating a Table Object

The following example walks you through creating a standard Oracle table object. This concept carries across all of the supported object types, across all of the supported platforms.

1. On the Datasource Explorer, expand the Schema node of an Oracle datasource.
2. Right-click the Tables node, and then select Create.
3. DBArtisan opens the Table wizard and leads you through the process of creating a table object.

4. Complete the wizard panels, and ensure that you create two or more columns in the table.
5. Click Finish.
DBArtisan lets you preview any and all generated scripts before you submit them to the database. This is standard for all object-related scripts.

Making changes to an existing table object

Changes to database tables, such as modifying column lengths, inserting new columns, or deleting unneeded ones, can require dropping off a table. This requires knowledge of the underlying object dependencies so that these dependent objects are rebuilt after the table has been recreated. DBArtisan provides the ability to perform “extended” table alterations by constructing an SQL script with the steps necessary to save off the original data, create the new table, and populate it with the original data. Once these steps are complete, all dependent objects are then rebuilt and permissions re-applied.

1. From the Explorer, Tables node, select the table you created in the previous example.

2. Double-click the table or from the Command menu, click Open.

DBArtisan opens the Table Editor. The Table Editor provides access to basic table properties, the list of table columns as well as any constraints, storage parameters, space allocation, partitioning, table dependencies, object privileges, table DDL and other attributes of the table.

3. Ensure that the Columns tab is selected and select one of the columns you created in this table you want to modify.

Details for the column are shown in the Column Attributes area on the right side of the pane.

4. In the Width or Scale text box, type a new value.

5. On the Table Editor toolbar, select the Alter button.

DBArtisan lets you preview the SQL script before you submit it to the database.

6. Close the Table Editor pane.

Working with Object DDL

DBArtisan allows you to easily extract DDL for single or multiple objects using several methods. The most straight-forward is described here:

1. On the Explorer, right-click the table you created earlier, and then select Extract.

The DDL for all highlighted objects is extracted directly in a DDL Editor where it can be altered, executed and saved to the database, with no intermediary steps required. For example:
2. Close the PL/SQL Editor pane.

Proceed to Session 3: Database Security Management.
Session 3: Database Security Management

DBArtisan can help you efficiently establish and maintain database security. Whether you are managing an existing production database or setting up a new environment, you’ll find consistent support across all of the supported platforms.

Adding a new database user

While this example focuses on creating a new Oracle user, the same wizard-driven principle applies to all security objects (groups, roles, etc.).

1. On the Datasource Explorer, expand an Oracle datasource, and then the Security node.
2. On the Security node, right-click Users, and then click Create.

DBArtisan opens the Create User Wizard and leads you through the process of adding a user.

3. Provide the information on each panel of the Create User Wizard until you reach the DDL View panel.

DBArtisan allows you to preview any and all generated scripts before they are submitted to the database. This is standard for all object-related scripts.

4. Click Execute to create the new user.
DBArtisan automatically opens the User Editor for the new user. The standard User Editor can be used to manage existing database users as shown below.

**Granting and Editing User Privileges**

Privileges can be easily granted, revoked, or viewed from within either of two editors within DBArtisan; the User Editor, or the individual object editor (Table, Procedure, etc.). The User Editor provides a tabbed interface, which can be used to view and modify individual attributes of the user.

1. In the User Editor, open the **Object Permissions** tab.
2. Use the **Object Type** dropdown to select a set of objects such as tables or views.
3. Right-click a cell (corresponding to a specific object and a specific permission, such as DELETE), and then click **Grant**.

A distinctive icon is shown in the cell, indicating that this permission is granted. You use a similar process to revoke privileges and perform other permission-based activities.

4. On the Object Editor toolbar, click **Alter** to implement the changes.

Proceed to [Session 4: Space Management](#).
Session 4: Space Management

Managing space is vital to ensure the availability and performance of your databases. DBArtisan incorporates many built-in space features that let you smartly manage and exploit all aspects of your database storage. The following examples walk you through a review of DBArtisan’s built-in support for reporting Oracle tablespace storage and space data.

- Built-in Space Management
- Advanced Space Management (Oracle and SQL Server only)
Built-in Space Management

While this example is specific to Oracle tablespaces, the same concept applies to all of the supported platforms.

2. On the Oracle datasource, expand the Storage node, and then select Tablespaces.
3. Right-click any tablespace listed in the right pane of the Explorer window, and then click Open.

Embarcadero DBArtisan opens the Tablespaces Editor.
4. Select the Properties tab. The Storage group on that tab provides a summary of the space settings for the tablespace.

5. Select the Extent Details tab. It provides more detail on an extent-by-extent basis.

6. On the Tablespace Editor, click the Space tab.

The Space tab displays a graphical view of the free and used blocks for the target tablespace.
7. Finally, on the Tablespace Editor, click the **Map** tab.

The **Map** tab displays a color-coded map of the objects contained on the tablespace. The map segments are proportional to the actual size of the objects on the tablespace.

Note the additional **Reorganize** and display options.

8. Close the Tablespaces Editor pane.
Built-in Space Management

Proceed to Advanced Space Management (Oracle and SQL Server only).
Advanced Space Management (Oracle and SQL Server only)

For advanced space analysis and management, DBArtisan’s optional Space Analyst component contains sophisticated diagnostics to help you pinpoint all space-related problems in your database, as well as an intelligent reorganization wizard that can reorganize all or selected parts of your database.

**Note:** Space Analyst is a separately-licensed component. If you are not working with an evaluation copy of DBArtisan or do not have a specific license, proceed to **Session 5: SQL Management**. Contact your license administrator or your Embarcadero representative about obtaining a license.

To see the sort of information provided by the Space Analyst

1. On the **Analyst** menu, select **Space Analyst**.

**Note:** If prompted to install components on the server, allow DBArtisan to install the components.

The Space Analyst launches in the DBArtisan workspace.

Embarcadero’s Space Analyst provides sophisticated diagnostic capabilities to troubleshoot bottlenecks and performance inefficiencies that result in poor space management. See the DBArtisan online help for a detailed walkthrough of all available features and functionality.
2. Select the **Data Files**, **Tablespace Map**, **Tables**, and **Indexes** tabs available at the bottom of the Space Analyst pane.

3. Close the Space Analyst pane.

Proceed to **Session 5: SQL Management**.
Session 5: SQL Management

DBArtisan provides powerful visual tools for creating and analyzing complex SQL statements and server-side code objects. The following examples walk you through DBArtisan's Visual Query Builder, feature-rich ISQL facility and some of the advanced analysis and debugging capabilities provided by the Embarcadero SQL Debugger and SQL Profiler:

- Working with Query Builder
- ISQL Window
- SQL Debugging, Analysis and Tuning.
1. From the **Tools** menu, select **Query Builder**.

DBArtisan opens the Query Builder.

2. In the **Tables/Views** tab, right-click a table or view and select **Add**.

3. In the window that opens, select the columns to return the result. For example:

   ```sql
   SELECT SYSTEM.ANH.SERVICE_NM,
          SYSTEM.ANH.ORIGIN_CD
   FROM SYSTEM.ANH
   ```

Query Builder generates the query text in the lower SQL window.

4. After the query is built, click the **Execute** button (green arrow) on the Query Builder toolbar.

Query Builder displays results in the lower SQL window.

5. Close the Query Builder pane.

Proceed to **ISQL Window**.
ISQL Window

DBArtisan offers a fully-featured SQL editor. In addition to basic text processing features, the editor environment offers testing/debugging and execution facilities. In combination with supporting features, the ISQL editor eases and speeds up the process of developing working scripts.

Automated error detection and coding assistance

DBArtisan provides a range of features that detect or help you avoid errors and save keystrokes in developing your scripts.

To enable these features:
1. On the File menu select Options. The Options dialog opens.
2. In the left-hand pane, expand the ISQL node and then select Code Assist.
3. On the Code Assist panel:
   - Ensure that Enable Code Complete is selected.
   - Ensure that Enable Real-time syntax checking is selected.
   - Ensure that Severity levels for semantic validation problems has Warning selected.
4. Click OK.

To see these features in action:
1. On the File menu, select New > ISQL.

DBArtisan opens the ISQL Editor window. You can add SQL code via your method of choice (free-form typing, retrieve from a file, paste copied code, etc.).

2. Experiment with the automated error detection and coding assistance as follows:
   - Type SELECT * FROM and stop typing. Note the error condition.

By default, DBArtisan runs a syntax check any time there is an interval of 1.5 seconds between keystrokes. You can also disable automatic syntax checking and only run a
check when you manually initiate it. Syntax error annotation persists until you correct the problem.

- This time type a fragment that includes the name of a nonexistent object, SELECT * FROM NON.OBJE C T, for example. For now, ignore any popups. The warning condition is a result of on-the-fly semantic validation. DBArtisan notifies you when a script contains a reference to an object that DBArtisan cannot resolve.

- Type SELECT * FROM followed by a space and then stop typing. If no popup appears, press CTRL+SPACE. The Code Complete suggestion box lets you select from objects or object name components such as databases or schema. This feature saves keystrokes and minimizes typing errors. See the online help for full descriptions of these features.

3. If you want to disable the automated error detection and coding assistance features, select File > Options and on the Code Assist page, click Restore defaults.

Feature Summary

The ISQL Editor window includes the following features and options:

- The ISQL window highlights all platform-specific and general keywords, and provides options for SQL code formatting and analysis.

- Once the code is executed, you have control over whether your transaction is committed or rolled back from the database.

- For all open ISQL windows, there are also options for connection locking, scheduling, executing your code across multiple datasources, explain plan generation, and SQL Tuning.

Setting environment options

DBArtisan lets you set platform-specific query options to immediately determine if your code is optimized.

1. Press F8.

DBArtisan opens the Query Option dialog.
2. Either close the **Query Options** dialog and then the SQL Editor window or enter a valid query in the ISQL editor and then execute your query by clicking the **Execute** button.

3. When complete, ensure that only the Datasource Explorer window is open.

Proceed to **SQL Debugging, Analysis and Tuning**.
SQL Debugging, Analysis and Tuning

While this example is specific to Oracle PL/SQL Debugging, the same interface and functionality applies to all of the supported platforms.

To see debugging in action

1. On the Datasource Explorer, expand any Oracle datasource node.
2. On the Oracle datasource, select the Procedures node.
3. In the right pane of the Explorer, right-click any stored procedure, and then select Debug.
4. If prompted, enter any input parameters and then click Continue.

After the SQL Debugger interface is displayed you can step through code, step into dependencies, set and watch variables, and even perform basic code profiling for each line of executed code. See the DBArtisan online help for a detailed listing of all available SQL features.

5. Experiment with debugging features and then close the debugger window.

Proceed to Session 6: Job Management.
Session 6: Job Management

DBArtisan freely integrates with the Microsoft Windows Task Scheduler, which allows you to virtually schedule any task to run on your own computer whenever and how often you’d like. While this example is specific to an Oracle table redefinition, the same concept applies to any job or script that can be scheduled.

To schedule a job, do the following:

1. On the Explorer, expand any Oracle datasource.

2. On the Oracle datasource, expand the Tables node, right-click any table, and select Extract. DBArtisan extracts the DDL that defines the selected table and opens an ISQL Editor window on the DDL.

3. From the ISQL window toolbar, click the Schedule button.

The Schedule Action dialog opens. You can provide a name, set notifications, and specify an output directory for the new job.

4. After you have completed the dialog, click OK. The Job Scheduler dialog opens.

5. Proceed as prompted to schedule your job. When finished, close the ISQL window.

You can use the Oracle Job Queue explorer node to monitor your job.
Proceed to Session 7: Data Management.
Session 7: Data Management

DBArtisan provides comprehensive facilities to help you manage the data in all of your databases. A visual data editor helps you add, change and delete data from your tables with all referential integrity enforced. You can create INSERT statements for tables using current data and also extract data as XML documents for certain databases. Rounding out its rich Schema Management capabilities, DBArtisan also allows you to migrate schema objects and associated table data from one database server to another, across the same or different platforms.

The following topics walk you through some of the data management features:

- Visual Data Editing
- Working with Table Data - Create Insert Statements
- Working with Table Data - Extract Data as XML
- Advanced Data Management - Schema and Data Migration
Visual Data Editing

To start the Visual Data Editor, do the following:

1. In the Datasource Explorer, right-click any table and select **Edit Data**. DBArtisan opens the **Data Editor Filter** dialog.

2. In **Columns**, select the columns that are to be included in the editable data.

You can also filter the editable rows by including your SELECT statement.

3. Click **OK**.

   In Live mode, all changes are applied to the database when you move off of an updated or inserted row. Deleted rows are immediately removed from the database. Batch mode allows you to make changes and then save all when all are complete. The mode is controlled by a dropdown in the Data Editor toolbar.

4. Experiment with editing your data, and when complete, on the Data Editor toolbar, click the **Execute** (blue arrow) button.

   DBArtisan commits your changes. Regardless of mode, all of the generated DML statements are viewable in the lower SQL window.
5. Close the Data Editor pane.

Proceed to Working with Table Data - Create Insert Statements.
Working with Table Data - Create Insert Statements

DBArtisan lets you generate a set of INSERT statements based on rows of an existing table.

2. On the Oracle datasource, expand the Tables node.
3. In the right pane of the Explorer window, right-click any table, and then select Create Insert Statements. DBArtisan opens the Create Insert Statements dialog. For example:

   ![Create Insert Statements dialog]

4. In Columns, select the columns you want to include in the INSERT statement.
5. You can also filter what rows are included by adding your WHERE clause.
6. Click OK.

The resulting INSERT statements are created and presented in an active ISQL window. At this point, they can be executed immediately, scheduled to execute later, or saved. Note that all extracted INSERT statements can be run against the same or different databases containing a similar schema.
Working with Table Data - Create Insert Statements

```sql
-- TABLE INSERT STATEMENTS

INSERT INTO HR.JOB_HISTORY ( JOB_HISTORY.EMPLOYEE_ID, JOB_HISTORY.START_DATE, JOB_HISTORY.END_DATE, JOB_HISTORY.JOB_ID, JOB_HISTORY.DEPARTMENT_ID )
/

INSERT INTO HR.JOB_HISTORY ( JOB_HISTORY.EMPLOYEE_ID, JOB_HISTORY.START_DATE, JOB_HISTORY.END_DATE, JOB_HISTORY.JOB_ID, JOB_HISTORY.DEPARTMENT_ID )
VALUES ( 102, TO_DATE('01/13/1993 12:00:00 AM', 'MM/DD/YYYY HH12:MI:SS AM'), TO_DATE('07/24/1998 12:00:00 AM', 'MM/DD/YYYY HH12:MI:SS AM'), 'IT_PROG', 60 )
/
```

7. Close the editor pane.

Proceed to Working with Table Data - Extract Data as XML.
Working with Table Data - Extract Data as XML

DBArtisan lets you generate an XML representation of table data.

To extract data as XML

2. On the Oracle datasource, expand the Tables node.
3. In the right pane of the Explorer window, right-click any table listed, and then select Extract Data as XML.
4. Select the columns to include in the SELECT statement.
5. You can also filter what rows are included by adding a WHERE clause in the Select Statement box.
6. Click OK.
7. Close the editor pane.

The resulting XML document is created and presented in an active XML Editor. At this point the document can be saved in XML format.

Proceed to Advanced Data Management - Schema and Data Migration.
Advanced Data Management - Schema and Data Migration

DBArtisan provides advanced data management tools that help you to move schema and corresponding table data across the same or different platforms. You can copy a single database object, all objects owned by a specific user, or an entire database, all guided by a wizard-driven process.

While this example is specific to an Oracle to SQL Server schema and data migration, the same concept applies to any migration involving any combination of the supported platforms.

To open the Schema Migration Wizard:

1. On the Utilities menu, select Schema Migration. DBArtisan opens the Migration Wizard.

2. Select the Perform new migration option.

3. Click Next. DBArtisan opens the next panel of the Migration Wizard. For example:

4. Select an Oracle datasource from the Source Datasource list and a Microsoft SQL Server datasource from the Target Datasource list.
5. Click **Next** and provide login credentials if prompted. DBArtisan opens the next panel of the Migration Wizard.

Since Microsoft SQL Server supports multiple databases per datasource, you must choose a database.

6. Select an entry from the **Target Database** list and then click **Next**. DBArtisan opens the next panel of the Migration Wizard.

![Migration Wizard - Step 4 of 7](image)

7. In the **Object Types** list, select the object types to be migrated to the target datasource.

As you select object types, the **Objects** list is updated to let you select specific objects to migrate. The **Expand/Collapse** icons let you drill down through dependencies/containment.

8. Use the **Objects** list to select the specific objects to migrate.

9. Click **Next**. DBArtisan opens the next panel of the Migration Wizard.
10. Examine the migration options offered but leave the default settings for now.

11. Click **Next**. DBArtisan opens the next panel of the Migration Wizard.

Clicking **Finish** executes the migration and lets you view the progress of the job.

Proceed to **Session 8: Performance Management**.
Session 8: Performance Management

DBArtisan offers a number of different options to help you manage the performance of your databases. First, DBArtisan ships with a built-in process monitor that helps you understand who is connected to your database along with each user’s current activity and session-related data. For more robust performance details, DBArtisan’s Performance Analyst add-on is a powerful client-side database monitor that runs fully contained in the DBArtisan console.

The following topics walk you through some of the performance management features:

- Monitoring Sessions
- Advanced Client-Side Performance Monitoring
Monitoring Sessions

While this example is specific to Oracle the Process Monitor is available for all of the supported platforms.

To start the DBArtisan Process Monitor:

2. From the Utilities menu, select Database Monitor.

The Database Monitor includes the following options and features:

- Highlight any session and any currently running SQL is displayed in the lower pane.
- You can drill-down into a specific session to display session-level statistical details, historical and current wait events along with a working copy of the currently running SQL that can be copied to an ISQL for Explain Plan generation.
- By using the Monitor dropdown options you can display more advanced database-level monitoring data such as locks, blocking locks, hit ratio by user, Top 20 SQL, etc.
Monitoring Sessions

3. Close the Database Monitor pane.

Proceed to **Advanced Client-Side Performance Monitoring**.
Advanced Client-Side Performance Monitoring

For advanced performance monitoring and management, DBArtisan’s optional Performance Analyst provides intelligent diagnostic information and strong drill-down details to help you get to the heart of any episode of performance degradation. Performance Analyst integrates completely with DBArtisan so that you can fix any performance problems with a few clicks of the mouse.

**Note:** Performance Analyst is available for Oracle, SQL Server, Sybase ASE and DB2 for Unix, Windows, and Linux.

**Note:** Performance Analyst is a separately-licensed component. If you are not working with an evaluation copy of DBArtisan or do not have a specific license, proceed to Session 10: General Utilities and Tools. Contact your license administrator or your Embarcadero representative about obtaining a license.

1. On the DataSource Explorer, select any Oracle datasource.

In addition to the Home page displayed initially, Performance Analyst presents several pages of statistics. Page categories include Memory, I/O, Space, Objects, Users, and OS. Each page contains several panes of related statistics, the Home page’s Key Ratio Analysis pane, for example:

![Key Ratio Analysis](image)

Note the toolbar at the top of the Performance Analyst. It lets you navigate among the Performance Analyst statistics pages.

![Toolbar](image)
3. Experiment with displaying the various pages available from the toolbar dropdowns.

See the DBArtisan online help Performance Analyst topics for a detailed walkthrough of all available features and functionality.

Proceed to **Session 9: Capacity Management**.
Session 9: Capacity Management

Planning for the future of your critical databases used to be a difficult task. However, DBArtisan’s optional Capacity Analyst tool makes it easy to understand where your databases are today and where they are headed in the future. Capacity Analyst lets you track key database metadata and performance metrics over time so you can perform trend analysis on key areas like growth, object fragmentation, I/O and session load. Like all of the Analyst Series products, Capacity Analyst runs fully contained within DBArtisan so you have access to smart, built-in forecasting mechanisms that allow you to predict when your databases run out of space and the ability to proactively manage your storage assets, all from the same console.

Performance Analyst is available for DB2 for Unix, Windows, and Linux, Sybase ASE, Oracle, and SQL Server.

2. From the Analyst menu, select Capacity Analyst.

Note: Capacity Analyst is a separately-licensed component. If you are not working with an evaluation copy of DBArtisan or do not have a specific license, proceed to Session 10: General Utilities and Tools. Contact your license administrator or your Embarcadero representative about obtaining a license.

The Capacity Analyst opens in the DBArtisan workspace for the target Oracle datasource.

![Capacity Analyst workspace](image)

See the relevant DBArtisan online help topics for a detailed walkthrough of all available features and functionality.

Proceed to Session 10: General Utilities and Tools.
Session 10: General Utilities and Tools

No evaluation of DBArtisan would be complete without a mention of the general utilities and tools that are available across all of the supported platforms. The **Utilities** menu offers primarily DBMS-specific operations while those offered on the **Tools** menu are more generic.

The **Utilities** menu contains the more advanced DBArtisan features. The available menu items are context-sensitive and version-specific for the selected datasource DBMS platform. This example above shows the **Utilities** menu features that are available for Oracle.

The **Tools** menu contains those features that are common across all DBMS platforms. The example above shows the **Tools** menu features that are available for all supported DBMS platforms. Note that if any other Embarcadero products are installed on your client they will be available on the **Tools** menu.

All DBArtisan utilities and tools provide a common interface that walks you through all input and execution requirements. All results are consistently presented so you can easily move between features without effort or confusion.

Proceed to **Session 11: Using Performance IQ**.
Session 11: Using Performance IQ

These query examples show the benefits and possibilities that Performance IQ provides for identifying bottlenecks in a database. Performance IQ helps you to take corrective actions and see the results of the taken actions.

As an example, different queries are presented for showing how Performance IQ works.

**SQL Server**

**CPU Waits query**

This query should be run against the target data source where we want to generate load. The script takes 1-2 minutes and shows CPU waits consumption in the Top Waits Window.

```sql
DECLARE @big AS BIGINT
SELECT @big = 0
WHILE @big < 300000000
    SELECT @big = @big + 1
```

**IO Scan**

The IO Scans.sql script included in the .zip you can find below, runs IO scans against the largest tables in a database. It needs some large tables to show some relevant IO wait times and cleans out the buffer cache beforehand to ensure that the scans are always done from disk.

In case you do not have any large tables, you can use the Northwind database (shipped with SQL Server - it can also be downloaded). Once you have the Northwind database, use the script Load suppliers Table For IO Scans.sql included in the .zip file below. This script makes special copies from Northwind to create a juicy big table to scan.

File:IoScan.zip
Blocking waits

In case you are not sure if the blocking waits are showing correctly the 2 scripts below will give an accurate representation:

Run this script first:

```sql
IF (SELECT COUNT(*) FROM tempdb..sysobjects WHERE name = N'##BlockingTable') = 0
    CREATE TABLE ##BlockingTable
        [SupplierID] [INT] NOT NULL
    ON [PRIMARY]
GO
BEGIN TRANSACTION
SELECT COUNT(*) FROM ##BlockingTable (TABLOCKX)
WAITFOR DELAY '00:03:02'
COMMIT TRANSACTION
```

2-3 seconds after that script starts running you can start to run the script below in another query window (or job). This second script will be blocked for almost 3 minutes by the first script. This should show up on Top Waits Window as a 3 minutes block wait.

```sql
SELECT COUNT(*) FROM ##BlockingTable (TABLOCKX)
```
Other Wait Types

This simple statement runs for 10 minutes and shows a 10 minutes WAITFOR type wait.

WAITFOR DELAY '00:10:00'

Quantity of statements

The SQL below creates 10,000 different SQL Statements in a very short period.

On a "clean" monitored DBMS server, they should show up as different statements.

What this SQL is designed to do is create a huge amount of background noise on a DBMS.
SET NOCOUNT ON
DECLARE @SQL nvarchar(1024)
DECLARE @COUNT INT
SELECT @COUNT = 1
WHILE @COUNT < 10000
BEGIN
    SELECT @COUNT = @COUNT + 1
    SELECT @SQL = N'WAITFOR DELAY ''00:00:00.007'' DECLARE @Counter int
    SELECT @Counter = COUNT(*) FROM master.sysprocesses WHERE ' + CONVERT(VARCHAR(20), RAND()) + 1000000 + N' <> ' + CONVERT(VARCHAR(20), RAND()) + 2000000
    EXEC (@SQL)
END
Specifying Application Preferences and Feature Options

The following topics show you how to customize the application configuration for your specific needs:

- Configuring Feature Options
- Locking Down Features Using the Registry
Configuring Feature Options

All application settings are available in the Options Editor, which is organized in a tabular format based on feature sets.

**To specify options for the DBArtisan application or a particular feature**

1. On the **File** menu, select **Options**.

   The Options Editor opens.

2. Click the tab corresponding to the feature you want to customize. Set feature options on the tab and then click **OK**.
Configuring Feature Options

**Connection Options** Specifies the timeout parameters, packet size for a connection, and ANSI to OEM settings.

**Data Editor Options** Specifies settings for Data Editor.

**Data Transfer Options** Sets default directories when performing data unload and load and data export and import operations.

**Datasource Options** Specifies general datasource management options and Datasource Navigator/Explorer preferences.

**DB Monitor Options** Lets you customize the Database Monitor display on a DBMS platform basis.

**DBMS Java Options** Specifies load Java files and drop Java files.

**DB2 Utilities Options** Sets default directories for executables used by DB2 LUW.

**DDL Extract Options** Specifies whether or not DROP statements should be included when extracting the schema of different database object types.

**Debug Options** Sets the duration of your debug initialization and debug session, enable or disable DBMS_OUTPUT, and enable the refresh option.

**Directories Options** Sets the default directories for placing the output of different operations such as HTML reports or schema extractions.

**Explorer Options** Sets defaults for the organization of objects in the Datasource Navigator/Explorer.

**General Options** Sets defaults for automatic login, restoring the last session, and other general application options.

**Grid Properties (Results window) Options** Dictates the physical appearance of the results window grid.

**ISQL Options** Sets defaults for the maximum allowable errors before aborting the execution of a SQL script, executing selected text, and the position of Query and Results tabs.

**Java Options** Lets you specify Java Virtual Machine options.

**LDAP Configuration Options** Sets preferences for LDAP Server usage.

**Logging Options** Sets defaults for SQL Logging.

**Migration Options** Sets the default options for schema migration operations.

**MySQL Utilities Options** Specifies paths to MySQL utilities.

**Oracle Utilities Options** Specifies the location of the Oracle Utilities.

**Query Builder Options** Specifies global settings for Query Builder.
Configuring Feature Options

**Results (ISQL) Options**  Specifies auto format result sets, sets the display and format of Result Windows, and the mail file type and default fonts.

**SMTP Mail Options**  Lets you specify defaults for your outgoing mail notifications.

**Space Analyst Options**  Sets Space Analyst options.

**Team Server 2016 Options**  Lets you integrate with the Embarcadero Team Server 2016 data governance metadata repository.

**Version Control Options**  Lets you select which version control system you want DBArtisan to use as the underlying version control system.

**Warnings Options**  Activates specific warnings when undesirable actions are attempted against a database.

**Note:** If there is an open document, the **Update Document Statement Properties** dialog opens. The **Update Document Statement Properties** dialog lets you override changes you made to a current document or documents with new settings you made in the Options Editor.
Connection Options

The Connection tab of the Options Editor lets you specify common connectivity options and provides access to DBMS-specific options.

Note: For DBArtisan system requirements and details on DBMS product support, see the Read Me at http://docs.embarcadero.com/products/dbartisan/.

Note: For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

The table below describes the options and functionality on the Connection tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login Timeout</td>
<td>Specifies the number of seconds that the application should wait for a response to a connection request from server. If server does not respond within the specified period, the application aborts the connection and returns an error message.</td>
<td>30</td>
</tr>
<tr>
<td>Query Timeout</td>
<td>Specifies the number of seconds that the application should wait for a response to a query from the server. If the server does not respond within the specified period, the application terminates its query process and returns an error.</td>
<td>0</td>
</tr>

Connection Options

Connection Options - Oracle

The Connection > Oracle tab of the Options Editor lets you select an installed client other than the active/default client version for Embarcadero driver connections. It also lets you override default client/server settings.

Note: For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

Note: For more general connectivity options, see Connection Options.

Group Setting Description

Hide time portion of DATE datatype if zero If selected, the time portion (HH:MM:SS) of DATE datatype results are suppressed in the ISQL Editor’s Results window, if the time portion is all zeroes.

OCI Client Selection

This group of controls apply only to use of the Embarcadero drivers with native Oracle clients. If no client is specified using these controls, the following sequence is used in determining the client to use for Oracle connections.
- The driver specified in the ORACLE_HOME environment variable
- The first driver found in the PATH environment variable
- The bundled Oracle Instant Client driver (v. 11)

Enable Client Selection Selecting this check box lets you override the default/active client specified by Oracle environment variables. This control enables and disables the Oracle Home control.

Oracle Home Select the directory of the Oracle client you wish to use.
### Connection Options

| **TNSNAMES.ORA Directory Path of Oracle configuration files** | **Browse to locate and select the directory containing the TNSNAMES.ORA file to use. Ensure that no file name is included with the path. If no file is specified using this control, the following sequence is used in determining the TNSNAMES.ORA file to use for Oracle connections.**  
- The directory specified in the TNS_ADMIN environment variable  
- The directory specified in the TNS_ADMIN key at the top level in HKLM\SOFTWARE\ORACLE  
- The directory specified in the TNS_ADMIN key in the client subkey (HOME or KEY_ prefixed) corresponding to the value of the ORACLE_HOME (if there is a particular client specified by the user, its TNS_ADMIN subkey will be used if present)  
- The directory ORACLE_HOME\NETWORK\ADMIN (if there is a particular client specified by the user, ORACLE_HOME is the client’s full path)  
- The directory ORACLE_HOME\net80\ADMIN (if there is a particular client specified by the user, ORACLE_HOME is the client’s full path)  
- All directories in PATH environment variable |

| **Default Driver Selection** | **By default, when you register a datasource, the native driver is automatically selected as the default connection option.**  
**NOTE:** For details on native driver and JDBC driver support, see the ReadMe file selecting View > Release Notes.  
The controls in this group let you specify one of the installed or packaged DBMS platform-specific JDBC drivers as the default connection option.  
**Connect using JDBC instead of the OCI client**  
For platforms for which a native driver is supported, this check box enables selection of a JDBC driver as the default connection option.  
For platforms for which no native driver is available, this check box is disabled.  
**JDBC driver to use**  
If multiple JDBC drivers are available for this platform, this control lets you select the specific JDBC driver to use as the default.  
**Assign to all disconnected Datasources**  
This control lets you assign either the native driver or the currently selected JDBC driver as the connection option for all datasources defined on the relevant DBMS platform that are currently not connected. If the Connect using JDBC instead of the OCI client setting is selected, all disconnected datasources are assigned the driver selected from the JDBC driver to use list as the connection option. Otherwise, the native driver is assigned to all disconnected datasources on this DBMS platform. |
Data Editor Options

The **Data Editor** tab of the Options Editor lets you provide preferences that dictate behavior of the table data editor.

**Note:** Option parameters set in the Options Editor override options set within Query Builder and Data Editor.

**Note:** For information on opening the Options Editor, see *[Specifying Application Preferences and Feature Options]*.

**Note:** For information on using the Data Editor, see *[Data Editor]*.

The table below describes the options and functionality on the **Data Editor tab**:

<table>
<thead>
<tr>
<th>Interface Element</th>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default Execution Mode</strong></td>
<td><strong>Live Mode</strong> lets you execute changes one row at a time. <strong>Batch Mode</strong> lets you make unlimited changes prior to execution. Batch Mode offers three sub-options: <strong>Ignore errors-continue processing</strong>, <strong>Prompt on Error</strong>, and <strong>Stop after error(s)</strong> (number of errors allowed before stopping execution)</td>
<td></td>
<td>Live Mode</td>
</tr>
<tr>

</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Embarcadero Technologies
Data Transfer Options

After opening the Options editor (see Specifying Application Preferences and Feature Options), you can make changes to the Data Transfer tab.

You can configure DBArtisan to use default directories when performing data unload and load and data export and import operations. Setting a default directory saves time because it describes a single reference point for loading or unloading, exporting and importing table or view data files.

The table below describes the options and functionality on the Data Transfer tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Unload</td>
<td>Specifies the name and location of the default directory in the Data Unload box.</td>
</tr>
<tr>
<td>Data Load</td>
<td>Specifies the name and location of the default directory in the Data Load box.</td>
</tr>
<tr>
<td>Oracle Export (for Oracle)</td>
<td>Specifies the name and location of the default directory in the Oracle Export box.</td>
</tr>
<tr>
<td>Oracle Import (for Oracle)</td>
<td>Specifies the name and location of the default directory in the Oracle Import box.</td>
</tr>
</tbody>
</table>
Datasource Options

The **Datasource** tab of the Options Editor lets you provide datasource categorization and storage preferences.

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).
### Datasource Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Datasource Storage Management</strong></td>
<td>Registry-based and file-based datasource catalog management is available. Prior to changing methods, see <a href="#">Specifying a Datasource Catalog Storage Option</a>. The following options are offered:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>o <strong>Windows Registry datasource catalog</strong>: The datasource catalog is stored and managed locally, in the Windows registry. This user can add and delete datasources and edit the registration details of existing resources. Any changes are retained across startups.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>o <strong>File based datasource catalog</strong>: The datasource catalog is stored locally and is file-based (%APPDATA%\Embarcadero\Data Sources\ in a default installation). This user can add and delete datasources and edit the registration details of existing resources. Any changes are retained across startups.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>o <strong>Network shared datasource catalog</strong>: The datasource catalog is file-based, and obtained from the location specified in the <strong>Location of shared datasources file</strong> control. Changes such as new datasources, deleted datasources or edited datasource registrations are lost on shutdown. Changing methods does not delete datasource definitions stored using the current method. When you change methods, existing catalog definitions are not automatically converted to the new method.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>o <strong>Team Server based datasource catalog</strong>: The datasource catalog is located on Team Server 2016 and is shareable between multiple users. Datasources changes are propagated to Team Server 2016.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Team Server 2016 URL must be configured in <a href="#">Team Server 2016 Options</a>.</td>
<td></td>
</tr>
</tbody>
</table>

#### Recent Datasource List Contains

- **Recent Datasources**
  - Lets you specify number of datasources to display when you select **Recent Datasources** from the **File** menu.

#### Re-sort the Datasource Combo based on Connection state

- **Selected**
  - Re-sorts the lists of datasources in the combo. It locates the connected datasources first.
Datasource Options

**Default to Alias Usage When Defining New Datasources**
For DBMS that support alias usage, defaults the Connection Information tab to alias usage selection.

**Datasource Category Settings**
Lets you select the optional user interface elements that are to be color-coded or labelled for datasources that have been assigned a selected category:

- Color the status bar using the datasource’s category color
- Color the tabs using the datasource’s category color
- Include category short name in the datasource toolbar combo

For an introduction to datasource categorization, see [Categorizing Datasources using Color-coding and Labeling](#).

**Note:** For information on using Embarcadero Team Server 2016 repository-based datasource definitions, see [Team Server 2016 Support](#).
DB Monitor Options

The Options Editor’s **DB Monitor** tab lets you specify color and refresh rate Database Monitor settings for a DBMS platform.

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

**Note:** For information on using Database Monitor, see [Database Monitor](#).

The table below describes the options and functionality on the **DB Monitor** tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS type dropdown</td>
<td>Lets you select the DBMS type that this set of custom settings applies to.</td>
</tr>
<tr>
<td><strong>Refresh Rate</strong></td>
<td>The initial rate at which the display is refreshed when you open a Database Monitor window on the specified platform.</td>
</tr>
<tr>
<td><strong>Process types, Item foreground, and Item background</strong></td>
<td>Lets you specify the colors of text and background for specific process types.</td>
</tr>
</tbody>
</table>
DBMS Java Options

The **DBMS_JAVA** tab of the Options Editor lets you choose between use of the **DBMS_JAVA** package and the loadJava.bat batch file when loading or dropping Java classes.

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

The table below describes the options and functionality on the **DBMS_JAVA** tab:

<table>
<thead>
<tr>
<th>Interface Element</th>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Load Java files</strong></td>
<td>Use the <strong>DBMS_JAVA</strong> package</td>
<td>Lets you schedule your SQL.</td>
<td>Selected</td>
</tr>
<tr>
<td></td>
<td><strong>Use batch file</strong></td>
<td>Uses batch file</td>
<td>Not selected</td>
</tr>
<tr>
<td></td>
<td><em>(oracle_home/bin/loadJava.bat)</em></td>
<td><em>(oracle_home/bin/loadJava.bat)</em></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Default Encoding option</strong></td>
<td>Leave blank to use the default.</td>
<td>Default</td>
</tr>
<tr>
<td><strong>Drop Java files</strong></td>
<td>Use the <strong>DBMS_JAVA</strong> package</td>
<td>Lets you schedule your SQL.</td>
<td>Selected</td>
</tr>
<tr>
<td></td>
<td><strong>Use batch file</strong></td>
<td>Uses batch file</td>
<td>Not selected</td>
</tr>
<tr>
<td></td>
<td><em>(oracle_home/bin/dropJava.bat)</em></td>
<td><em>(oracle_home/bin/dropJava.bat)</em></td>
<td></td>
</tr>
</tbody>
</table>

For related information, see the following object actions:

- [Drop Java](#)
- [Load Java](#)
DB2 Utilities Options

Some functionality against DB2 LUW datasources makes use of native DB2 utilities.

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

The table below describes the options and functionality of the **DB2 Utilities** tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>db2cmd.exe</td>
<td>Use this control to specify the location of the directory containing the <strong>db2cmd.exe</strong> utility.</td>
</tr>
<tr>
<td>db2.exe</td>
<td>Use this control to specify the location of the directory containing the <strong>db2.exe</strong> utility.</td>
</tr>
</tbody>
</table>
**DDL Extract Options**

The **DDL Extract** tab of the Options Editor lets you specify results-handling preferences for use of the **Extract** object action.

**Note:** For information on opening the Options Editor, see *Specifying Application Preferences and Feature Options*.

**Note:** For information on using the **Extract** object action, see *Extract*.

### Common options

The table below describes the options and functionality on the **DDL Extract tab**, main view, of the Options Editor:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extract to multiple windows</td>
<td>Select to extract the schema for each object into separate DDL windows. <strong>NOTE:</strong> This option only works when you extract DDL for multiple objects.</td>
</tr>
<tr>
<td>Extract in dependency order</td>
<td>This is the default. When you select a number of objects as part of an extraction job, this option ensures objects will be extracted in the proper dependency order. If the option is not selected, errors may result when you execute the script. It’s also true, however, that loading the dependencies can add significant overhead when you are extracting numerous objects.</td>
</tr>
<tr>
<td>Script Use Statement</td>
<td>This option is for Sybase. Optimizes extraction through generating Use statements in the generated script.</td>
</tr>
<tr>
<td>Grouping Extracted DDL</td>
<td>There are two option as to how the DDL is generated for an extract operation: Group the Drop and Create DDL for each object together - Objects are extracted one at a time. In the DDL generated by the extract, the Drop statement for a selected or referenced object is followed by the Create statement for that object. Group DDL statements by type - all Drop statements, then all Create statements - In the DDL generated by the extract, Drop statements for all selected or referenced objects are grouped to precede Create statements for those objects. This method ensures that all dependencies are respected. For more information on DROP options and dependencies, see <em>DBMS-specific DDL Extract Options</em>.</td>
</tr>
</tbody>
</table>

### DBMS-specific DDL Extract Options

The DBMS-specific views of the DDL Extract tab let you specify:

- The object types to include DROP statements for
- The default dependent object types for each object type included in extraction/migration operations

You can choose to include DROP statements before you perform ad hoc DDL extractions. You can use this feature to modify and to re-compile database objects. To recompile a database object, drop it before recreating it. This option drops any existing
objects of the same name before recreating the object. The data in the existing table is not saved when you specify a DROP statement for extracted DDL.

**Caution:** Because dropping an object is a destructive action, you should carefully consider including drop statements before activating this option.

You can also specify dependent object types included in extraction/migration operations. Each DBMS-specific view of the DDL Extract tab lets you specify the object dependencies for each object type. Dependent object types selected on that view are by default selected when you run an extraction/migration operation and can be overridden using those wizards. For more information see Extract.
**Debug Options**

The **Debug tab** of the Options Editor lets you specify operational preferences for the Debugger.

**Note:** For information on opening the Options Editor, see *Specifying Application Preferences and Feature Options*.

**Note:** For information on using the Debugger, see *Embarcadero SQL Debugger*.

The table below describes the options and functionality on the **Debug** tab:

<table>

Embarcadero Technologies
Directories Options

The **Debug tab** of the Options Editor lets you configure default directories when performing certain operations. You can set the default directories for:

- Wizard operations
- Report generation
- Schema extraction
- HTML templates for customizing reports

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

The table below describes the options and functionality on the **Directories** tab. The %APPDATA%, %MYDOCS%, and %PROGFILES% placeholders represent the location of the Application Data, My Documents, and Program Files folders relevant to your operating system:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wizard Definitions</td>
<td>Specifies the name and location of the default directory for saving wizard operations. This option applies to wizard operations in which you have the option to save the definition file, such as data unload/load or schema migration operations.</td>
<td>%%APPDATA%%\Embarcadero\DBArtisan\DefFiles</td>
</tr>
<tr>
<td>HTML Reports</td>
<td>Specifies the name and location of the default directory for the output from generated HTML reports. For information on generating reports, see Report.</td>
<td>%%APPDATA%%\Embarcadero\DBArtisan\Report</td>
</tr>
<tr>
<td>Schema Extraction</td>
<td>Specifies the name and location of the default directory for placing the output from schema extraction operations.</td>
<td>%%MYDOCS%%\Embarcadero\DBArtisan\Extract</td>
</tr>
<tr>
<td>Directory</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>HTML Template</td>
<td>Specifies the name and location of the default directory where the HTML template on which to base HTML reports can be found. This feature lets you customize your HTML reports.</td>
<td></td>
</tr>
<tr>
<td>User SQL Scripts</td>
<td>Specifies the name and location of the default directory for SQL Scripts.</td>
<td></td>
</tr>
<tr>
<td>Job Config Files</td>
<td>Specifies the location of any ETSQLX job configuration files you have set on your local machine. For more information, see ETSQLX Command Line Utility.</td>
<td></td>
</tr>
</tbody>
</table>
#include Files

Specifies the name and location of the directory searched for files specified by a #include directive in the ISQL editor, Procedure Object Editor, or Package Body Object Editor if there are no paths specified on the Datasource Properties tab of the Datasource Registration Editor. For more information, see Registering Datasources.

For more information on compiler directives, see SQL Preprocessing: #define and #include.
Explorer Options

The Explorer options are available on the following Options Editor tabs:

- Explorer Options - Main Tab
- Explorer Options - Organization Tab
- Explorer Options - Limits Tab

Explorer Options - Main Tab

The Options Editor’s Explorer tab controls the appearance and behavior of the Datasource Navigator/Explorer.

Note: For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

Note: For related information, see Using the Datasource Navigator/Explorer.

Use the following table as a guide to modifying settings on this tab:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh after Object Commands</td>
<td>Refreshes the Explorer automatically after an object has been modified or created.</td>
</tr>
<tr>
<td>Retain View Setting on Close</td>
<td>Select to retain the current state of the Datasource Explorer so that it opens the same way on the next startup.</td>
</tr>
<tr>
<td>Column filters use regular expressions by default</td>
<td>Lets you use regular expressions when defining criteria for display of database objects in the right-hand pane of the Explorer.</td>
</tr>
<tr>
<td>Display Explorer on startup</td>
<td>Activates the Datasource Explorer on startup. For more information, see Using the Datasource Navigator/Explorer.</td>
</tr>
<tr>
<td>Landing Page View</td>
<td>Enables landing page views on a DBMS-by-DBMS basis. Landing pages display informative metadata that gives you a quick overview of your server/database.</td>
</tr>
</tbody>
</table>

In DBArtisan, additional settings are available:
Explorer Options

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Explorer on startup</td>
<td>Activates the Datasource Explorer on startup. For more information, see Using the Datasource Navigator/Explorer.</td>
</tr>
<tr>
<td>Landing Page View</td>
<td>Enables landing page views on a DBMS-by-DBMS basis. Landing pages display informative metadata that gives you a quick overview of your server/database.</td>
</tr>
</tbody>
</table>

Explorer Options - Organization Tab

The Options Editor’s Explorer > Organization tab controls the appearance and behavior of the Datasource Navigator/Explorer.

**Note:** For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

**Note:** For related information, see Using the Datasource Navigator/Explorer.

Use the following table as a guide to modifying settings on this tab

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Explorer organization</td>
<td>Lets you select a default grouping option of Organize by Object Owner (groups objects, by object type, for each user) or Organize by Object Type (groups objects by object type for all users in the same list). Grouping by object owner is most efficient if you are working with databases containing a high number of objects. You can change the organization manually during a session. For details, see Basic Viewing Options in the Navigator/Explorer.</td>
</tr>
<tr>
<td>Show System Objects and Show Only My Objects (available if you are organizing the Datasource Explorer by object type)</td>
<td>Lets you select a default Datasource Explorer tree display options for system objects and objects that you own. Available options in the two groups are: Never - the relevant objects are not displayed by default. Always - the relevant objects are always displayed by default. Use datasource filter - The relevant default datasource filter is enabled. For more information, see Filtering in the Navigator/Explorer. You can change the Show System Objects and Show Only My Objects settings manually during a session. For details, see Basic Viewing Options in the Navigator/Explorer.</td>
</tr>
</tbody>
</table>

In DBArtisan, the following setting is also available

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sort Type</td>
<td>Lets you select between alphanumeric and lexicographic options.</td>
</tr>
</tbody>
</table>

Explorer Options - Limits Tab

The Options Editor’s Explorer > Limits tab controls the appearance and behavior of the Datasource Navigator/Explorer.
Explorer Options

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

**Note:** For related information, see [Using the Datasource Navigator/Explorer](#).

While the DBMS is queried as necessary when you navigate the node hierarchy, it also caches nodes for the purpose of quickly repopulating if you move away from and then back to a node. For example if you open a **Tables** node and then an **Indexes** node and then again select the **Tables** node, the cached **Tables** sub-nodes are displayed.

The following settings are available

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cache Expiration Time</strong></td>
<td>The duration a node is cached. Selecting a node after this expiration interval results in a fresh population.</td>
</tr>
<tr>
<td><strong>Maximum number of children to display per tree node</strong></td>
<td>Lets you place an upper limit of the number of nodes to display per node.</td>
</tr>
</tbody>
</table>

In DBArtisan, the following setting is also available

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Number of tree nodes to cache</strong></td>
<td>Lets you place an upper limit of the number of nodes to cache. For example, if set to 3, and you navigate to <strong>Tables</strong>, then <strong>Indexes</strong>, then <strong>Primary Keys</strong>, then <strong>Triggers</strong>, going back to <strong>Tables</strong> would force a fresh population since the <strong>Triggers</strong> node pushed out <strong>Tables</strong> from the cache;</td>
</tr>
</tbody>
</table>
General Options

The General tab of the Options Editor lets you specify general application options.

Note: For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

The table below describes the options and functionality on the General tab:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main tab Confirm on Exit</td>
<td>Ensures that a prompt is issued confirming the operation before exiting the application.</td>
<td>Selected</td>
<td></td>
</tr>
<tr>
<td>Max Editors in a Single Open Operation</td>
<td>Specifies the maximum number of editors allowable from a single Open operation.</td>
<td>5</td>
<td></td>
</tr>
<tr>
<td>Max Entries in Output Window</td>
<td>Specifies the maximum number of messages that can appear in the Output Window before the contents are flushed. This option conserves memory resources. You can clear the Output window or raise the maximum number allowed at any time.</td>
<td>1500</td>
<td></td>
</tr>
</tbody>
</table>

The General tab also offers the following DBMS-specific sub-tabs:

Oracle sub-tab

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Dictionary View Usage</td>
<td>Lets you synchronize use of the Oracle Data Dictionary DBA and ALL/USER views with the privileges associated with the role used in creating and using the datasource.</td>
<td></td>
</tr>
<tr>
<td>Role-based Views</td>
<td>Views based on the user’s role will be used. That is, users with DBA privileges will use DBA views.</td>
<td></td>
</tr>
<tr>
<td>DBA Views</td>
<td>DBA views are always used.</td>
<td></td>
</tr>
<tr>
<td>All Views</td>
<td>All views are always used.</td>
<td></td>
</tr>
<tr>
<td>Use Datasource Configuration for Views</td>
<td>lets you set up Data Dictionary usage on a view-by-view basis when editing or registering a datasource. For more information, see Registering Datasources.</td>
<td></td>
</tr>
<tr>
<td>Preserve Case in Object Identifiers</td>
<td>Preserves case of the database object.</td>
<td>Not selected</td>
</tr>
</tbody>
</table>

Sybase and SQL Server sub-tabs

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rename action style</td>
<td>Lets you specify whether user-defined objects or datatypes are renamed using an extended ALTER or using the sp_rename procedure.</td>
<td>extended alter</td>
</tr>
</tbody>
</table>
Grid Properties (Results window) Options

The Grid Properties tab of the Option editor lets you set preferences for the layout and appearance of the grid in an Results window.

**Note**: For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

The table below describes the options and functionality on the Grid Properties tab:

<table>
<thead>
<tr>
<th>Interface Element</th>
<th>Options and descriptions</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Titles and Gridlines</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3D-Buttons</td>
<td>Enables or disables a 3-D appearance on row and column headings in the grid.</td>
<td>Set</td>
</tr>
<tr>
<td>Horizontal Gridlines</td>
<td>Enables or disables ruling between rows of the grid.</td>
<td>Set</td>
</tr>
<tr>
<td>Vertical Gridlines</td>
<td>Enables or disables ruling between columns of the grid.</td>
<td>Set</td>
</tr>
<tr>
<td>Mark Headings</td>
<td>Enables or disables highlighted row and column headings.</td>
<td>Set</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays a preview of the settings currently selected in the Titles and Gridlines group.</td>
<td></td>
</tr>
</tbody>
</table>
ISQL Options

The ISQL options are available on the following Options Editor tabs:

- ISQL Options - Main Tab
- ISQL Options - Oracle Tab
- ISQL Options - DB2 Tab
- ISQL Options - Sybase Tab
- ISQL Options - SQL Server Tab
- ISQL Options - Sybase IQ Tab
- ISQL Options - MySQL Tab
- ISQL Options - DB2 OS390 Tab
- ISQL Options - Editor Tab
- ISQL Options - Auto format Tab
- ISQL Options - Code Assist Tab

ISQL Options - Main Tab

The Options Editor’s ISQL tab and its sub-tabs control the appearance and behavior of the SQL Editor.

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

**Note:** For information on using the SQL Editor, see [Coding Environments/Editors](#).

Use the following table as a guide to modifying settings on this tab:
### ISQL Options

| **Max Errors Before Aborting Execution** | Sets the maximum number of errors allowed before aborting the execution of a script. A zero indicates that the option is inactive and that you recognize no limit to the number of errors allowed. This value is used when step executing SQL scripts. |
| **Execute Selected Text** | Executes a portion of a selected SQL script. |
| **Check Syntax When Executing** | For DB2, required to execute DB2 call statements in the ISQL Window. |
| **Automatically lock connection** | When disabled, a prompt to commit or rollback the transaction is displayed when you close the ISQL editor window. Enabling this options disables the prompts and locks the connection automatically. |
| **Prompt to lock database connection** | Locks the database connection on execution. |
| **Tabs** | Sets the appearance of the ISQL Window tabs to either the top or bottom of the ISQL Window. |
| **File Association** | Specifies whether the application should open an unknown file type automatically into an ISQL Window or prompt you with a message that the file type is not recognized. |
| **Query Plan Layout** | Sets the default orientation of a graphical query plan. For more information, see [Setting up the Execution Environment with Query options](#). |

### ISQL Options - Oracle Tab

The Options Editor’s **ISQL > Oracle** tab controls the appearance and behavior of the SQL Editor when executing against an Oracle environment.

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

**Note:** For information on using the SQL Editor, see [Coding Environments/Editors](#).

Use the following table as a guide to modifying settings on this tab:
### ISQL Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable DBMS Output</td>
<td>Lets you specify buffer size. 0 is the default.</td>
</tr>
<tr>
<td>Auto-Commit changes</td>
<td>Applies auto commit status changes to all open windows.</td>
</tr>
<tr>
<td>View xmltype as clob</td>
<td>When enabled, xmltype columns are displayed as CLOBs in the Results grid and the Data editor. Without this option selected, SELECT statements that qualify xmltype columns produce an OciTypeBinder conversion error. With the option selected, the SELECT submitted is modified to include a getclobval() method call.</td>
</tr>
<tr>
<td>Retain connection in pool after use</td>
<td>This option determines what happens to a connection after it is unlocked by the ISQL window. If selected, the connection will be returned to the application connection pool. If unselected, the unlocked connection will be disconnected.</td>
</tr>
<tr>
<td>Default Query Plan</td>
<td>Lets you select the default display, tree-based or graphical, when you generate a query plan. For more information, see Viewing a Tree-based or Graphical Query Plan (Oracle).</td>
</tr>
<tr>
<td>Load Query Options</td>
<td>If this option is not enabled, a set of default query options is loaded that customize your execution environment, and periodically sends those settings to the server. Enabling this option and specifying an XML file, forces load of a previously saved query options file each time an ISQL windows opens against this DBMS platform. This lets you override default query options. You can also enable this option when saving a query options file. For information on other load and save options, specific query options offered, manually updating query options, and conditions for which query options are sent to the server, see Setting up the Execution Environment with Query options.</td>
</tr>
</tbody>
</table>

### ISQL Options - DB2 Tab

The Options Editor’s ISQL > DB2 tab controls the appearance and behavior of the SQL Editor when executing against a DB2 LUW environment.

**Note:** For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

**Note:** For information on using the SQL Editor, see Coding Environments/Editors.

Use the following table as a guide to modifying settings on this tab:
**Set Isolation Level**
Sets the default for the value of the *Isolation Level* option on the Query Options dialog. For details, see [Setting up the Execution Environment with Query options](#).

**Auto-Commit changes**
Applies auto commit status changes to all open windows.

**Create Explain plan tables if required**
If set to TRUE, Explain Plan tables are created, as necessary. If set to FALSE and you don’t manually create tables, Explain Plan operations will fail.

**Create explain plan tables on the SYSTOOLS schema**
If set to TRUE, Explain Plan tables are created on the SYSTOOLS schema. If the tables already exist in the user’s default schema, those tables continue to be used. Refer to DB2 documentation for a listing of Explain Plan tables that must be deleted in order to use the SYSTOOLS option. If set to FALSE, Explain Plan tables are created under the user’s default schema.

**Retain connection in pool after use**
This option determines what happens to a connection after it is unlocked by the ISQL window. If selected, the connection will be returned to the application connection pool. If unselected, the unlocked connection will be disconnected.

**Load Query Options**
If this option is not enabled, a set of default query options is loaded that customize your execution environment, and periodically sends those settings to the server. Enabling this option and specifying an XML file, forces load of a previously saved query options file each time an ISQL window opens against this DBMS platform. This lets you override the default query options. You can also enable this option when saving a query options file. For information on other load and save options, specific query options offered, manually updating query options, and conditions for which query options are sent to the server, see [Setting up the Execution Environment with Query options](#).

### ISQL Options - Sybase Tab

The Options Editor’s **ISQL > Sybase** tab controls the appearance and behavior of the SQL Editor when executing against a Sybase ASE environment.

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

**Note:** For information on using the SQL Editor, see [Coding Environments/Editors](#).

Use the following table as a guide to modifying settings on this tab:
ISQL Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-Commit changes</td>
<td>Applies auto commit status changes to all open windows.</td>
</tr>
<tr>
<td>Retain connection in pool after use</td>
<td>This option determines what happens to a connection after it is unlocked by the ISQL window. If selected, the connection will be returned to the application connection pool. If unselected, the unlocked connection will be disconnected.</td>
</tr>
<tr>
<td>Load Query Options</td>
<td>If this option is not enabled, a set of default query options is loaded. That set of query options customize your execution environment, and periodically sends those settings to the server. Enabling this option and specifying an XML file, forces load of a previously saved query options file each time an ISQL window opens against this DBMS platform. This lets you override the default query options. You can also enable this option when saving a query options file. For information on other load and save options, specific query options offered, manually updating query options, and conditions for which query options are sent to the server, see Setting up the Execution Environment with Query options.</td>
</tr>
</tbody>
</table>

ISQL Options - Sybase IQ Tab

The Options Editor’s ISQL > Sybase IQ tab controls the appearance and behavior of the SQL Editor when executing against a Sybase IQ environment.

Note: For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

Note: For information on using the SQL Editor, see Coding Environments/Editors.

Use the following table as a guide to modifying settings on this tab:
### ISQL Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Enable Set Query Options</strong></td>
<td>Sets the default value of the Send Set Options setting on the Query Options dialog. For details, see Setting up the Execution Environment with Query options. Changing this value does not affect ISQL sessions currently open.</td>
</tr>
<tr>
<td><strong>Auto-Commit changes</strong></td>
<td>Applies auto-commit status changes to all open windows.</td>
</tr>
<tr>
<td><strong>Retain connection in pool after use</strong></td>
<td>This option determines what happens to a connection after it is unlocked by the ISQL window. If selected, the connection will be returned to the application connection pool. If unselected, the unlocked connection will be disconnected.</td>
</tr>
<tr>
<td><strong>Load Query Options</strong></td>
<td>If this option is not enabled, a set of default query options is loaded. That set of options customize your execution environment, and periodically sends those settings to the server. Enabling this option and specifying an XML file, forces load of a previously saved query options file each time an ISQL window opens against this DBMS platform. This lets you override the default query options. You can also enable this option when saving a query options file. For information on other load and save options, specific query options offered, manually updating query options, and conditions for which query options are sent to the server, see Setting up the Execution Environment with Query options.</td>
</tr>
</tbody>
</table>

### ISQL Options - SQL Server Tab

The Options Editor’s ISQL > SQL Server tab controls the appearance and behavior of the SQL Editor when executing against a SQL Server environment.

**Note:** For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

**Note:** For information on using the SQL Editor, see Coding Environments/Editors.

Use the following table as a guide to modifying settings on this tab:
ISQL Options

### Option

**Enable Set Query Options**

Sets the default value of the **Send Set Options** setting on the Query Options dialog. For details, see [Setting up the Execution Environment with Query options](#). Changing this value does not affect ISQL sessions currently open.

**Auto-Commit changes**

Applies auto commit status changes to all open windows.

**Retain connection in pool after use**

This option determines what happens to a connection after it is unlocked by the ISQL window. If selected, the connection will be returned to the application connection pool. If unselected, the unlocked connection will be disconnected.

**Load Query Options**

If this option is not enabled, a set of default query options is loaded. That set of options customize your execution environment, and periodically sends those settings to the server. Enabling this option and specifying an XML file, forces load of a previously saved query options file each time an ISQL window opens against this DBMS platform. This lets you override the default query options. You can also enable this option when saving a query options file. For information on other load and save options, specific query options offered, manually updating query options, and conditions for which query options are sent to the server, see [Setting up the Execution Environment with Query options](#).

### ISQL Options - MySQL Tab

The Options Editor’s **ISQL > MySQL** tab controls the appearance and behavior of the SQL Editor when executing against a MySQL environment.

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

**Note:** For information on using the SQL Editor, see [Coding Environments/Editors](#).

Use the following table as a guide to modifying settings on this tab:
## ISQL Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retain connection in pool after use</td>
<td>This option determines what happens to a connection after it is unlocked by the ISQL window. If selected, the connection will be returned to the application connection pool. If unselected, the unlocked connection will be disconnected.</td>
</tr>
<tr>
<td>Load Query Options</td>
<td>If this option is not enabled, a set of default query options is loaded. That set of options customizes your execution environment, and periodically sends those settings to the server. Enabling this option and specifying an XML file, forces load of a previously saved query options file each time an ISQL window opens against this DBMS platform. This lets you override the default query options. You can also enable this option when saving a query options file. For information on other load and save options, specific query options offered, manually updating query options, and conditions for which query options are sent to the server, see <a href="#">Setting up the Execution Environment with Query options</a>.</td>
</tr>
</tbody>
</table>

## ISQL Options - DB2 OS390 Tab

The Options Editor’s **ISQL > DB2 OS390** tab controls the appearance and behavior of the SQL Editor when executing against a DB2 z/OS environment.

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

**Note:** For information on using the SQL Editor, see [Coding Environments/Editors](#).

Use the following table as a guide to modifying settings on this tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retain connection in pool after use</td>
<td>This option determines what happens to a connection after it is unlocked by the ISQL window. If selected, the connection will be returned to the application connection pool. If unselected, the unlocked connection will be disconnected.</td>
</tr>
<tr>
<td>Load Query Options</td>
<td>If this option is not enabled, a set of default query options is loaded. That set of options customizes your execution environment, and periodically sends those settings to the server. Enabling this option and specifying an XML file, forces load of a previously saved query options file each time an ISQL window opens against this DBMS platform. This lets you override the default query options. You can also enable this option when saving a query options file. For information on other load and save options, specific query options offered, manually updating query options, and conditions for which query options are sent to the server, see <a href="#">Setting up the Execution Environment with Query options</a>.</td>
</tr>
</tbody>
</table>

## ISQL Options - Teradata Tab

The Options Editor’s **ISQL > Teradata** tab controls the appearance and behavior of the SQL Editor when executing against a Teradata environment.
**Note:** Teradata datasources support is intended as a technical preview. Minimal functionality is provided. For information on technical previews, see the Read Me at http://docs.embarcadero.com.

**Note:** For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

**Note:** For information on using the SQL Editor, see Coding Environments/Editors.

Use the following table as a guide to modifying settings on this tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retain connection in pool after use</td>
<td>This option determines what happens to a connection after it is unlocked by the ISQL window. If selected, the connection will be returned to the application connection pool. If unselected, the unlocked connection will be disconnected.</td>
</tr>
<tr>
<td>Load Query Options</td>
<td>If this option is not enabled, a set of default query options is loaded. That set of options customizes your execution environment, and periodically sends those settings to the server. Enabling this option and specifying an XML file, forces load of a previously saved query options file each time an ISQL windows opens against this DBMS platform. This lets you override the default query options. You can also enable this option when saving a query options file. For information on other load and save options, specific query options offered, manually updating query options, and conditions for which query options are sent to the server, see Setting up the Execution Environment with Query options.</td>
</tr>
</tbody>
</table>

**ISQL Options - Editor Tab**

The Options Editor’s **ISQL > Editor** tab controls the appearance and behavior of the SQL Editor window.

**Note:** For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

**Note:** For information on using the SQL Editor, see Coding Environments/Editors.

The table below describes the options and functionality on the **Editor** tab:
<table>
<thead>
<tr>
<th>Group</th>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>Show Toolbar and Show Status Bar</td>
<td>Enables/disables these ISQL Window user interface elements.</td>
<td>Selected</td>
</tr>
<tr>
<td></td>
<td>Maximize on new or open</td>
<td>Indicates that the ISQL Editor window should be maximized on opening. If you already have an active MDI Window that is maximized, the default behavior is to maximize a new child window. To deactivate this option, ensure you do not have any active MDI Windows.</td>
<td>Selected</td>
</tr>
<tr>
<td></td>
<td>File Tracking</td>
<td>Indicates that the ISQL Editor should use the File Tracking Facility to monitor the status of a file. If a file has been modified and saved outside the application, the application loads the most current version of the file into the IISQL Editor based on the options set for Auto-Reload File (see above.)</td>
<td>Selected</td>
</tr>
<tr>
<td></td>
<td>Auto-Reload File</td>
<td>If File Tracking is enabled, indicates that the application should automatically reload a file that has been externally modified without prompting you. If you turn this option off, you are prompted before reloading your file if external changes have been saved.</td>
<td>Not selected</td>
</tr>
<tr>
<td></td>
<td>Auto-Save File</td>
<td>Indicates that files in the ISQL Editor should automatically be saved at the indicated time interval. Backup files are saved to: In DBArtisan,%APPDATA%\DBArtisan\Backup. Backup files use a naming convention of the form ~ETxxxx.tmp.. For a listing of backup file names and the path of the file to which they correspond, see the registry key: In DBArtisan, HKEY_CURRENT_USER\Software\Embarcadero\DBArtisan\version\Backup</td>
<td>Selected (5 minutes)</td>
</tr>
<tr>
<td>Command History</td>
<td>Save File Before Overwriting</td>
<td>Specifies the action you want the application to take when selecting a command from the Command History box. You have the option to be reminded to save a file before overwriting (Ask First), to automatically save a file before overwriting (Always), or to automatically overwrite the file with the command (Never).</td>
<td>Ask First</td>
</tr>
<tr>
<td></td>
<td>Save Most Recent</td>
<td>Specifies the number of commands you want to save in the Command History list in the top of the ISQL Window toolbar. The maximum value is 99.</td>
<td>15</td>
</tr>
</tbody>
</table>
ISQL Options

**Printing**  
Lets you select common printer options.

**Appearance**  
Sets syntax highlighting on so that all keywords and comments are colored for easier reading and debugging.

**Show Line Numbers**  
Places line numbers in the left column of an ISQL Window.

**Enable Outlining**  
Enables and disables outlining.

**Enable Text Wrapping**  
Enables and disables a typical text wrap feature.

**Editor Font**  
Sets the font face, style, and size displayed in the editor.

**Syntax Colors**  
Sets syntax coloring for keywords, comments, quotes, and default text for various file types and scripts from the *Syntax Coloring* dialog.

**Formatting**  
Sets automatic indentation for each carriage return, new line in your SQL script.

**Auto Indent**  
Sets tabs as the specified number of spaces in result sets.

**Expand Tabs and Tab Size**  
When copying text from the editor, no substitution is made for end-of-line characters. This provides the fastest cut and paste operation.

**Clipboard Line Endings**  
When copying text from the editor, end-of-line characters are replaced with platform-specific equivalents (Windows - CR LF, UNIX - LF, Macintosh - CR). This lets you copy text into environments such as Notepad, that require platform-specific end-of-line characters. This option avoids unnecessary characters and incorrect display, but cut-and-paste operations take more time to complete.

**ISQL Options - Auto format Tab**

After opening the Options editor, you can make changes to the *Auto Format* tab of the ISQL pane.

The Options Editor’s *ISQL > Auto Format* tab lets you specify the style and spacing of SQL statements in an ISQL window when you choose to auto format SQL in the ISQL editor.
ISQL Options

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

**Note:** For information on using the SQL Editor, see [Coding Environments/Editors](#).

On opening, the **Preview** area shows an SQL statement formatted according to the current **Auto Format** settings. Click **Edit** to open the **Auto Format Options** dialog. Use the following table as a guide to understanding and modifying the settings in this dialog:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Keywords</strong></td>
<td>Lets you select a character case (UPPERCASE, LOWERCASE, INITIALCAPS, or NO CHANGE) formatting treatment for SQL keywords.</td>
</tr>
<tr>
<td><strong>Right Margin</strong></td>
<td>Specifies the maximum number of characters per line.</td>
</tr>
<tr>
<td><strong>New line before keyword</strong></td>
<td>If enabled, a new line is forced before every SQL keyword. If disabled, lines are only forced for statement type and clause type keywords.</td>
</tr>
<tr>
<td><strong>BEGIN ..END block</strong></td>
<td>If enabled, empty BEGIN ..END blocks occupy a single line.</td>
</tr>
<tr>
<td><strong>Stack lists</strong></td>
<td>If enabled, a new line and indenting is forced for each item in comma-separated list such as argument lists.</td>
</tr>
<tr>
<td><strong>List indent size</strong></td>
<td>If <strong>Stack lists</strong> is enabled, this control lets you specify the number of spaces each list item will be indented from the current offset.</td>
</tr>
<tr>
<td><strong>Parenthesis indent size</strong></td>
<td>Lets you specify the number of indenting spaces for forced lines following an open parenthesis.</td>
</tr>
<tr>
<td><strong>Conditions format style</strong></td>
<td>Specifies how conditions in clauses are formatted: CONDITIONS_WRAPPED - lines are not forced before conditions.</td>
</tr>
<tr>
<td></td>
<td>CONDITIONS_STACKED_WITH_LEADING_OPERATORS - a new line is forced for each condition in a clause, with logical operators, if present for a line, displayed at the start of the line.</td>
</tr>
<tr>
<td></td>
<td>CONDITIONS_STACKED_WITH_TRAILING_OPERATORS - a new line is forced for each condition in a clause, with logical operators, if present for a line, displayed at the end of the line.</td>
</tr>
<tr>
<td><strong>Conditions stack threshold</strong></td>
<td>For <strong>Conditions format style</strong> selections that specify stacking, this value specifies the minimum number of conditions that must appear in a clause before conditions are stacked.</td>
</tr>
<tr>
<td><strong>THEN statements</strong></td>
<td>If enabled, simple THEN clauses are kept to a single line.</td>
</tr>
</tbody>
</table>

**ISQL Options - Code Assist Tab**

Code assist options are available on the following tabs:

- ISQL Options - Code Assist - Main Tab
ISQL Options

- ISQL Options - Code Assist - Advanced Tab

ISQL Options - Code Assist - Main Tab

The Options Editor’s ISQL > Code Assist tab lets you activate and select options for coding assistance and error-detection features available from the ISQL editor:

- **Code Complete**: lets you insert or replace object names, selected from suggestion lists, as you edit a script. For more information, see Code Complete.

- **Semantic validation**: detects object name references to objects not present in the datasource index. For more information, see Semantic Validation.

- **Real-time syntax checking**: on-the-fly syntax checking is performed as you type. For more information, see Syntax Checking.

- **Hyperlinks**: lets you invoke object actions against objects referenced in a script. For more information, see Hyperlink Object Actions.

- **Object metadata display**: lets you view Connect server metadata for referenced objects. For details, see Viewing Embarcadero Team Server 2016 Model Metadata in the SQL Editor.

The ISQL - Code Assist tab has the following settings:

<table>
<thead>
<tr>
<th>Group/Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Enable Code Complete</strong></td>
<td>Lets you enable or disable the Code Complete feature. When disabled, Code Complete cannot be invoked automatically or manually. Because of the overhead in maintaining internal resources used in implementing this feature, a slight performance increase can result from disabling the feature. When auto-activation is disabled, the Code Complete feature must be invoked manually. When auto-activation is enabled, the Code Complete feature is invoked automatically each time the interval between keystrokes exceeds the specified Auto-activation delay.</td>
</tr>
<tr>
<td><strong>Insert single proposals automatically</strong></td>
<td>Specifies that if a Code Complete suggestion list would contain only a single suggestion, that suggestion is inserted automatically.</td>
</tr>
<tr>
<td><strong>Fully qualify completions automatically</strong></td>
<td>Specifies that Code Complete results are returned fully qualified, rather than the minimum required to identify the object.</td>
</tr>
<tr>
<td><strong>Code Validation</strong></td>
<td>Enable Real-time syntax checking</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td></td>
<td>Severity levels for semantic validation problems</td>
</tr>
<tr>
<td></td>
<td>Perform syntax and semantic validation on files smaller than</td>
</tr>
<tr>
<td><strong>DB Action Menu</strong></td>
<td>Enable DBAction menu in the editor</td>
</tr>
<tr>
<td></td>
<td>Show DB Actions in submenu</td>
</tr>
<tr>
<td></td>
<td>Key used in conjunction with right-mouse</td>
</tr>
<tr>
<td><strong>Metadata</strong></td>
<td>Enables display/use of metadata for referenced objects, obtained from a Connect server repository, in the following user interface elements: tooltips, window gutter, and code complete proposals. You can also have metadata added as comments when formatting code. For detailed information on setting up and using this feature, see Viewing Embarcadero Team Server 2016 Model Metadata in the SQL Editor.</td>
</tr>
<tr>
<td><strong>Performance</strong></td>
<td>Enables/disables the ISQL Performance feature. For more information see ISQL Performance.</td>
</tr>
<tr>
<td>Cache lifespan in minutes</td>
<td>Allows you to select the update timing for the ISQL Performance feature. ISQL performance updates the cache information with the sample rate selected. For more information, see ISQL Performance.</td>
</tr>
<tr>
<td>Restore defaults</td>
<td>Restores all settings on the tab to the original defaults.</td>
</tr>
</tbody>
</table>

**Note:** For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

**Note:** For information on using the SQL Editor, see Coding Environments/Editors.

**ISQL Options - Code Assist - Advanced Tab**

Coding assistance and error detection features such as Hyperlink object actions, Code Complete, and Semantic Validation rely on:
ISQL Options

- Parsing of SQL entered in the SQL Editor into keywords, object name references, data, and so on
- A database object index generated for a connected datasource. On the first connection to a datasource, an index of specified object types is generated, with an imposed, configurable, upper limit on the number of objects contained in the index. On each subsequent connection, the index is updated to reflect any additions or changes on the datasource.

**Note:** The object index is stored in a persistent database with a database path of %TEMP%. With that in mind, the index may be deleted by the system administrator or automated administration-related processes.

When coding assistance and error detection features are enabled, the index is queried for the names of objects referenced in your scripts queries. This information is then used for tasks such as recognizing object types, detecting misspelled object names, and populating suggestion lists.

The Options Editor’s **ISQL > Code Assist > Advanced** tab lets you force parsing, if required, and customize how the index is generated. Since there is performance overhead associated with generation and usage of the index, you can control the properties and usage of the index.

**Note:** For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

The table below describes the options and functionality on the **ISQL > Code Assist > Advanced** Tab of the Options Editor:
## ISQL Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Scan entire file for context</strong></td>
<td>This control is enabled only if the ISQL &gt; Code Assist tab’s Enable Real-time syntax checking check box is deselected and the Severity levels for semantic validation problems is set to IGNORE. When this control is enabled, SQL Editor content continues to be parsed. That is, if you have disabled real-time syntax checking and effectively disabled semantic validation, you can still use the Hyperlinks feature.</td>
</tr>
<tr>
<td><strong>Limit scanning to files smaller than</strong></td>
<td>Lets you place an upper limit on the size of files parsed for Code Assist features.</td>
</tr>
<tr>
<td><strong>Object types to be indexed</strong></td>
<td>Lets you select specific object types (aliases, synonyms, functions, packages, procedures, tables, or views) that will be included in the object index. While this can be used to reduce the index size and therefore improve performance, Hyperlinks, Semantic Validation, and Code Complete functionality associated with object types not included in the index will not be available.</td>
</tr>
<tr>
<td><strong>Recycle cache space when index size exceeds</strong></td>
<td>This imposes a soft ceiling on the number of objects stored in the index. After updating the index on connection to a datasource, the total number of objects in the index is compared to this value. If the value is exceeded, the oldest definitions are deleted.</td>
</tr>
<tr>
<td><strong>The maximum number of results to return when querying the object index</strong></td>
<td>Specifies the number of results when querying against the cache databases, to improve performance when working with large databases. This limit is applied per object type.</td>
</tr>
<tr>
<td><strong>Refresh</strong></td>
<td>Each time you open an ISQL editor window, schema information for the object types supported is obtained for the Code Complete and Semantic Validation features. That information is updated with any modifications that you make and persists until the window is closed. The Refresh button ensures that the information is current in case other users or applications are modifying the schema while the current SQL editor session window is open.</td>
</tr>
</tbody>
</table>
Java Options

DBArtisan requires JDBC connections. The Options Editor’s Java tab lets you set or change options that apply to the Java virtual machine (JVM) that is running on the client.

Note: For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

The table below describes the options and functionality of the Java tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>JVM Options:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Initial Heap Size</td>
<td>Set the size, in MB, for the repository where live and dead objects</td>
<td>64 MB</td>
</tr>
<tr>
<td></td>
<td>comingling with free memory. If memory runs out, JVM executions stop</td>
<td></td>
</tr>
<tr>
<td></td>
<td>so the garbage can be collected and expunged. Each platform</td>
<td></td>
</tr>
<tr>
<td></td>
<td>responds differently, so trial and error can help you maximize</td>
<td></td>
</tr>
<tr>
<td></td>
<td>performance.</td>
<td></td>
</tr>
<tr>
<td>Maximum Heap Size</td>
<td>Set the upper limit for your heap size.</td>
<td>64 MB</td>
</tr>
<tr>
<td>Maximum Perm Gen</td>
<td>Set the upper limit for the permanent generation size.</td>
<td>Version-specific</td>
</tr>
<tr>
<td>Additional Options</td>
<td>Add options here ONLY in consultation with Embarcadero Technical Support.</td>
<td>N/A</td>
</tr>
</tbody>
</table>
LDAP Configuration Options

When using the Discover Datasources feature, you can have an LDAP Server searched for datasources. Similarly, when manually registering a datasource, you can select from server names obtained from an LDAP Server. The **LDAP Configuration** tab of the Options Editor lets you provide the information required to establish a session with the LDAP Server and obtain the required datasource information.

**Note**: For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

The table below describes the options and functionality on the **LDAP Configuration** tab:

<table>
<thead>
<tr>
<th>Group</th>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server</td>
<td>Host Port</td>
<td>The FQDN or IP address of the LDAP server.</td>
</tr>
<tr>
<td></td>
<td>Search Base DN and Suggest</td>
<td>Lets you provide the distinguished name to be used as the search base. The Suggest button is only enabled after you select an authentication type and provide details, as required. It queries the server for possible DNs and populates the combo box with the results.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Anonymous Login</td>
<td>Selecting this check box directs DBArtisan to send LDAP requests without performing a bind. This also disables the other Authentication controls.</td>
</tr>
<tr>
<td></td>
<td>User, Password, and Remember</td>
<td>Let you provide the credentials used when sending LDAP requests.</td>
</tr>
<tr>
<td>Options</td>
<td>Size Limit and Time Limit</td>
<td>Lets you specify the maximum number of entries returnable and the maximum time, in seconds, to wait for the search to complete.</td>
</tr>
</tbody>
</table>

**Topics**

- [Manually Registering or Editing Datasources](#)
- [Automatically Discovering Datasources](#)
Logging Options

After opening the Options editor (see Specifying Application Preferences and Feature Options), you can make changes to the Logging tab. The Logging tab lets you set defaults that specify the behavior and placement of SQL, output and trace file logging.

SQL logging provides an audit trail. You can examine this log to determine the SQL executed to complete a task. The table below describes the SQL Logging options and functionality on the Logging tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log all SQL Statements to a File</td>
<td>Indicates that the application should log all of the SQL that it executes to a file. SQL logging provides an audit trail. You can examine this log to determine the SQL executed to complete a task.</td>
</tr>
<tr>
<td>Logfile Path</td>
<td>If you choose to log the SQL generated by the application, specify the drive, directory, and file name.</td>
</tr>
<tr>
<td>Max File Size</td>
<td>Specifies the maximum size for the logfile. When the logfile reaches this threshold, it automatically starts deleting lines in the logfile (starting with the oldest statements) to remain within the specified size limit.</td>
</tr>
<tr>
<td>Truncate</td>
<td>Empties the entire contents of the logfile.</td>
</tr>
</tbody>
</table>

Output logging lets you monitor only messages issued by the server versus all SQL logged by the application. You can examine this log to determine all messages the server issued. The table below describes the output logging options and functionality on the Logging tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log all Output Messages to a File</td>
<td>Indicates that the application should log all server messages sent to the Output window. This type of logging lets you monitor only messages issued by the server versus all SQL logged by the application. You can examine this log to determine all messages the server issued.</td>
</tr>
<tr>
<td>Logfile Path</td>
<td>If you choose to log the server messages generated in the Output window, specify the drive, directory, and file name.</td>
</tr>
<tr>
<td>Max File Size</td>
<td>Specifies the maximum size for the output logfile. When the output logfile reaches this threshold, it automatically starts deleting lines in the file (starting with the oldest statements) to remain within the specified size limit.</td>
</tr>
<tr>
<td>Truncate</td>
<td>Empties the entire contents of the output logfile.</td>
</tr>
</tbody>
</table>

Tracing is typically disabled (Trace Level set to Off) unless you are trying to diagnose a problem. When enabled, the sequence of trace messages generated by the application, severity specified, is written to a .log file. The file name includes a date stamp.

A trace file is created on each run, one per day. If multiple instances of the same application are running, each instance will also have its own trace file for that day. The
trace file will be written to until the OS denies writing to it due to the file being too big or not enough disk space. Unless the **Trace Level** is set to the higher levels such as **Trace** or **Max**, there won't be much in this file normally, so space should not be a problem. Up to 10 days of trace files are kept.

If tracing is turned on in the application (any **Trace Level** other than **Off** is set) the trace file will be locked until the application exits or the **Trace Level** is set to **Off**. The table below describes the Trace File options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Trace Path</strong></td>
<td>Fully specify the directory where trace files are to be stored.</td>
</tr>
<tr>
<td><strong>Trace Level</strong></td>
<td>In descending order of severity (and ascending order of total messages logged), Trace Level options are Fatal Errors, Errors, Warning, Info, Debug, Trace, and Max.</td>
</tr>
<tr>
<td><strong>Truncate</strong></td>
<td>Empties the entire contents of the current trace file. Not available</td>
</tr>
</tbody>
</table>
Migration Options

After opening the Options editor (see Specifying Application Preferences and Feature Options), you can make changes to the Migration tab. The Migration tab sets the default values effective when you open the Migration Wizard, a utility that lets you migrate schema and data. For information on this utility, see Using the Schema Migration Wizard.
MySQL Utilities Options

DBArtisan integrates with MySQL utilities. For access to these utilities, you need to specify their location in the MySQL Utilities tab of the Options Editor. You can use the MySQL Dump and Import Utilities.

**Note:** For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

The table below describes the options and functionality on the MySQL Utilities tab.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mysqldump</td>
<td>Specifies a path for the MySQL dump utility, mysqldump.exe. By default, MySQL installs this utility in the C:\mysql\bin directory.</td>
</tr>
<tr>
<td>mysqlimport</td>
<td>Specifies a path for the MySQL import utility, mysqlimport.exe. By default, MySQL installs this utility in the C:\mysql\bin directory.</td>
</tr>
</tbody>
</table>
Oracle Utilities Options

To make use of features that integrate with Oracle utilities, you need to specify their location on the Oracle Utilities tab of the Options Editor. You can use the Oracle Export, Import Utilities, and SQL * Loader.

Note: For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

The table below describes the options and functionality on the Oracle Utilities tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Pump Export</td>
<td>Specifies a path for the Oracle expdp.exe utility.</td>
</tr>
<tr>
<td>Data Pump Import</td>
<td>Specifies a path for the Oracle impdp.exe utility.</td>
</tr>
<tr>
<td>Export</td>
<td>Specifies a path for the Oracle Export utility. By default, Oracle installs to C:\Orant\Bin directory.</td>
</tr>
<tr>
<td>Import</td>
<td>Specifies a path for the Oracle Import utility. By default, Oracle installs to C:\Orant\Bin directory.</td>
</tr>
<tr>
<td>SQL*Loader</td>
<td>Specifies a path for the SQL * Loader utility. By default, Oracle installs to C:\Orant\Bin directory.</td>
</tr>
<tr>
<td>Default Bind Size</td>
<td>Specifies the bind size. Default is set to 70KB.</td>
</tr>
</tbody>
</table>
Query Builder Options

The Options Editor’s **Query Builder Options** tab lets you specify operational and execution preferences for the Query Builder. Option parameters set on the Options Editor elicit a prompt if there are different options set on an open individual session. Global options override properties set within individual Query Builder sessions.

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

**Note:** For information on using the Query Builder, see [Query Builder](#).

The table below describes the options and functionality on the **Query Builder tab**:

<table>
<thead>
<tr>
<th>Interface Element</th>
<th>Option Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Code Generation</strong></td>
<td>Adds a line of SQL code indicating which database or instance is used in the statement.</td>
<td>Selected</td>
</tr>
<tr>
<td></td>
<td>Adds a line of SQL code showing the table owner name as part of the query.</td>
<td>Selected</td>
</tr>
<tr>
<td></td>
<td>Includes the output row limit set in the Execution settings.</td>
<td>Not selected</td>
</tr>
<tr>
<td></td>
<td>SQL/92 is a standard for relational database management systems.</td>
<td>Not selected</td>
</tr>
<tr>
<td><strong>Execution</strong></td>
<td>To set the maximum number of rows in your result set, type the number in the dialog. This lessens congestion of server processes when queries execute by setting row count limits.</td>
<td>1000 rows</td>
</tr>
<tr>
<td><strong>General</strong></td>
<td>Reveals the data type in each column for tables in the SQL Diagram pane.</td>
<td>Not selected</td>
</tr>
<tr>
<td></td>
<td>Opens a <strong>Confirm Delete</strong> dialog when an item is deleted.</td>
<td>Selected</td>
</tr>
<tr>
<td></td>
<td>Checks syntax every time an execute statement, refresh or copy statement begins.</td>
<td>Not selected</td>
</tr>
<tr>
<td></td>
<td>Automatically sets style and spacing of display.</td>
<td>Selected</td>
</tr>
<tr>
<td><strong>Auto Join</strong></td>
<td>Automatically detects names and data types, and create joins for multiple tables.</td>
<td>Selected</td>
</tr>
<tr>

</tr>
<tr>
<td>Option</td>
<td>Description</td>
<td>Status</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>Require same data type</td>
<td>Automatically joins columns with the same data type.</td>
<td>Selected</td>
</tr>
<tr>
<td>Syntax Checker</td>
<td>Automatic Syntax Check</td>
<td>Selected</td>
</tr>
<tr>
<td>Warn on non index join</td>
<td>Returns a warning when it detects a join against a non-indexed column, or a column not participating in a primary key</td>
<td>Not selected</td>
</tr>
<tr>
<td>Display</td>
<td>Lets you set the style, size, and color of Column Font and Title Font.</td>
<td>Available</td>
</tr>
<tr>
<td></td>
<td>Also lets you set the background Table Color for the SQL Diagram Pane.</td>
<td></td>
</tr>
</tbody>
</table>
Reports Options

The Options Editor’s **Reports** tab lets you:

- Append a date and timestamp to report file names. This prevents existing reports from being overwritten.
- Save reports in date-specific folders.
- Save reports in PDF format as opposed to HTML.
- Let you include a provided image and title to reports.

**Note:** For information on opening the Options Editor, see *Specifying Application Preferences and Feature Options*.

**Note:** For information on generating reports, see *Report*.
Results (ISQL) Options

The Options Editor’s Results tab lets you specify operational and appearance details for the SQL Editor.

**Note:** For information on opening the Options Editor, see Specifying Application Preferences and Feature Options.

**Note:** For information on using the SQL Editor, see Coding Environments/Editors.

The table below describes the options and functionality on the Results tab:

<table>
<thead>
<tr>
<th>Interface Element</th>
<th>Options and descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Results Option pane</td>
<td><strong>Result Window</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Single Window</strong> - Displays all results in one tabbed result window. Multiple result sets together in the window. Single Window and Multiple Windows options are mutually exclusive. <strong>Multiple Windows</strong> - Displays multiple result sets one result set per window. <strong>Attached to Editor</strong> - Sets results as tabbed windows attached to the ISQL window. Used in conjunction with Single Window option or Multiple Window option. Attached and Unattached options are mutually exclusive. <strong>Unattached</strong> - Sets results appear separate from the ISQL Window. Used in conjunction with Single Window option or Multiple Windows option. <strong>Reuse Window</strong> - Sets new result sets to overwrite any current result sets in an open Result Window. Only valid for Single and Attached to Editor combination.</td>
</tr>
<tr>
<td>Results File</td>
<td><strong>Mail File Type</strong> - Selects the file type to use when sending result sets via a MAPI-compliant mail package. Valid formats include the proprietary Results type, Tab delimited, Comma separated, and HTML. <strong>Schedule File Type</strong> - Selects the schedule file type. Valid formats include Tab delimited, Comma separated, and HTML. <strong>Include column titles when saving</strong> - Includes column titles when saving a result set. If this option is turned off, result sets are not saved.</td>
</tr>
<tr>
<td>Result Set Options</td>
<td><strong>Default Rowcount</strong> - Lets you limit the number of rows returned to the result window of the ISQL window (default 0). <strong>Sybase ASE and SQL Server: Text Size (bytes)</strong> - Lets you specify the text size (default 8192). <strong>Oracle:LONG Size (bytes)</strong> - Lets you specify the LONG size (default 8192). <strong>LOB Preview: Text Size (bytes)</strong> - Specifies the length of the preview of LOB column data (default 4096).</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Lets you select a result sorting: Alphabetic or Lexicographic.</td>
</tr>
</tbody>
</table>
## Results (ISQL) Options

<table>
<thead>
<tr>
<th>Format pane</th>
<th>Column Formatting</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Auto Format (Best Fit)</strong> - Sets column widths automatically to accommodate the longest piece of data in a column. Large queries depend on the longest row formatting, so activating this option can affect performance. <strong>Use pre-defined column</strong> - Lets you select column type and character length</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Enable Date/Time Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lets you select the date/time format.</td>

</table>

**Moving datasources** Action performed when moving a datasource

**Moving Datasources**

When you moved a datasource through drag-and-drop into a group or from one group to another, three options are available:

- **Prompt always**: When moving a datasource, a window is prompted asking if you want to move the datasource or move it leaving a copy in the old group.
- **Move Always**: When moving a datasource, no copy will be left in the old group.
- **Don't remove from old group Always**: When moving a datasource, a copy will be left in the old group.

**Note:** These controls can be set or disabled using registry entries. For details, see [Locking Down Features Using the Registry](#).

For more information on repository-based resources, see [Team Server 2016 Support](#).
Version Control Options

The Options Editor’s **Version Control tab** lets you select which version control system you want to use as the underlying version control system.

For configuring the Version Control functionality:

1. Open the **Options Editor** Clicking **File** menu and selecting **Options**.
2. Select **General** and **Version Control** to open the **Version Control Tab**.
3. Select the Version Control System in the **Available source control plug-ins** drop-down list.

**Note:** If you are using a 64 bit version of DBArtisan with a 32 bit MSSCCI version control provider, the **Use 32-bit MSSCCI Provider** checkbox must be checked.

4. Select the **Username** for the Version Control System.
5. Specify the local **Working Directory**
6. **Click Ok**
**Note:** After adding a project or file to the version control, the Version Control System launches its Configuration Wizard to start to work with it and add that project or file to the version control.

**Topics**

- [Version Control](#)
Warnings Options

You can have warning messages issued to users whenever improper operations are attempted in a database. Warning messages differ by platform. The Options Editor’s Warnings tab lets you select the DBMS-specific events that generate warnings.

**Note:** For information on opening the Options Editor, see [Specifying Application Preferences and Feature Options](#).

The tables below describes the options of the **Warnings** tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Platform</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create an index on the same tablespace</td>
<td>Issues a warning message whenever a user does not create an index on a different tablespace than the table. This makes it possible for the server to read the index and table data in parallel.</td>
<td>DB2, Oracle, Microsoft SQL Server and Sybase ASE</td>
</tr>
<tr>
<td>same tablespace as the associated table</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create an index on the same tablespace</td>
<td>Issues a warning message whenever a user does not create an index on a different tablespace than the table. This makes it possible for the server to read the index and table data in parallel.</td>
<td>Oracle, Microsoft SQL Server and Sybase ASE</td>
</tr>
<tr>
<td>same tablespace as the associated table</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create an object in the SYSTEM tablespace</td>
<td>Issues a warning message whenever a user tries to create or place an object on the SYSTEM tablespace.</td>
<td>Oracle, Microsoft SQL Server and Sybase ASE</td>
</tr>
<tr>
<td>Create an object in the SYSTEM tablespace</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create a user with default or temp</td>
<td>Issues a warning message when a user is created with a default or temp tablespace on the SYSTEM tablespace.</td>
<td>Oracle, Microsoft SQL Server and Sybase ASE</td>
</tr>
<tr>
<td>tablespace as the SYSTEM tablespace</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create a user with default or temp</td>
<td></td>
<td></td>
</tr>
<tr>
<td>tablespace as the SYSTEM tablespace</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create an object in the master database</td>
<td>Issues a warning message when an object is created in the master database.</td>
<td>Microsoft SQL Server and Sybase ASE</td>
</tr>
<tr>
<td>Create a table or index on the default</td>
<td>Issues a warning message when a table or index is created on the default segment.</td>
<td>Microsoft SQL Server and Sybase ASE</td>
</tr>
<tr>
<td>segment</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create a non-clustered index on same segment</td>
<td>Issues a warning message when a non-clustered index is created on the same segment as the associated table.</td>
<td>Microsoft SQL Server and Sybase ASE</td>
</tr>
<tr>
<td>as the associated table</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Locking Down Features Using the Registry

Administrators can restrict certain features on individual machines through registry settings. Those settings are stored in the following location:

- In DBArtisan, HKLM\Software\Embarcadero\DBArtisan\Admin

The following general datasource and connection settings are available:

<table>
<thead>
<tr>
<th>Name (and Type)</th>
<th>Description and Supported Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>RestrictedPlatforms (REG_SZ)</td>
<td>A comma-separated list (db2=0,mssqlserver=1, for example) dictating DBMS platform support on the machine. Valid names for the name=value pairs are db2, os390, mssqlserver, mysql, oracle, sybase, mssqlazure, odbc, jdbc, and sybaseiq. Any non-zero value for a name=value pair results in that platform not being unavailable on that machine. A zero value (the default) results in the platform being available on that machine.</td>
</tr>
<tr>
<td>DisableAutoConnect (REG_DWORD)</td>
<td>When set to any non-zero value, users cannot use the auto-connect feature when registering or logging in to a datasource.</td>
</tr>
<tr>
<td>SharedDatasourceCatalogPath (REG_SZ)</td>
<td>Providing a path to the network shared datasource catalog forces DBArtisan to use that datasource catalog storage option. Registry-based and file-based catalog storage will be unavailable on this machine.</td>
</tr>
</tbody>
</table>

The following settings control configuration options on the Team Server page of the Options Editor and the Embarcadero Team Server Log In dialog. For details, see Team Server 2016 Options and Setting up and Connecting to Team Server 2016.
## Locking Down Features Using the Registry

<table>
<thead>
<tr>
<th>Name (and Type)</th>
<th>Description and Supported Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ConnectURL (REG_SZ)</strong></td>
<td>The full Embarcadero Team Server 2016 URL that the user must use if Team Server 2016 is enabled. If a value is specified, the Team Server URL control on the Team Server page of the Options Editor is set to read-only.</td>
</tr>
<tr>
<td><strong>UseConnect (REG_DWORD)</strong></td>
<td>If a value of 1 (TRUE) is specified, use of Embarcadero Team Server 2016 is enabled. If a value of 0 (FALSE) is specified, use of Team Server 2016 is disabled. If either value is specified, the Use Team Server control on the Team Server page of the Options Editor is disabled.</td>
</tr>
<tr>
<td><strong>AllowKeepMeSignedIn (REG_DWORD)</strong></td>
<td>If a value of 1 (TRUE) is specified, the Keep me signed in control on the Embarcadero Team Server - Log In dialog is set to an unchecked state and the control is disabled.</td>
</tr>
</tbody>
</table>

UseConnect and AllowKeepMeSignedIn is type REG_DWORD (legal values for both are 0 for FALSE and 1 for TRUE).

Administrators not wanting to use these settings from the HKLM root key, can use the same options in HKCU root key:

- In DBArtisan, HKCU\Software\Embarcadero\DBArtisan\Admin

If the option is specified in both locations, HKLM takes precedence over HKCU.
Datasource and Server Management

After installation, you must set up datasource definitions to establish reusable connections to your database servers. The following topics describe the function of datasources, the process of establishing datasource connections, and the related options provided:

- **Registering Datasources**
  Provides instructions on how to set up datasource definitions, manually and automatically.

- **Connecting to Datasources**
  Provides instructions on how to connect to datasources, manually and automatically.

- **Troubleshooting Client Setup**
  Provides advice on solving common connectivity problems.

- **Using the Datasource Navigator/Explorer**
  Describes the user interface mechanism that lets you browse among datasources, drill down to the database object level, and initiate datasource or object actions.

- **Using the Manage Datasources Utility**
  Describes a utility offering shortcuts to datasource options.

In addition, DBArtisan offers a set of server operation and configuration options. For details, see *Server Management Options*. 
Registering Datasources

A datasource is the connection profile that lets you have access to a database, and, therefore, to your data. So, when you register a datasource, you’re telling the application how to get at the database(s) you want to operate on. In fact, all database activities are performed through datasources, so you need a datasource profile for each database instance (or database server) in your enterprise. Each connection profile consists of basics such as unique name, DBMS-specific connection parameters, and user credentials.

Collectively, datasource definitions are stored in a datasource catalog. The catalog can be registry-based, local file-based, or network shared file-based, with each method addressing particular advantages. For details, see Specifying a Datasource Catalog Storage Option.

You register datasources using the following techniques:

- **Manual registration**: You can register datasources individually. For details, see Manually Registering or Editing Datasources.

- **Automatic discovery**: You can have search computers or your network for datasources. For details, see Automatically Discovering Datasources.

- **Import/Export**: You can export and import sets of datasource registrations. For details, see Importing and Exporting Datasource Definitions.

- **Embarcadero Team Server 2016**: Integrating with Team Server 2016 lets you work with datasource definitions on a data governance metadata repository. For details, see Team Server 2016 Support.

As an aid in maintaining your datasource registrations, you can quickly view basic registration details of a datasource. For details, see Viewing Datasource Properties.

Lastly, when a datasource registration becomes obsolete, you can unregister the datasource. For details, see Unregistering Datasources.
Specifying a Datasource Catalog Storage Option

A Datasource Catalog is a collection of defined datasources. On startup, a Datasource Catalog is loaded using one of three methods, specified using the Options editor:

- **Windows Registry datasource catalog** - The datasource catalog is stored and managed locally, in the Windows registry. This user can add and delete datasources and edit the registration details of existing resources. Any changes are retained across startups.

  This method is compatible with other Embarcadero products using registry-based datasource definition storage. If more than one of those products is installed on the same machine, they can share the same Datasource Catalog.

- **File based datasource catalog** - The datasource catalog is stored locally and is file-based. Each datasource definition included in the catalog is stored in a single file (.dsd file suffix) in the `%APPDATA%\Embarcadero\Data Sources\` folder, in a default installation. This user can add and delete datasources and edit the registration details of existing resources. Any changes are retained across startups.

  This method is compatible with other Embarcadero products using file-based datasource definition storage. If more than one of those products is installed on the same machine with DBArtisan, all can share the same Datasource Catalog.

- **Network shared datasource catalog** - The datasource catalog is file-based, and obtained from a user-specified location such as a network share. At each startup, the definitions are imported from the network shared file (.etsds file suffix).

  Changes such as new datasources, deleted datasources or edited datasource registrations are lost as soon as this user shuts down DBArtisan. This method allows centralized maintenance of the Datasource Catalog and sharing of a single catalog among multiple users across a network.

**Note:** The definition files used in both the File based datasource catalog and Network shared datasource catalog methods do not store user ID and password credentials. Credentials, links to definition files in the current user’s catalog, and folder structure are stored in the `%APPDATA%\Embarcadero\Data Sources\metadata\dsuri.xml` file.

**Note:** On individual computers, administrators can force use of the network shared option. For details, see [Locking Down Features Using the Registry](#).

For information on choosing a method and specifying the network location of a Shared Datasource Management definition file, see [Datasource Options](#).

Regardless of the catalog storage method, the Datasource Catalog can be built manually by explicitly registering datasources or using automated methods such as the Discover Datasources feature. For details, see [Registering Datasources](#).
Keep in mind that changes made with **Network shared datasource catalog** in effect, are lost on shutdown.

In order to set up a **Network shared datasource catalog** scheme, you can build a catalog first using the **File based datasource catalog** or **Windows Registry datasource catalog** method. You can subsequently use the **Manage Datasources** facility to export your **Network shared datasource catalog** file to the location that others will use to load the file. For details, see **Importing and Exporting Datasource Definitions**.

More generally, the **Manage Datasources** facility’s import/export functions can be used to exchange datasource definitions between users employing the different storage methods. Even more simply, these functions save time in allowing datasource definitions to be defined once and then shared with multiple users.
Manually Registering or Editing Datasources

Each database instance must be registered. Whether you are registering a new datasource, registering a new datasource based on an existing datasource definition, or editing preexisting connection information, you use the Datasource Registration dialog box.

To register a new datasource or edit an existing datasource

1. Use one of the following actions:
   - To register a new datasource, from the **Datasource** menu, select **Register Datasource**.
   - To register a new datasource based on an existing definition, select the existing datasource in the Navigator/Explorer and then from the **Datasource** menu, select **Register Like**.
   - To edit registration information, on the Navigator/Explorer, right-click a datasource and select **Edit**.

2. Use the following topics as a guide to providing the information required to register or edit the datasource:
   - **Selecting Database Type/Connectivity Options When Registering Datasources**
   - **Providing Connection Information When Registering Datasources**
   - **Providing Security Parameters When Registering Datasources**
   - **Providing Custom Driver Properties When Registering Datasources**
   - **Specifying Datasource Properties When Registering Datasources**
   - **Specifying Oracle Views Configuration When Registering Datasources**
   - **Specifying Group and Category Details When Registering Datasources**

3. When ready, click **Finish** and respond to the prompt to connect immediately.

**Note:** The **Test Connection** button can be used when creating or editing a datasource to verify that a connection can be established. Keep in mind that the information currently provided in the wizard is used to test the connection and therefore connection information, credentials, and custom JDBC driver properties if appropriate, must be valid.
Selecting Database Type/Connectivity Options When Registering Datasources

The **Datasource Registration** Wizard’s **Database Type** panel lets you specify the basic connectivity method for the datasource you are creating.

Prior to registering datasources, you should be familiar with the connectivity options available for each DBMS platform.

- For DBArtisan system requirements and details on DBMS product support, see the **Read Me** at [http://docs.embarcadero.com/products/dbartisan/](http://docs.embarcadero.com/products/dbartisan/).

**Note:** The Options Editor lets you indicate preferences, select options, and provide details not available with the Datasource Registration Wizard. For details, see **Connection Options**.

**Note:** On individual computers, administrators can restrict the available DBMS platforms available using registry settings. For details, see **Locking Down Features Using the Registry**.

To use Embarcadero’s default drivers **requiring dedicated client software installed on the client machine**

1. From the **Available database types** list, select one of the following:
   - IBM DB2 Universal Database
   - Microsoft SQL Server
   - MySQL
   - Oracle
   - PostgreSQL Servers
   - Sybase Adaptive Server
   - Sybase IQ
   - Teradata

If there is currently a DBMS node selected in the Navigator/Explorer, that database type is automatically selected.

**Note:** If you are connected to an Embarcadero Team Server 2016 installation, you can select an entry of the selected database type from the **Related Team Server Data Source** list. This prepopulates the wizard with definitions/settings from the Connect server for that datasource and sets up the new datasource definition to be attached to the Team Server 2016 datasource. When an item is selected from the **Related Team Server Data Source** list, clicking **Unrelate** removes the Team Server 2016...
settings/definitions from the current definition and cancels attachment to the Team Server 2016 datasource. When no item is selected from the Related Team Server Data Source list, clicking Relate uses the (alphabetically) first matching Team Server 2016 datasource of the selected database type to populate/attach, and if there are no matching definitions, opens a dialog to let you select a definition from Team Server 2016. For more information on Team Server 2016 datasources, see Team Server 2016 Support.

2. Click Next.

To specify a custom JDBC driver
1. From the Available database types list, select Generic JDBC.
2. Click Next.

To specify a generic ODBC driver or to use an ODBC connection
1. From the Available database types list, select Generic JDBC.
2. Click Next.
Providing Connection Information When Registering Datasources

Connection information is provided on a DBMS platform basis. The following topics describe platform-by-platform descriptions of the required and optional connection information:

- Providing DB2 Connection Information When Registering Datasources
- Providing MySQL Connection Information When Registering Datasources
- Providing Oracle Connection Information When Registering Datasources
- Providing PostgreSQL Connection Information When Registering Datasources
- Providing SQL Server Connection Information When Registering Datasources
- Providing Sybase ASE Connection Information When Registering Datasources
- Providing Sybase IQ Connection Information When Registering Datasources
- Providing Teradata Connection Information When Registering Datasources
- Providing Connection Information When Registering a Generic JDBC Datasource
- Providing Connection Information When Registering a Generic ODBC Datasource

Providing DB2 Connection Information When Registering Datasources

The **Datasource Registration Wizard's Connection Information** panel lets you provide details required to establish a connection to a DB2 datasource. Available options depend on the **Registration Type** value selected.

The following table describes these settings:
Providing Connection Information When Registering Datasources

<table>
<thead>
<tr>
<th>Registration Type</th>
<th>Option/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple</td>
<td>Host/Instance - The network name of the machine hosting the datasource. Port - This defaults to 50000 but can be overwritten. Database - The name of the database this user should connect to. <strong>Datasource Name</strong> - This is the name of the datasource as it will appear in the Navigator/Explorer.</td>
</tr>
<tr>
<td>Use alias from IBM client</td>
<td><strong>Server</strong> - Select from the names of servers defined in the IBM client. <strong>Datasource Name</strong> - This is the name of the datasource as it will appear in the Navigator/Explorer.</td>
</tr>
<tr>
<td>Use Data from the LDAP Server</td>
<td>This option is only enabled if LDAP is enabled and configured on the Options Editor’s <strong>LDAP Configuration</strong> tab. For details, see <strong>LDAP Configuration Options</strong>. <strong>Server</strong> - Select from the names of servers obtained from the LDAP server. Host/Instance - The network name of the machine hosting the datasource. Port - This defaults to 50000 but can be overwritten. Database - The name of the database this user should connect to. <strong>Datasource Name</strong> - The datasource as it will appear in the Navigator/Explorer.</td>
</tr>
</tbody>
</table>

Keep the following in mind when registering a DB2 datasource:

- The Options Editor lets you indicate preferences, select options, and provide details not available with the Datasource Registration Wizard. For details, see **Connection Options**.
- Consult DB2 documentation for detailed information on general LDAP support, supported LDAP servers, and client configuration before trying to register LDAP-specified datasources. For assistance, see **Accessing Third Party Documentation**.
- For more general information on registering datasources, see **Manually Registering or Editing Datasources**.

Providing MySQL Connection Information When Registering Datasources

The **Datasource Registration Wizard’s Connection Information** lets you provide details required to establish a connection to a MySQL datasource. The following table describes these setting:
Providing Connection Information When Registering Datasources

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server</td>
<td>Enter the name of the host, for example doctest01.</td>
</tr>
<tr>
<td>Port (optional)</td>
<td>The default port is 3306. You do not need to enter this information.</td>
</tr>
<tr>
<td>Default Database</td>
<td>You must enter the name of the default database.</td>
</tr>
<tr>
<td>Datasource Name</td>
<td>This field is automatically populated with the server name, but you can rename it to whatever you want.</td>
</tr>
</tbody>
</table>

**Note:** The Options Editor lets you indicate preferences, select options, and provide details not available with the Datasource Registration Wizard. For details, see [Connection Options](#).

For more general information on registering datasources, see [Manually Registering or Editing Datasources](#).

Providing Oracle Connection Information When Registering Datasources

The **Datasource Registration** Wizard’s **Connection Information** lets you provide details required to establish a connection to an Oracle datasource. Available options depend on the **Registration Type** value selected.

The following table describes these setting:
### Providing Connection Information When Registering Datasources

<table>
<thead>
<tr>
<th>Registration Type</th>
<th>Options/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple</td>
<td>Host - Manually enter the name of the host machine. Port - The default is 1521, but you can change it to wherever the Oracle listener is set up. SID/Service Name - Enter the SID or Service Name to correspond with the option you select. Instance Name - The specific name used to identify the Oracle instance (the SGA and the Oracle processes). Datasource Name - The field is automatically populated with the host name, but you can change it.</td>
</tr>
<tr>
<td>Use Connection Descriptor</td>
<td>Connect Descriptor - provide a TNS Connect String, a connect identifier that defines the parameters that need the Oracle Net Service to connect to a database service. Datasource Name - The field is automatically populated with the host name, but you can change it.</td>
</tr>
<tr>
<td>Use TNS Names alias</td>
<td>You can specify a non-default TNSNAMES.ORA file using the Options editor. For details, see Connection Options - Oracle. Oracle Alias - The dropdown is populated with server names from the TNSNAMES.ORA file. Select an Oracle alias. Connect Descriptor - A read-only field that displays the TNS Connect String obtained from the alias definition from the TNSNAMES.ORA file. Datasource Name - The field is automatically populated with the host name, but you can change it.</td>
</tr>
<tr>
<td>Use Data from the LDAP Server ()</td>
<td>This option is only enabled if LDAP is enabled and properly configured on the Options Editor’s LDAP Configuration tab. For details, see LDAP Configuration Options. Oracle Alias - The dropdown is populated with the names of servers obtained from the LDAP server specified on the Options Editor’s LDAP Configuration tab. Connect Descriptor - A read-only field that displays the TNS Connect String obtained from the alias definition from the LDAP server. Datasource Name - The field is automatically populated with the host name, but you can change it.</td>
</tr>
</tbody>
</table>

Keep the following in mind when registering an Oracle datasource:

- You can register an Oracle ASM instance directly using the Datasource Registration Wizard. No Datasource Navigator/Explorer tree is available when connecting to the ASM instance. The ISQL Editor is available with this type of connection.

- Consult Oracle documentation for detailed information on general LDAP support, supported LDAP servers, and client configuration before trying to register LDAP-specified datasources. For assistance, see Accessing Third Party Documentation.

- For more general information on registering datasources, see Manually Registering or Editing Datasources.
Providing PostgreSQL Connection Information When Registering Datasources

The Datasource Registration Wizard’s Connection Information lets you provide details required to establish a connection to a PostgreSQL datasource. The following table describes these settings:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The host name for the PostgreSQL Server.</td>
</tr>
<tr>
<td>Port</td>
<td>The port that the PostgreSQL server is listening on.</td>
</tr>
<tr>
<td>Database</td>
<td>The name for the database to connect to.</td>
</tr>
<tr>
<td>Datasource Name</td>
<td>This field automatically populates with the host name. You can change it to whatever you want.</td>
</tr>
</tbody>
</table>

**Note**: The Options Editor lets you indicate preferences, select options, and provide details not available with the Datasource Registration Wizard. For details, see Connection Options.

For more general information on registering datasources, see Manually Registering or Editing Datasources.

Providing SQL Server Connection Information When Registering Datasources

The Datasource Registration Wizard’s Connection Information lets you provide details required to establish a connection to a SQL Server datasource. The following table describes these setting:

**Note**: If you are registering a named instance on a server, you are restricted to use of the Use Network Library Configuration/Alias method below. Prior to registering the datasource, use the SQL Server Configuration Manager to create an alias to the instance, making it available as an Alias selection on the Connection Information panel.
### Providing Connection Information When Registering Datasources

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Simple</strong></td>
<td><strong>Protocol (TCP/IP or Named Pipes)</strong> - You need to select one or the other to register a SQL Server database. <strong>Host</strong> - the host name. <strong>Port</strong> - Depending on your section, you can optionally indicate the port for TCP/IP or the pipe name depending on your means of connection. <strong>Default DB</strong> - Optionally give the default name for the database. <strong>Datasource Name</strong> - The field is automatically populated with the host name, but you can rename to whatever you want.</td>
</tr>
<tr>
<td><strong>Use Network Library Configuration</strong></td>
<td><strong>Use Encryption</strong> - enables multiprotocol encryption. <strong>Alias</strong> - Select an alias. <strong>Protocol (TCP/IP or Named Pipes)</strong> - You need to select one or the other to register a SQL Server database. <strong>Host</strong> - Displays the host name. <strong>Port</strong> - Depending on your section, you can optionally indicate the port for TCP/IP or the pipe name depending on your means of connection. <strong>Default DB</strong> - Optionally give the default name for the database. <strong>Datasource Name</strong> - The field is automatically populated with the host name, but you can rename to whatever you want.</td>
</tr>
</tbody>
</table>

**Note:** The Options Editor lets you indicate preferences, select options, and provide details not available with the Datasource Registration Wizard. For details, see [Connection Options](#).

For more general information on registering datasources, see [Manually Registering or Editing Datasources](#).

### Providing Sybase ASE Connection Information When Registering Datasources

The [Datasource Registration Wizard](#)'s **Connection Information** lets you provide details required to establish a connection to a Sybase ASE datasource. The following table describes these settings:
Providing Connection Information When Registering Datasources

<table>
<thead>
<tr>
<th>Registration Type</th>
<th>Option/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple</td>
<td><strong>Use SSL Encryption</strong> - If this option is selected, the JDBC connection will be established using SSL encryption. <strong>Host</strong> - Manually enter the name of the host. <strong>Port</strong> - There is no default for this optional field. <strong>Default DB</strong> - Optionally give the default name for the database. <strong>Datasource Name</strong> - This field automatically populates with the server name. You can change it to whatever you want.</td>
</tr>
<tr>
<td>Use alias information from the SQL.INI FILE</td>
<td><strong>Sybase Server</strong> - Select a server from the dropdown. <strong>Host</strong> - Automatically populated when you select an alias. <strong>Port</strong> - There is no default for this optional field. <strong>Default DB</strong> - Optionally give the default name for the database. <strong>Datasource Name</strong> - This field automatically populates with the server name. You can change it to whatever you want.</td>
</tr>
<tr>
<td>Use data from the LDAP server</td>
<td><strong>Use SSL Encryption</strong> - The connection will be established using SSL encryption. <strong>Sybase Server</strong> - Select a server from the dropdown. <strong>Host</strong> - Automatically populated when you select an alias. <strong>Port</strong> - There is no default for this optional field. <strong>Default DB</strong> - Optionally give the default name for the database. <strong>Datasource Name</strong> - This field automatically populates with the server name. You can change it to whatever you want.</td>
</tr>
</tbody>
</table>

**Note:** The Options Editor lets you indicate preferences, select options, and provide details not available with the Datasource Registration Wizard. For details, see [Connection Options](#).

For more general information on registering datasources, see [Manually Registering or Editing Datasources](#).

Providing Sybase IQ Connection Information When Registering Datasources

The Datasource Registration Wizard’s Connection Information lets you provide details required to establish a connection to a Sybase IQ datasource. The following table describes these settings:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The host name for the Sybase IQ Server.</td>
</tr>
<tr>
<td>Port</td>
<td>The port that Sybase IQ is listening on.</td>
</tr>
<tr>
<td>Database</td>
<td>The name for the database to connect to.</td>
</tr>
<tr>
<td>Datasource Name</td>
<td>This field automatically populates with the host name. You can change it to whatever you want.</td>
</tr>
</tbody>
</table>

**Note:** The Options Editor lets you indicate preferences, select options, and provide details not available with the Datasource Registration Wizard. For details, see [Connection Options](#).
Providing Connection Information When Registering Datasources

For more general information on registering datasources, see Manually Registering or Editing Datasources.

Providing Teradata Connection Information When Registering Datasources

The Datasource Registration Wizard’s Connection Information lets you provide details required to establish a connection to a Teradata datasource. The following table describes these settings:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The host name for the Teradata Server.</td>
</tr>
<tr>
<td>Port</td>
<td>The port that the Teradata server is listening on.</td>
</tr>
<tr>
<td>Database</td>
<td>The name for the database to connect to.</td>
</tr>
<tr>
<td>Datasource Name</td>
<td>This field automatically populates with the host name. You can change it to whatever you want.</td>
</tr>
</tbody>
</table>

Note: The Options Editor lets you indicate preferences, select options, and provide details not available with the Datasource Registration Wizard. For details, see Connection Options.

For more general information on registering datasources, see Manually Registering or Editing Datasources.

Providing Connection Information When Registering a Generic JDBC Datasource

The Datasource Registration Wizard’s Connection Information lets you provide basic information details required to establish a connection to a generic JDBC datasource.

Note: For requirements and functionality restrictions for generic JDBC connections, see Generic JDBC/ODBC Connectivity.

The following table describes the settings on this panel:
Providing Connection Information When Registering Datasources

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC driver to use</td>
<td>If you are defining a datasource using a custom JDBC driver, this field is automatically populated with the value you entered in the Template Connect URL for new data source field. For more information, see Providing details for a new custom JDBC driver. Type a valid connection URL or edit the URL template to provide a valid connection URL.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>This is the name that will appear in the Datasource Navigator/Explorer.</td>
</tr>
</tbody>
</table>

**Note:** In addition to basic connection properties, you can also specify provider-specific JDBC properties. For details, see Providing Custom Driver Properties When Registering Datasources.

**Take one of the following actions:**

1. To specify a JDBC driver that you have not used before, click Manage to register a new driver. For more information, see Providing details for a new custom JDBC driver.
2. To use a custom JDBC driver you have already registered, select that driver from the JDBC driver to use dropdown.

**Providing details for a new custom JDBC driver**

When registering a datasource, if you select a generic JDBC connection, you must specify the installed JDBC driver to be used. If you have not used that driver, you can register that driver while defining a datasource.

**Note:** Before setting up a custom driver, consult the documentation for that driver to obtain details such as the driver class and connection URL for that driver type.

**To specify a new custom JDBC driver**

1. Open a datasource registration dialog. For details, see Manually Registering or Editing Datasources.
2. From the Available database types list, select Generic JDBC.
3. On the Connection Information page, click Manage. The JDBC Driver Editor opens.
4. In the Name field, type a name or description for the new driver.
5. Click the Add button associated with the Driver Archives list and use the Open dialog to locate and select the library or archive for the driver.
6. In the Class field, type the driver class.
7. In the Template Connect URL for new data source field, provide a connection URL template. There are no constraints on the value that you enter. When providing details on the Datasource Registration Wizard’s Connection Information panel, the template will automatically be entered in the Connection URL field, letting you provide actual values for any placeholders you provide in the URL template entered here.

Providing Connection Information When Registering a Generic ODBC Datasource

The Datasource Registration Wizard’s Connection Information lets you provide details required to establish a connection to a generic ODBC datasource.

**Note:** For requirements and functionality restrictions for generic ODBC connections, see Generic JDBC/ODBC Connectivity.

The following table describes the settings on this panel:

<table>
<thead>
<tr>
<th>Use Connect String</th>
<th>Option/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unselected</td>
<td><strong>Datasource Name</strong> - Provide the name that will appear in the Datasource Navigator/Explorer for this datasource. <strong>DSN</strong> - Provide the DSN for the datasource.</td>
</tr>
<tr>
<td>Selected</td>
<td><strong>Datasource Name</strong> - Provide the name that will appear in the Datasource Navigator/Explorer for this datasource. <strong>Connect String</strong> - Provide the full connection string for the datasource.</td>
</tr>
</tbody>
</table>

**Note:** Consult the documentation for the ODBC driver and the datasource you are connecting to for details on DSN and connect string requirements.
Providing Security Parameters When Registering Datasources

The **Datasource Registration Wizard**’s **Security Parameters** panel lets you provide user credentials and specify other DBMS-specific security settings. The following table describes these settings and their DBMS availability:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>The User ID that DBArtisan will use to connect to the datasource.</td>
</tr>
<tr>
<td>Password</td>
<td>The password associated with the User ID.</td>
</tr>
<tr>
<td>Connect As (Oracle)</td>
<td>When relevant, choose the appropriate user/administrator level: NORMAL, SYSASM, SYSDBA, or SYSOPER.</td>
</tr>
<tr>
<td>Domain (SQL Server)</td>
<td>For MS SQL only. Identify the domain if the user has restricted access.</td>
</tr>
<tr>
<td>Auto connect?</td>
<td>Spares the user from reentering the password every time you connect. On individual computers, auto connect can be disabled by administrators. For details, see <a href="#">Locking Down Features Using the Registry</a>.</td>
</tr>
<tr>
<td>Omit User ID and Password (Generic JDBC and Generic ODBC only)</td>
<td>Selected, no user ID or password are passed when connecting to the datasource.</td>
</tr>
<tr>
<td>Connect using Windows Authentication or Connect using OS Authentication (IBM DB2 for Windows, Unix, and Linux, MySQL, Oracle, SQL Server)</td>
<td>Login to the server is verified using Windows/OS authentication.</td>
</tr>
<tr>
<td>Connect using Kerberos Authentication (Sybase ASE)</td>
<td>If this option is selected, login to the server is verified using Kerberos authentication. <strong>NOTE:</strong> This is only available of the Use alias information in the SQL.INI file/Sybase Server option on the Connection Information tab is selected. For details, see <a href="#">Data Editor Options</a>.</td>
</tr>
</tbody>
</table>

For more general information on registering datasources, see [Manually Registering or Editing Datasources](#).
Providing Custom Driver Properties When Registering Datasources

The **Datasource Registration** Wizard’s **Custom Driver Properties** panel lets you specify optional, provider-specific connection string keywords or properties beyond those offered on other panels of the wizard.

**Note:** Consult driver/client documentation for details on supported driver properties. For a listing of supported DBMS drivers and clients, see the **ReadMe.htm** file for this release (View > Release Notes).

**To add a driver property for this datasource connection**

1. Click **New**. An **Add Driver Property dialog** opens.

2. Select a property name from the **Name** dropdown or type the name of the property. The dropdown is automatically populated with the most commonly-used properties for a platform driver. However, all properties (name/value pairs) supported for that driver can be specified.

3. Type the property value in the **Value** field.

4. Optionally, provide a **Description**.

5. Click **OK**.

The dialog closes and the new property’s name and value are displayed in the **Property Name/Property Value** list.

Use the **Edit** button to initiate editing of a selected property name/value pair. Similarly, use the **Delete** button to remove a selected property name/value pair from the list.
Specifying Datasource Properties When Registering Datasources

The **Datasource Registration** Wizard’s **Datasource Properties** panel lets you specify properties used in conjunction with application features. The following table describes these settings and their DBMS availability:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>#Include Search Directories</strong></td>
<td>Enter one or more paths on this datasource, which will be searched for files in conjunction with use of the <strong>#include</strong> directive in the ISQL editor, Procedure Object Editor, or Package Body Object Editor. Separate multiple paths using semicolons. For example: <code>c:\myscripts;c:\Program Files\Scripts</code> For more information on use of the <strong>#include</strong> directive, see <a href="#">SQL Preprocessing: <strong>#define and #include</strong></a>. Note that if there are no entries specified here, the directory specified on the <strong>Directories</strong> tab of the Options editor will be searched. For more information, see <a href="#">Directories Options</a>.</td>
</tr>
<tr>
<td><strong>Database device default path</strong> (Sybase ASE)</td>
<td>The database device default path is used when creating a new database device.</td>
</tr>
<tr>
<td><strong>View in Team Server</strong></td>
<td>If there is an attached datasource on a connected Embarcadero Team Server 2016 installation, this control opens a browser on the Team Server 2016 with the definition displayed.</td>
</tr>
<tr>
<td><strong>View Related ER Models</strong></td>
<td>Opens a dialog displaying models related to the current datasource and letting you create and delete relationships.</td>
</tr>
<tr>
<td><strong>Edit Related Data Source</strong></td>
<td>Opens a Registration Editor that will let you modify the associated Team Server 2016 datasource definition.</td>
</tr>
</tbody>
</table>

For more general information on registering datasources, see [Manually Registering or Editing Datasources](#).
Specifying Oracle Views Configuration When Registering Datasources

The **Datasource Registration** Wizard's **Oracle View Config** panel lets you manually configure access to Oracle Data Dictionary DBA or ALL/USER views to conform to the view privileges associated with a specific role.

**Note:** In order to enable manual configuration of Oracle Data Dictionary views for Oracle datasources and make this panel available, you must select **Use Datasource Configuration for Views** in the Options Editor (File > Options > General > Oracle). For more information, see [General Options](#).

Only DBA views with an ALL/USER equivalent are offered on this panel. You can use the following methods to select DBA or ALL/USER type views on a view-by-view basis:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual selection using the <strong>Use DBA View</strong> check boxes</td>
<td>Selecting the <strong>Use DBA View</strong> check box associated with an individual view makes the DBA group version of that view available. Deselecting the <strong>Use DBA View</strong> check box associated with an individual view makes the ALL/USER group version of that view available.</td>
</tr>
<tr>
<td><strong>Reset to All</strong></td>
<td>Deselects all <strong>Use DBA View</strong> check boxes, making only ALL views accessible.</td>
</tr>
<tr>
<td><strong>Reset to DBA</strong></td>
<td>Selects all <strong>Use DBA View</strong> check boxes, making DBA views accessible.</td>
</tr>
<tr>
<td><strong>Resolve Automatically</strong> (only available when editing a connected datasource)</td>
<td>Queries the datasource and selects the <strong>Use DBA View</strong> check box for each DBA view to which the current user has access.</td>
</tr>
</tbody>
</table>

Changes take effect as soon as you click the **Finish** button.

For more general information on registering datasources, see [Manually Registering or Editing Datasources](#).
Specifying Group and Category Details When Registering Datasources

The **Datasource Registration** Wizard’s **Datasource Group** panel lets you specify properties that help you organize your datasources. The following table describes these settings and their DBMS availability:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Select the datasource group folder</strong></td>
<td>Select the folder that is to contain this datasource.</td>
</tr>
<tr>
<td><strong>Select a category</strong></td>
<td>If you want to use category-based user interface item color-coding and labeling for this datasource, this dropdown lets you select an existing category to assign this datasource to that category. You can also select <strong>Customize</strong> to manage your categories. For details, see <a href="#">Customizing Datasource Categories</a>. For an introduction to datasource categorization and related tasks, see <a href="#">Categorizing Datasources using Color-coding and Labeling</a>.</td>
</tr>
</tbody>
</table>

For more general information on registering datasources, see [Manually Registering or Editing Datasources](#).
Automatically Discovering Datasources

You can automate registration of datasources by importing datasource definitions from the following locations:

- DBMS configuration files/registry entries
- LDAP Servers
- TOAD product datasource definitions (specifically from TOAD for Oracle, TOAD for Microsoft SQL Server, TOAD for MySQL, TOAD for Sybase (both ASE and IQ))
- An Embarcadero Team Server 2016 repository. For detailed information, see Team Server 2016 Support

For example, if you have a multiple DBMS platform license, the Discover Datasources feature finds all unregistered datasources that you are licensed for. If you have an Oracle only license, Discover Datasources finds all unregistered Oracle datasources.

Use the information in Setting up to Automatically Discover Datasources to ensure that you are ready to use the Dscover Datasources feature.

There are two relevant scenarios for this feature.

For details, see the following topics:

- Discovering Datasources on First Application Startup
- Manually Discovering Datasources

In addition to Auto-Discovering your database servers, datasources are automatically placed within a DBMS-specific database group folder in the Navigator/Explorer. For more information, see Categorizing Datasources using Color-coding and Labeling.

For related information, see Connecting to Datasources.
Setting up to Automatically Discover Datasources

Some search targets used by the Discover Datasources feature rely on customer-provided information. The Options Editor lets you provide the following:

- The names and locations of configuration files such as the Oracle TNSNAMES.ORA file and the Sybase ASE SQL.INI file. For details, see [Connection Options](#).
- Identification and authentication details of an LDAP Server that can publish datasources. For details, see [LDAP Configuration Options](#).
- Enabling and configuration of an Embarcadero Team Server 2016 connection. For details, see [Team Server 2016 Support](#). In addition, you must be logged in to the Embarcadero Team Server 2016. For details, see [Setting up and Connecting to Team Server 2016](#).

In addition, there are environment details that can impact this feature. For details, see [Trouble-shooting Client Setup](#).
Discovering Datasources on First Application Startup

On first startup, a dialog box displays, giving you the option to Auto-Discover all configured datasources. If you click Yes, the Auto-Discover feature searches the DBMS configuration files on your computer and automatically discovers all the datasources that you are licensed for.

**Note:** Microsoft SQL Server datasources are registered through a Windows system call to your network. Provide login information (user name and password) the first time you connect to a datasource. For more information, see [Disconnecting from a Datasource](#).

**Note:** IBM DB2 for Linux, Unix, and Windows databases use ODBC/CLI or DB2 (attach) to connect. Therefore, you need the proper ODBC/CLI Connection established in order for the auto-discover feature to find your IBM DB2 for Linux, Unix, and Windows databases, including registering the DB2 datasource to ODBC as a system datasource. Although your datasources are auto-discovered, provide login information (user name and password) the first time you connect to a datasource.
Manually Discovering Datasources

You can discover datasources residing on your system that are not currently registered datasources. The Discover Datasources operation can retrieve a list of discovered datasources, which includes the name of the server or instance, the type of DBMS, and source (DBMS configuration files/registry entries, LDAP Servers, TOAD datasource definitions, Embarcadero Team Server 2016) of all unregistered datasources found on your network or local machine. Once discovered, you have the option to register datasources.

Completing the Discover Datasources Dialog Box

1. On the **Datasource** menu, click **Discover Datasources**.

The **Discover Datasources** dialog box opens and when the search is complete, displays all discovered datasources. The source (**Local alias, Network, LDAP, or Toad**) and status of each is displayed.

2. Select the check box next to any datasources you want to register.

3. Click **Register**.
Importing and Exporting Datasource Definitions

A datasource catalog is loaded on startup. It is a collection of datasource definitions that the user can work against. How the catalog is stored and whether changes to the catalog are temporary or permanent, depends on the datasource storage method used. For an introduction, see Specify a Datasource Catalog Storage Option.

Note: On individual computers, administrators can restrict the available DBMS platforms using registry settings. For details, see Locking Down Features Using the Registry.

Regardless of the storage method used, you can add datasources to the currently loaded catalog by importing datasource definitions from the following sources:

- Windows Registry - if you previously used the Windows Registry datasource catalog storage method but are now using one of the file-based methods
- File-based datasource catalog storage method files (.dsd file suffix)
- Network-shared datasource catalog storage method files (.etsds file suffix)

Similarly, you can export the currently loaded datasource catalog definitions to a file-based datasource catalog or network-shared datasource catalog storage method files.

The ability to export and import datasource definitions provides a number of practical advantages. For example:

- Simple sharing among users - if you have a large number of datasources to register, you can have one user walk through the process of registering each datasource and then export those definitions. Other users can then import the resulting datasource definition files.

- Sharing definitions among users employing different datasource storage methods - datasource definitions or entire catalogs created using the Windows Registry datasource catalog or File based datasource catalog methods can be exported for use by users employing any of the three methods.

To export one or more datasource definitions

1. On the Datasource menu, select Manage Datasources.

The Manage Datasources dialog box opens.

2. Select a single datasource, multiple datasources, or a default or custom datasource group folder.

Note: Datasource group folder information is not exported. Datasources are exported as individual files with no higher level grouping.

3. Click Export. An Export Data Sources Folder dialog opens.
4. Take one of the following actions:

- To export datasource definitions to individual files that can be imported on a datasource-by-datasource basis, select **Export Data Sources to Individual Data Source Files** and use the associated control to locate and select a target folder.

- To export datasource definitions to a single file for use by installations employing the Shared Datasource Managed catalog storage method, select **Export Data Sources To a Shared Data Source Management File** and use the associated control to locate and select a target folder and provide a file name. For information on how to designate a user as a shared datasource managed catalog storage method, see **Datasource Options**.

5. Click **OK**.

**Note:** User ID and password credentials are not exported to the datasource definition file.

After export, other users can then import the datasource definitions.

**To add one or more datasource definitions to a catalog**

1. On the **Datasource** menu, click **Manage Datasources**.

   The **Manage Datasources** dialog box opens.

2. Select the datasource group folder where the files or files are to be imported.

3. Click **Import**. An **Import Data Sources** dialog opens.

4. Take one of the following actions:

   - If you previously used the Windows Registry catalog storage method but are currently using the Locally Managed or Shared Datasource Managed method, select **Import Previously Registered Embarcadero Data Sources From Registry** to load any datasources registered when you were using the Windows Registry catalog method.

   - To import datasource definitions from individual datasource definition files (**.dsd** file suffix), select **Import Previously Registered Embarcadero Data Sources From File(s)**, click **Add**, and use the **Select datasource definitions to import** dialog to locate and select the files to be added.

   - To import datasource definitions from a single Shared Datasource Managed storage method file (**.etsds** file suffix) file, select **Import Data Sources From a Shared Datasource Management File** and use the associated control to locate and select the target file.

5. Click **OK**.
After importing a datasource definition file, you can either edit the datasource registration to provide security parameters or provide credentials when connecting to the datasource.
Viewing Datasource Properties

You can view the name, type, version, status and mode of a connected datasource. The **Datasource Properties** dialog also lets you view the middleware or connectivity software that is being used to establish a particular datasource connection. You can use this information to troubleshoot connectivity problems, determining vital information such as the server version, connectivity library used, and library version and date.

**Note:** For information on establishing a datasource connection, see [Connecting to Datasources](#).

To view key properties of a connected datasource

1. On the Datasource Navigator/Explorer, select a datasource with an established connection. For more information, see [Using the Datasource Navigator/Explorer](#).
2. On the **Datasource** menu, select **Properties**.

The **Datasource Properties** dialog box opens.
Unregistering Datasources

You can unregister datasources when you no longer need them.

Note: Unregistering a datasource does not delete the physical database. It simply removes the datasource definition, and connection information, from the datasource catalog.

1. In the Datasource Navigator/Explorer, right-click the target datasource and select Unregister. For more information, see Using the Datasource Navigator/Explorer.
2. When prompted to confirm, click Yes.

Note: The datasource manager is shared across Embarcadero's database management products. When you remove a datasource in any of Embarcadero's database management tools the datasource is removed across all relevant products.

Topics

- Registering Datasources
Connecting to Datasources

There are two general categories of methods for connecting to a datasource.

**Automatic**  You can set datasources to automatically connect each time you open the application. You can do this when registering a datasource or as an option when explicitly connecting to a datasource. For details, see Registering Datasources and Manually Registering or Editing Datasources.

**Explicit**  If you do not use the automatic connection option for a datasource, you must explicitly connect to a datasource before you can use that datasource.

The following topics provide instruction on explicit connection and disconnection options:

- Connecting to a Datasource From the Navigator/Explorer
- Connecting to Datasources from an Alphabetical Listing
- Disconnecting from a Datasource

**Topics**

- Registering Datasources
Connecting to a Datasource From the Navigator/Explorer

The first time you start the application, you are prompted to register your datasources. During this process, you can select the Auto Connect check box, which automatically connects all registered datasource each subsequent time you open the application. For details, see Moving Datasources Between Groups.

If you did not check the Auto Connect box, or if you clicked No when prompted to connect to a database after registering, you must connect manually, each time you want to access that datasource.

If you later want to automatically connect your datasources, you can edit the datasource to make that change.

**Tip:** To configure your datasource to login automatically, refer to Registering Datasources.

**To manually connect to a datasource**

1. In the Datasource Navigator/Explorer, right-click a datasource and select **Connect** from the context menu. For details on the Navigator/Explorer, see Using the Datasource Navigator/Explorer.

   A **Login to...** dialog box opens.

2. Type a **Login ID** and **Password**.

3. Optionally, and only if available, provide **Login As**, **Default Schema ID**, and **Default Function Path** values.

4. Select **Auto Connect** to automatically connect to the datasource in the future.

5. Click **OK**.

When a successful connection is made, datasource display expands to show the top level of nodes available on that datasource.

**Connecting with Team Server 2016 Credentials**

When connecting to a datasource from Team Server 2016 you can connect using the Team Server 2016 credentials. For that you must create the credentials in the Team Server 2016 application before create Login Credentials.
Connecting to Datasources from an Alphabetical Listing

The Select Datasource dialog lets you sequentially connect to a set of datasources chosen from a list.

To connect to one or more datasources

2. For each datasource that you want to connect to, select a datasource from the Datasource list, and then click Connect to connect to the selected datasource.

3. If the last datasource you connect to supports multiple databases, you can optionally select a database from the Database list, and then click OK to have that database selected.

The datasource display expends to show the top level of nodes available on the datasources you connected to. For more information, see Using the Datasource Navigator/Explorer.
Disconnecting from a Datasource

When you disconnect from a server, the application immediately breaks the connection between any open ISQL Windows, the servers, and databases. Although your ISQL Windows are still visible, the connections are no longer valid. If you attempt to execute a script, an attempt to reconnect to a registered datasource, if available, is made.

To disconnect from a datasource

1. In the Datasource Navigator/Explorer, right-click a datasource and select Disconnect. For information on the Navigator/Explorer, see Using the Datasource Navigator/Explorer.

Note: If necessary, a dialog box opens, asking if you want to commit all pending transactions for that connection or to rollback all before disconnecting. You cannot disconnect if there is an uncommitted transaction.
Trouble-shooting Client Setup

If you are using native Embarcadero drivers to connect to a datasource, improperly configured client software can lead to the following symptoms:

- Failure to Auto-Discover accessible datasources.
- Inability to properly register a datasource
- Failure to manually connect to a registered datasource
- Error messages indicating missing client software files

**Note:** For details on the various ways to register and connect to datasources, see [Datasource and Server Management](#).

Regardless of the DBMS platform, your first step in trouble-shooting client connectivity is to ensure that your client is specified in the **PATH** environment variable.

For DBMS-specific help:

- [Trouble-shooting Sybase Connectivity](#)
- [Trouble-shooting Oracle Connectivity](#)
- [Trouble-shooting DB2 LUW and DB2 z/OS Connectivity](#)
- [Trouble-shooting SQL Server Connectivity](#)

**Trouble-shooting Sybase Connectivity**

A common cause of client connectivity issues against a Sybase DBMS is the client on the workstation not being compatible with DBArtisan or the Sybase environment on your workstation not being configured properly.

Verify that your Sybase environment variables have been set properly on your workstation. If you make any changes, restart DBArtisan.

Ensure you at least have the following variables (Environment Variables accessible through the Control Panel):

- **SCROOT**
- **SYBASE**
- **SYBASE_OCS**
- **SYBROOT**
- **LIB** - ensure that the Sybase LIB directory is listed here
- **INCLUDE** - ensure that the Sybase INCLUDE directory is listed here

Verify that the **PATH** value has only **ONE SET** of Sybase directories listed. You can modify this from the same Environment Variable window above in the **PATH** value:
Trouble-shooting Client Setup

%SystemRoot%\system32;%SystemRoot%;%SystemRoot%\system32\WBEM;C:\PROGRA~1\Serena\vm\win32\bin;C:\PROGRA~1\Serena\vm\common\bin\win32;C:\oracle\ora92\bin;C:\oracle\ora92\jre\1.4.2\bin\client;C:\sybase\OCS-15_0\lib3p;C:\sybase\OCS-15_0\dll;C:\sybase\OCS-15_0\bin;C:\sybase\DataAccess\ADONET\dll;C:\sybase\DataAccess\OLEDB\dll;C:\sybase\DataAccess\ODBC\dll;C:\sybase\Shared\Sybase Central 4.3;C:\sybase\ua\bin;C:\Program Files\Internet Explorer;C:\WINDOWS\system32;C:\WINDOWS;C:\WINDOWS\System32\Wbem;C:\Program

In order to use the Auto-Discover feature, a valid SQL.ini file must be located in the following location:

C:\sybase\version_identifier_directory\ini

Where the version_identifier_directory is the name of the release-specific directory associated with this purpose, such as OCS-15_0 or OCS-12_5.

Trouble-shooting Oracle Connectivity

An Oracle client must be installed on the workstation. It must be defined/specified in the following locations:

- The ORACLE_HOME in the Windows Registry
- The Environment PATH value

In addition, in order for the Auto-Discover feature to work, there must be a valid Oracle tnsnames.ora and sqlnet.ora file in the Oracle client installed. They must be installed in the %Oracle_home\Network\Admin directory. As well, the sqlnet.ora file must have the NAMESDIRECTORY_PATH value of TNSNAMES.

A typical sqlnet.ora file:

# sqlnet.ora Network Configuration File:
C:\oracle\product\10.2.0\client_2\network\admin\sqlnet.ora

# Generated by Oracle configuration tools.

# This file is actually generated by netca. But if customers choose to # install "Software Only", this file wont exist and without the native # authentication, they will not be able to connect to the database on NT.

SQLNET.AUTHENTICATION_SERVICES= (NTS)

SQLNET.INBOUND_CONNECT_TIMEOUT = 30
SQLNET.SEND_TIMEOUT = 30
Trouble-shooting Client Setup

SQLNET.RECV_TIMEOUT = 30
TRACE_FILENO_SERVER=3
LOG_FILE_SERVER=svr.log
TRACE_FILE_CLIENT=clientsqlnet.trc

NAMESDIRECTORY_PATH= (TNSNAMES)

Trouble-shooting DB2 LUW and DB2 z/OS Connectivity

The client must be defined in the workstation PATH value.

In order to Auto-Discover or manually register DB2 datasources, they must be configured in the DB2 Configuration Assistant. If DB2 datasources are not being detected, have your DBA provide a Configuration Assistant profile.

Trouble-shooting SQL Server Connectivity

In general, SQL Server datasources rarely go undetected. Each database server sends out a ping (via a service) to the network and DBArtisan is usually able to find this. The SQL Server client must be defined in the workstation PATH value.
Using the Datasource Navigator/Explorer

The Datasource Navigator provides a visual method for browsing, accessing, and manipulating objects. The Datasource Navigator contains a hierarchy consisting of groups, datasources, object type, and object nodes. Higher level nodes in the hierarchy have an associated Expand/Collapse icon, letting you drill down through the hierarchy to expose lower level nodes and objects.

- Groups organize the available data sources. A default set of groups corresponds to the supported DBMS platforms. You can also create custom groups to organize your data sources. For more information, see Categorizing Datasources using Color-coding and Labeling.

- Inside these groups are the data sources on your network that you have registered. You must register data sources in order to work against them. For more information, see Registering Datasources and Connecting to Datasources.

- With the exceptions of the Filters node, nodes below the datasource level correspond to the object types supported on the DBMS platform. For more information on the Filters node, see Filtering in the Navigator/Explorer.

- At the lowest level, are the individual database objects on the data source. For a listing of object types by DBMS platform and detailed support summaries for each type, see Supported Objects.
DBArtisan also provides the Database Explorer, providing functions similar to the Navigator. Key differences are as follows:

- It is a two-pane window that lets you use the left pane to drill down to the object level while using the right pane to view details on the currently selected node. For example, if the selected node is a supported object type, the right pane will show individual objects of that type. For details, see Navigating the Datasource Explorer and Displaying Nodes or Objects.

- Intermediate level nodes correspond to a default hierarchy of object type categories. For example, the Security node for a given platform may contain object types such as users, logins, or roles. For an introduction to the hierarchy of datasource nodes, see Understanding the Explorer Tree Hierarchy.

For information on opening and closing the Navigator/Explorer, Hiding and Displaying the Datasource Navigator/Explorer

Bookmarks provide another means to quickly navigate to specific Navigator/Explorer object nodes. For details, see Working with Bookmarks.

You can also initiate object type-specific actions and open object editors from the Navigator/Explorer. For details, see Initiating Object Actions in the Navigator/Explorer.

A number of viewing and organization options are available. They let you optimize the Navigator/Explorer for your own purposes. These include:

- Basic viewing options that let you toggle between type-based or owner-based display, one-step expansion and collapse of hierarchy elements, hiding or display of system objects, saving of view option settings.

- Creating custom datasource groups to provide a deeper level of organization.

- Categorizing datasources using color-coding and labeling to quickly distinguish between datasources used for different purposes in your organization.

- Filtering the Navigator/Explorer tree to display only selected nodes and objects. You can filter by name, schema or object type,
Using the Datasource Navigator/Explorer

- **Monitored Instances**: This node is located at the topmost level.
- **Triggered Alerts**: This node is located below the **Monitored Instances** node. This node contains the Datasources instances with triggered alerts from Team Server 2016. This is located right below the **Triggered Alerts** node.
- **Saved Searches**: This node is located right below the **Triggered Alerts** node. This folder contains search definitions that you created using the advanced search feature. For details, see Searching Team Server 2016 for Datasources.

When DBArtisan is connected to Team Server 2016, you can:

- Create a local datasource from a definition on the repository: register a local datasource as you would do for any static datasource, but use the **Relate Team Server Source** control to attach the local definition to a specified Team Server 2016 datasource definition. For more information, see Manually Registering or Editing Datasources.

Datasources attached to a Team Server 2016 definition are identified by a green arrow in the upper left part.

- Detach a currently attached local datasource definition so that it is no longer synchronized with the Team Server 2016 definition: right-click the attached Datasource Navigator and select **Unrelate Team Server Data Source** and select **Yes** when prompted to verify.

- Refresh/View Related ER Models: Right-click an attached datasource and select either **Refresh Related ER Models** or **View Related ER Models**.

- Work with multiple local and Team Server 2016 datasources. For details, see Reconciling Local and Team Server 2016 Datasources.

**Topics**

- Customizing the Navigator/Explorer Displays.
- Connected/Selected Datasource options
- Filtering columns in Database Object Displays
- Working with Bookmarks
- Working with Supplementary Organizer Tabs
Hiding and Displaying the Datasource Navigator/Explorer

Display of the Datasource Navigator can be toggled on and off.

**To Toggle Display of the Navigator On and Off**

- Select View > Datasource Navigator.

Whether a Datasource Explorer opens on DBArtisan startup is dictated by an Options Editor setting. For details, see Explorer Options.

Otherwise, the Explorer can be opened or closed, as needed.

**To open a Datasource Explorer**

- Select View > Activate Explorer.

**To close the two-pane Datasource Explorer window**

- Click the close window button (X) at the top, left.

For context information, see Using the Datasource Navigator/Explorer.
While you can connect to multiple datasources, at any one time only one connected datasource is the currently selected datasource. The currently selected datasource is displayed in the **Datasource** toolbar. For multiple-database datasources such as SQL Server and Sybase, a currently selected database is also displayed.

Certain features, to varying degrees, depend on the currently selected datasource or selected datasource/database combination. On a fairly trivial level, availability of some features or the initial state of a feature on being invoked is dependent on the selected datasource:

- In DBArtisan, **Utilities** menu feature availability (backup, restore, import, export, for example) depends on the DBMS platform of the selected datasource.
- Some features, Query Builder for example, have user interface controls for selecting a datasource. On opening, these user interface items default to the currently selected datasource.

More strongly dependent on the selected datasource is the SQL Editor. A SQL Editor window not locked to a datasource, will direct all transactions to the currently selected datasource.

**Note:** For information on how to lock and unlock a SQL Editor window, see [Locking a SQL Editor Window to a Datasource](#).

When the Datasource Navigator/Explorer is active, a SQL Editor opened against a particular datasource will continue to direct transactions to that datasource, until you explicitly change the selected datasource. Whether a SQL Editor or any other window or other user interface element is active, the method of explicitly changing the selected datasource is the same.

### To Explicitly Make a Datasource the Selected Datasource

1. Select the datasource from the **Select Datasource** dropdown on the Datasource toolbar. Optionally, on a multi-database DBMS platform, select a database using the **Select From Available Databases** dropdown.

With a Datasource Navigator/Explorer active, while an unlocked SQL Editor window is open, the selected datasource can be changed explicitly or automatically in response to Navigator/Explorer navigation or related user interface actions.

This can result in the following issues:

- Active session-specific features such as execution directives and query options being sent to the wrong datasource
Connected/Selected Datasource options

- Features such as Semantic Validation returning false errors

How the selected datasource changes depends on the state of the **Link** button appearing at the top of the Navigator/Explorer pane:

<table>
<thead>
<tr>
<th>Link Button State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="The Navigator/Explorer is linked to the Select Datasource combo" /></td>
<td>You can explicitly change the active datasource by selecting a datasource from the <strong>Select Datasource</strong> dropdown. The active datasource changes automatically as datasource-associated windows such as object editors become active in the Workspace or as you select nodes in the Navigator/Explorer. As a side effect, the associated datasource node in the Navigator/Explorer tree is selected.</td>
</tr>
<tr>
<td><img src="image" alt="The Navigator/Explorer is NOT linked to the Select Datasource combo" /></td>
<td>When linking is inactive, you can only explicitly change the active datasource when an SQL Editor window is open. The active datasource still changes automatically as datasource-associated windows such as object editors become active in the Workspace. And when linking is inactive, the change in the selected datasource has no effect on the selected node in the Navigator/Explorer tree.</td>
</tr>
</tbody>
</table>

**To toggle between the two link states**

1. Click the **Link** button.
Navigating the Datasource Explorer and Displaying Nodes or Objects

The Datasource Explorer features a hierarchical tree. All higher level nodes have an Expand/Collapse control that lets you drill down the hierarchy or hide hierarchy levels accordingly.

For a description of higher level nodes and the functionality provided for those nodes, see Understanding the Explorer Tree Hierarchy.

When you select an object on the left-hand pane of the Datasource Explorer, you can view corresponding data in the right pane. This varies by node type:

- When a group is selected in the left-hand pane, the right-hand pane displays datasources and sub-groups contained in that group.

- When a datasource is selected in the left-hand pane, the right-hand pane displays a set of configuration or operational parameters for the datasource, if available.

- When a node is selected in the left-hand pane, the right-hand pane display depends on the hierarchy level of the selected node. At the lowest level, when a node corresponding to an object type is selected, the right-hand pane displays all objects of that type as well as key properties of the object. Right-hand pane display for a higher level node, corresponding to a grouping of object types, may be a simple list of the available object types in that category.
Filtering columns in Database Object Displays

In DBArtisan, Datasource Explorer name filtering is available when an object type is displayed in the left pane with objects of the selected type displayed in the right panel. For more information, see Hiding and Displaying the Datasource Navigator/Explorer.

In the Database Navigator, name filtering is available with the Browser feature.

Two methods of filtering are available in the object displays. Both make use of the text boxes appearing below column names in the display.

<table>
<thead>
<tr>
<th>Table Owner</th>
<th>Table Name</th>
<th>Index Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOVIESL</td>
<td>CUSTOMER</td>
<td>CUSTOMER_IE1</td>
</tr>
<tr>
<td>MOVIESL</td>
<td>CUSTOMER</td>
<td>CUSTOMER_IE2</td>
</tr>
<tr>
<td>MOVIESL</td>
<td>CUSTOMER</td>
<td>CUSTOMER_IE3</td>
</tr>
<tr>
<td>MOVIESL</td>
<td>EMPLOYEE</td>
<td>EMPLOYEE_IE1</td>
</tr>
<tr>
<td>MOVIESL</td>
<td>EMPLOYEE</td>
<td>EMPLOYEE_IE2</td>
</tr>
</tbody>
</table>

To show only rows for which a given column value contains one or more contiguous characters

1. Type those characters into the text box below that column name.

To make use of regular expressions in column filtering

1. Ensure that regular expression usage is enabled. For details, see Explorer Options.
2. Type a valid regular expression search criteria into the text box below that column name. For more information, see Regular Expressions Support.

Note: The RegEx ON/RegEx OFF button in the lower right lets you enable or disable regular expression usage on-the-fly.
Working with Bookmarks

Bookmarks provides easy datasource navigation. You can right-click any node of the Navigator/Explorer tree and add a bookmark. After a bookmark is created, you can simply select it from the Bookmarks menu, and be instantly positioned and connected to the resource in the Datasource Navigator/Explorer tree.

Up to 256 bookmarks can be created.

To create a bookmark

1. On the Navigator/Explorer, right-click the target node, and then select Add Bookmark. The Add Friendly Bookmark Name dialog opens.
2. Type the bookmark name.
3. Click OK.

Note: You cannot create multiple bookmarks referencing the same node.

To navigate to a bookmarked node

1. Select the Options menu (designated with a down arrow, above the Navigator/Explorer tree), select Bookmarks, select a DBMS platform, and then select the bookmarked node.

Editing Bookmarks

1. Select the Options menu (designated with a down arrow, above the Navigator/Explorer tree), and then select Bookmarks > Bookmark Manager. The Bookmark Manager dialog opens.
   - Rename a bookmark by selecting it and then clicking Rename. Then use the Edit Bookmark Name dialog to provide a new name.
   - Delete a bookmark by selecting it and then clicking Delete.
Initiating Object Actions in the Navigator/Explorer

In the Datasource Explorer, when a node corresponding to an object type is selected, objects of that type are displayed in the right-hand pane. Toolbar and right-click options available from the Explorer window apply to information or objects displayed in the Explorer window or to the window itself.

In the Datasource Navigator, right-click options let you initiate object actions against object types or against specific objects.
Right-click Object Actions in the Datasource Navigator/Explorer

The right-click context menu for each object type lets you open creation wizards or editors or initiate object type specific actions.

For context information, see [Hiding and Displaying the Datasource Navigator/Explorer](#).

- [Object actions](#)
Understanding the Explorer Tree Hierarchy

The Explorer tree organizes and nests subjects as branches, or nodes. By expanding or collapsing the tree, you can efficiently browse multiple servers and databases and penetrate to the appropriate level of detail.

The Explorer tree nodes give you quick access to instance and server configuration, as well as security and performance functionality. The node names depend on the platform. For example, the **Instance** node in IBM DB2 is very similar to the **Server** node in Sybase ASE.

**Tip:** For IBM DB2 for Linux, Unix, and Windows, DBArtisan offers enhanced navigation of the **System**, **Instance**, and **Database** nodes of the Explorer. DBArtisan lets you view, manage, and navigate DB2 for Windows/Unix datasources at the instance node level rather than at the database level.

The following table shows the nodes immediately below the datasource level on a platform-by-platform basis:

<table>
<thead>
<tr>
<th>Node Name</th>
<th>DB2 LUW</th>
<th>DB2 z/OS</th>
<th>MySQL</th>
<th>ORCL</th>
<th>PSTGRS</th>
<th>SQL SVR</th>
<th>SYB ASE</th>

---

Embarcadero Technologies
Analyst Explorer Node

The Analyst node of the Navigator/Explorer provides shortcuts to the License-specific Analyst Series tools. For details, see Add-on tools.
Application Processes Explorer Node

The Application Processes node of the Explorer includes portions of the mainframe DB2 subsystem that relate to application programming. The Application Processes node also includes two components that are industry innovations: a search tool for statements, and a means to expose previously established access paths.

DBArtisan places Application Processes as the first level of information under datasources.

Platform availability and hierarchy placement

DB2 LUW  DB2 z/OS  MySQL  ORCL  PSTGRS*  SQL SVR  SYB ASE  SYB IQ

✓

Explorer node location

DBArtisan places Application Processes as the first level of information under the datasource node in the Explorer.

Sub-nodes

Expanding this node provides access to the following nodes:

- Plans
- Packages
- DBRM
- Procedures
- Triggers

For a support summary for those object types, see Supported Objects.
Databases Explorer Node

The Databases node provides access to the set of databases on a datasource.

Platform availability and hierarchy placement

<table>
<thead>
<tr>
<th>Platform</th>
<th>Available</th>

<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>

This node is placed as the first level below the datasource level.

Explorer node location

DBArtisan places the Filters node as the first level of information under the datasource node in the Explorer.

Sub-nodes

The Filters node contains default Explorer tree filters and any custom filters you create for that datasource or create across that DBMS type. Controls let you enable or disable the default and custom filters. Options for creating and maintaining custom filters are provided.
Instance Explorer Node

Platform availability

DB2 LUW  DB2 z/OS  MySQL  ORCL  PSTGRS *  SQL SVR  SYB ASE  SYB IQ

✓  ✓

The following topics provide node descriptions for those DBMS for which DBArtisan supports an Instance node:

- Instances (Oracle)
- Instances (DB2 LUW)

Instances (Oracle)

Explorer node location

DBArtisan places the Instance node as the first level of information under the datasource node in the Explorer.

Sub-nodes

- ASM and ASM > Disk Groups nodes (only visible if the Datasource has an ASM instance): for a support summary, see Disk Groups.
- Version node: provides specific version information for the datasource.
- Configuration node: lets you view, extract, and modify configuration/initialization parameters. For detailed information, see Working with Configuration/initialization Parameters.
- Oracle Job Queues node: for a support summary, see Job Queues.
- Scheduler node: Lets you access object types in support of DBMS_Scheduler. For details, see the following topics.
  - Chains
  - Jobs (Oracle)
  - Programs
  - Schedules

Instances (DB2 LUW)

Explorer node location

DBArtisan places the Instance node as the first level of information under the datasource node in the Explorer.
Sub-nodes

- **Database Configuration** node: lets you view and modify configuration/initialization parameters. For detailed information, see [Working with Configuration/initialization Parameters](#).

- **Datasources** node: lets you connect to specific datasources.

**Toolbar or Right-click Actions**

Right-clicking the **Instance** node also lets you take the following actions:

- **New UDB Database**: see [Databases Wizard (DB2 LUW)](#).
- **Quiesce (Instance)** and **Unquiesce**: for more information on objects actions, see [Object actions](#).
Performance Explorer Node

This node provides access to a set of DBMS-specific performance-related objects.

Explorer node location

DBArtisan places the Performance node as the first level of information under the datasource node in the Explorer.

Sub-nodes and Platform Availability

Expanding this node provides access to the following nodes:

- DB2
- DB2
- MySQL
- ORCL
- PSTGRS
- SQL
- SYB
- SYB
- LUW
- z/OS
- *
- SVR
- ASE

Note: Top Waits, Top I/O and Monitoring Alerts only available when Performance IQ configured and activated.
For a support summary for the Event Monitors, Image Copies, and Buffer Pools object types, see Supported Objects.

The following topics provide details on all sub-nodes except the Event Monitors, Image Copies, and Buffer Pools nodes.

**Note:** For DB2 z/OS, performance is a result of the DB2 API calls. The DB2 API calls are subject to change depending on the version and DB2 SDK call interface of the DB2 server. Performances do not appear in the system catalog tables.

### Active Threads Node

Active threads are the processes running on your database. When you select the Active Thread node on the Explorer, DBArtisan displays the active threads that are currently running on the IBM DB2 for z/OS and OS/390 database. To utilize all Database Monitor functionality, on the Utilities menu, select Database Monitor.

**Platform availability and Explorer node location**

- DB2 z/OS Performance > Active Threads
- ORCL Performance > Blocking locks
- SQL SVR Performance > Blocking Locks
- SYB ASE Performance > Blocking Locks

**Toolbar or Right-click Actions**

The following object-specific action is available for this object type:

- **Cancel Thread**

For a complete listing of object actions and detailed instructions, see Object actions.

For details on actions available from the Explorer, see Initiating Object Actions in the Navigator/Explorer.

### Blocking Locks Node

The Blocking Locks node on the Explorer displays only the locks that are blocked. To utilize all Database Monitor functionality, on the Utilities menu, select Database Monitor.

**Platform availability and Explorer node location**

- ORCL Performance > Blocking locks
- SQL SVR Performance > Blocking Locks
- SYB ASE Performance > Blocking Locks

**Toolbar or Right-click actions**

The following object-specific action is available for this object type:

- **Kill**

For a complete listing of object actions and detailed instructions, see Object actions.
For details on actions available from the Explorer, see *Initiating Object Actions in the Navigator/Explorer*.

**Connected Users Node**

This node displays `sp_iqconnection` procedure output including:

- User details (ConnHandle, Name, Userid)
- Connection details (ReqType, LastReqTime, ConnCreateTime, CommLink, NodeAddr, DBremote)
- Command details (IQCmdType, LastIQCmdTime)
- Cursor details (IQ Cursors, LowestIQCursorState)
- Thread details (IQ threads)
- Transaction details (TxnID, LastIdle)
- Storage space details (TempTableSpaceKB, TempWorkingSpaceKB)
- Message identifier details (IQConnID)
- Internal counter details (satoiq_count, iqtosa_count)

**Platform availability and Explorer node location**

[SYB IQ Database Monitor > Connected Users](#)

**Toolbar or Right-click actions**

The following object-specific action is available for this object type:

- Kill

For a complete listing of object actions and detailed instructions, see *Object actions*.

For details on actions available from the Explorer, see *Initiating Object Actions in the Navigator/Explorer*.

**Database Locks**

The Database Locks node lists `DISPLAY DATABASE(*) LIMIT(*) LOCKS` output, showing status codes, connection ID, correlation ID, and lock information (LockInfo field) for all programs holding locks on databases or spaces.

**Note:** LockInfo consists of lock status (H, W, or R), a lock state (IS, IX, S, U, SIX, X, or NSU), lock type (S, T, C, R, W, P, PP) and lock duration (A, C, H, M, P, or I). Similarly, status codes display standard -display command output (ARBDP, AREO*, ACHKP, AREST, AUXW, CHKP, COPY, DBETE, GRECP, ICO PY, LPL, LSTOP, PSRBD, RBDP, RBDP*, REC P, REF P, RELDP, REO RP, RESTP, RO, RW, STO P, ST O PE, ST O PP, UT, UTRO, UTRW, UTUT, and WEPR). For detailed descriptions of these items, connection
IDs and correlation IDs, consult DB2 for z/OS documentation. For more information, see Accessing Third Party Documentation.

Related Information
- Performance Databases Node
- Restricted Tablespaces

Inactive Threads

Inactive threads are processes that are idle. When you select the Inactive Thread node on the Explorer, DBArtisan displays the inactive threads that are currently running on the IBM DB2 for z/OS and OS/390 database. To utilize all Database Monitor functionality, on the Utilities menu, click Database Monitor.

Platform availability and Explorer node location
DB2 z/OS Performance > Inactive Threads

Toolbar or Right-click actions
The following object-specific action is available for this object type:
- Cancel Thread

For a complete listing of object actions and detailed instructions, see Object actions.
For details on actions available from the Explorer, see Initiating Object Actions in the Navigator/Explorer.

Indoubt Threads

Indoubt threads are processes waiting for resources to become active. When you select the Indoubt Thread node on the Explorer, DBArtisan displays the indoubt threads that are currently running on the IBM DB2 for z/OS and OS/390 database. To utilize all Database Monitor functionality, on the Utilities menu, select Database Monitor.

Platform availability and Explorer node location
DB2 z/OS Performance > Indoubt Threads

Toolbar or Right-click actions
The following object-specific actions are available for this object type:

Platform availability and Explorer node location
SYB IQ Database Monitor > Table Locks

Toolbar or Right-click actions
The following object-specific action is available for this object type:

- Kill

For a complete listing of object actions and detailed instructions, see Object actions.

For details on actions available from the Explorer, see Initiating Object Actions in the Navigator/Explorer.

Traces
The Traces node displays a list of active traces. Traces let you monitor and collect DB2 for OS/390 monitoring, auditing, performance, accounting, statistics, and serviceability (global) data.
Note: This information is read-only.

Platform availability and Explorer node location

DB2 z/OS Performance > Traces

Toolbar or Right-click actions

For details on actions available from the Explorer, see Initiating Object Actions in the Navigator/Explorer.

Utilities

The Utilities node displays wizards that are typically run from the command line and do not apply to a particular type of schema object. Some of these wizards are also available via the command menus for objects. The wizards include:

- Check Data
- Check Index
- Copy
- Copy to Copy
- Load
- Merge Copy
- Modify Recovery
- Modify Statistics
- Quiesce Tablespace
- Rebuild Index
- Recover
- Reorg Index
- Reorg Tablespace
- Runstats Index
- Runstats Tablespace
- Unload
- Maintain Template

Tip: To run a wizard, select the command in the right pane of the application and click the Execute button on the Explorer toolbar.

**Toolbar or Right-click actions**

For details on actions available from the Explorer, see *Initiating Object Actions in the Navigator/Explorer*.

**Version Explorer Node**

DBArtisan places **Version** under the **Server** node of the Explorer. When you select **Version**, DBArtisan shows version information about your datasource in the right pane of the Explorer window.

**Platform availability and Explorer node location**
**Server Explorer Node**

**Toolbar or Right-click actions**

For details on actions available from the Explorer, see [Initiating Object Actions in the Navigator/Explorer](#).

**SQL Server Agent**

DBArtisan assists you in using the Microsoft SQL Server Agent service to automate administration of a Microsoft SQL server. Microsoft SQL Server Agent manages, and schedules, allowing programmed responses to server events or the execution of scheduled administrative tasks. Automating recurring administrative tasks and responses to server events can save considerable time for other administrative tasks.

**Platform availability and Explorer node location**

- **SQL SVR** Server> SQL Server Agent

**Sub-nodes**

Expanding this node provides access to the following nodes:

- **Alerts**
- **Jobs (Oracle)**
- **Logs (SQL Server Agent)**
- **Operators**

For a support summary for those object types, see [Supported Objects](#).

**Note:** Before using SQL Agent elements from DBArtisan, consult the Microsoft SQL Server documentation for a detailed understanding of the prerequisites, operational requirements, and functionality provided by that service. For more information, see [Accessing Third Party Documentation](#).

**Logs Explorer Node**

On PostgreSQL datasources, the Logs node provides access to logging output files.

**Platform availability and Explorer node location**
**PSTGRS** * Server> Logs

**Toolbar or Right-click actions**

For details on actions available from this node, see [Rotate Log](#).
Storage Explorer Node

Object types corresponding to storage mechanisms are stored under the Storage Explorer node.

Platform availability

<table>
<thead>
<tr>
<th>DB2 LUW</th>
<th>DB2 z/OS</th>
<th>MySQL</th>
<th>ORCL</th>
<th>PSTGRS</th>
<th>SQL SVR</th>
<th>SYB ASE</th>

</tr>
</tbody>
</table>

Sub-nodes

The following table lists the sub-nodes available, DBMS-by-DBMS, when the Storage node is expanded:

| Bufferpools | ✓       | ✓       |
| Control Files | ✓       |
| Directories | ✓       |
| Data Caches | ✓       |
| Database Devices | ✓       |
| Dump and Backup Devices | ✓ | ✓ |
| Nodegroups | ✓       |
| Redo Log Groups | ✓ |
| Rollback Segments | ✓ |
| Stogroups | ✓ |
| Tables spaces | ✓ | ✓ | ✓ | ✓ |

For a support summary for those object types, see Supported Objects.
Subsystem Explorer Node

The Subsystem node displays detailed information about the DB2 subsystem.

Platform availability

- DB2 LUW
- DB2 z/OS
- MySQL
- ORCL
- PSTGRS
- SQL SVR
- SYB ASE
- SYB IQ

Explorer node location

DBArtisan places the Subsystem node as the first level of information under the datasource node in the Explorer.

Sub-nodes

Expanding this node provides access to the following nodes:

- Connections
- DDF
- Parameters

Connections

Connections displays the current connections to the subsystem.

Note: The information is read-only.

Platform availability and Explorer node location

- DB2 z/OS Subsystem > Connections

Toolbar or Right-click actions

For details on actions available from the Explorer, see Initiating Object Actions in the Navigator/Explorer.

DDF

DDF (distributed data facility) displays the information regarding the status and configuration of the DDF, a set of DB2 for OS/390 components through which DB2 for OS/390 communicates with another RDBMS.

Note: The information is read-only.

Platform availability and Explorer node location

- DB2 z/OS Subsystem > DDF

Toolbar or Right-click actions

Embarcadero Technologies
Working with Supplementary Organizer Tabs

In addition to the commonly used Navigator/Explorer tab, the Organizer window offers the following tabs:

- **Project** - when working with the Project Management feature, this tab provides a visual method for browsing, accessing, and manipulating your projects. For more information on working with projects, see Project Management.

- **VC Files** - when working with the Version Control feature, this tab provides access to version control files. For more information on working with projects, see Version Control.

- **Favorites** - lets you designate and access favorite scripts. This tab lets you view, navigate, save, recall, and execute scripts. Sample Favorite Scripts are installed for Microsoft SQL Server, Oracle, and Sybase Adaptive Server. For more information, see Using the Script Library.
Using the Script Library

The Script Library provides a drag-and-drop library interface of all supported DBMS syntax, SQL syntax, built-in functions, optimizer hints, and SQL-conditional syntax. Additionally, it provides the ability to create custom folders to store commonly-used code for quick and efficient access or execution, as needed.

To open the Script Library:

1. Select **View > Script Library**. The **Script Library** tab opens.

See the following topics for more information:

- Basic File and Folder Operations in the Script Library
- Execution Options in the Script Library
- Viewing and Setting File Properties in the Script Library

Basic File and Folder Operations in the Script Library

By default, the Script library contains a set of folders corresponding to supported DBMS platforms. These high level folders are preloaded with platform-specific subfolders, *System Diagnostics* and *Schema* for example, as well as files corresponding to DDL for object types supported on that platform.

The following basic options are provided.

- **Creating a subfolder**: right-click on a folder, select **New Folder**, and immediately provide a non-default name for the new folder.

- **Sorting the files in a folder to alphabetical order**: right-click on a file or folder and select **Sort**.

- **Renaming a file or folder**: right-click on a file or folder, select **Rename**, and provide a new name for the file or folder.

- **Deleting a file or folder**: right-click on a file or folder, select **Delete**, and select **Yes** when prompted to confirm.

- **Adding a SQL, J Script, or VBScript file to a folder**: right-click on a folder, select **New Item**, and use the controls on the **Script Library Item Properties** dialog to specify the file type, locate and select the file, and provide a hot key keystroke sequence to open the file.

Execution Options in the Script Library

The following execution options are offered:

- **Opening a SQL, J Script, or VBScript file in the relevant editor**: right-click the file and select **Open**.
Using the Script Library

- **Executing a file**: right-click the file and select **Execute**, and then respond to any prompts regarding datasource or file type.

- **Opening a file in the Script Execution Facility**: right-click the file and select **Script Execution Facility**. For more information, see *Script/File Execution Facilities*.

**Viewing and Setting File Properties in the Script Library**

The following options are available:

- **Viewing the file/folder information, file type, and hot key sequence for an item**: right-click the file and select **Properties**.
Customizing the Navigator/Explorer Display

DBArtisan offers flexibility in the elements displayed and in how elements are displayed in the Datasource Navigator/Explorer.

- Basic Viewing Options in the Navigator/Explorer
- Categorizing Datasources using Color-coding and Labeling
- Filtering in the Navigator/Explorer
- Working with Datasource Groups
Basic Viewing Options in the Navigator/Explorer

The dropdown menu, available above the Datasource Navigator/Explorer tree, provides basic organization and display options.

To change basic organization and viewing options

1. From the Options dropdown menu, select an option. Use the following table as a guide to your selection.
### Basic Viewing Options in the Navigator/Explorer

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Organize by</strong> Object Owner or Organize by Object Type</td>
<td>Toggling these options has the following effect: <strong>Owner</strong> - the Navigator/Explorer displays objects for each user, categorized by object type. This display mode is most efficient if you are working with databases containing a high number of objects. <strong>Type</strong> - the Navigator/Explorer displays all objects, categorized by object type, for all users in the same list. This display mode speeds or slows performance in databases that contain many objects.</td>
</tr>
<tr>
<td><strong>Show System Objects and Show Only My Objects</strong></td>
<td>Lets you control display of system objects and objects that you own: NEVER, ALWAYS, or USE DATASOURCE FILTER. For information on filter options, see <a href="#">Simple, on-the-fly, Character-based Tree Filtering</a>.</td>
</tr>
<tr>
<td><strong>Filter</strong></td>
<td>Lets you control the datasources you want to show when connected to Team Server 2016. The filter lets you <strong>Show Only My Data Sources</strong>. If you do not use Team Server 2016 as datasource catalog, the option <strong>Show Only Team Server Data Sources</strong> is available, otherwise, the option is not enabled.</td>
</tr>
<tr>
<td><strong>Full Refresh</strong></td>
<td>Select to refresh.</td>
</tr>
<tr>
<td><strong>Reconcile Data Sources</strong></td>
<td>The <strong>Reconcile Team Server Data Sources</strong> dialog lets you work simultaneously with multiple datasource definitions. For more information see <a href="#">Reconciling Local and Team Server 2016 Datasources</a>.</td>
</tr>
<tr>
<td><strong>Expand All Groups</strong></td>
<td>Select to expand all groups.</td>
</tr>
<tr>
<td><strong>Collapse All Groups</strong></td>
<td>Select to collapse all groups.</td>
</tr>
<tr>
<td><strong>Collapse All Datasources</strong></td>
<td>Select to collapse all datasources.</td>
</tr>
<tr>
<td><strong>Retain View Settings</strong></td>
<td>Select to retain the current state of the Navigator/Explorer so that it opens the same way the next time you start DBArtisan.</td>
</tr>
<tr>
<td><strong>Bookmarks</strong></td>
<td>Provides access to bookmark resources. For more information, see <a href="#">Active Threads Node</a>.</td>
</tr>
</tbody>
</table>

**Tip:** You can also set these options on the [Explorer Options](#) tab of the Options editor.
Working with Datasource Groups

Datasource groups help you to organize the datasources in your enterprise. Datasource Groups behave as folders in the Windows Explorer, allowing you to group related datasources together. Anywhere that datasources are presented in a hierarchical tree format, datasource group folders expand to display one or more contained datasources.

By default, the Datasource Navigator and Datasource Explorer have one group per supported DBMS platform.

You can create custom groups or subgroups. This level of organization is useful if you want to group large numbers of registered datasources or have another need to organize datasources. For basic database group maintenance tasks, see the following topics:

- Removing, Adding, and Renaming Datasource Groups.
- Changing the Level of a Datasource Group in the Hierarchy.

When you manually register a datasource, you have the option of changing the default group to which the datasource will automatically be assigned. Subsequently, you can move a datasource from one folder to another. For details, see Moving Datasources Between Groups.

Moving Datasources Between Groups

There are two ways to change datasource groups:

- Dragging the datasource between groups
- Invoking the Change Group dialog box.

Note: You should always disconnect from a datasource before changing datasource groups.

To move a datasource between groups by dragging and dropping

1. If necessary, expand groups until both the datasource and the target datasource group are visible.

2. Drag the datasource over the target folder and drop it there.

To move a datasource using the Change Datasource Group dialog box
1. If necessary, expand groups until the datasource you want to move is visible.

2. Right-click the datasource you want to move, and select **Change Group**.

   The **Change Datasource Group** dialog box opens.

3. Use the **Select...** tree to locate and select the target group.

4. Click **OK**.

   For more general information on datasource groups and associated tasks, see [Categorizing Datasources using Color-coding and Labeling](#).

### Removing, Adding, and Renaming Datasource Groups

A set of datasource group maintenance tasks are available. You can remove database groups that you no longer need to access, or that have otherwise become obsolete. Keep the following in mind when removing datasource groups:

- If a datasource group contains datasources or other datasource groups, those items are deleted when you delete the containing group. You should move any contained datasources or groups before preceding. For details on moving datasources, see [Moving Datasources Between Groups](#).

- The default datasource groups correspond to the DBMS platforms supported. If you delete a default group, it will be recreated if you subsequently register a datasource for the associated platform.

**To remove a datasource group**

1. If necessary, expand datasource groups in the Navigator/Explorer until the datasource you want to remove is visible.

2. Right-click the datasource group, and select **Remove**. You are prompted to verify.

3. Click **Yes**.

**To create a new datasource group**

1. If creating a folder within an existing folder, expand datasource groups in the Navigator/Explorer until the target group is visible.

2. On the Navigator/Explorer tree take one of the following actions:

   - To create a new folder at the top level, right-click in empty space and select **New** from the context menu.

   - To create a folder within an existing folder, right-click the target folder and select **New** from the context menu.
Working with Datasource Groups

The **New Datasource Group** dialog opens.

3. In the **Datasource Group Name** box, type the name of the new datasource group.
4. Click **OK**.

Lastly, you can change the name of an existing datasource group.

**To rename a datasource group**

1. If necessary, expand datasource groups in the Navigator/Explorer until the datasource you want to rename is visible.
2. On the Navigator/Explorer, right-click the datasource group folder, and select **Rename**. The **Rename Datasource Group** dialog opens.
3. In the **Datasource Group Name** box, type the new name of the datasource group.
4. Click **OK**.

For related information, see the following topics:

- See [Changing the Level of a Datasource Group in the Hierarchy](#) for information on changing hierarchy levels.
- See [Categorizing Datasources using Color-coding and Labeling](#) for more general information on working with datasource groups.

### Changing the Level of a Datasource Group in the Hierarchy

You can reorganize the datasource group tree by moving individual groups up and down the hierarchy.

**To move a datasource group to the top level of the hierarchy**

1. If necessary, expand groups until the datasource group you want to move is visible.
2. Drag the target group to open space in the Navigator/Explorer pane.

![MySQL Servers](#)

![My_Custom_Group](#)

![Oracle Servers](#)

![Sybase Servers](#)

![My_Custom_Group](#)

**To make a datasource group a subgroup within another group**
1. If necessary, expand groups until the datasource group you want to move and the target group are visible.

2. Drag the target group and drop it on the datasource group that is to be the new parent.

For related information, see the following topics:

- See **Removing, Adding, and Renaming Datasource Groups** for information on basic datasource tree tasks.
- See **Categorizing Datasources using Color-coding and Labeling** for more general information on working with datasource groups.
Categorizing Datasources using Color-coding and Labeling

You can set up a means to visually distinguish between datasources used for different purposes in your organization. You can assign a category, such as development or production, when creating or editing a datasource. This color-codes or labels particular user interface elements associated with that datasource.

When you assign a category to a datasource, the Navigator/Explorer icons for the datasource show a distinctive color-coded category indicator. Optionally, you can customize your categorization scheme to include the following user interface elements:

- A short name label included in the Datasource toolbar combo/dropdown when a categorized datasource is selected
- Color-coded tabs on windows associated with actions against a categorized datasource, editor or ISQL windows for example
- Color-coding of the status bar at the bottom of the main window

The default categories [and short name labels] and the associated colors are as follows:
Categorizing Datasources using Color-coding and Labeling

<table>
<thead>
<tr>
<th>Default Category</th>
<th>Short Name</th>
<th>Label</th>
<th>Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Production</td>
<td>PROD</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Development</td>
<td>DEV</td>
<td></td>
<td></td>
</tr>
<tr>
<td>QA</td>
<td>QA</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Test</td>
<td>TEST</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In addition to the defaults, you can create custom category/color code/label category combinations.

To work with color-coded datasource resources, you must be familiar with the following tasks:

- Enabling the specific user interface items that can be color-coded or labelled. For details, see Datasource Options.
- Customizing your category scheme. For details, see Customizing Datasource Categories.
- Assigning a category to a datasource when creating or editing it. For details, see Manually Registering or Editing Datasources.

Customizing Datasource Categories

You can customize your datasource category scheme. A datasource category has the following configurable components:

- **Category name**: The name displayed as a selection in the Select a category dropdown
- **Short Name**: The abbreviation shown in the Datasource toolbar dropdown when a categorized datasource is selected.
- **Color**: The color used to denote a categorized datasource in the Navigator/Explorer tree icons and window tabs.

*Note*: Display of specific user items used to denote categories is configurable. For more information, see Datasource Options.

To customize your datasource categories

1. On the Datasource menu select Register Datasource and then select the Datasource Group panel.
2. From the Select a category dropdown select Customize. The Manage Datasource Categories dialogs opens.
3. Take one of the following actions:
Categorizing Datasources using Color-coding and Labeling

- Create a new category by clicking New and selecting or providing a Full name, Short name, and Color combination.

- Edit an existing category by selecting the category, clicking Edit and modifying the name and color combination.

**Note:** The short name for a category cannot be edited.

- Delete an existing category by selecting the category, clicking Delete and verifying the deletion at the prompt.
Filtering in the Navigator/Explorer

For ease of navigation, you can filter the Navigator/Explorer tree to display only selected nodes and objects. The following filtering options are available:

- Real-time modification of the tree to show only nodes with names matching a typed character string. For details, see Simple, on-the-fly, Character-based Tree Filtering.

- Permanent object filters, enabled and disabled for individual datasources, that restrict display based on object name and owning schema (and optionally, object type). For details, see Object Name/schema Filtering.

- The ability to restrict object types displayed for each DBMS platform. For details, see Node, or Object Type, Filtering.

Two default filters applying to owned and system objects are available. For details, see Using the Default Filters.

Simple, on-the-fly, Character-based Tree Filtering

The Filter box at the top of the Navigator/Explorer provides a quick, ad hoc way to restrict the nodes displayed.

To restrict the Navigator/Explorer tree display to only user-defined nodes whose name contains a particular character string

- Type one or more characters in the Filter box.

The display is updated to show only nodes whose name contains the typed character string and their parent nodes.

Note: The Clear button in the Filter box (X) deletes the contents of the Filter box and restores the unfiltered tree display.

Object Name/schema Filtering

Object filters let you restrict the Navigator/Explorer tree display for a datasource by name, owning schema, or name/schema combinations. These filters are defined at the DBMS platform level and are enabled or disabled on a datasource by datasource level. Multiple object filters can be created for a DBMS platform, letting you enable combinations of filters for a single datasource, ad hoc enabling and disabling of individual filters depending on your requirements, and so on.

Each filter consists of one or more ANDed conditions based on name or schema. For example, you could create a two-condition filter that restricts the Navigator/Explorer tree for a datasource to display only objects belonging to the Schema QA and whose name starts with the string Test.
Each filter condition is a simple expression that tests object names for equality (Equals, Not Equals), inclusion in a specified list (In, Not In), or using pattern matching (Like, Not Like). Optionally, an object filter can also be used to restrict display of specified object types on a datasource.

**To create an object filter that can be enabled for all datasources for a DBMS platform**

1. Right-click in the Navigator/Explorer tree and select **Filter** from the context menu.

The Filters dialog opens. The **Object Filters** tab opens by default, letting you create an object filter definition. The **Node Filters** tab, on the other hand, lets you perform real-time filtering of object types for all datasources on a DBMS platform. For details, see Node, or Object Type, Filtering.

2. In the **View** area, select **By Filter**.

**Note:** The current instructions create a filter at the DBMS level. To create a filter for a single datasource, select the **By Datasource** view, select a specific datasource, and then proceed to **step 4**.

3. Expand the icon corresponding to the DBMS for which you want to create a filter and ensure that the icon is selected.

4. Click **New** and type a name for the new filter.

5. On the **Predicates** tab, create one or more name-based or schema-based conditions, all of which must be satisfied when this filter is enabled. Objects that
Filtering in the Navigator/Explorer

do not satisfy the conditions will be filtered from view. Use the following guidelines in constructing conditions:

- The **Like** and **Not Like** operators take pattern-matching **Values**. Wildcard characters and conventions supported on the target DBMS are supported.

- The **In** and **Not In** operators take a comma-delimited list such as CO,CA,CU, as a **Value**.

- Click the associated **New** button to add new predicates.

6. Optionally, on the **Database Elements** tab, select the check boxes for all object types to which this filter is to be applied. The filter does not affect the display of any deselected object types.

7. Click **OK**.

By default, when you create an object filter for a DBMS platform, it is enabled for each registered datasource of that DBMS type.

**To disable or enable an object filter for a datasource**

1. Right-click in the Navigator/Explorer tree and select **Filter** from the context menu. The **Filters** dialog opens.

2. In the **View** area, select **By Datasource**.

3. Expand the icon corresponding to the target DBMS and then expand the icon corresponding to the specific datasource for which you want to for enable or disable a filter.

4. Enable an object filter by selecting the associated check box or disable the object filter by deselecting the check box.

5. Click **OK**.

**Note:** You can also enable and disable filters using controls found under the **Filters** node for each datasource in the Navigator/Explorer tree.

You can also use the **Filters** dialog to select and edit an object filter, rename or create a clone of an existing object filter, and delete filters.

**Node, or Object Type, Filtering**

Node filtering lets you hide specified Navigator/Explorer tree nodes for a DBMS platform. For example, if you do not typically work with credential-related objects such as users, groups, profiles or logins, you may wish to filter those out of the Navigator/Explorer tree. You could either disable display of the individual object types or if practical, disable display of the **Security** node for the DBMS.

**To change the hidden/displayed status of object types for a DBMS platform**
Filtering in the Navigator/Explorer

1. Right-click in empty space in the Navigator/Explorer tree and select **Filter** from the context menu. The **Filters** dialog opens.

The **Node Filters** tab opens by default, letting perform real-time filtering of object types for all datasources on a DBMS platform. The **Object Filters** tab, on the other hand, lets you create permanent, name-based or schema-based filters. For details, see **Object Name/schema Filtering**.

2. Click the **Node Filters** tab.

3. Expand the icon corresponding to the DBMS for which you want to create a node filter, and continue to expand nodes until all nodes for which you want to change the hidden/displayed status, are visible.

4. Ensure that all nodes corresponding to objects types that are to be displayed, are selected. Similarly, ensure that all nodes corresponding to objects types that are to be hidden, are deselected.

5. Click **OK**.

Hidden/displayed status is retained for the DBMS until you explicitly open the Filters dialog and change the current settings.

**Using the Default Filters**

The **Filters** node for each registered datasource includes two default Navigator/Explorer tree filters, **Ignore System Objects** and **Show Only My Objects**. These filters can be enabled and disabled for each datasource but cannot be edited or deleted.
Server Management Options

The following features are offered for operating and configuring servers:

- Starting, pausing, and resuming a server (SQL Server)
- Shutting Down a Server (SQL Server, Sybase ASE)
- Working with Configuration/initialization Parameters
- Session Recording
Starting, pausing, and resuming a server (SQL Server)

You can start a server that has been shut down. As well, you can also pause and resume the SQL Server service.

To start a server, pause a server, or resume after pausing

- Use the Datasource menu’s Start Server, Pause Server, and Continue After Pause commands.
Shutting Down a Server (SQL Server, Sybase ASE)

You can perform an ordered or immediate shutdown of an SQL Server or Sybase ASE.

To shut down a server

1. In the Navigator/Explorer, select the target datasource.

2. On the Datasource menu, select Shutdown. The Shutdown Server dialog box opens. Once of the options and functionalities are selected, click Execute.

The table below describes the options and functionality on the Shutdown Sever dialog.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>Shuts down the server in an orderly fashion. Logins are disabled and currently executing Transact-SQL statements and stored procedures are allowed to finish. <strong>Wait Time</strong> (Sybase ASE only) - Lets you enable a grace period, an upper limit on how long to wait for normal operations to complete before forcing a shutdown. Wait time is specified in hours, minutes, and seconds, and if this option is not enabled, the Sybase ASE server will wait indefinitely before shutting down.</td>
</tr>
<tr>
<td>Immediate</td>
<td>Shuts down the server immediately. Checkpoints are not performed. The server terminates all user processes and rolls back any active transactions.</td>
</tr>
</tbody>
</table>

For information on the scheduling option, see Scheduling.
Working with Configuration/initialization Parameters

You can view, extract, and modify DBMS-specific configuration/parameters:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Parameter, options, or variables</th>
<th>For a listing, see:</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2 LUW</td>
<td>Database systems configuration parameters</td>
<td>Supported DB2 LUW System Configuration Parameters</td>
</tr>
<tr>
<td>MySQL</td>
<td>Server System Variables</td>
<td>Supported MySQL Server System Variables</td>
</tr>
<tr>
<td>ORCL</td>
<td>Initialization parameters</td>
<td>Supported Oracle Initialization Parameters</td>
</tr>
<tr>
<td>SQL SVR</td>
<td>Server Configuration Options</td>
<td>Supported SQL Server Configuration Options</td>
</tr>
<tr>
<td>SYB ASE</td>
<td>Configuration parameters</td>
<td>Supported Sybase ASE Configuration Parameters</td>
</tr>
</tbody>
</table>

To display the server configuration/initialization parameters and options

1. Open the Datasource Explorer as configuration/parameter nodes are not visible in the Navigator. For more information, see Working with Bookmarks.
2. Connect to the datasource for which you want to view the server configuration/initialization parameters or options.

For details, see Connecting to Datasources.

3. Take one of the following actions:
   - If working against a DB2 LUW datasource, select the Database Configuration node.
   - If working against a SQL Server, MySQL, or Sybase ASE datasource, expand the Server node and then select the Configuration node.
   - If working against an Oracle datasource, expand the Instance node and then select the Configuration node.

Server configuration/initialization parameters or options are displayed in the right pane of the Explorer.

See the following topics provide instructions on other available options:

- Extracting Configuration/Initialization Statements
- Modifying Configuration/Initialization Parameters and Options
Extracting Configuration/Initialization Statements

You can extract the following statement types corresponding to the DBMS-specific methods for setting server configuration/initialization parameters.

- **MySQL**: SET... SET GLOBAL...
- **ORCL**: ALTER SYSTEM SET
- **SQL SVR**: RECONFIGURE/GO/EXEC sp_configure
- **SYBASE**: EXEC sp_configure

To extract configuration/initialization parameter statements

1. Open the Datasource Explorer as configuration/parameter nodes are not visible in the Navigator. For more information, see [Working with Bookmarks](#).
2. Connect to the datasource for which you want to view the server configuration/initialization parameters or options. For details, see [Connecting to Datasources](#).
3. Display the configuration/initialization parameters or options for the server. For details, see [Working with Configuration/initialization Parameters](#).

The server configuration parameters are displayed in the right pane of the Explorer.

4. In the right pane of the Explorer, right-click one or more selected parameters and select **Extract**. The DDL Editor opens. For more information, see [Using the SQL Editor](#).

For related information, see [Modifying Configuration/Initialization Parameters and Options](#).
Modifying Configuration/Initialization Parameters and Options

You can modify the configuration/initilization parameters for each server.

**Note:** Before modifying configuration/initilization parameters consult the documentation for each platform. Many changes to these parameters require you to shutdown and to restart the server or have other effects. For access to third-party documentation, see [Accessing Third Party Documentation](#).

**Note:** Not all available parameters are modifiable.

To modify a configuration/initilization for a datasource

1. Connect to the datasource for which you want to view the server configuration/initilization parameters or options.

   For details, see [Connecting to Datasources](#).

2. On the **Datasource** menu, click **Configure**.

   - If you are working with DB2 LUW, Sybase ASE, or Oracle, a dialog opens, displaying each supported configuration/initilization parameter, its current value, and a description. Double-click a parameter to open an **Edit Configuration** dialog on the parameter. Provide a new value in the **New Value** box and then click **OK** to accept the new value and close the dialog. When finished editing parameters, click **Execute**.

   - If you are working with SQL Server or MySQL, a System Configuration tab opens, displaying each supported configuration/initilization parameter, its current value, and a description. Click in the **Value** field of a parameter to select it and then click in the **Value** field a second time to enable editing. Provide a new value in the **Value** field and then click anywhere outside the field to accept the new value. When finished editing parameters, close the tab and when prompted to save the system configuration, select **Yes**.

**Notes on Oracle Managed Files (OMF)**

For Oracle 9i only, Oracle Managed Files (OMF) support is provided. OMF automatically manages files for tablespace, redo logs, and control files. Oracle automatically creates and removes operating system files as you create and drop storage objects.

You can enter the following query to set the `db_create_file_dest` parameter at the system level. You can set the parameter value for the session level by using `Alter session` clause:
DB_CREATE_FILE_DEST = '/u01/oradata/sample2'

**Tip:** You can also set the parameter at the system level in the Edit Configuration dialog box.
Session Recording

The session recording feature records changes to the server. The Session Recording feature lets you create a script file that you can execute as a batch at another time.

The session recording feature automates repetitive tasks that you routinely perform by issuing the commands in the collected script with a single command. Session recording lets you:

- Streamline time consuming, repetitive tasks.
- Execute multiple actions with from a single file.
- Automate a complex series of tasks by creating a batch file.
- Distribute automated tasks to multiple users with the session recording file.

The Session Recording feature is not available for operations that are destructive to your server. These operations include:

- Schema Migration
- Data Load
- ISQL and DDL Editors

When you activate session recording, these operations are grayed out and not available.

You can also use the session recording feature for Tivoli Integration. Schema change management sessions are recorded to instruction files, which are read by Tivoli Management Systems. Tivoli subsequently transports these to multiple managed endpoints for local execution.

For more information, see Recording a Session and Executing a Session File.
Recording a Session

You can create a session file that includes a series of commands or actions using the 
Session Recording Mode dialog box.

Completing the Session Recording Mode Dialog Box

1. On the Datasource menu, click Session Recording.

The table below describes the options and functionality on the Enter Session Recording
Mode dialog box.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Session Name</td>
<td>Lets you type the name of the session.</td>
</tr>
<tr>
<td>Session File</td>
<td>Lets you type the location and session file name or click the browse button.</td>
</tr>
</tbody>
</table>

Note: Each task that you record is appended to the session file. In place of an Execute
button, a Record button is displayed. To record a certain task, click the Record Button to
open the Task Recording dialog box.

2. When you want to exit session recording mode, open an ISQL Window that lets you
review the session file.

3. On the Datasources menu, click Session Recording.

An SQL window opens.

For more information, see Session Recording and Executing a Session File.
Executing a Session File

You can execute a session file which includes a series of collected commands in a single batch from an ISQL Window.

1. On the File menu, click Open.

The Open Files dialog box opens.

2. Select the session file(s) (*.ses) from the file list, or in the File Name box, type a session file name.

3. Click OK.

The session file opens into a SQL window.

4. On the SQL tool bar, click the Execute button.

5. On the SQL tool bar, click the Step-Execute button to see a graphical display to identify the execution path of the script, and then click the Execute button to execute the session file.

6. On the SQL tool bar, click the Query Plan button to see a graphical display to identify the execution path of the script.

7. Click the Execute button.

The script executes.

For more information, see Session Recording.
Using the Manage Datasources Utility

The Manage Datasources dialog box lets you manage datasources throughout your enterprise from a single vantage point. It provides concise, relevant information on your datasources in a simple grid format. It provides centralized access to common datasource operations such as adding, modifying, deleting, discovering, importing, and exporting datasources.

To open the Manage Datasources dialog box:

1. On the Datasource menu, click Manage Datasources.

The Manage Datasources dialog box opens.

The grid format lets you access and view datasource specifications. Datasources are grouped according to the default, DBMS-based folder structure and then within any custom datasource groups you have set up. The table below describes information available for each datasource entry:
### Column Description

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Datasource Name</td>
<td>Uses an explorer-like interface to display all registered datasources and their groups. You can navigate this column in the same manner as the datasource explorer, by clicking on nodes to expand or collapse your view of the datasources.</td>
</tr>
<tr>
<td>Connect String</td>
<td>Displays the full connection string for the datasource.</td>
</tr>
<tr>
<td>Default User Id</td>
<td>Displays the Default User ID for the datasource.</td>
</tr>
<tr>
<td>Auto-Connect?</td>
<td>Indicates whether the Auto Connect feature is turned on or off.</td>
</tr>
<tr>
<td>Host Computer</td>
<td>Displays the name of the Host Computer if one has been configured.</td>
</tr>
<tr>
<td>Default Schema</td>
<td>Displays view default schemas for your DB2 datasources.</td>
</tr>
</tbody>
</table>

In addition, you can take the following actions:

- Click the **New Datasource** button to register a datasource. For more information, see [Registering Datasources](#).
- Select a datasource and click the **Edit Datasource** button to edit that datasource definition.
- Select a datasource and click the **Remove Datasource** button to unregister that datasource definition. For more information, see [Categorizing Datasources using Color-coding and Labeling](#).
- Click the **Discover** button to locate all configured datasources on your network and automate the process of registering them. For more information, see [Moving Datasources Between Groups](#).
- Import or export datasource definitions. For details, see [Importing and Exporting Datasource Definitions](#).
Team Server 2016 Support

Team Server 2016 is a data governance repository that can be used as an aid in managing enterprise data. It centralizes data resources, aids in resource-allocation planning, and fosters collaboration.

As an inventory, Team Server 2016 stores the following resources:

- Datasource definitions
- ER/Studio data models
- Glossaries and definitions
- User details.

Team Server 2016 is also a communications hub and information center. Activity streams provide the following:

- Datasources are monitored for DBMS alerts on conditions regarding storage and performance.
- Add, modify, and delete resource details are logged.
- Users can post comments on resources or to other users.

Common social media conventions such as Likes and Follows are supported.

DBArtisan integrates with Team Server 2016. For information on preliminary steps, see Setting up and Connecting to Team Server 2016. Once configured and connected, the following options are provided:
Datasources  Datasource definitions on Team Server 2016 can be viewed in the [Datasource Navigator/Explorer](https://www.embarcadero.com/products/datasources). Local datasources created from the Team Server 2016 definitions can be permanently synchronized with the definitions on Team Server 2016. A set of options and actions let you manage your local and Team Server 2016 datasource definitions and their relationships. An advanced search mechanism is also provided. For details, see [Working with Team Server 2016 Datasources](https://www.embarcadero.com/products/datasources).

Data models  If a database or schema of a synchronized datasource has associated model data in Team Server 2016, model data such as alerts and attribute/entity descriptions can be displayed in the SQL Editor as Code Assist proposals, as comments automatically added to scripts, as tooltips, and as the basis for warnings due to alerts. For details, see [Viewing Embarcadero Team Server 2016 Model Metadata in the SQL Editor](https://www.embarcadero.com/products/datasources).

Activity Streams  Users can monitor their own activity stream or the activity stream for a datasource definition on the Team Server 2016. For details, see [Working with Team Server 2016 Streams](https://www.embarcadero.com/products/datasources).

Team Server 2016 as Datasource Catalog  DBArtisan lets you work with [Team Server 2016](https://www.embarcadero.com/products/datasources) as the datasource catalog. For details, see [Working with Team Server 2016 as Datasource Catalog](https://www.embarcadero.com/products/datasources).

Working from Team Server 2016  In addition, DBArtisan lets you open a browser interface that lets you work directly with Team Server 2016. For details, see [Working Directly with Team Server 2016](https://www.embarcadero.com/products/datasources).

Topics
- [Setting up and Connecting to Team Server 2016](https://www.embarcadero.com/products/datasources)

- [Viewing Embarcadero Team Server 2016 Model Metadata in the SQL Editor](https://www.embarcadero.com/products/datasources)
- [Working Directly with Team Server 2016](https://www.embarcadero.com/products/datasources)
Setting up and Connecting to Team Server 2016

Before you can make use of resources on Team Server 2016, you must login to the server. See your Team Server 2016 administrator for a login URL, credentials, and permissions setup.

1. Ensure that Team Server 2016 usage is enabled. For details, see Team Server 2016 Options.

2. Select Team > Login... and then use the Embarcadero Team Server - Log In dialog to provide credentials and complete the login.

Note: Use the Keep me signed in check box to have logins persist across startups and shutdowns of DBArtisan. The Keep me signed control can be set and disabled using a registry entry. For details, see Locking Down Features Using the Registry.

After logging in, you have access to resources on the Team Server 2016 in the Datasource Navigator/Explorer.

Topics

- Viewing Embarcadero Team Server 2016 Model Metadata in the SQL Editor

- Working Directly with Team Server 2016
Working with Team Server 2016 Datasources

With DBArtisan properly configured, and subsequent login to Team Server 2016, the Datasource Navigator/Explorer the available datasource definitions on the Team Server 2016. A datasource definition on Team Server 2016 can be registered as a local datasource.

Registering a Team Server 2016 datasource as a local datasource creates a local copy of the datasource definition, accessible in the existing Datasource Navigator/Explorer.

Note: For access to Team Server 2016 documentation, see docs.embarcadero.com.

By default, when you register a Team Server 2016 datasource as a local datasource, the local definition is “attached“ to the Team Server 2016 version. The local definition’s key connectivity information is synchronized with the Team Server 2016 definition on each attempt to connect to the datasource.

An attached datasource has a distinctive icon:

You can subsequently detach a local datasource definition from a Team Server 2016 definition. Settings for the detached, local datasource definition are those that were active on the Team Server 2016 definition when the datasource was detached. When no longer attached to a Team Server 2016 datasource definition, a detached datasource is
functionally no different than any locally registered (manually registered or automatically discovered) datasource.

**Datasource Navigator/Explorer** lets you perform tasks such as attaching local datasources and managing datasource definitions residing on Team Server 2016.

Basic steps in getting started with Team Server 2016 datasources are as follows:

1. **Enable and configure Team Server 2016 usage** - For details, see [Team Server 2016 Options](#).

2. **Log in to Team Server 2016** - For details, on how to establish a session with Team Server 2016, see [Setting up and Connecting to Team Server 2016](#).

3. **Register Team Server 2016 datasources definitions as local datasources** - See [Using the Datasource Navigator/Explorer](#) for information on how to use a simple Navigator/Explorer interface to manage your local/Team Server 2016 datasources.

**Note:** Key connectivity information, the **Connection Information** tab settings (excluding **Datasource Name**) and a custom JDBC driver if supplied, is not editable in the resulting local datasource definition. **Security Parameters** tab information, such as **User ID** and **Password**) is not copied to the local datasource definition.

4. **Connect to a Team Server 2016 datasource that you have registered locally** - See [Connecting to Datasources](#).

**Topics**

- Searching Team Server 2016 for Datasources
- Reconciling Local and Team Server 2016 Datasources
- Viewing Embarcadero Team Server 2016 Model Metadata in the SQL Editor
Searching Team Server 2016 for Datasources

While the Datasource Navigator/Explorer provides a useful browsing mechanism, you can also perform an advanced search of datasources on Team Server 2016. The Team Server Data Source Search dialog lets you search for Team Server 2016 datasource definitions by name or by one or more ANDed conditions:

<table>
<thead>
<tr>
<th>Name</th>
<th>Datasource Type</th>
<th>Host Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Production Level</td>
<td>Location</td>
</tr>
<tr>
<td>Application Affinity</td>
<td>Status</td>
<td>Additional Notes</td>
</tr>
<tr>
<td>Version, Space Used</td>
<td>Space Used %</td>
<td>Space Free</td>
</tr>
<tr>
<td>Space Free %</td>
<td>Number of Cores</td>
<td>Logins, Statements Executed</td>
</tr>
<tr>
<td>Host Ping Time</td>
<td>Database Ping Time</td>
<td>Query Response Time</td>
</tr>
</tbody>
</table>

To initiate a name-based or criteria-based advanced search

1. Ensure that Team Server 2016 usage is enabled and that you are logged in. For details, see Setting up and Connecting to Team Server 2016.
2. Select **Datasource > Team Server Data Source Search**....

OR

3. Click the **New Data Source Search** button, located in the top of the **Datasource Navigator/Explorer**. The **Saved Searches** node must be selected.

OR

4. Right-click the **Saved Searches** node, located in the top of the **Datasource Navigator/Explorer** and selecting **New Data Source Search**....

The **Team Server Data Source Search** dialog opens.

To search by criteria

1. Use the expand/collapse control to expose the condition controls.

This deactivates the **Search** box.

2. Use the criteria, operator, and value controls to create a condition.

3. To add conditions, use the **+** control and repeat the previous step.

4. When ready, click **Search**.

For more general information on Team Server 2016 integration, see [Team Server 2016 Support](#).
Reconciling Local and Team Server 2016 Datasources

The Reconcile Team Server Data Sources dialog lets you work simultaneously with multiple datasource definitions.

To reconcile multiple datasource definitions

1. Ensure that Team Server 2016 usage is enabled and that you are logged in. For details, see Setting up and Connecting to Team Server 2016.

2. On the Datasource Navigator/Explorer dropdown, select Reconcile Data Sources. The Reconcile Team Server Data Sources dialog opens.

3. Reconcile your Team Server 2016 and local datasources using the three list boxes as follows:
   - **Matching data sources** - lists Team Server 2016 datasource definitions and local datasource definitions with identical connection information details but that are currently not attached. Selecting an entry from this list attaches the local datasource to the Team Server 2016 datasource, ensuring that any changes to the Team Server 2016 definition will be copied to the local datasource definition on the next attempt to connect to the datasource.
   - **Unmatched Team Server data sources** - lists Team Server 2016 datasource definitions for which there are no local datasource definitions with matching connection information. Selecting an entry from this list creates a matching local datasource definition and attaches the local definition to the matching Team Server 2016 datasource definition.
   - **Unmatched local data sources** - lists local datasource definitions for which there are no Team Server 2016 datasource definitions with matching connection information. Selecting an entry from this list creates a matching Team Server 2016 datasource definition and attaches the local definition to the Team Server 2016 datasource definition.

4. Click Reconcile.

*Note:* For more information on local, attached, and matching datasource definitions, see Working with Team Server 2016 Datasources.
Working with Team Server 2016 Streams

Embarcadero Team Server 2016 activity streams include user Likes, user follows, and alerts associated with users or datasources. You can open a window to view your notification.

**Note:** Embarcadero Team Server 2016 is a licensed feature. For access to Team Server 2016 features and to obtain credentials, contact your Team Server 2016 administrator. For access to Team Server 2016 documentation, see [http://docs.embarcadero.com/](http://docs.embarcadero.com/).

**To view the activity stream for a Team Server 2016 resource**

1. Ensure that Team Server 2016 usage is enabled and configured. For details, see [Team Server 2016 Options](#).

2. Select **View > Team Server > Streams**. The **Team Server 2016 Streams** window opens.

3. Use the controls in the **Team Server 2016 Streams** window to display the activity stream for the current user or a Team Server 2016 datasource definition.

For more general information on Team Server 2016 integration, see [Team Server 2016 Support](#).
Viewing Embarcadero Team Server 2016 Model Metadata in the SQL Editor

If a database or schema has associated model data in Team Server 2016, model data such as alerts and attribute/entity descriptions can be displayed/included in the SQL Editor in the following ways:

- Attribute/Entity descriptions can be included in Code Assist proposals
- On explicitly formatting a script, metadata for tables and views referenced in `SELECT, CREATE PROCEDURE, CREATE FUNCTION, CREATE TRIGGER, CREATE VIEW` statements are added in a single comment block above the referencing statement
- When hovering the mouse over a table column name, table name or view name, a tooltip showing the entity/attribute description is displayed
- Warning icons are displayed in the window gutter beside lines referencing objects whose metadata includes alerts
- On execution of a script referencing objects whose metadata includes alerts, the error pane opens with an entry for each referenced object.

**Note:** Metadata for view columns is not available.

**To use model metadata in the SQL Editor**

1. Ensure that Team Server 2016 repository usage is enabled and that you are logged in to the Team Server 2016. For details, see [Team Server 2016 Options](#) and [Setting up and Connecting to Team Server 2016](#).

2. Configure the Metadata features in the Options editor. For details, see [ISQL Options - Code Assist Tab](#).

For related information, see [Team Server 2016 Support](#).
Working Directly with Team Server 2016

You can open a browser interface on Team Server 2016 to access its full range of functionality. This includes increased datasource and data model functionality, access to glossaries and terms, reporting, and access to other users.

To open a browser interface on Team Server 2016

1. Ensure that access to Team Server 2016 has been enabled. For details, see Team Server 2016 Support.

2. Select Tools > Team Server > View in Web browser.

For access to the full set of Team Server 2016 documentation, see http://docs.embarcadero.com/.
Working with Team Server 2016 as Datasource Catalog

Team Server 2016 can be used as a datasource Catalog. When configuring Team Server 2016 as datasource catalog, all the dbms from the configured Team Server 2016 are shown in the Datasource Navigator/Explorer.

In Tools > Options > Datasources you can select Team Server 2016 as the source of the catalog. For more information, see Datasource Options.
Database Object Management

Extensive object management facilities are available for each supported DBMS platform. The following sets of topics describe the major areas of support:

- **Supported Objects**
  Describes the database objects and related elements supported. In addition to a listing of all supported objects by DBMS platform, a support summary is provided for each object type.

- **Creating objects**
  Tells you how to create new objects using graphical wizards.

- **Modifying objects using editors**
  Tells you how to edit existing objects.

- **Object actions**
  Provides details on the actions and operations that you can perform against database objects.
Supported Objects

Database object management features are available across different supported database platforms. The table below indicates the supported object types by platform:

<table>
<thead>
<tr>
<th>DB2</th>
<th>DB2</th>
<th>ITB/FBD</th>
<th>MySQL</th>
<th>ORCL</th>
<th>PSTGRS</th>
<th>SQL</th>
<th>SYB</th>
<th>SYB</th>
</tr>
</thead>
<tbody>
<tr>
<td>LUW</td>
<td>z/OS</td>
<td>*</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

* Indicates partial support.

Alerts

An alert is a definition that matches one or more Microsoft SQL Server events with a response. Errors and messages, or events, are generated by Microsoft SQL Server and entered into the Microsoft Windows application log. SQL Server Agent reads the application log and compares events to alerts that you defined. When SQL Server Agent finds a match, it fires an alert. DBArtisan lets you define alerts to respond to SQL Server events by notifying operators, forwarding the event to another server, or executing a job. These administrative tasks runs automatically if the SQL Server Agent service has been started.

Creating and editing

- Alerts Wizard (SQL Server) and Alerts Editor (SQL Server)

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

Bufferpools

Bufferpools are areas of system memory to cache table and index data pages. DBArtisan retrieves table and index data pages from their physical storage location and places them in the bufferpool so that when you modify or access data, you can retrieve the data from memory rather than a physical device or file. Bufferpools improve database system performance because DBArtisan can retrieve the data quickly from memory.

Creating and editing

- **Bufferpools Wizard for IBM_DB2 (DB2 LUW)** and **Bufferpool Editor (IBM_DB2 LUW)**
- **Buffer Pools Editor (IBM_DB2 Z/OS)**

Clusters

Clusters provide an optional method of storing table data. A cluster comprises of a group of tables that share the same data blocks, and which are grouped together because they share common columns and are often used together. The related columns of tables stored in a cluster are known as the cluster key.

There are two types of clusters:

- Index
- Hash

Index clusters store the cluster data together and index the cluster key, which should make them faster at retrieving a range of data rows.

Hash clusters apply hashing functions to the cluster key to determine the physical location of a data row, which should make them faster at retrieving specific data rows.

Note: To place a table on a cluster, include the ON CLUSTER syntax within the CREATE TABLE statement. Placing a table on a cluster precludes you from placing it on a tablespace or defining the associated storage parameters.

Creating and editing

- Clusters Wizard (Oracle) and Clusters Editor (Oracle).

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

Databases

Databases are a collection of tables, or a collection of index spaces and tablespaces. The goals of a database system are straightforward but challenging. In general, a database aims to manage large amounts of data in a multi-user environment. It should achieve high performance while letting many users access the same information concurrently without compromising data integrity. A database also must protect against unauthorized access and provide reliable solutions for failure recovery.

- IBM DB2 for OS/390 and z/OS Instances
- Sybase ASE Databases
IBM DB2 for Linux, Unix, and Windows Instances

Databases are a collection of tables, or a collection of index spaces and table spaces. The goals of a database system are straightforward but challenging. In general, a database aims to manage large amounts of data in a multi-user environment. It should achieve high performance while letting many users access the same information concurrently without compromising data integrity. A database also must protect against unauthorized access and provide reliable solutions for failure recovery.
Microsoft SQL Server Databases

Databases are a collection of tables, or a collection of index spaces and tablespaces. The goals of a database system are straightforward but challenging. In general, a database aims to manage large amounts of data in a multi-user environment. It should achieve high performance while letting many users access the same information concurrently without compromising data integrity. A database also must protect against unauthorized access and provide reliable solutions for failure recovery.

**Note:** Microsoft SQL Server recommends that you do not create any user objects, such as tables, views, stored procedures, or triggers, in the master database. The master database includes the system tables that store the system information used by SQL Server, such as configuration option settings.
IBM DB2 for OS/390 and z/OS Instances

Databases are a collection of tables, or a collection of index spaces and tablespaces. The goals of a database system are straightforward but challenging. In general, a database aims to manage large amounts of data in a multi-user environment. It should achieve high performance while letting many users access the same information concurrently without compromising data integrity. A database also must protect against unauthorized access and provide reliable solutions for failure recovery.
Sybase ASE Databases

Databases are a collection of tables, or a collection of index spaces and tablespaces. The goals of a database system are straightforward but challenging. In general, a database aims to manage large amounts of data in a multi-user environment. It should achieve high performance while letting many users access the same information concurrently without compromising data integrity. A database also must protect against unauthorized access and provide reliable solutions for failure recovery.
Data Caches

Data Caches are devices stored in memory. If configured properly, they can substantially boost performance by allowing users to read or write data in memory instead of to or from physical disk. With System 11, you can now “borrow” memory from the default data cache and allocate it to customized data caches.

Named data caches let you achieve substantially greater concurrency. Data caches also increase the likelihood that Sybase ASE reads data from memory and not disk. DBArtisan lets you bind particularly active databases (for example, tempdb), tables (for example, syslogs and sysindexes) or indexes to dedicated data caches. In addition, you can boost performance by creating memory pools, each configured for different I/O throughput (2 K to 16 K), within every named data cache.

In spite of their potential, named data caches are not a panacea for performance problems. You should still carefully optimize your queries and indexing strategy. Poor configuration of named data caches can lead to worse performance because precious memory resources are misallocated. To determine data cache performance, you should examine the cache hit ratio.

Creating and editing

- Data Caches Wizard (Sybase ASE) and Data Cache Editor (Sybase ASE)

DBMS platform availability and object actions/operations supported

Directories

Directories create an alias to an external operating system directory to your database files, which can be used for storing large binary object files. When you create a directory, provide the full path name to the outside operating system where the BFILE’s are stored. This object lets you store large files, such as video, outside of the database. The directory object lets you provide a simple alias to the full path name of an outside server's file system, which you can then use to point to the files when creating procedural logic objects. This saves the developer from having to type the full path name when coding.

To create a Directory object, you need CREATE ANY DIRECTORY system privileges. You also create or have in place a corresponding operating system directory to store the file. This directory must have the correct read permissions for Oracle processes.

Creating and editing

- Directories Wizard (Oracle) and Directories Editor (Oracle)

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type For an introduction to object actions and details on usage of specific actions, see Object actions.

Disk Groups

When connected to an Oracle datasource with an ASM instance, the Navigator/Explorer’s Instance node shows ASM and ASM > Disk Groups subnodes. DBArtisan lets you connect to the ASM instance and provides basic object management for disk groups.

DBArtisan lets you use the default datasource connection or a dedicated connection to the ASM instance. When using the default datasource connection, you can open a Disk Group Editor but you can only view limited properties of the disk group. With a dedicated connection to the ASM instance, you can create and edit disk groups and make use of the disk group-specific object actions: Check Disk Group, Mount Disk Group, Rebalance Disk Group, and Undrop Disk. After connecting to the datasource, you are prompted to choose between the default datasource connection and a dedicated ASM instance connection on the first object action against a disk group. The connection type persists and you can also explicitly change the connection type using the Manage ASM Connection and Disconnect ASM Connection actions.

Note: The ASM and Disk Groups nodes are only visible if the datasource instance has an ASM instance.

Creating and editing

- Disk Groups Wizard (Oracle) and Disk Groups Editor (Oracle)

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

Dump and Backup Devices

Dump devices store backups of databases and transaction logs. In Microsoft SQL Server, dump devices have been renamed to backup devices. Before you can dump a database or its transaction log, first create a dump device that stores the resulting backup file. Microsoft SQL Server and Sybase ASE lets you create tape and disk dump devices. Disk dump devices are a fast and convenient mechanism for backups. Tape dump devices facilitate off site storage for enhanced disaster recovery.

Creating and editing

- Backup Devices Wizard (SQL Server) and Backup Devices Editor (SQL Server)
- Dump Devices Wizard (Sybase ASE) and Dump Devices Editor (Sybase ASE)

DBMS platform availability and object actions/operations supported

The following table lists object actions available for this object type. For an introduction to object actions and details on usage of specific actions, see Object actions.

Extended Procedures

Extended Procedures are dynamic link libraries that can be used to load and execute application routines written in other programming languages, such as C or Visual Basic. Extended Procedures function and appear in the same manner as normal stored procedures in that you can pass parameters to them and obtain results.

Note: Extended Procedures can only be accessed on the Master database.

Creating and editing

- Extended Procedures Wizard (Sybase ASE) and Extended Procedures Editor (Sybase ASE)

DBMS platform availability and object actions/operations supported

**DBMS platform-specific notes**

MySQL MySQL recognizes two types of tables, MyISAM and InnoDB. MyISAM tables access data records using an index, where InnoDB tables allow transactions and foreign keys. Therefore, the discussion of foreign keys is limited to your InnoDB tables.
Full-text Catalogs

A full-text catalog is a set of operating system files that store full-text indexes. Full-text catalogs, along with full-text indexes and the object actions supported for these object types, provide full text search support.

**Note:** Before working with full-text catalogs, consult Microsoft SQL Server documentation for a general understanding of full-text searching. For more information, see [Accessing Third Party Documentation](#).

Creating and editing

Related information

- [Full-text Indexes](#)
Full-text Indexes

A full-text index stores information used by the Full-Text Engine to compile full-text queries that can quickly search a table for particular words or word combinations. A full-text index stores information about key words and their location within one or more columns of a table.

Full-text indexes, along with full-text catalogs and the object actions supported for these object types, provide full text search support.

**Note:** Before working with full-text indexes, consult Microsoft SQL Server documentation for a general understanding of full-text searching. For more information, see [Accessing Third Party Documentation](#).

Functions

Functions are subroutines that you define. Functions are useful for reusable application logic. You can use functions to determine the best methods for controlling access and manipulation of the underlying data contained in an object.

The table below describes the types of user-defined functions you can create:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column or External Table</td>
<td>You can write in a host programming language, such as C. This function can act on a table and returns a table value rather than a scalar value.</td>
</tr>
<tr>
<td>External Scalar Function</td>
<td>You can write in a language other than SQL, such as C++ or Java and returns a scalar value to the program. This type of function is referenced by the CREATE FUNCTION statement and can be used to perform computations on data contained in the database but cannot directly reference the data.</td>
</tr>
<tr>
<td>OLEDB Function</td>
<td>Accesses OLE DB data in user-defined OLE DB external tables.</td>
</tr>
<tr>
<td>Sourced Function</td>
<td>Inherits the semantics of another function and can be an operator.</td>
</tr>
<tr>
<td>Template Function</td>
<td>Partial functions that do not contain any executable code. Mainly used in a federated database to map the template function to a data source function - Oracle, SQL Server, Sybase ASE, etc. A function mapping needs to be created in conjunction with the template function.</td>
</tr>
</tbody>
</table>

Creating and editing

### Important Notes

With respect to functions and stored procedures, it can be necessary to have statements executed before and after creation of the procedure or function. This can be useful for example, if you need to create or drop temporary tables used by the function or procedure. Two tag pairs, ETStart and ETEnd, let you embed statements in the first comment block of a stored procedure or function. The following shows the expected syntax:

```sql
create procedure dbo.procname(@a numeric) as
/*
<ETStart>SQL Statement</ETStart>
<ETEnd>SQL Statement</ETEnd>
*/
begin
...```
Groups

Groups are a defined collection of database users. The primary use of groups is to consolidate the management of permissions. By matching together similar users into groups, you can greatly reduce the number of commands required to set permissions.

Every user automatically belongs to the public group. To assign a user to another group, add the user to that group. Then the user belongs to that group and public.

**Note:** A user can only belong to one group at a time other than public.

**Creating and editing**

- Groups Wizard (DB2 LUW) and Groups Editor (IBM DB2 LUW)
- Groups Editor (Oracle)
- Groups Wizard (Sybase ASE) and Groups Editor (Sybase ASE)

**Note:** Creation and editing of objects of this type is not supported against Sybase IQ datasources.

**DBMS platform availability and object actions/operations supported**

The following table lists object actions available for this object type. For an introduction to object actions and details on usage of specific actions, see [Object actions](#).

<table>
<thead>
<tr>

**DBMS platform availability and object actions/operations supported**

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see [Object actions](#).
Image Copies

Image Copies are a full image copy of all pages in a tablespace, partition, data set, or index space. Image Copies can also be an incremental image copy of only pages that have been modified since the last use of the Image Copy Wizard.

Creating and editing

No support is provided for creating or editing Image Copies.

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

**DB2 z/OS**

- **Copy to Copy** ✓
- **Merge Copy** ✓
- **Modify Recovery** ✓
Indexes

Indexes are optional structures associated with tables. You can create indexes specifically to speed SQL statement execution on a table. When properly used, Indexes are the primary means of reducing disk I/O. Indexes are logically and physically independent of the data in the associated table. Unique Indexes guarantee that no two rows of a table have duplicate values in the columns that define the index.

Creating and editing

- Indexes Wizard (DB2 LUW) and Indexes Editor (IBM DB2 LUW)
- Indexes Wizard (DB2 Z/OS) and Indexes Editor (IBM DB2 Z/OS)
- Indexes, Primary Keys, or Unique Keys wizard (MySQL) and Indexes, Primary Keys, and Unique Keys editors (MySQL)
- Indexes Wizard (Oracle) and Indexes Editor (Oracle)
- Indexes Wizard (PostgreSQL) and Indexes Editor (PostgreSQL)
- Indexes Wizard (SQL Server) and Indexes Editor (SQL Server)
- Indexes Wizard (Sybase ASE) and Indexes Editor (Sybase ASE)

Note: Creation and editing of objects of this type is not supported against Sybase IQ datasources.

Indexes

Missing indexes is a feature which helps you to improve the performance of your system. The Missing indexes functionality proposes you to create new indexes for improving the system in case they are needed.

Availability of Missing Indexes for different DBMS:

- Missing Indexes (SQL Server)

DBMS-specific information

- IBM DB2 for Linux, Unix, and Windows Indexes
- IBM DB2 for OS/390 and z/OS Indexes
- Microsoft SQL Server Indexes
- Oracle Indexes
- Sybase ASE Indexes
IBM DB2 for Linux, Unix, and Windows Indexes

IBM DB2 for Linux, Unix, and Windows offers two types of indexes:

- Unique
- Non-Unique

Unique Indexes guarantee that no two rows of a table have duplicate values in the columns that define the index.
Microsoft SQL Server Indexes

Microsoft SQL Server offers two types of indexes: clustered and non-clustered. Clustered indexes physically sort table data to match their logical order. Non-clustered indexes only order the table data logically. In a database, an index lets you speed queries by setting pointers that allow you to retrieve table data without scanning the entire table. An index can be unique or non-unique.

Microsoft SQL Server creates indexes as B-Trees, which are a series of pointers mapping index pages to their underlying data pages. As tables and, therefore, indexes grow, the number of levels in the B-Tree increases. The B-Tree of a clustered index is shorter than that of a non-clustered index because the leaf level of a clustered index is the data page.

A sound indexing strategy is critical to overall system performance. One pitfall to avoid is placing many indexes on a table without regard for their cumulative cost. Remember that indexes improve read but slow write performance because Microsoft SQL Server must update more information in the system catalog. Consequently, extra indexes can actually slow overall performance if data modification occurs frequently on the table. To determine the efficacy of indexes, you should tune your queries using SHOWPLAN and IO STATISTICS and analyze the selectivity of indexes using DBCC SHOW_STATISTICS.

System indexes and user-defined indexes are handled separately in the Datasource Navigator/Explorer to ensure that system indexes are not accidentally altered or dropped.
Oracle Indexes

Oracle offers two types of indexes. The table below describes these indexes:

<table>
<thead>
<tr>
<th>Index</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>A table index is defined on an individual table.</td>
</tr>
<tr>
<td>Cluster</td>
<td>A cluster index is defined on a set of tables physically stored together in a cluster. In an Oracle database, both table and cluster indexes use a B-tree structure.</td>
</tr>
</tbody>
</table>

The indexing strategy, particularly with large, active tables, is critical to overall system performance. The optimal definition and number of indexes for a given table is determined by the mix of access paths to that table performing insert, update, delete and select operations. For example, adding or changing an index can speed up your selects but slow your inserts, updates and deletes. Careful tuning and testing helps you achieve the best overall performance.

**Tip:** Indexes generally improve read operations in a database, but you should not place too many indexes on some tables. Since Oracle must maintain each index along with its referenced table, placing too many indexes on a table that is the object of much insert, update, and delete activity, can actually degrade performance.

Even when an index exists on a table, the way a SQL statement is coded can actually disallow the use of the index. To prevent this from happening, follow these rules of thumb:

- Try not to use SQL statements that include the NOT IN, NOT LIKE, <>, IS NULL operators because they typically suppress the use of indexes.
- When referencing concatenated indexes with queries, be sure the leading column in the index is used. If it isn't, the index won't be used at all.
- Avoid using functions in WHERE predicates.

If you must use functions, investigate the use of function-based indexes.

**Index Partitions**

Index partitions are similar to table partitions. There are three types of partitioned indexes that Oracle supports:

1. Local prefixed
2. Local nonprefixed
3. Global prefixed

**Note:** An index cannot be partitioned if it is a cluster index or if the index is defined on a clustered table.

**Local prefixed and nonprefixed indexes**
A local partitioned index has keys that refer to rows in a single table partition. A local partitioned index is automatically partitioned to mirror the underlying table. The number of partitions or subpartitions and the partition bounds for the partitioned index correspond with the partitions on the table. Oracle maintains this correspondence. If the table partitions are altered, the index partitions are altered accordingly.

A local partitioned index is prefixed if it is partitioned on the same column as the underlying table. The local partitioned index is nonprefixed if it is partitioned on a different column.

Global prefixed indexes

A global partitioned index can refer to rows in more than one table partition or subpartition. Global partitioned indexes are more difficult to manage than local partitioned indexes because any change in the underlying table partition affects all partitions in a global index. As a result, there is increased partition maintenance.

**Note:** A global index can only be range partitioned but it can be defined on any kind of partitioned table.
IBM DB2 for OS/390 and z/OS Indexes

IBM DB2 for OS/390 and z/OS offers two types of indexes:

- Unique
- Non-Unique

Unique Indexes guarantee that no two rows of a table have duplicate values in the columns that define the index.

Non-Unique indexes let table rows have duplicate values in the columns that define the indexes.
Sybase ASE Indexes

Sybase ASE offers two types of indexes: clustered and non-clustered. Clustered indexes physically sort table data to match their logical order. Non-clustered indexes only order the table data logically. In a database, an index lets you speed queries by setting pointers that let you retrieve table data without scanning the entire table. An index can be unique or non-unique.

Sybase ASE creates indexes as B-Trees, which are a series of pointers mapping index pages to their underlying data pages. As tables and, therefore, indexes grow, the number of levels in the B-Tree increases. The B-Tree of a clustered index is shorter than that of a non-clustered index because the leaf level of a clustered index is the data page.

A sound indexing strategy is critical to overall system performance. One pitfall to avoid is placing many indexes on a table without regard for their cumulative cost. Remember that indexes improve read but slow write performance because Sybase ASE must update more information in the system catalog. Consequently, extra indexes can actually slow overall performance if data modification occurs frequently on the table. To determine the efficacy of indexes, you should tune your queries using SHOWPLAN and IO STATISTICS and analyze the selectivity of indexes using DBCC SHOW_STATISTICS.

System indexes and user-defined indexes are handled separately in the Datasource Navigator/Explorer to ensure that system indexes are not accidentally altered or dropped.
**Missing Indexes (SQL Server)**

Missing indexes is a feature which helps you to improve the performance of your system. The Missing indexes functionality proposes you to create new indexes for improving the system in case they are needed.

To access Missing Indexes:

### From Performance Node

**Accessing Missing Indexes**

1. Open the **Performance** node of the tree.
2. Select **Missing Indexes** node.

**Adding Indexes**

From the **Missing Index** you can create an **Index** with the information needed. For that:

1. Double click in the **Missing Index** you want to create.

**OR**

2. Right-click and **Create...**

It opens the **Indexes Wizard (SQL Server)** filled with the information from the selected **Missing Index**.

### From Databases Node

**Accessing Missing Indexes**

1. Open the **Databases** node of the tree.
2. Open the database of the tree where you want to check if there are **Missing Indexes**.
3. Select the **Tables** node in the tree.
4. Open the **Table Editor** where you want to check if there are "Missing Indexes". See **Opening an Object Editor**.
5. Select the **Missing Indexes** panel if enabled.

You can also access the **Missing Indexes** with the dedicated node under the **Database** node.

**Adding Indexes**

From the **Missing Index** panel you can create an **Index** with the information needed. For that:
1. Double click in the **Missing Index** you want to create.

OR

2. Right-click and **Create...**

It opens the [Indexes Wizard (SQL Server)](http://example.com) filled with the information from the selected **Missing Index**.

**From Database Monitor**

**Accessing Missing Indexes**

1. Click **Utilities > Database Monitor**.

The Database Monitor opens.

2. Select the **Missing Indexes** tab.

**Adding Indexes**

1. Select one of the Missing Indexes.

The query for creating the Index for the selected Missing Index is shown in the SQL Window if the **SQL Toggle** is selected.

2. Click **Create** in the Database Monitor window.
Instance

**Note:** This object is supported for IBM DB2 and Oracle.

Instance is placed as the first level of information under the Datasource node in the Datasource Navigator/Explorer. Instance includes:

- DB Manager Configuration
- Data sources

**Available Functionality**

The following functionality is available for this object type:

[Databases Wizard (DB2 LUW)](Databases Wizard) [Quiesce (Database)](Quiesce) [Unquiesce](Unquiesce)
Java Classes

The Java Classes contain compiled Java code. Java Classes are made up of a group of data items, with associated functions that perform operations. The data items are called fields or variables; the functions are referred to as methods.

Tip: Oracle is shipped with a JVM (Java Virtual Machine). The JVM provided by Oracle sits atop the Oracle RDBMS and interacts directly with the RDBMS instead of the operating system.

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

SYB IQ

Drop

Extract  ✓
Libraries

Libraries are an object type that represent a call to an operating system shared library. After the call is made, libraries can be used by SQL or PL/SQL to link to external procedures or functions. Libraries are only to be used on operating systems that support shared libraries and dynamic linking. Libraries serve as pointers or aliases to physical operating system shared library files and do not have existence as a physical object on their own, rather they rely on the physical existence of the files in the external operating system library to which they refer. To access the function or procedures stored in the library, you need execute privileges at the operating system level where the shared library resides.

Creating and editing

- Libraries Wizard (Oracle) and Libraries Editor (Oracle)

DBMS platform availability and object actions/operations supported

Linked Servers

Linked servers let you create links to OLE DB data sources. With a linked server you can execute commands against OLE DB data sources on different servers. Using linked servers you can:

- Access remote servers
- Issue enterprise-wide distributed queries, updates, commands, and transactions.

Distributed Queries

Before you run a distributed query, write the following as the first statement of your SQL script:

```sql
SET ANSI_NULLS ON
GO
SET ANSI_WARNINGS ON
GO
```

Creating and editing

- Linked Servers Wizard (SQL Server) and Linked Servers Editor (SQL Server)

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

### SQL SVR

<table>
<thead>
<tr>
<th>Object</th>
<th>Available</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drop</td>
<td>✓</td>
</tr>
<tr>
<td>Extract</td>
<td>✓</td>
</tr>
<tr>
<td>Migrate</td>
<td>✓</td>
</tr>
<tr>
<td>Report</td>
<td>✓</td>
</tr>
</tbody>
</table>
Logins

Logins let you access your account. Your login account controls access to the server and all of the databases within it. Only the System Administrator or System Security Officer can create logins. Once you can log into a server, you need additional privileges to access user databases. Specifically, each database owner adds the login as a user or alias to the database.

Creating and editing

- Logins Wizard (SQL Server) and Logins Editor (SQL Server)
- Logins Wizard (Sybase ASE) and Logins Editor (Sybase ASE)

DBMS platform availability and object actions/operations supported

The following table lists object actions available for this object type. For an introduction to object actions and details on usage of specific actions, see Object actions.

<table>
<thead>
<tr>
<th>SQL SVR</th>
<th>SYB ASE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add/Modify Login Trigger</td>
<td>✓</td>
</tr>
<tr>
<td>Bind To Temporary Database</td>
<td>✓</td>
</tr>
<tr>
<td>Change Password</td>
<td>✓</td>
</tr>
<tr>
<td>Create Like</td>
<td>✓</td>
</tr>
<tr>
<td>Drop</td>
<td>✓</td>
</tr>
<tr>
<td>Drop Login Trigger</td>
<td>✓</td>
</tr>
<tr>
<td>Extract</td>
<td>✓</td>
</tr>
<tr>
<td>Migrate</td>
<td>✓</td>
</tr>
<tr>
<td>Report</td>
<td>✓</td>
</tr>
<tr>
<td>Unbind From Temporary Database</td>
<td>✓</td>
</tr>
</tbody>
</table>

Navigator/Explorer Details

Depending on the DBMS platform, the icon associated with a login differs according to the login’s locked or unlocked state, when viewed in the Navigator/Explorer.
Logins

**DBMS Platform**  |  **Icon**  |  **Login Account State**
---|---|---
SQL SVR or SYB ASE | | Locked
| | Unlocked

**DBMS-specific notes**

**Microsoft SQL Server Logins**

Logins let you access your account. Your login account controls access to the server and all of the databases within it. Only the System Administrator or System Security Officer can create logins. Once you can log into a server, you need additional privileges to access user databases. Specifically, each database owner adds the login as a user or alias to the database.

**Sybase ASE Logins**

Logins let you access your account. Your login account controls access to the server and all of the databases within it. Only the System Administrator or System Security Officer can create logins. Once you can log into a server, you need additional privileges to access user databases. Specifically, each database owner adds the login as a user or alias to the database.
Logs (SQL Server Agent)

The following summarizes support for archived SQL Server Agent logs.

Creating and editing
Logs are generated and cannot be created or edited.

DBMS platform availability and object actions/operations supported
The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

<table>
<thead>
<tr>
<th>Platform</th>
<th>Open (Logs and Error logs)</th>
<th>Report</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQL SVR</td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>
Materialized Query Tables

A materialized query table is a table whose definition is based on the result of a query. The materialized query table typically contains precomputed results based on the data existing in the table or tables that its definition is based on. If the SQL compiler determines that a query will run more efficiently against a materialized query table than the base table or tables, the query quickly executes against the materialized query table.

Creating and editing

- Materialized Query Tables Wizard (DB2 LUW) and Materialized Query Tables Editor (IBM DB2 LUW)

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

DB2 LUW

- Select * From ✓
- Set Integrity ✓
- Transfer Ownership ✓
- Update Statistics ✓
Materialized Views

Note: This object is supported by Oracle only.

Materialized views are used to dynamically copy data between distributed databases. There are two types of materialized views:

- Complex
- Simple

Complex materialized views copy part of a master table or data from more than one master table. Simple materialized views directly copy a single table. You cannot directly update the underlying data contained in materialized views.

Creating and editing

- Materialized Views Wizard (Oracle) and Materialized Views Editor (Oracle)

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

<table>
<thead>
<tr>
<th>ORCL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compile ✓</td>
</tr>

<tr>
<td>Migrate ✓</td>
</tr>
<tr>
<td>Rename ✓</td>
</tr>
<tr>
<td>Report ✓</td>
</tr>
<tr>
<td>Shrink ✓</td>
</tr>
</tbody>
</table>
Materialized View Logs

Materialized View logs are tables that maintain a history of modifications to the master table, and they are used to refresh simple materialized views. When you create a materialized view log, Oracle automatically creates a log table to track data changes in the master table and a log trigger to maintain the data in the log table.

Creating and editing

- Materialized View Logs Wizard (Oracle) and Materialized View Logs Editor (Oracle)

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

<table>
<thead>
<tr>
<th>ORCL</th>
<th>Drop</th>

</tbody>
</table>
Operators

Operators are individuals responsible for the maintenance of one or more computers running Microsoft SQL Server. E-mail, pager, and Net Send can notify these operators.

Creating and editing

- Operators Wizard (SQL Server) and Operators Editor (SQL Server)

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

<table>
<thead>
<tr>
<th>SQL SVR</th>
<th>Drop</th>
<th>Extract</th>
<th>Rename</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>
Outlines

Outlines are a set of results for the execution plan generation of a particular SQL statement. When you create an outline, plan stability examines the optimization results using the same data used to generate the execution plan. That is, Oracle uses the input to the execution plan to generate an outline, and not the execution plan itself.

Creating and editing

- Outlines Wizard (Oracle) and Outlines Editor (Oracle)

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

</tr>
</tbody>
</table>
Packages

Note: This object is supported by IBM DB2 for Linux, Unix, and Windows, IBM DB2 for OS/390 and z/OS, and Oracle only.

Packages contain all the information needed to process SQL statements from a single source file. You can use packages to process and call batches of SQL. Depending on the platform, packages can include:

- Procedures
- Functions
- Types
- Variables
- Constants
- Exceptions
- Cursors
- Subprograms

Packages offer a number of important advantages over using standalone procedures and functions, including the ability to:

- Modify package objects without recompiling dependent database objects.
- Declare global variables and cursors that can be shared within the package.
- Grant privileges more efficiently.
- Load multiple package objects into memory at once.

Packages usually have two parts: a header or specification and a body, although sometimes the body is unnecessary. The package header declares the members of the package while the body details the logic underlying each of the package components.

Note: The Datasource Navigator/Explorer splits out package headers and package bodies; however, you create both a package header and body from the packages node.

Creating and editing

- Packages Editor (IBM DB2 LUW)
- Packages Editor (IBM DB2 Z/OS)
- Packages Wizard (Oracle) and Packages Editor (Oracle)

DBMS platform availability and object actions/operations supported

The following table lists object actions available for this object type. For an introduction to object actions and details on usage of specific actions, see Object actions.
<table>
<thead>
<tr>
<th>DB2 LUW</th>
<th>DB2 z/OS</th>
<th>ORCL</th>
</tr>

<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>
Package Bodies

Package Bodies implement the package specification in that the package body includes the definition of every cursor and subprogram declared in the package specification.

Creating and editing

While Package Bodies are listed as a separate object in the Datasource Navigator/Explorer, they are created on the Packages Editor in conjunction with Packages. For more information, see Package Bodies Editor (Oracle).

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type For an introduction to object actions and details on usage of specific actions, see Object actions.

<table>
<thead>
<tr>

</tbody>
</table>
Partition Functions

Partition functions are functions that map the rows of a table or index into partitions based on the values of a specified column. Partition functions are referenced in partition scheme definitions in partitioning indexes or tables.

Creating and editing

See the following topics:

- [Partition Functions Wizard (SQL Server)](#) and [Partition Functions Editor (SQL Server)](#)

Available Functionality

**SQL SVR**

- **Drop** ✓
- **Extract** ✓
- **Migrate** ✓
- **Report** ✓

For related information, see the following topics:

- [Partition Schemes](#) and [Partition Schemes Wizard (SQL Server)](#)
- [Indexes Wizard (SQL Server)](#)
- [Tables Wizard (SQL Server)](#)
Partition Schemes

Partition schemes map the partitions of a partitioned table or index to filegroups. The number and domain of the partitions for a partitioned table or index are specified in a partition function definition. Partition scheme definitions are referenced when partitioning indexes or tables.

Creating and editing

See the following topics:

- [Partition Schemes Wizard (SQL Server)](Partition Schemes Wizard (SQL Server)) and [Partition Schemes Editor (SQL Server)](Partition Schemes Editor (SQL Server))

Available Functionality

[SQL SVR]

Procedures

Procedures are a reusable block of PL/SQL, stored in the database, that applications can call. Procedures streamline code development, debugging, and maintenance by being reusable. Procedures enhance database security by letting you write procedures granting users execution privileges to tables rather than letting them access tables directly.

Creating and editing

- Procedures Wizard (DB2 LUW) and Procedures Editor (IBM DB2 LUW)
- Procedures Wizard (DB2 Z/OS) and Procedures Editor (IBM DB2 Z/OS)
- Procedures Wizard (Oracle) and Procedures Editor (Oracle)
- Procedures Wizard (SQL Server) and Procedures Editor (SQL Server)
- Procedures Wizard (Sybase ASE) and Procedures Editor (Sybase ASE)

Note: Creation and editing of objects of this type is not supported against Sybase IQ datasources.

DBMS platform availability and object actions/operations supported

The following table lists object actions available for this object type. For an introduction to object actions and details on usage of specific actions, see Object actions.

DB2 LUW  DB2 z/OS  ITB/FBD  *  ORCL  SQL SVR  SYB ASE  SYB IQ

<tr>
<td>Create Synonym</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>Describe</td>
<td>✓ ✓ ✓ ✓ ✓ ✓</td>
<td>Procedures perform procedural logic in your Sybase ASE applications. They are batches of SQL statements that are compiled and stored in the system catalog. Procedures execute faster than embedded SQL statements because they are pre-compiled and have execution plans for use by the optimizer. When you create a procedure, Sybase ASE builds a query tree, which it stores in a system table. When you execute a procedure for the first time, Sybase ASE loads it from the system table, compiles, and optimizes it. Sybase ASE places the resulting query plan in the procedure cache where it remains on a most recently used basis. In addition to better performance, procedures yield other benefits, including easier code maintenance, additional security and reduced network traffic.</td>
</tr>

<td>✓</td>
<td></td>
</tr>
</tbody>
</table>

**Note**: Extended procedures are also supported. For details, see Extended Procedures.
Executing Statements Before and After Procedure or Function Creation

With respect to functions and stored procedures, it can be necessary to have statements executed before and after creation of the procedure or function. This can be useful for example, if you need to create or drop temporary tables used by the function or procedure. Two tag pairs, ETStart and ETEnd, let you embed statements in the first comment block of a stored procedure or function. The following shows the expected syntax:

```
create procedure dbo.procname(@a numeric) as
/*
<ETStart>SQL Statement</ETStart>
<ETEnd>SQL Statement</ETEnd>
*/
begin
...
```
Profiles

Profiles are a mechanism for allocating system and database resources to users. Profiles let you specify limits on:

- Number of sessions
- CPU time
- Connect time
- Idle time
- Logical reads and space in the SGA's shared pool

You can assign profiles to one or more users. The database's default profile and all of its resource limits are assigned to users without a specific profile assignment.

Creating and editing

- Profiles Wizard (Oracle) and Profiles Editor (Oracle)

DBMS platform availability and object actions/operations supported

The following table lists object actions available for this object type. For an introduction to object actions and details on usage of specific actions, see Object actions.

<table>
<thead>
<tr>
<th>Object</th>

Related Information

See details for the following object types

- Chains
- Jobs (Oracle)
- Schedules
Recycle Bin

DBArtisan provides basic support for Oracle's Recycle Bin feature. When enabled, dropped tables, indexes, and associated objects are stored in the Recycle Bin until explicitly purged.

Creating and editing

The Recycle Bin cannot be created or edited.

DBMS platform availability and object actions/operations supported

On the Datasource Navigator/Explorer, selecting the Recycle Bin node has the same effect as issuing a SHOW RECYCLEBIN statement. The contents of the Recycle Bin are displayed.

Related actions include:

<table>
<thead>
<tr>
<th>ORCL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Recycle Bin ✓</td>
</tr>
<tr>
<td>Flashback Recycle Bin Entry ✓</td>
</tr>
<tr>
<td>Purge Recycle Bin ✓</td>
</tr>
<tr>
<td>Purge Recycle Bin Entry ✓</td>
</tr>
</tbody>
</table>

Note: Select * From functionality is supported as a right-click option for individual tables in the Recycle Bin. For details on this feature, see Select * From.
Redo Log Groups

Redo Logs save information on the state of the database after an update. If the database fails before the update is written to the datafiles, the update can be re-done, bringing the changes back after a crash, so it appears the update did happen.

**Tip:** Have sufficient redo logs available so that other Oracle threads do not have to wait until one is free before performing an update.

Redo logs are arranged in groups, and when a particular group is being written to, each member receives the same data.

**Tip:** To avoid crashes, have two logfiles in a group, each one being on a different (physical) disk.

**Creating and editing**

- Redo Log Groups Wizard (Oracle) and Redo Log Groups Editor (Oracle)

**DBMS platform availability and object actions/operations supported**

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

</tbody>
</table>
Remote Servers

Remote Servers are servers on a network that you can access through your local server. Instead of logging directly into a remote server, you can log into your local server and execute a remote procedure call to it.

The local server routes all commands to the remote server. To communicate with a remote server, you log into a local server and submit your remote procedure calls for remote servers. The remote server receives remote procedure calls from the local server and processes them accordingly.

Creating and editing

- Remote Servers Wizard (SQL Server) and Remote Servers Editor (SQL Server)
- Remote Servers Wizard (Sybase ASE) and Remote Servers Editor (Sybase ASE)

Note: Against Sybase IQ datasources, DBArtisan does not offer support for creating or editing objects of this type.

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

Microsoft SQL Server Roles

Roles let you manage permissions for users to perform a set of activities based on job functions. Roles are a mechanism for streamlining the assignment of object and system privileges to multiple users. Instead of granting sets of privileges to individual users, you can create a role, grant system and object privileges to that role, and then grant that role to all the users who should share the same privileges. You can grant one or more roles to the same user. Therefore, if you need to change the permissions for a certain role you can do so, and not have to grant or revoke the permissions for each individual user.

Topics

- Server Roles.
Oracle Roles

Oracle Roles

Roles are a mechanism for streamlining the assignment of object and system privileges to multiple users. Instead of granting sets of privileges to individual users, you can create a role, grant system and object privileges to that role, then simply grant that role to all the users who should share the same privileges. You can grant one or more roles to the same user.

DBMS-specific functionality

- For information on activating and deactivating roles for the current login in the current session, see Role Activation.
Sybase ASE Roles

Roles are a mechanism for streamlining the assignment of object and system privileges to multiple users. Instead of granting sets of privileges to individual users, you can create a role, grant system and object privileges to that role, then simply grant that role to all the users who should share the same privileges. You can grant one or more roles to the same user.

**DBMS-specific functionality**

- For information on activating and deactivating roles for the current login in the current session, see [Role Activation](#).
Rollback Segments

Rollback segments manage all transactions in your Oracle databases. They maintain read consistency among concurrent users in a database and can rollback transactions. They are transaction logs that maintain discrete records of changes to data. By maintaining a history of data changes, rollback segments can rollback uncommitted transactions so that data is rolled back to their prior state.

**Tip:** Databases with large user bases and intensive data manipulation characteristics can benefit from having multiple rollback tablespaces that are placed on different server drives or file systems. This strategy aids in the reduction of I/O and rollback segment contention.

Because all changes are logged to a rollback segment, they can become a performance bottleneck as the number of concurrent users and transaction activity increases. You can tune rollback segment performance by creating additional ones to handle increased traffic. To determine whether rollback segment performance is satisfactory, you should monitor the ratio of gets to waits. If you see that the number of waits is climbing, create another rollback segment to further spread concurrency.

**Note:** The analysis for determining when to add a rollback segment can be quite complicated. As a rule-of-thumb, however, many DBAs simply plan on allocating a rollback segment for every four concurrent users.

The proper sizing of rollback segments is critical to their overall performance. Performance degrades whenever a rollback segment must extend, wrap or shrink in response to transaction loads. Ideally, you want to make their extents as small as possible while ensuring that each transaction fits into a single extent, which in practice is very difficult to achieve.

**Note:** You should carefully monitor each rollback segments for the occurrence of extends, wraps and shrinks. If you see a high level of extends and wraps, then the rollback segment is probably too small. If you see a high level of shrinks, then you should increase the rollback segment’s optimal size.

**Creating and editing**

- Rollback Segments Wizard (Oracle) and Rollback Segments Editor (Oracle)

**DBMS platform availability and object actions/operations supported**

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

**Rules**

Rules promote data integrity by allowing you to validate the values supplied to a table column. They are reusable objects that you can bind to table columns or user datatypes. For example, you can create a rule, bind it to a column in a table and have it specify acceptable values that can be inserted into that column.

Schema

A Schema is a container of objects that can be owned by any user.

Note: The Schema nodes available under DB2 LUW, DB2 z/OS, and Oracle datasources do not own a specific set of objects. They are simply an organizational container for all database objects for a datasource or database.

Segments

Segments are a mechanism for placing tables and indexes on specific logical partitions. You create segments on one or more fragments of a database. You can map segments to specific database fragments, which in turn reside on specific hard disks; and, mapping segments lets you increase i/o throughput by placing intensively used tables and indexes on different physical devices. You can allocate tables and indexes to segments by including placement statements at the end of CREATE TABLE or CREATE INDEX statements.

Creating and editing

- Segment Wizard (Sybase ASE) and Segments Editor (Sybase ASE)

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

Structured Types

Structured types define an abstract data type or object composed of a collection of similar types of data. For example, create an structured type that defines a full address rather than the pieces of an address, such as city, state and postal code. An structured type stores the pieces of an address in a single type, storing them in the same location and allowing the full address to be accessed and manipulated as single unit rather than multiple units.

Structured types are useful for ensuring uniformity and consistency as they are defined as single encapsulated entity that can be reused in other structured types and objects. They also offer flexibility by allowing for the creation of objects that represent real-world situations which is limited in relational objects.

Synonyms

The function and usage of synonyms differs by DBMS platform

**DB2 z/OS**
An alternate name for an existing table, view, or alias.

**Oracle**
An alternative name for a table, view, sequence, procedure, function, package, materialized view, java class, type, or another synonym.

**SQL Server**
A single-part name used to reference multi-part names in SQL statements. While synonyms can be created for functions, procedures, tables, and views, consult Microsoft SQL Server documentation for restrictions on function and procedure support. For more information, see [Accessing Third Party Documentation](#).

Creating and editing

### DBMS platform-specific notes

MySQL MySQL servers can store tables in multiple formats, including MyISAM and InnoDB. MyISAM tables (ISAM is the acronym for indexed sequential access method) are used most often for read operations. The read operation is very fast, but you cannot include any referential integrity, such as a foreign key. Also, MyISAM tables only issue table-level locks. InnoDB tables, on the other hand, do permit transactions and foreign key constraints. InnoDB tables also lock data at the row level, which is appropriate for high transaction tables. Additional table types available are MERGE, MEMORY, FEDERATED, and ARCHIVE among others. For a complete discussion of table types, go to the MySQL documentation of table and engine types. For more information, see Accessing Third Party Documentation.
Tablespaces are storage structures that act as partitions for the database. You can create a tablespace to store table data and other objects related to table performance such as indexes or large object data. Tablespaces are used to manage large complex databases. Once you have created a tablespace, you can place objects on it.

**Tip:** Create separate tablespaces for your tables and indexes and put each tablespace on a different drive or file system. Segmenting tables and their corresponding indexes in this manner helps eliminate I/O contention at the server level.

**Note:** IBM DB2 for Linux, Unix, and Windows lets you assign a location for table or index data directly to physical storage devices. Each tablespace can also be broken down into a collection of containers which are the actual physical storage files or devices. You can then spread the data or database objects across multiple file systems, thereby giving you the necessary space for objects that require it.

Once you have created a tablespace, you can place individual tables and indexes on it. Because tablespaces map to physical drives, you can improve I/O performance by placing tables and their indexes on physically separated table spaces.

Triggers

Triggers are a special type of procedure that automatically fire when defined data modification operations (insert, update, or delete) occur on a target table or view. Trigger support differs by DBMS type, but in general offers options such as:

- Standard INSERT/DELETE/UPDATE event support
- BEFORE/AFTER timing control
- Row/statement trigger type control
- INSTEAD OF triggers
- Compound triggers
- Enabled/disabled status options

Types

Types define an abstract data type or object composed of a collection of similar types of data. For example, create an object type that defines a full address rather than the pieces of an address, such as city, state and postal code. An object type stores the pieces of an address in a single type, storing them in the same location and allowing the full address to be accessed and manipulated as single unit rather than multiple units.

Object types are useful for ensuring uniformity and consistency as they are defined as single encapsulated entity that can be reused in other object types and objects. They also offer flexibility by allowing for the creation of objects that represent real-world situations which is limited in relational objects.

You can choose to create a type that is incomplete, complete, a VARRAY, or a nested table or any combination of the above. An incomplete type specifies no attributes and can be used for circular references such as person - female. It lets the type be referenced before it is complete. The VARRAY type can be used to store small sets of related data. For example, if you have ten offices (each one with a different description) at a particular division in your company, you could create a VARRAY of 10 to hold the details of these offices. The values for a VARRAY type must be fixed and known and small values as they are stored in RAW format. A nested table type can be used when data is repeated for the same entity an unknown number of times and storage is a concern.

Creating and editing

- Object Types Wizard (Oracle) and Types Editor (Oracle)

Note: Objects of this type cannot be created or edited against PostgreSQL datasources.

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type For an introduction to object actions and details on usage of specific actions, see Object actions.

Type Bodies

Type Bodies implement object type specification by containing the definition of every cursor and subprogram declared in the object type specification. While Type Bodies are listed as a separate object in the Datasource Navigator/Explorer, they are created on the Types editor in conjunction with Types.

Creating and editing

While listed as separate objects in the Datasource Navigator/Explorer, type bodies are created and edited on the Body tab of the Types Editor. For details, see Types Editor (Oracle).

DBMS platform availability and object actions/operations supported

The table below lists the platforms on which this object type is available. It also lists the object actions available against objects of this type. For an introduction to object actions and details on usage of specific actions, see Object actions.

User Datatypes

User-defined datatypes promote domain consistency by streamlining the definition of commonly used table columns in a database. You can build a customized datatype from system datatypes and bind defaults and rules to it to enhance integrity. When you reference the user datatype in a column, the column assumes all of the properties of the user datatype.

Creating and editing

- User Datatypes (DB2 LUW) and User Datatypes Editor (IBM DB2 LUW)
- User Datatypes Wizard (DB2 Z/OS) and User Datatypes Editor (IBM DB2 Z/OS)
- User Datatypes Wizard (SQL Server) and User Datatypes Editor (SQL Server)
- User Datatypes Wizard (Sybase ASE) and User Datatypes Editor (Sybase ASE)

User Messages

User Messages lets you catalog error messages that your database applications can reuse. Microsoft SQL Server stores your error messages in a system table, sysmessages. To return error messages from stored procedures and triggers, you need to call a system stored procedure and pass an error number as a parameter.

Creating and editing

- User Messages Wizard (SQL Server) and User Messages Editor (SQL Server)
- User Messages Wizard (Sybase ASE) and User Messages Editor (Sybase ASE)

Navigator/Explorer Details

Depending on the DBMS platform, the icon associated with a user differs according to the account’s locked or unlocked state, when viewed in the Navigator/Explorer.
**DBMS Platform Icon User Account State**

**ORCL** or **SYB IQ**  🔄 Locked

izational System

**IBM DB2 for Linux, Unix, and Windows Users**

IBM DB2 for Linux, Unix, and Windows relies on your machine’s operating system to define users for the server. You create and maintain users through your operating system.

**Note:** DBArtisan lets you set a default SQLID user for a DB2 data source. This lets the user set the implicit schema for the unqualified object references to a schema different from the user’s login id.

**IBM DB2 for OS/390 and z/OS Users**

IBM DB2 relies on the operating system you are running to define users for the server. This means that users are created and maintained through your operating system.

**Note:** DBArtisan lets you set a default SCHEMA user for a DB2 data source. This lets the user set the implicit schema for the unqualified object references to a schema different from the user’s login id.

**Microsoft SQL Server Users**

Microsoft SQL Server controls access at the database level by requiring the System Administrator or Database Owner to add a login as a database user or alias. After you create a database user, you can implement further security by granting or revoking the privileges for that user on specific database objects. To consolidate the process of granting or revoking permissions to many users, the database owner can assign users to groups.

**MySQL Users**

Unlike adding new users to other platforms, MySQL doesn’t rely solely on a userid/password combination. The MySQL server must not only validate the user and password, but also the host from which the connection is being requested before the new user is admitted to the server’s inner sanctum. The User Wizard and User Editor enable these validations.

**Oracle Users**

To access an Oracle database, you need a user account authenticated with a password. A user account is what Oracle uses to permit access by the user. You can assign the following optional properties to the user:
Users

- Default tablespace
- Temporary tablespace
- Quotas for allocating space in tablespaces
- Profile containing resource limits

Sybase ASE Users

Sybase ASE controls access at the database level by requiring the System Administrator or Database Owner to add a login as a database user or alias. After you create a database user, you can implement further security by granting or revoking the privileges for that user on specific database objects. To consolidate the process of granting or revoking permissions to many users, the database owner can assign users to groups.
Views

Views are SQL queries stored in the system catalog that customize the display of data contained in one or more tables. Views behave like tables because you can query views and perform data manipulation operations on them. However, views do not actually store any data. Instead, they depend on data contained in their base tables. Views let you:

- View a customized selection of data from one or more tables. As a result, you can display data more cogently to different sets of users, even though the underlying data is the same.
- Restricting access to a defined set of rows and columns.

Creating and editing

- Views Wizard (DB2 LUW) and Views Editor (IBM DB2 LUW)
- Views Wizard (DB2 Z/OS) and Views Editor (IBM DB2 Z/OS)
- Views Wizard (Oracle) and Views Editor (Oracle)
- Views Wizard (PostgreSQL) and Views Editor (PostgreSQL)
- Views Wizard (SQL Server) and Views Editor (SQL Server)
- Views Wizard (Sybase ASE) and Views Editor (Sybase ASE)

Note: Creation and editing of objects of this type is not supported against Sybase IQ datasources.

Creating objects

A set of easy-to-use wizards are available for creating objects. For an introduction to object creation wizards, see Overview and Common Usage of Object Wizards.

Platform-by-platform discussions of wizards are discussed as follows:

- IBM DB2 for Linux, Unix, and Windows Object Wizards
- IBM DB2 for z/OS Object Wizards
- Microsoft SQL Server Object Wizards
- MySQL Object Wizards
- Oracle Object Wizards
- PostgreSQL Object Wizards
- Sybase ASE Object Wizards
Overview and Common Usage of Object Wizards

An object wizard lets you create new database and server objects on a datasource. For example, a Tables wizard lets you create columns, set up permissions to work with that table, provide details on physical storage for the table, and so on. Each pane on an object wizard lets you perform a logical task or collection of logical tasks for that object type. For example:

![Create Index Wizard - Step 1 of 6](image)

Topics

- Opening an Object Wizard
- Navigating and Setting Properties in an Object Wizard
- Adding a Comment to an Object
- Setting Permissions or Privileges for an Object
- Previewing the DDL Generated to Create the New Object
Opening an Object Wizard

Object wizards are accessed from the Datasource Navigator/Explorer pane of the main window.

To open an Object wizard for a server or database object

1. Connect to the datasource where you want to create a new resource. For more information, see Datasource and Server Management.

2. On the Datasource Navigator/Explorer, expand the target datasource.

3. Continue to expand folders under the datasource until the type of object you want to create is visible.

4. On the Datasource Navigator/Explorer, right-click on the specific type of object that you want to create and select Create from the context menu.

The object wizard for that object type opens.
Navigating and Setting Properties in an Object Wizard

When you invoke an object wizard, it opens on the first pane of the wizard, typically a Properties pane. As you select options or provide details, you use the navigation buttons at the bottom of the window and the pane controls at the left of the window to navigate through the wizard.

- Use the Next button to move to the next pane of the wizard.

**Note:** In some cases, the Next button is not activated until required information is provided. Similarly, some panes of a wizard do not become accessible until activated by choice of an option or property on a previous pane. For example, a Partitions tab in a table wizard may only become available if the Clustered and Number of Partitions options on a prior tab are set accordingly.

- Use the Back button to move to the previous pane of the wizard.

- Use the pane controls at the left of the window to move to a specific pane of the wizard.
Adding a Comment to an Object

The object wizards for certain object types feature a Comment tab that lets you add an explanatory note to specific object definitions. Comments are stored in the REMARKS column of the object’s system-catalog.

To add a comment to an object:

1. Open an object wizard on an object type that permits comments. For details, see Opening an Object Wizard.

See the topics for specific Object editors later in this chapter for information on whether that object type supports comments.

2. Click the Comment panel when enabled.

3. In the Comment area, type an explanatory note of up to 254 characters long.
Setting Permissions or Privileges for an Object

When you open an Object wizard to create an object with associated privileges, the Permissions (or Privileges or Object Permissions or System Permissions) panel for that editor displays the relevant privileges and lets you make changes accordingly:

To set permissions for an object:

1. Open an object wizard on an object type with associated permissions or privileges. For details, see Opening an Object Wizard.

See the topics for specific Object wizards later in this chapter for information on whether that object type supports permissions/privileges.

2. Click the Permissions (Privileges, Object Permissions or System Permissions) panel when enabled.

3. For each specific permission to be granted to an entity such as a user, login, or group, select the cell corresponding to the entity and specific permission, and click the Grant button. To revoke a privilege, select a cell showing a Granted permission and click Revoke.
Previewing the DDL Generated to Create the New Object

The final pane or tab of a wizard or editor is most commonly designated **DDL View** or **Definition**.

- A **DDL View** tab/panel lets you view the DDL generated by your selections on the other tabs/panels of the wizard or editor.

- A **Definition** tab/panel is only available for objects such as triggers and procedures, for which you must provide the additional SQL statements that provide the actions taken for that object.

In most cases you arrive at **DDL View** or **Definition** by navigating through panes or tabs, choosing options as you proceed. Alternatively, if you have provided all required information for that object type, you can click **Finish** or **Execute** to create the object.
IBM DB2 for Linux, Unix, and Windows Object Wizards

You create DB2 LUW objects using the following wizards:

- Aliases Wizard (DB2 LUW)
- Bufferpools Wizard for IBM DB2 (DB2 LUW)
- Databases Wizard (DB2 LUW)
- Event Monitors Wizard (DB2 LUW)
- Foreign Keys Wizard (DB2 LUW)
- Functions Wizard (DB2 LUW)
- Groups Wizard (DB2 LUW)
- Indexes Wizard (DB2 LUW)
- Materialized Query Tables Wizard (DB2 LUW)
- Nodegroups Wizard (DB2 LUW)
- Primary Keys Wizard (DB2 LUW)
- Procedures Wizard (DB2 LUW)
- Schemas Wizard (DB2 LUW)
- Sequences Wizard (DB2 LUW)
- Structured Types Wizard (DB2 LUW)
- Tables Wizard (DB2 LUW)
- Tablespaces Wizard (DB2 LUW)
- Triggers Wizard (DB2 LUW)
- Unique Keys Wizard (DB2 LUW)
- User Datatypes (DB2 LUW)
- Users Wizard (DB2 LUW)
- Views Wizard (DB2 LUW)

In addition, see Create Synonym.
Aliases Wizard (DB2 LUW)

An alias offers you security and convenience so that you can refer to an object without revealing who owns it or what database it belongs to. You can create aliases for tables, views, and even other aliases. The Alias Wizard lets you create an alias without knowing the underlying commands. As you complete the Alias Wizard process, a CREATE ALIAS statement is generated based on the information that you supply.

To create a new alias using a wizard:

1. Open a creation wizard for an alias. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details see Aliases (DB2 LUW) - Properties.
   - Comment panel - for details, see Adding a Comment to an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Aliases (DB2 LUW) - Properties

When creating or editing an alias, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schema</td>
<td>Select the schema that is to own the alias.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the alias.</td>
</tr>
<tr>
<td>Target Owner</td>
<td>Select the owner of the object to which you are creating an alias.</td>
</tr>
<tr>
<td>Target Type</td>
<td>Select the type of object to which you want to create an alias.</td>
</tr>
<tr>
<td>Target Name</td>
<td>Select the specific object to which you are creating an alias.</td>
</tr>
</tbody>
</table>

For context information on the wizard and editor that include this tab/panel, see Aliases Wizard (DB2 LUW) and Aliases Editor (IBM DB2 LUW).
Bufferpools Wizard for IBM DB2 (DB2 LUW)

The Bufferpool Wizard lets you create a bufferpool (an area of memory where data pages are read, altered, and held during an operation) without knowing the underlying commands. As you complete the Bufferpool Wizard, DBArtisan constructs the necessary CREATE BUFFERPOOL statement based on the information that you supply. Note that the bufferpool you’re creating to store the data from the tables in selected database won’t be active until you restart the database.

The Bufferpool Wizard lets you:

- Name the tablespace and specify the size of the bufferpool.
- Set storage options for UNIX systems.
- Set Bufferpool disbursement parameters.
- Override the default bufferpool size for partitions (or nodes).

To Open the Bufferpool Wizard

1. On the Navigator/Explorer, find the database where you want to add the new bufferpool.
2. On the Buffer Pools branch of the Performance node, right-click and select New.
3. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see BufferPools (DB2 LUW) - Properties.
   - Nodegroups panel - for details, see BufferPools (DB2 LUW) - Nodegroups.
   - Partitions panel - for details, see BufferPools (DB2 LUW) - Partitions.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
4. Finally, use the Execute button to create the object.

BufferPools (DB2 LUW) - Properties

When creating or editing a buffer pool, this tab/panel lets you work with the following settings:
### Bufferpools Wizard for IBM DB2 (DB2 LUW)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create deferred</td>
<td>Lets you defer changes until the next database activation.</td>
</tr>
<tr>
<td>Pagesize</td>
<td>The page size, in KB, is available in the increments 4, 8, 16, or 32.</td>
</tr>
<tr>
<td>Automatic Size</td>
<td>Enables automatic size adjustment to account for workload.</td>
</tr>
<tr>
<td>Number of Pages</td>
<td>Indicate the number of pages you want to include in the new bufferpool. If the database is partitioned database, the default size is of all the partitions (or nodes) where the bufferpool exists. A value of -1, the default, means the size will be taken from the database configuration parameter (BUFFPAGE).</td>
</tr>
<tr>
<td>No. of Block Pages and Block Size</td>
<td>Lets you specify NUMBLOCKPAGES and BLOCKSIZE values used when creating or modifying buffer pools.</td>
</tr>
</tbody>
</table>

**BufferPools (DB2 LUW) - Nodegroups**

Lets you select the Nodegroups on which to create the buffer pool. For more information, see Nodegroups Wizard (DB2 LUW).

**BufferPools (DB2 LUW) - Partitions**

Lets you modify the default size of associated partitions.
Databases Wizard (DB2 LUW)

The Database Wizard lets you create a database (a structured collection of data that can be updated or queried) without knowing the underlying commands. Databases can be simple, that is one file with many records and the same fields, or much more complicated with multiple files with different fields.

To open the IBM DB2 for Linux, Unix, and Windows Database Wizard

On the Registration tool bar, click New UDB Database.

Or

On the Navigator/Explorer, right-click an instance node or the Datasources node, and then click New UDB Database.

The tables below describe the fields you may encounter as you complete the wizard.

**Naming the New Database**

<table>

<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the name of the database?</td>
<td>Each database requires a unique name. The database name should be between 1 - 8 characters and must begin with a letter A-Z. It’s wise to avoid the symbols @, #, and $ if the database will exist in a communications environment or be summoned from an area where those characters do not exist in the language (and hence, on a keyboard).</td>
</tr>
<tr>
<td>What is the datasource name for the new database?</td>
<td>Each datasource should have a unique name. This is the name that will appear on the Navigator/Explorer.</td>
</tr>
<tr>
<td>What is the alias name of the database.</td>
<td>OPTIONAL: A database alias is the local synonym given to the database you are creating, and must be unique. If you don’t assign an alias, the database name becomes the default alias. Note that a DB2 client can have connections to two different databases with the same name if those databases live on different servers and each database has its own alias.</td>
</tr>
<tr>
<td>What is the comment used for the database?</td>
<td>OPTIONAL: Lets you type a comment up to 30 characters. Any comment you enter can be changed later.</td>
</tr>
</tbody>
</table>

**Drive Path and Parameters**
Databases Wizard (DB2 LUW)

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On what drive/path will the database reside?</td>
<td>Optional: Leave blank if you want to create the database using the DFTBPATH (default database path configuration) parameter.</td>
</tr>
<tr>
<td>What default tablespace parameters should be used?</td>
<td>Optional Extent size: This is the number of pages of table data that will be written before data is written to the next container. Number of segments: The default is 0. The number you designate specifies the number of extended memory segments available for the database to use. You should only set this number if you have a large amount of real memory.</td>
</tr>
<tr>
<td>What global default parameters should the database use?</td>
<td>Territory: The territory where the database was created. This is purely informational, for example, en_US and is related to region-specific support. Codeset: IBM-1252 or UTF-8 are the options for language support. Collating Sequence: Compatibility, Identity, System are your choices for comparing character data. Note: The collation sequence can’t be changed after the database has been created.</td>
</tr>
</tbody>
</table>

Finish

Opens the Preview SQL dialog.

Add Catalog/Temporary/User Containers

There are three distinct wizard panels, one for each container type, that enable you to customize your database. Click Next or Finish depending on how you want to proceed.

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What container(s) will be used to store the catalog/temporary tables?</td>
<td>Use System Managed Space: If you select this option, the operating system’s file system manager allocates and manages the space where the catalog tables are stored. This is the default. Use Database Managed Space: If you select this option, the database manager controls the storage space for catalog tables. Add or Edit - For details, see Add/Edit Container for Tablespace.</td>
</tr>
<tr>
<td>What optional default storage parameters should be used.</td>
<td>Optionally identify values for extent size, pre-fetch size, transfer rate, and overhead.</td>
</tr>
</tbody>
</table>

Finish

Opens the Preview SQL dialog.

Add/Edit Container for Tablespace

The table below describes the options and functionality on this dialog:
<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Container Parameters</td>
<td>These parameters are enabled for modification only if you have opted to use database managed space. When enabled, you can either indicate file size parameters or specify device information.</td>
</tr>
<tr>
<td>Directory</td>
<td>Identify the directory where the catalog table container will be stored.</td>
</tr>
<tr>
<td>File Name</td>
<td>Identify a name for the file where the catalog table container will be stored.</td>
</tr>
<tr>
<td>Device Information</td>
<td>Enable either raw partition and type a value, or raw drive, and select a value.</td>
</tr>
</tbody>
</table>
Event Monitors Wizard (DB2 LUW)

An event monitor is used to collect information about a particular database and connected appliances when one or more events you specify take(s) place. Where a snapshot monitor captures information for a given moment in time, the event monitor lets you trace the activity you specify.

The Event Monitor Wizard lets you provide basic properties, select event types, and specify conditions where appropriate, for an event monitor.

To create a new event monitor using a wizard:

1. Open a creation wizard for an event monitor. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Event Monitors (DB2 LUW) - Properties.
   - **Definition** panel - for details, see Event Monitors (DB2 LUW) - Definition.
   - **Conditions** panel - for details, see Event Monitors (DB2 LUW) - Conditions.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the **Execute** button to create the object.

Event Monitors (DB2 LUW) - Properties

When creating or editing an event monitor, this tab/panel lets you work with the following settings:
### Event Monitors (DB2 LUW) - Definition

This tab/panel lets you specify the **Event Types** used to construct the `CREATE EVENT MONITOR` statement `FOR` clause.

The base set of event types is `BUFFERPOOLS, CONNECTIONS, DATABASE, DEADLOCKS, DEADLOCK WITH DETAILS, STATEMENTS, TABLES, TABLESPACES, and TRANSACTIONS`.

For IBM DB2 for Linux, Unix, and Windows version 9.0, `DEADLOCK WITH DETAILS HISTORY` and `DEADLOCKS WITH DETAILS HISTORY VALUES` event types are available.

For IBM DB2 for Linux, Unix, and Windows version 9.5, `ACTIVITIES, THRESHOLD VIOLATIONS, and STATISTICS` event types are available.

**Note:** If your choices are all from the `DEADLOCKS...` types, you can also specify **Deadlock Monitoring** of **Global** or **Local**. If you select Local, specify the **Database Partitions** the event monitor is to run against.

### Event Monitors (DB2 LUW) - Conditions

Available only for `CONNECTION`, `STATEMENT`, and `TRANSACTION` **Event Types**, this tab lets you identify a condition used to determine which `CONNECTION`, `STATEMENT`, or `TRANSACTION` the event monitor will collect data for.
Foreign Keys Wizard (DB2 LUW)

Foreign keys are unique values that refer to specific columns of other tables. Thus, a foreign key links two tables together. The Foreign Key Wizard makes it easy for you to create a relational link between two tables, thereby speeding queries and giving you faster access to data. The Foreign Key Wizard lets you create a foreign key without knowing the underlying commands.

To create a new foreign key using a wizard:

1. Open a creation wizard for a foreign key. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Foreign Keys (DB2 LUW) - Properties
   - **Column Mapping** panel - for details, see Foreign Keys (DB2 LUW) - Column Mapping
   - **Comment** panel - for details, see Adding a Comment to an Object.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the **Execute** button to create the object.

Foreign Keys (DB2 LUW) - Properties

When creating or editing a foreign key, this tab/panel lets you work with the following settings:
Foreign Keys Wizard (DB2 LUW)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Schema</td>
<td>The schema owning the table where the foreign key is being created.</td>
</tr>
<tr>
<td>Table Name</td>
<td>This is the table where the foreign key link originates—the child table.</td>
</tr>
<tr>
<td>Name</td>
<td>Lets you select a constraint name. System Generated Name - DB2 automatically generates a name. User Specified Constraint Name - You type the name.</td>
</tr>
<tr>
<td>Enabled</td>
<td>TRUE enables the Foreign Key while FALSE disables the Foreign Key.</td>
</tr>
<tr>
<td>Delete Rule</td>
<td>Select an action: <strong>NO ACTION</strong> - ensures that referenced values cannot be updated or deleted if to do so would violate referential integrity. <strong>CASCADE</strong> permits a referenced row in a child table to be deleted/updated if it is deleted/updated in the parent table. A row in the child table is SET NULL when rows in the parent table are deleted/updated. <strong>RESTRICT</strong> prevents a command from executing if changes to referential data prompts an error.</td>
</tr>
<tr>
<td>Update Rule</td>
<td>Select an action. <strong>NO ACTION</strong> - ensures that referenced values cannot be updated or deleted if to do so would violate referential integrity. <strong>RESTRICT</strong> - prevents a command from executing if changes to referential data prompts an error</td>
</tr>
</tbody>
</table>

Foreign Keys (DB2 LUW) - Column Mapping

1. Under **Referenced Table**, choose the **Owner** and then the **Name** of the referenced, or parent, table.

2. Under the **Main Table**, select check boxes corresponding to the columns that are to reference columns in the referenced table.
The Functions Wizard lets you create a relationship between one set of values and another. You can develop reusable subroutines so you can control, access, and manipulate the data that underlies an object. As you complete the Function Wizard process, a CREATE FUNCTION statement is generated based on the information that you supply. The Function Wizard lets you create a function without knowing the underlying commands.

**Note:** To create a user-defined function, you need CREATE ANY privileges or IMPLICIT_SCHEMA authority on the database if the schema does not already exist.

**To create a new function using a wizard:**

1. Open a creation wizard for a function. For details, see [Opening an Object Wizard](#).
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see [Functions (DB2 LUW) - Properties](#).
   - **Advanced** panel - for details, see [Functions (DB2 LUW) - Advanced](#).
   - **Source** panel (only available for a **Function Type** of SOURCED) - for details, see [Functions (DB2 LUW) - Source](#).
   - **Parameters** panel (only available for a **Function Type** of SQL, SOURCED, or TEMPLATE) - for details, see [Functions (DB2 LUW) - Parameters](#).
   - **Return Scalar** panel - for details, see [Functions (DB2 LUW) - Return Scalar](#).
   - **Return Columns** panel (only available when you choose a **Function Type** of EXTERNAL TABLE) - for details, see [Functions (DB2 LUW) - Return Columns](#).
   - **Body** panel - for details, see [Functions (DB2 LUW) - Body](#).
   - **DDL View** panel - for details, see [Previewing the DDL Generated to Create the New Object](#).
3. Finally, use the **Execute** button to create the object.

**Functions (DB2 LUW) - Properties**

When creating or editing a foreign key, this tab/panel lets you work with the following settings:
Functions Wizard (DB2 LUW)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schema, Name, and Specific Name</td>
<td>Let you select the owner of the function, provide a name for the function, and provide the Specific name to be used by some SQL statements and DB2 commands for this function.</td>
</tr>
<tr>
<td>Function Type</td>
<td>Select the type of function: External Scalar - written in a programming language and returns a scalar value. External Table - written in a programming language and returns a complete table. OLEDB - accesses OLE DB data in user-defined OLE DB external tables. Sourced - another function is invoked to implement the function you are creating. SQL Language - written in SQL and returns a table, scalar value, or single row. Template: - this is a partial function and can only be invoked from a federated datasource. For more information, see About function types.</td>
</tr>
<tr>
<td>Language</td>
<td>If you chose a Function Type of EXTERNAL SCALAR or EXTERNAL TABLE, specify a language of C, JAVA, or OLE. For more information, see About function types.</td>
</tr>
<tr>
<td>Return Type</td>
<td>For a Function Type of SQL, select ROW, TABLE, or SCALAR. For other Function Type choices, this indicates the default return type for that choice.</td>
</tr>
<tr>
<td>External Name</td>
<td>Provide the External Name of the function.</td>
</tr>
<tr>
<td>SQL Access Level</td>
<td>Indicates whether the function can execute SQL statements. CONTAINS SQL: Statements that don’t read or modify SQL can be executed. NO SQL: No SQL statements can be executed. READS SQL: Statements that cannot modify SQL can be executed.</td>
</tr>
</tbody>
</table>

Functions (DB2 LUW) - Advanced

This tab is only available after clicking the Advanced button on the Function wizard’s Properties panel. It lets you work with the Threadsafe, Fenced, Scratchpad, Scratchpad Length, Allow Parallel, Final Call, Parameter Style, Inherit Special Registers, DBINFO, Deterministic, External Action, Called on Null Input, and Parameter CCSID properties.

Functions (DB2 LUW) - Source

Note: This panel is only available for a Function Type of SOURCED.

Select the Schema, Name, and Specific Name of the source function. Function Parameters and Return Type for the selected function are displayed. For more information, see About function types.
**Functions (DB2 LUW) - Parameters**

**Note:** This panel is only available for a **Function Type** of SQL, SOURCED, or TEMPLATE.

For each parameter for this function, use the New button to add a new parameter, provide a name for the parameter, and in the **Attributes** area, select a **Type**, and if appropriate, the **Precision**, **Scale**, and **Size** options.

**Functions (DB2 LUW) - Return Scalar**

Under **Return Datatype**, select a Type and depending on your choice, provide or select **Precision**, **Scale**, **Size**, and **As Locator** options.

To make use of a CAST FROM clause, under **Cast Datatype** set **Enabled** to True, select a **Type**, and if appropriate, the **Scale**, **Size**, and **As Locator** options.

**Functions (DB2 LUW) - Return Columns**

**Note:** This panel is only available when you choose a **Function Type** of EXTERNAL TABLE.

For each column returned by this function, use the New button to add a new parameter, provide a name for the parameter, and in the **Attributes** area, select a **Type**, and if appropriate, the **Precision**, **Scale**, **Size**, and **As Locator** options.

**Functions (DB2 LUW) - Body**

Enter the return statement for the function.

**About function types**

**External Scalar/Table/OLE DB Function**

External scalar user-defined functions are implemented in an external programming language. The functions are executed on the server and can read SQL data but cannot make changes to the data. These functions are often used to extend the set of built-in functions for DB2, perform logic inside a SQL query that SQL can't perform on its own, and, encapsulate a scalar query that is often used as a subquery in SQL statements, for example, if given an ingredient, search a table for a recipe that uses that ingredient.

When specifying the **Specific Name** for one of these function types:

- If you are using C language, specify the full library path and the function name, otherwise IBM DB2 Database Manager assumes the function is under the IBM DB2 library.
- If you are using Java script, specify the Class ID and the function name, otherwise IBM DB2 Database Manager assumes the function is under the IBM DB2 library.
If you are using OLE language, specify the full library path and the function name, otherwise IBM DB2 Database Manager assumes the function is under the IBM DB2 library.

Sourced Functions
When you create a sourced function, the new function you are creating will be implemented by a preexisting (source) function that’s known to the database manager. The source function can be a built-in function or a previously created user-defined scalar function.

When you select the appropriate schema, you are really specifying an implicit schema privilege. In other words, you’re selecting a schema/function that belongs to a user with DBAdmin privileges. If you want to use a built-in function, you must specify the function’s specific name.

SQL Language Function
The function you are creating is written in SQL. A table, scalar value, or single row is returned.

Template Function
A template function is better thought of as a template for a function. It’s a partial function that has no executable code. You create a function template for mapping it to a datasource function. When the mapping is created, you can specify the function template be used in queries submitted to the federated server. When the query is processed, the federated server invokes datasource function where the template is mapped and returns the appropriate values.
**Groups Wizard (DB2 LUW)**

The Group Wizard lets you define new groups and to assign the appropriate object and system level privileges. Any user who is a part of the group you create will inherit the authorities and privileges assigned to the group.

**To Open the Group Wizard**

1. On the Navigator/Explorer, find the datasource where you want to add the new group.
2. Expand the **Security** branch, right-click **Groups**, and select **New**.

The table that follows describes the fields you may encounter as you complete the Group Wizard:

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the name of the group?</td>
<td>Lets you enter the name of the group.</td>
</tr>
<tr>
<td>What database authority(ies) do you want to give this group?</td>
<td>Select all or some of the authorities: <strong>BINDADD</strong>: User can create new database packages <strong>CONNECT</strong>: Gives users access to the database <strong>CREATETAB</strong>: A user can create new tables in the database <strong>CREATE_NOT_FENCED</strong>: Allows a user to create user-defined functions <strong>IMPLICIT_SCHEMA</strong>: Enables any user to implicitly create a schema by creating an object with a CREATE statement using a schema name that doesn't already exist. <strong>DBADM</strong>: Gives users administrative privileges. <strong>LOAD</strong>: Users can load data into a table. <strong>NOTE</strong>: The authorities listed here are the system privileges.</td>
</tr>
</tbody>
</table>
Indexes Wizard (DB2 LUW)

Comparable to an index in a book, an index gives you speedy access to particular records in a table. The Index Wizard lets you create an index without knowing the underlying commands.

To create a new index using a wizard:

1. Open a creation wizard for an index. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Indexes (DB2 LUW) - Properties.
   - **Columns** and **Include Columns** panels - for details, see Indexes (DB2 LUW) - Columns and Include Columns.
   - **Comment** panel - for details, see Adding a Comment to an Object.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the **Execute** button to create the object.

Indexes (DB2 LUW) - Properties

When creating or editing an index, this tab/panel lets you work with the following settings:
Indexes Wizard (DB2 LUW)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent Type, Parent Schema and Parent Name</td>
<td>Choose the type (TABLE or MATERIALIZED QUERY TABLE) owning schema, and name of the parent object in which the index is being created.</td>
</tr>
<tr>
<td>Schema and Name</td>
<td>Choose the owner and name of the index being created.</td>
</tr>
<tr>
<td>Index Type</td>
<td>Index enforces uniqueness on the values of the table's index key.</td>
</tr>
<tr>
<td>Clustered</td>
<td>Specifies that the index is the clustering index of the table. The cluster factor of a clustering index is maintained or improved dynamically as data is inserted into the associated table, by attempting to insert new rows physically close to the rows for which the key values of this index are in the same range.</td>
</tr>
<tr>
<td>Allow Reverse Scans</td>
<td>If selected, a ALLOW REVERSE SCAN clause is included with the CREATE/ALTER INDEX statement, specifying that the index supports both forward and reverse scans.</td>
</tr>
<tr>
<td>Compress (9.7^)</td>
<td>YES - Selecting this option adds a COMPRESS YES clause, enabling index compression. NO - Selecting this option adds a COMPRESS NO clause, disabling index compression. DEFAULT - Selecting this option specifies default compression handling to that of the parent object.</td>
</tr>
<tr>
<td>Percent Free</td>
<td>Lets you provide a PCTFREE value, specifying the percentage of each index page to leave as free space when building the index, from 0 to 99.</td>
</tr>
<tr>
<td>Minimum Percent Used</td>
<td>Lets you provide a MINPCTUSED value, specifying whether index leaf pages are merged online, and the minimum percentage threshold of space used on index leaf pages.</td>
</tr>
</tbody>
</table>

Indexes (DB2 LUW) - Columns and Include Columns

Index columns can be segregated into unique key columns (Columns pane) and Include columns that are to be part of the index but do not form part of the unique key.

The steps in completing the panes for the two column types are identical.

- From the Column dropdown, select a column for the index and specify a Sort option. To add more columns, click the New button and then follow the steps in the last instruction. Use the Delete button to drop columns.
Materialized Query Tables Wizard (DB2 LUW)

A materialized query table (MQT) is a table based on the result of a query. An MQT contains information that is summarized from other tables and can save time when processing dynamic SQL queries. The Materialized Query Table Wizard lets you create a table without knowing the underlying commands.

To Open the Materialized Query Wizard

1. On the Navigator/Explorer, find the datasource where you want to add the new materialized query table.

2. Expand the Schema branch, right-click Materialized Query Tables, and select New.

The table that follows describes the fields you may encounter as you complete the Materialized Query Table Wizard.

Note: These options are only available if the tablespace you selected is a database managed tablespace.
<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Who owns the table?</td>
<td>Choose the owner of the table you’re creating from the drop-down list.</td>
</tr>
<tr>
<td>What is the name of the table?</td>
<td>Type the name of the materialized query table you are creating.</td>
</tr>
<tr>
<td>Select a tablespace on which to place the table:</td>
<td>OPTIONAL: No selection is the default. But you can select a tablespace that belongs to the new table’s owner if you want.</td>
</tr>
<tr>
<td>Specify separate tablespaces for index and long data</td>
<td>OPTIONAL: Lets you separate indexes or long data from the table. Indexes Long data.</td>
</tr>
<tr>
<td>Specify the query on which this table is based</td>
<td>Write the query you want to use to create the table. Note: Every select list element must have a name (use the AS clause for expressions)</td>
</tr>
<tr>
<td>Add the columns belonging to this table Add the columns belonging to the partition key</td>
<td>Click Add, Insert or Edit to add or modify table columns. Click Drop to delete a selected column.</td>
</tr>
<tr>
<td>Do you want the table replicated across database partitions?</td>
<td>The default is no, but check the box if you do want to replicate the table. Replicated materialized query tables can help you improve query performance by enabling collocation between tables. Replication is especially helpful when you have joins between large fact tables and small dimension tables. It’s best if tables that are to be replicated are infrequently updated.</td>
</tr>
<tr>
<td>Definition Only</td>
<td>Lets you select definition options, Include Column Defaults and Include Identity Column Attributes. When you select the Definition Only option, the new table is treated as if it was a base table rather than a MQT. After you complete the wizard, the Tables Editor opens.</td>
</tr>
<tr>
<td>Refreshable</td>
<td>Lets you select refresh options: Immediate: The table you are creating will be refreshed automatically when changes are made to the base table(s). Deferred: Static SQL will not be optimized. Changes to the base table(s) will not be reflected. Query Optimization: Enabled: Queries will be routed to the MQT. Disabled: This is the default. Maintained by: System: This is the default User After you complete the wizard, the Material Query Tables Editor opens.</td>
</tr>
<tr>
<td>Would you like extra information regarding SQL changes to this table to be written to the log?</td>
<td>If you opted to replicate the table, you must make a selection here. Yes means you want to receive error messages issued by the DB2 replication programs. Include Longvar Columns means you want to receive error messages for these columns if long varchar data is a part of the table you’re replicating. No</td>
</tr>
</tbody>
</table>
Materialized Query Tables Wizard (DB2 LUW)

Would you like to skip logging changes made to this table by Insert... and Alter Table operations in the same unit of work in which this table is created?

- Initially Not Logged: This is an option that can reduce logging and increase performance, but also means that you cannot recover the table when rolling forward. Logged Initially. This is the default.

What type of table lock would you like when it is being accessed?

- Row: This is the default. During a table or index scan, DB2 locks each row that is scanned before determining whether that row is relevant to the query. Table: During a table scan, DB2 locks the table so no data can be added or altered while the query is executed.

What percent of free space to leave for load and reorganization?

- -1 is the default.

Do you want data to append to the end of the table?

- Yes No: This is the default

Do you want the access plan to this table to be based on existing statistics and optimization level?

- Volatile: A volatile table's contents can vary from empty to huge at run time and can render collected statistics inaccurate. Not Volatile: This is the default.

Enter a comment

- Optional
Nodegroups Wizard (DB2 LUW)

A nodegroup is a named subset of one or more database partitions. The Node Group Wizard lets you create a node group without knowing the underlying commands. When you create a nodegroup, the wizard simply asks you to name the nodegroup and select the partitions to include in the nodegroup.

To Open the Nodegroup Wizard

1. On the Navigator/Explorer, find the datasource where you want to add the new Nodegroup.
2. Expand the Storage branch, right-click Nodegroups, and select New.
Primary Keys Wizard (DB2 LUW)

A primary key is a column or group of columns that you can use to identify or access one or more specific rows in a table. A primary key is ‘constrained’ in that no values can be null and no two values are equal. You can only create one primary key for any table. The Create Primary Key Constraint dialog lets you create a primary key without knowing the underlying commands.

When you create a primary key, specify the table owner and the table on which you want to place the primary key constraint. You name the constraint and select the column(s) you want to include.

To create a new primary key using a wizard:

1. Open a creation wizard for a primary key. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Primary Keys (DB2 LUW) - Properties.
   - Columns panel - for details, see Primary Keys (DB2 LUW) - Columns.
   - Comment panel - for details, see Adding a Comment to an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object. For more information, see Previewing the DDL Generated to Create the New Object.

Primary Keys (DB2 LUW) - Properties

When creating or editing a primary key, this tab/panel lets you work with the following settings:
### Primary Keys Wizard (DB2 LUW)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table Schema</strong> and <strong>Table Name</strong></td>
<td>Choose the owner and name of the table in which the primary key is being created.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Choose the owner and name of the primary key being created.</td>
</tr>
<tr>
<td><strong>Time period policy</strong></td>
<td>This setting is for use with tables set up as business-time tables. For more information, see <a href="#">Tables (DB2 LUW v10) - Temporal Properties</a>. When selected, a BUSINESS_TIME WITHOUT OVERLAPS option is specified against the column or columns defining the constraint, in the generated DDL. This ensures that values for the constraint columns are unique with respect to the time for the BUSINESS_TIME period. When you select this option, columns specified as business-time begin period and end period are not available as candidates on the <strong>Columns</strong> tab/panel.</td>
</tr>
</tbody>
</table>

### Primary Keys (DB2 LUW) - Columns

From the **Column** dropdown, select a column for the primary key and specify a **Sort** option. To add more columns, click the **New** button and then follow the steps in the last instruction. Use the **Delete** button to drop columns.
Procedures Wizard (DB2 LUW)

Procedures are a reusable block of PL/SQL, stored in the database, that applications can call. Procedures streamline code development, debugging, and maintenance by being reusable. Procedures enhance database security by letting you write procedures granting users execution privileges to tables rather than letting them access tables directly.

To create a new procedure using a wizard:

1. Open a creation wizard for a procedure. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Procedures (DB2 LUW) - Properties.
   - Advanced panel - for details, see Procedures (DB2 LUW) - Advanced.
   - Parameters panel - for details, see Procedures (DB2 LUW) - Parameters.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Procedures (DB2 LUW) - Properties

When creating or editing a procedure, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schema</td>
<td>Select the owner for the procedure.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide the name of the function.</td>
</tr>
<tr>
<td>Specific Name</td>
<td>Optionally, provide the unique name of the procedure.</td>
</tr>
<tr>
<td>Language</td>
<td>Select among C, JAVA, COBOL, OLE, or SQL. The database manager will call the procedure accordingly.</td>
</tr>
<tr>
<td>External Name</td>
<td>Provide the external name of the procedure.</td>
</tr>
<tr>
<td>SQL Access Level</td>
<td>Select an option: MODIFIES SQL DATA - the procedure can support any SQL statement except those that cannot be supported in procedures. CONTAINS SQL DATA - only SQL statements that neither modify nor read SQL data can be executed in the procedure. READS SQL DATA - some SQL statements that don’t modify SQL data can be included in the procedure.</td>
</tr>
</tbody>
</table>

**Procedures (DB2 LUW) - Advanced**

When creating or editing a procedure, this tab/panel lets you work with the following settings:
### Procedures Wizard (DB2 LUW)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Results Sets</td>
<td>Indicate the estimated upper bound of returned result sets. 0 is the default.</td>
</tr>
<tr>
<td>External Action</td>
<td>Select the External Action option.</td>
</tr>
<tr>
<td>New Save Point</td>
<td>Lets you specify a NEW SAVEPOINT LEVEL clause for the procedure.</td>
</tr>
<tr>
<td>Threadsafe</td>
<td>Specify whether the procedure is safe to run within the same process as other routines.</td>
</tr>
<tr>
<td>Fenced</td>
<td>If you select yes, you are saying you do not want the procedure to run in the manager operating system environment. This means the database management system will protect its internal resources from the procedure. This option can affect the procedure’s operation. To run a procedure as not fenced, or a No selection, you must have SYSADMIN or DBADMIN privileges because of the potential to compromise data if the procedure has not been adequately tested.</td>
</tr>
<tr>
<td>Parameter Style</td>
<td>Lets you select an option: DB2DARI, DB2GENERAL, DB2SQL, GENERAL, GENERAL WITH NULLS, J AVA, and SQL. DB2GENERAL is for Java Language only. DB2SQL is for C, COBOL, or OLE Language only. GENERAL is for C Language only. GENERAL WITH NULLS is for C or COBOL Language only. J AVA is for J ava Language only. SQL is for C, COBOL, or OLE Language only.</td>
</tr>
<tr>
<td>Program Type</td>
<td>MAIN: valid for C or COBOL Language and Parameter Style GENERAL, GENERAL WITH NULLS, SQL, or DB2SQL only. In this case, parameters will be passed as an argument counter or argument vector. SUBROUTINE: the procedure expects the parameters to be passed as separate arguments.</td>
</tr>
<tr>
<td>Inherit Special Registers</td>
<td>Lets you specify this optional clause dictating that the procedure will inherit initial values from the environment of the invoking statement.</td>
</tr>
<tr>
<td>DBINFO</td>
<td>Specific information contains such information as the database name, application ID, database code page, and so on.</td>
</tr>
<tr>
<td>Deterministic</td>
<td>Enabling this feature specifies the procedure will always return the same result for given argument values. Disabling it means there are state values that affect the results and so the same result will not always be returned when you use identical inputs to invoke the procedure.</td>
</tr>
<tr>
<td>Parameter CCSID</td>
<td>Select an encoding scheme of ASCII, UNICODE, or NONE for character or graphic string parameters.</td>
</tr>
</tbody>
</table>

### Procedures (DB2 LUW) - Parameters

For each parameter for this function, use the New button to add a new parameter, provide a name for the parameter, and in the Attributes area, select a Type, specify a Parameter Mode of INPUT, OUTPUT, or INPUT_OUTPUT, and if appropriate, the Precision, Scale, and Size options.
Sequences Wizard (DB2 LUW)

A sequence allows the automatic generation of values, something well-suited to the generation of unique key values. Sequences are not tied to particular table columns. The Sequence Wizard lets you create a sequence without knowing the underlying commands. As you complete the Sequence Wizard, a CREATE SEQUENCE statement is generated from the information that you have supplied. When finished, you can compile the sequence on the target database or to write a script file containing the CREATE SEQUENCE statement.

The Sequence Wizard lets you:

- Specify the name and owner of the sequence.
- Set both the value of the sequence, and an interval and ranges for incrementing it.
- Cache the sequence, cycle the sequence when it reaches its minimum or maximum values, and guarantee that sequence numbers are generated in the order of request.

*Note:* To create a sequence, it must belong to your schema or you need CREATE SEQUENCE privileges.

**To Open the Sequence Wizard**

1. On the Navigator/Explorer, find the datasource where you want to add the new Sequence.
2. Expand the Schema branch, right-click Sequences, and select *New*.

The table that follows describes what you may encounter as you complete the Sequence Wizard:
### Required Information

<table>
<thead>
<tr>
<th>Description</th>
<th>Required Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>You decide.</td>
<td>Who owns the sequence?</td>
</tr>
<tr>
<td>Your choice.</td>
<td>What is the sequence name?</td>
</tr>
<tr>
<td>Choose among BIGINT (big integer), decimal (choose width as well), integer, small integer.</td>
<td>What numeric datatype should the Sequence use?</td>
</tr>
<tr>
<td>Starting with 1 is the default.</td>
<td>What is the first sequence number to be generated?</td>
</tr>
<tr>
<td>Increment by 1 is the default.</td>
<td>What is the interval between sequence numbers?</td>
</tr>
<tr>
<td>Choose none or set a value</td>
<td>What is the sequence’s minimum value?</td>
</tr>
<tr>
<td>Choose none or set a value</td>
<td>What is the sequence’s maximum value?</td>
</tr>
<tr>
<td>Preallocating and storing values in the cache reduces synchronous I/O to the log when values are generated for the sequence. If Yes, give number of values No</td>
<td>Should DB2 preallocate sequence numbers and cache them for faster access?</td>
</tr>
<tr>
<td>Lets you make the sequence cycle and continue to generate numbers. Yes or No</td>
<td>Should the sequence continue to generate values after reaching either its maximum or minimum value?</td>
</tr>
<tr>
<td>Select to generate sequence numbers in the order of request. The ORDER option is useful when you are using the sequence number as a timestamp. Yes or No</td>
<td>Should the sequence numbers be generated in the order of request?</td>
</tr>
</tbody>
</table>
The Schema Wizard lets you create the structure of a database system including database objects.

**To Open the Schema Wizard**

1. On the Navigator/Explorer, find the datasource where you want to add the new Schema.
2. Right-click **Schema** and select **New**.

All you need to do when the single-panel wizard opens is to give a unique name to the schema you’re creating.
Structured Types Wizard (DB2 LUW)

The Structured Type wizard lets you create the object type specification and define attributes for a structured type. You then use the Structured Type editor to define the methods and body for the type.

To Open the Type Wizard

1. On the Navigator/Explorer, find the datasource where you want to add the new Structured Type.
2. Expand the Schema branch, right-click Structured Type, and select Create.
3. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Structured Types (DB2 LUW) - Properties.
   - Attributes panel - for details, see Structured Types (DB2 LUW) - Attributes.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
4. Finally, use the Execute button to create the object.

On completion, the Structured Type editor opens, letting you provide method and body specifications for the structured type. For details, see Structured Types Editor (IBM DB2 LUW).

Structured Types (DB2 LUW) - Properties

When creating or editing a structured type, this tab/panel lets you work with the following settings:
Structured Types (DB2 LUW) - Attributes

For each attribute to be added to the structured type, click the New button, and provide a name for the attribute.

With an attribute selected, you can modify the Datatype. Depending on the datatype you choose you can provide the following datatype qualifiers:

- **Width** (decimal only)
- **Scale** (decimal only)
- **Size** (blob, character, clob, dbclob, graphic, varchar, vargraphic only)
- **Allow log** (blob, clob, dbclob only)
- **Allow compact** (blob, clob, dbclob only)
- **For bit data** (character, long varchar, varchar, only)
Tables Wizard (DB2 LUW)

The Table Wizard lets you create a table without knowing the underlying commands.

To create a new table using a wizard:

1. Open a creation wizard for a table. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Tables (DB2 LUW) - Properties.
   - Columns panel - for details, see Tables (DB2 LUW) - Columns.
   - Partition panel - for details, see Tables (DB2 LUW) - Partition.
   - Tablespaces panel - for details, see Tables (DB2 LUW) - Tablespaces.
   - Dimension panel - for details, see Tables (DB2 LUW) - Dimensions.
   - Distribution Key Columns panel - for details, see Tables (DB2 LUW) - Distribution Key Columns.
   - Indexes panel - for details, see Tables (DB2 LUW) - Indexes.
   - Temporal Properties panel - for details, see Tables (DB2 LUW v10) - Temporal Properties.
   - Constraints panel - for details, see Tables (DB2 LUW) - Constraints.
   - Comment panel - for details, see Adding a Comment to an Object.
   - Permissions panel - Setting Permissions or Privileges for an Object
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Tables (DB2 LUW) - Properties

When creating or editing a table, this tab/panel lets you work with the following settings:
### Tables Wizard (DB2 LUW)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schema</td>
<td>Select the schema that is to own the table.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the table.</td>
</tr>
<tr>
<td>Percent Free</td>
<td>The table-level lock prevents concurrently operating applications from using or changing a table. When scanning a table for a query, a row-level lock locks the row when it is being assessed.</td>
</tr>
<tr>
<td>Lock Size</td>
<td>Enable or Disable appending data to the end of the table.</td>
</tr>
<tr>
<td>Append Data</td>
<td>Enable this feature if a table contents may fluctuate from empty to very large. The access plan will not depend on the existing statistics for that table.</td>
</tr>
<tr>
<td>Volatile</td>
<td>Enable or disable value compression</td>
</tr>
<tr>
<td>Compress</td>
<td>Enable or disable row compression.</td>
</tr>
<tr>
<td>Row Compression</td>
<td>Enables this level of logging when creating, recreating, or reorganizing an index.</td>
</tr>
<tr>
<td>Security Policy</td>
<td>Lets you add a security policy to a table.</td>
</tr>
<tr>
<td>RestrictDrop</td>
<td>Corresponds to the DB2 Restrict on Drop attribute.</td>
</tr>
<tr>
<td>Log Index Build</td>
<td>Enables this level of logging when creating, recreating, or reorganizing an index.</td>
</tr>
<tr>
<td>CCSID</td>
<td>Specify ASCII or UNICODE or leave unspecified. If specified, this is the encoding scheme for string data. If unspecified, CCSID default encoding is used.</td>
</tr>
<tr>
<td>Tablespace, Index Tablespace, and Long Data Tablespace</td>
<td>Select a tablespace, an index tablespace, and a tablespace for Long or LOB table columns.</td>
</tr>
<tr>
<td>Do not initially log</td>
<td>If enabled, all changes to the table will be flushed out at commit time. This also means that if a statement fails, the unit of work will rollback. If you are concerned about recoverability, disable this feature.</td>
</tr>
<tr>
<td>Data Capture</td>
<td>Specify additional information logged by selecting DATACAPTURE NONE, DATA CAPTURE CHANGES, or DATA CAPTURE CHANGES INCLUDE LONGVAR.</td>
</tr>
</tbody>
</table>

### Tables (DB2 LUW) - Columns

For each column in the table, click the New button to create a column and provide a name for the column. Then, in the Column Attributes area, provide details for the column.

Use the Delete button to drop a selected column.
**Row Properties** (V10) settings are available when you select a **Type** of TIMESTAMP. These settings are used in conjunction with settings on the **Temporal Properties** tab in setting up system and application temporal tables. For more information, see [Tables (DB2 LUW v10) - Temporal Properties](#).

Specific settings are:

- **As Row Begin** - adds a GENERATED ALWAYS AS ROW BEGIN option to the column specification, used to track when a row is current.
- **As Row End** - adds a GENERATED ALWAYS AS ROW END option to the column specification.
- **Transaction Start ID** - adds a GENERATED ALWAYS AS TRANSACTION START ID option to the column specification indicating that this column captures the start times for transactions that affect rows.

A column can have only one of the three settings selected.

When you select a **Row Properties** setting, the **Scale** value and if appropriate, the **Allow Nulls**, **Default Value**, and **Expression** settings are automatically adjusted for compatibility with row generation. Similarly, if one of the three **Row Properties** settings is selected for a column, and any of the **Scale**, **Allow Nulls**, **Default Value**, or **Expression** settings are modified, then the selected **Row Properties** setting is cleared.

**Tables (DB2 LUW) - Partition**

Under **Partition Columns**, for each partition column, click the **New** button and then choose a column name from the dropdown. To add a **Data Partition**, click the **New** button to open a dialog that lets you add a partition.

**Tables (DB2 LUW) - Tablespaces**

For each Data Tablespace or Long Tablespace, click the **New** button and then choose a tablespace from the dropdown. To specify an Index Tablespace, select a tablespace from the dropdown.

**Tables (DB2 LUW) - Dimensions**

For each column that is to make up a dimension, click the **New** button to open a dialog that lets you add a column.

**Tables (DB2 LUW) - Distribution Key Columns**

For each column that is to make up the distribution key, click the **New** button and then select a column from the dropdown.
Tables (DB2 LUW) - Indexes

Click **Add** to open the Index wizard. For more information, see [Indexes Wizard (DB2 LUW)](#).

Tables (DB2 LUW v10) - Temporal Properties

This tab/panel lets you specify temporal properties to a table, designating it as a table that records the period of time when a row is valid.

**Note:** Before using this object action, consult DB2 LUW documentation for details on setup and use of the temporal tables feature. For more information, see [Accessing Third Party Documentation](#).

This tab/panel has the following controls:

- **System-time table** - selecting this option creates a table with the `PERIOD SYSTEM_TIME` clause, designating it as a system-period temporal table. This option is available if the table has three columns of type TIMESTAMP, and the following prerequisites have been met:
  - At least one TIMESTAMP-typed column has the **As Row Begin** property selected
  - At least one TIMESTAMP-typed column has the **As Row End** property selected
  - At least one TIMESTAMP-typed column has the **Transaction Start ID** property selected

For details on column definitions, see [Tables (DB2 LUW) - Columns](#).

The **Row-begin column**, **Row-end column**, and **Transaction Start ID column** controls are automatically populated with the columns having the corresponding property.

When you select this option, in the generated DDL, the **Row-begin column** and **Row-end column** values are used as the `PERIOD SYSTEM_TIME` column parameters, defining the system period.

- **Business-time table** - selecting this option creates a table with the `PERIOD BUSINESS_TIME` clause, designating it as an application-period temporal table. This option is available if the table has two columns of type DATE or TIMESTAMP, for which no **Row Properties** have been assigned.

The **Begin column** and **End Column** controls are automatically populated with the valid candidate columns from the table’s column list and the first distinct column pair is automatically chosen for convenience.

- **Use history table** - this set of controls is only active when **Business-time table** is selected. It lets you associate a history table. When you select **Use history table**, the Owner and Name controls are activated, letting you identify the history table to associate with this table.
Note that a constraint created on a business-time table can enforce the uniqueness of the data for any point in business time via the **Time period policy** property that has been added in the constraint wizards. For details, see the following topics:

- Primary Keys (DB2 LUW) - Properties
- Unique Keys (DB2 LUW) - Properties

**Tables (DB2 LUW) - Constraints**

Selecting a constraint type and clicking **Add** opens the object wizard for that object type. For details see:

- Primary Keys Wizard (DB2 LUW)
- Unique Keys Wizard (DB2 Z/OS)
- Foreign Keys Wizard (DB2 Z/OS)
Tablespaces establish connections between the physical storage devices of your database system and the logical containers or tables being use to store data. In essence, a tablespace is a storage structure that can hold tables, indexes, large objects, and long data. The Tablespace Wizard lets you create a tablespace without knowing the underlying commands.

To create a new tablespace using a wizard:

1. Open a creation wizard for a tablespace. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Tablespaces (DB2 LUW) - Properties.
   - Container panel - for details, see Tablespaces (DB2 LUW) - Container.
   - Comment panel - for details, see Adding a Comment to an Object.
   - Permissions panel - Setting Permissions or Privileges for an Object
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Tablespaces (DB2 LUW) - Properties

When creating or editing a tablespace, this tab/panel lets you work with the following settings:
Tablespaces Wizard (DB2 LUW)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tablespace properties</td>
<td><strong>Type</strong> - Select REGULAR, LARGE, TEMPORARY, or USER TEMPORARY. <strong>Use Automatic Storage</strong> and <strong>Managed By</strong> let you specify whether storage is</td>
</tr>
<tr>
<td></td>
<td>managed automatically, by the database, or by the system. <strong>Database Partition Group</strong> - lets you select a database partition group. <strong>Buffer Pool</strong> -</td>
</tr>
<tr>
<td></td>
<td>lets you select a buffer pool. <strong>Drop Recovery</strong> - For REGULAR type tablespaces, lets you enable/disable drop recovery.</td>
</tr>
<tr>
<td>Performance properties</td>
<td>This group lets you specify or select the <strong>Page Size</strong>, <strong>Extent Size</strong>, <strong>Prefetch Automatic</strong>, <strong>Prefetch Size</strong>, <strong>Overhead</strong>, <strong>Transfer Rate</strong>,</td>
</tr>
<tr>
<td></td>
<td>and <strong>File System Caching</strong> properties.</td>
</tr>
<tr>
<td>Automatic Storage</td>
<td>This group lets you specify or select the <strong>AutoResize</strong>, <strong>Initial Size</strong>, <strong>Increase Size</strong>, <strong>Max Size Unlimited</strong>, and <strong>Max Size</strong> attributes.</td>
</tr>
<tr>
<td>properties</td>
<td></td>
</tr>
</tbody>
</table>

Tablespaces (DB2 LUW) - Container

For each container in the tablespace, in the **Container Properties** area, provide the following container properties: **Database Partitions**, **Type** (FILE or DEVICE), **Name**, and **Size**, and then click the **New** button.

Use the **Delete** button to drop a selected container.
Triggers Wizard (DB2 LUW)

A trigger defines a set of actions that take place in conjunction with, or are triggered, for a particular base table, with an insert, update, or delete statement. Triggers are dandy ways to validate input data, read from other tables for cross-referencing purposes, and other similar purposes. The Trigger Wizard lets you create a trigger without requiring you to know any of the underlying commands.

To create a new trigger using a wizard:

1. Open a creation wizard for a trigger. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Triggers (DB2 LUW) - Properties.
   - Column Selection panel - for details, see Triggers (DB2 LUW) - Column Selection.
   - Definition panel - for details, see Triggers (DB2 LUW) - Definition.
3. Finally, use the Execute button to create the object.

Triggers (DB2 LUW) - Properties

When creating or editing a trigger, this tab/panel lets you work with the following settings:
### Triggers Wizard (DB2 LUW)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table Schema and Table Name</strong></td>
<td>Choose the owner and name of the table for which the trigger is being created.</td>
</tr>
<tr>
<td><strong>Schema and Name</strong></td>
<td>Choose the owner and name of the trigger being created.</td>
</tr>
<tr>
<td><strong>Trigger Timing</strong></td>
<td>BEFORE: These triggers serve as extensions to the constraint subsystem and are most often used to validate input data, generate values for newly inserted rows, and read from other tables for cross-reference purposes. Note: Before triggers must be created as a For Each Row. AFTER: Such a trigger is run after the integrity constraint validations; they can be used to modify operations in the database or be used for activities beyond the database, like supporting an alert notification.</td>
</tr>
<tr>
<td><strong>Trigger Events</strong></td>
<td>An INSERT trigger must be associated with an INSERT statement. For example, if a data load operation doesn’t include an INSERT statement, the trigger will not be invoked. An UPDATE trigger can be associated with specific columns of the base table and will only be activated if those columns are updated.</td>
</tr>
<tr>
<td><strong>Trigger Type</strong></td>
<td>STATEMENT (fires once). ROW (fires for each affected row): The trigger runs as many times as there are rows in the affected section. If the set of affected rows is empty, the trigger doesn’t run.</td>
</tr>
<tr>
<td><strong>Old Table Alias</strong></td>
<td>Type the name of a temporary table of rows as they exist before they’re updated or deleted.</td>
</tr>
<tr>
<td><strong>New Table Alias</strong></td>
<td>Type a name for a temporary table of rows as they exist after they’re inserted or updated.</td>
</tr>
<tr>
<td><strong>Old Row Alias</strong></td>
<td>Type a name for the rows as they are before they’ve been deleted or updated.</td>
</tr>
<tr>
<td><strong>New Row Alias</strong></td>
<td>Type a name for the rows as they are after they’ve been inserted or updated.</td>
</tr>
</tbody>
</table>

### Triggers (DB2 LUW) - Column Selection

If you chose UPDATE as the Trigger Event, select the columns, select the check box beside each column that is to fire the trigger.

### Triggers (DB2 LUW) - Definition

Complete the CREATE TRIGGER outline provided by typing or pasting the body of the trigger.
Unique Keys Wizard (DB2 LUW)

A unique key constraint is a key for which no two of its values can be equal and no values can be null. A table can have a number of unique constraints, but it cannot have more than one unique constraint on the same set of columns. If you are creating a unique key constraint on a table that already exists (as opposed to creating a unique key at the time the table is first generated), a unique index must already exist on the columns of the unique key you want to constrain. If no unique index exists, the Index Wizard will open as you complete the Create Unique Key Constraint dialog.

To create a new unique key using a wizard:

1. Open a creation wizard for a unique key. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Unique Keys (DB2 LUW) - Properties.
   - Columns panel - for details, see Unique Keys (DB2 LUW) - Columns.
   - Comment panel - for details, see Adding a Comment to an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Unique Keys (DB2 LUW) - Properties

When creating or editing a unique key, this tab/panel lets you work with the following settings:
## Unique Keys Wizard (DB2 LUW)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table Schema and Table Name</strong></td>
<td>Choose the owner and name of the table in which the unique key is being created.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the unique key being created.</td>
</tr>
<tr>
<td><strong>Time period policy</strong></td>
<td>This setting is for use with tables set up as business-time tables. For more information, see <a href="#">Tables (DB2 LUW v10) - Temporal Properties</a>. When selected, a BUSINESS_TIME WITHOUT OVERLAPS option is specified against the column or columns defining the constraint, in the generated DDL. This ensures that values for the constraint columns are unique with respect to the time for the BUSINESS_TIME period. When you select this option, columns specified as business-time begin period and end period are not available as candidates on the Columns tab/panel.</td>
</tr>
</tbody>
</table>

## Unique Keys (DB2 LUW) - Columns

From the **Column** dropdown, select a column for the primary key and specify a **Sort** option. To add more columns, click the **New** button and then follow the steps in the last instruction. Use the **Delete** button to drop columns.
User Datatypes (DB2 LUW)

User defined datatypes allow column definitions to be consistent across a database. They let you associate frequently used datatype information to be associated with a specified function and take advantage of performance features available to built-in datatypes including indexing and parallel database queries.

To create a new user datatype using a wizard:

1. Open a creation wizard for a user datatype. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see User Datatypes (DB2 LUW) - Properties.
   - Comment panel - for details, see Adding a Comment to an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

User Datatypes (DB2 LUW) - Properties

When creating or editing a user datatype, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the user datatype.</td>
</tr>
<tr>
<td>Datatype</td>
<td>Provide a name for the datatype.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the base datatype.</td>
</tr>
<tr>
<td>Size</td>
<td>Provide the size of the datatype.</td>
</tr>
<tr>
<td>Allow Bit Data</td>
<td>The option is only available for certain datatypes. A check means you want to store the data in a bit format.</td>
</tr>
</tbody>
</table>
Users Wizard (DB2 LUW)

Users have authorization to use a database and its objects, and the User Wizard gives you an easy way to add new ones.

To create a new user using a wizard:

1. Open a creation wizard for a user. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Users (DB2 LUW) - Properties.
   - Object Permissions and System Permissions panels - Setting Permissions or Privileges for an Object
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Users (DB2 LUW) - Properties

When creating or editing a user datatype, this tab/panel lets you provide the user Name.
Views Wizard (DB2 LUW)

A view gives you an alternative way to look at data in one or more tables. You can customize how you see a table’s contents.

To create a new view using a wizard:

1. Open a creation wizard for a view. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Views (DB2 LUW) - Properties.
   - Definition panel - for details, see Views (DB2 LUW) - Definition.
3. Finally, use the Execute button to create the object.

Views (DB2 LUW) - Properties

When creating or editing a view, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schema</td>
<td>Select the owner of the view. The owner of the view must have SELECT privileges for the tables in the CREATE view statement or DBADM authority on the database that contains the table.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the view.</td>
</tr>
<tr>
<td>Check Type</td>
<td>CHECK_NONE - No search conditions must be satisfied for insert or update operations. CHECK_LOCAL - Update and insert operations on view must satisfy the search conditions of the view and underlying views that are defined with a check option. Furthermore, every updatable view that is directly or indirectly defined on view inherits those search conditions (the search conditions of view and all underlying views of that are defined with a check option) as a constraint on insert or update operations. CHECK_CASCADE - Update and insert operations on the view must satisfy the search conditions of view and all underlying views, regardless of whether the underlying views were defined with a check option. Furthermore, every updatable view that is directly or indirectly defined on view inherits those search conditions (the search conditions of view and all underlying views) as a constraint on insert or update operations.</td>
</tr>
</tbody>
</table>

Views (DB2 LUW) - Definition

Complete the CREATE VIEW statement by typing or pasting in the relevant query.
IBM DB2 for z/OS Object Wizards

You create DB2 OS390 objects using the following wizards:

- Aliases Wizard (DB2 Z/OS)
- Databases Wizard (DB2 Z/OS)
- Foreign Keys Wizard (DB2 Z/OS)
- Functions Wizard (DB2 Z/OS)
- Indexes Wizard (DB2 Z/OS)
- Plans Wizard (DB2 Z/OS)
- Primary Keys Wizard (DB2 Z/OS)
- Procedures Wizard (DB2 Z/OS)
- Stogroups Wizard (DB2 Z/OS)
- Synonyms Wizard (DB2 Z/OS)
- Tables Wizard (DB2 Z/OS)
- Tablespaces Wizard (DB2 Z/OS)
- Triggers Wizard (DB2 Z/OS)
- Unique Keys Wizard (DB2 Z/OS)
- User Datatypes Wizard (DB2 Z/OS)
- Users Wizard (DB2 Z/OS)
- Views Wizard (DB2 Z/OS)

In addition, see Create Synonym.
Aliases Wizard (DB2 Z/OS)

An alias offers you security and convenience so that you can refer to an object without revealing who owns it or what database it belongs to. You can create aliases for tables or views. The Alias Wizard lets you create an alias without knowing the underlying commands. As you complete the Alias Wizard process, a CREATE ALIAS statement based on the information that you supply is generated. To create an alias, you must have CREATE ALIAS privileges or sysadmin or sysctrl authority.

To create a new alias using a wizard:

1. Open a creation wizard for an alias. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Aliases (DB2 z/OS) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Aliases (DB2 z/OS) - Properties

When creating or editing a view, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schema</td>
<td>Select the schema that is to own the alias.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the alias.</td>
</tr>
<tr>
<td>Target Owner</td>
<td>Select the owner of the object to which you are creating an alias.</td>
</tr>
<tr>
<td>Target Type</td>
<td>Select the type of object (TABLE, VIEW) to which you are creating an alias.</td>
</tr>
<tr>
<td>Target Name</td>
<td>Select the specific object to which you are creating an alias.</td>
</tr>
</tbody>
</table>
Databases Wizard (DB2 Z/OS)

The Database Wizard lets you create a database (a structured collection of data that can be updated or queried) without knowing the underlying commands. Databases can be simple, that is one file with many records and the same fields, or much more complicated with multiple files with different fields.

To create a new database using a wizard:

1. Open a creation wizard for a database. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Databases (DB2 z/OS) - Properties.
   - Permissions panel - for details, see Setting Permissions or Privileges for an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Databases (DB2 z/OS) - Properties

When creating or editing a database, this tab/panel lets you work with the following settings:
### Databases Wizard (DB2 Z/OS)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Provide a unique name for the database.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Workfile: This option is only available if the server is configured in IBM DB2 for OS/390 and z/OS to allow sharing. For more information, contact your System administrator. Temp: This option indicates the database is only for declared temporary tables. A temp database cannot be shared.</td>
</tr>
<tr>
<td><strong>Group Member</strong></td>
<td>Specifies the member for which this database is being created. Use this only in a shared environment.</td>
</tr>
<tr>
<td><strong>Tablespace Buffer Pool</strong></td>
<td>Select the default buffer pool to be used for tablespaces created within the database.</td>
</tr>
<tr>
<td><strong>Index Buffer Pool</strong></td>
<td>Select the default buffer pool name to be used for indexes created within the database.</td>
</tr>
<tr>
<td><strong>Storage Group</strong></td>
<td>Select the default storage group to support the DASD space requirements for tablespaces and indexes within the database.</td>
</tr>
<tr>
<td><strong>Encoding Scheme</strong></td>
<td>Select an encoding schema of DEFAULT, ASCII, EBCDIC, or UNICODE. NOTE: To change the encoding scheme for a database after it has been created to use a different coded character set identifier (CCSID) that supports the Euro symbol, all data must be unloaded and reloaded. For more information regarding the encoding scheme, contact your System administrator.</td>
</tr>
</tbody>
</table>
Foreign Keys Wizard (DB2 Z/OS)

Foreign keys are unique values that refer to specific columns of other tables. Thus, a foreign key links two tables together. The Foreign Key Wizard makes it easy for you to create a relational link between two tables, thereby speeding queries and giving you faster access to data. The Foreign Key Wizard lets you create a foreign key without knowing the underlying commands.

To create a new foreign key using a wizard:

1. Open a creation wizard for a foreign key. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Foreign Keys (DB2 z/OS) - Properties.
   - Column Mapping panel - for details, see Foreign Keys (DB2 z/OS) - Column Mapping.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Foreign Keys (DB2 z/OS) - Properties

When creating or editing a foreign key, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Schema</td>
<td>Select the owner of the referencing, or child, table.</td>
</tr>
<tr>
<td>Table Name</td>
<td>Select the name of the referencing, or child, table.</td>
</tr>
<tr>
<td>Name</td>
<td>If you do not want to use the system-generated name, provide a new one.</td>
</tr>
<tr>
<td>Delete Rule</td>
<td>Select the action to be taken (NO ACTION, RESTRICT, CASCADE, or SET NULL)</td>
</tr>
<tr>
<td></td>
<td>when a row of the referenced, or parent, table is deleted.</td>
</tr>
</tbody>
</table>

Foreign Keys (DB2 z/OS) - Column Mapping

Under Referenced Table, choose the Owner and then the Name of the referenced, or parent, table.
Under the **Main Table**, select check boxes corresponding to the columns that are to reference columns in the referenced table. Then, under **Referenced Table**, select the corresponding column check boxes.
Functions Wizard (DB2 Z/OS)

The Functions Wizard lets you create a relationship between one set of values and another. You can develop reusable subroutines so you can control, access, and manipulate the data that underlies an object. As you complete the Function Wizard process, a CREATE FUNCTION statement is generated based on the information that you supply.

**Note:** To create a user-defined function, you need CREATE ANY privileges or IMPLICIT_SCHEMA authority on the database if the schema does not already exist.

To create a new function using a wizard:

1. Open a creation wizard for a function. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Functions (DB2 z/OS) - Properties.
   - **Source** panel - (Only available for a Function Type of SOURCED.) for details, see Functions (DB2 z/OS) - Source.
   - **Parameters** panel - for details, see Functions (DB2 z/OS) - Parameters.
   - **Return Scalar** panel - for details, see Functions (DB2 z/OS) - Return Scalar.
   - **Return Columns** panel - (Only available when you choose a Function Type of EXTERNAL TABLE.) for details, see Functions (DB2 z/OS) - Return Columns.
   - **Body** panel - for details, see Functions (DB2 z/OS) - Body.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the **Execute** button to create the object.

Functions (DB2 z/OS) - Properties

When creating or editing a function, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Schema, Name, and Specific Name</strong></td>
<td>Select the owner of the function, provide a name for the function, and provide the Specific name to be used by some SQL statements and DB2 commands for this function.</td>
</tr>
<tr>
<td><strong>Function Type</strong></td>
<td>External Scalar: This allows you to extend the function by adding your own or another party’s definition for the function. External Table: Use this to create a function that is written in ASSEMBLE, C, COBOL, or PLI to return a table after it is deployed. Sourced: Here you are creating a function that is based on an existing scalar or table function with an application server. SQL: This type of function returns a single value when the function is invoked if the SQL statement that defines it is valid.</td>
</tr>
<tr>
<td><strong>Language</strong></td>
<td>If you chose a Function Type of EXTERNAL SCALAR or EXTERNAL TABLE, specify a language of ASSEMBLE, C, COBOL, or PLI.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Identifies the return type of the function.</td>
</tr>
<tr>
<td><strong>External Name</strong></td>
<td>Provide the External Name of the function.</td>
</tr>
<tr>
<td><strong>SQL Access Level</strong></td>
<td>Indicates whether the function can execute SQL statements. CONTAINS SQL: Statements that don’t read or modify SQL can be executed. NO SQL: No SQL statements can be executed. READS SQL: Statements that cannot modify SQL can be executed.</td>
</tr>
<tr>
<td><strong>WLM Environment</strong></td>
<td>Specify a Workload Management Environment (Required if Language is JAVA/CMP, JAVA/REXX, the Procedure contains a LOB parameter, Security is set to ‘USER’ or ‘DEFINER’, or program type is ‘SUB’).</td>
</tr>
<tr>
<td><strong>WLM For Nested</strong></td>
<td>Self-explanatory</td>
</tr>
</tbody>
</table>

**Functions (DB2 z/OS) - Source**

*Note:* Only available for a Function Type of SOURCED.

Select the **Schema, Name, and Specific Name** of the source function.

**Functions (DB2 z/OS) - Parameters**

For each parameter for this function, use the New button to add a new parameter, provide a name for the parameter, and in the Attributes area, select a Type, and if appropriate, the Precision, Scale, Size, and As Locator options.

**Functions (DB2 z/OS) - Return Scalar**

Under **Return Datatype**, select a Type and depending on your choice, provide or select Precision, Scale, Size, and As Locator options.
To make use of a CAST FROM clause, under **Cast Datatype** set **Enabled** to True, select a **Type**, and if appropriate, the **Scale**, **Size**, and **As Locator** options

**Functions (DB2 z/OS) - Return Columns**

**Note:** Only available when you choose a **Function Type** of EXTERNAL TABLE.

For each column returned by this function, use the New button to add a new parameter, provide a name for the parameter, and in the **Attributes** area, select a **Type**, and if appropriate, the **Precision**, **Scale**, **Size**, and **As Locator** options.

**Functions (DB2 z/OS) - Body**

Enter the return statement for the function.
Indexes Wizard (DB2 Z/OS)

Like the index in a book, a database index makes it easier for you to access information quickly. An index lists the location of rows, sorted by the contents of one or more columns.

To create a new index using a wizard:

1. Open a creation wizard for an index. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Indexes (DB2 z/OS) - Properties
   - Columns panel - for details, see Indexes (DB2 z/OS) - Columns
   - Indexes panel - for details, see Indexes (DB2 z/OS) - Storage
   - Partitions panel - for details, see Indexes (DB2 z/OS) - Partitions
   - Comment panel - for details, see Adding a Comment to an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Indexes (DB2 z/OS) - Properties

When creating or editing an index, this tab/panel lets you work with the following settings:
### Setting Description

**Table Schema and Table Name**
Choose the owner and name of the table in which the index is being created.

**Schema and Name**
Choose the owner and name of the index being created.

**Index Type**
Unique: Prevents the selected table from having two or more rows with the same value of the index key. The uniqueness is enforced at the end of the SQL statement update. Also, null values are treated like any other values, so a column cannot contain more than one null. If you later elect to partition the index, the columns specified for the unique key must include all columns for the partitioning key.

Non-Unique (default)

**Clustered**
Enable or disable clustering. Unless you specifically select the CLUSTER option when you create an index, the first index you create on a table will be bestowed with that distinction. Each table can only have one clustering index at a time. The clustering index tells DB2 to insert rows in the table in the order of the clustering key values. Inserted rows will be stored contiguously in sequence when possible. Columns frequently searched with a range of values BETWEEN, less than, greater than, and LIKE, or GROUP BY, etc., are good candidates for a clustering index.

**Number of Partitions**
If you enabled Clustering, specify the number of partitions.

**Buffer Pool**
Provide the buffer pool in which this index should reside

**Defer, Close, Copy, and Define**
Enable or disable these DB2 options as required.

**Piece Size**
The maximum addressability of the dataset for a non-partitioned index.

**Compress**
Enabling this setting specifies a COMPRESS=YES parameter when creating the table, resulting in a compressed index. This feature is available if the size of the specified Buffer Pool is 8k, 16k, or 32k.

**Index on expression**
Setting the check box enables the Index on Expression feature. The key expression is then provided on the Columns tab/panel. For details, see Indexes (DB2 z/OS) - Columns.

**Padded**
Setting this check box specifies that the table is to be created with the PADDED keyword. This feature must be enabled if you are using index keyrandomization. The RANDOM setting is applied on a column by column basis on the Columns tab/panel.

---

**Indexes (DB2 z/OS) - Columns**
The actions you take on this tab/panel depend on whether you set the **Index on Expression** check box on the Properties panel. For more information, see *Indexes (DB2 z/OS) - Properties*.

- **If Index on Expression is disabled:**
  From the **Column** dropdown, select a column for the index and specify a **Sort** option.

  **Note:** If you want to use the **RANDOM** sort option, you must first set the **Padded** check box on the Properties tab/panel.

- **If Index on Expression is enabled:**
  Enter a valid key-expression in the **Expression** field and choose a **Sort** order.

To add more columns/key-expressions, click the **New** button and then follow the steps in the last instruction. Use the Delete button to drop columns.

### Indexes (DB2 z/OS) - Storage

This tab/panel lets you perform the following tasks:

- Select a dataset management scheme
- Provide associated attribute values

**To select a data set management scheme:**

1. Click the **Edit** button. The **Data Set Management** dialog opens.
2. Set one of the following data set management options:

   - **DB2 will define and manage the data sets on a volume of the default storage group of the database**
   - **DB2 will define and manage the data sets on a volume of the specified storage group** - Select a storage group (a storage group is made up of disk device volumes): Each data set will be defined on a volume listed in the storage group you select.

Minimum primary space allocation: 12 kilobytes is the default.

Minimum secondary space allocation: 12 kilobytes is the default.

**Note:** If the primary and (118 x) secondary space allocations combine to be greater than 2 gigabytes, more than one data set may eventually be used.

Erase data sets when index dropped? If choose this option, DB2 will overwrite all data with zeros before they are deleted as a security measure.

   - **User will manage the data sets on a specified VCAT catalog-name** - Enter or select the VCAT. Do not select this option for an index on a declared temporary table.
3. Click **OK**.
Indexes Wizard (DB2 Z/OS)

In addition to the attributes specific to your data set management choice, this tab/panel also offers the following settings:

- **Free Page**
  One free page exists for every x pages. The x specifies how often to leave a page of free space when index entries are created from executing a DB2 utility or creating an index for a table with pre-existing rows. (0-255)

- **Percent Free**
  The percentage of free space you want to leave in every page when entries are added to an existing index. The default is 10%.

- **GBP Cache**
  This option is available only in a data-sharing environment. ALL: As pages are read, all of them will be cached in the group buffer pool. CHANGED: Updated pages are cached to the group buffer pool. NONE: No pages will be cached.

Indexes (DB2 z/OS) - Partitions

Displays the default settings for the number of partitions you specified on the Properties pane. Select a partition and click the Edit button to modify details for that partition.
A plan, also known as the application plan, is a control structure that is used to process the SQL statements DB2 encounters when it is executing those SQL statements. The Plan Wizard, really, the Bind Plan Wizard, creates the structure that is used in the bind process--the process by which the output from the SQL precompiler is converted into usable form. Some authorization checking is necessary.

To Open the Bind Plan Wizard

1. On the Navigator/Explorer, find the database where you want to add the new bind plan.
2. On the Plan branch, right-click and select Create.

The Bind Plan Wizard lets you set plan parameters, add packages, and set bind properties. The table below describes the options and functionality on the Bind Plan wizard:

<table>
<thead>
<tr>
<th>Panel</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plan Name</td>
<td>Lets you select the plan name.</td>
</tr>
<tr>
<td>Qualifier</td>
<td>OPTIONAL: Lets you select a qualifier, the plan creator.</td>
</tr>
<tr>
<td>Action</td>
<td>OPTIONAL: Lets you select an action.</td>
</tr>
<tr>
<td>Sql Rules</td>
<td>OPTIONAL: Determines whether you can execute a type 2 CONNECT statement to an existing SQL connection, according to DB2 rules.Lets you select DB2 or STD.</td>
</tr>
<tr>
<td>Cache Size</td>
<td>OPTIONAL: Lets you select or type the cachsize in bytes, the authorization cache acquired in the EDM pool for the plan. At run time, the authorization cache stores user IDs authorized to run. Consulting the cache can avoid a catalog lookup for checking authorization to run the plan.</td>
</tr>
<tr>
<td>Plan Owner</td>
<td>OPTIONAL: Determines the authorization ID of the owner of the plan.</td>
</tr>
<tr>
<td>Current Server</td>
<td>OPTIONAL: Determines the location to connect to before running the plan.</td>
</tr>
<tr>
<td>Resource Acquire</td>
<td>OPTIONAL: Use - Acquires table space locks only when first used by a bound application program. Allocate - Acquires all table space locks when the plan is allocated. The value has no effect on dynamic SQL statements, which always use ACQUIRE(USE).</td>
</tr>
</tbody>
</table>

Embarcadero Technologies
Disconnect

*OPTIONAL:* Determines which remote connections to destroy during commit operations. The option applies to any application process that uses the plan and has remote connections of any type. Regardless of the value of this option, a commit operation destroys all connections in the release pending state. Explicit - Destroy only connections in the release pending state. This value allows you maximum flexibility for controlling remote connections. Automatic - Destroy all remote connections. Conditional - Destroy all remote connections unless an open cursor defined as WITH HOLD is associated with the connection.

2. Lets you select the **Member Name, PDS Name** (partitioned data set) and click **Add** to enter each member and PDS name.

3. Lets you select the **Location** to connect to, the **Collection** (location of the DBMS where the plan binds and where the description of the plan resides.) and a **Package**.

4. Isolation

Determined how far to isolate an application from the effects of other running applications.

**Keep Dynamic**

Specifies that DB2 keeps dynamic SQL statements after commit points. The application does not need to prepare an SQL statement after every commit point. DB2 keeps the dynamic SQL statement until the application process ends, a rollback operation occurs or the application executes an explicit PREPARE statement with the same statement identifier. If the prepared statement cache is active, DB2 keeps a copy of the prepared statement in the cache. If the prepared statement cache is not active, DB2 keeps only the SQL statement string past a commit point. DB2 then implicitly prepares the SQL statement if the application executes an OPEN, EXECUTE, or DESCRIBE operation for that statement.

**Current Data**

Determines whether to require data currency for read-only and ambiguous cursors when the isolation level of cursor stability is in effect. It also determines whether block fetching can be used for distributed, ambiguous cursors.

**Degree**

Determines whether to attempt to run a query using parallel processing to maximize performance. Lets you select an option.

**Dynamic Rules**

Determines what values apply at run time for the following dynamic SQL attributes: The authorization ID that is used to check authorization

The qualifier that is used for unqualified objects

The source for application programming options that DB2 uses to parse and semantically verify dynamic SQL statements Whether dynamic SQL statements can include GRANT, REVOKE, ALTER, CREATE, DROP, and RENAME statements

**Release**

Determines when to release resources that a program uses. Options are at each **Commit** point or **Dealocate** when the program terminates.
**Validate**

Determines whether to recheck, at run time, errors found during bind. The option has no effect if all objects and needed privileges exist. **Bind** - If not all objects or needed privileges exist at bind time, the wizard displays an error messages, and does not bind the package. **Run** - If not all objects or privileges exist at bind time, the process issues warning messages, but the bind succeeds. DB2 checks existence and authorization again at run time for SQL statements that failed those checks during bind. The checks use the authorization ID of the plan owner.

**Explain**

Obtains information about how SQL statements in the member list of the plan, are to execute, and then inserts that information into the table owner.PLAN_TABLE, where owner is the authorization ID of the owner of the plan or package. This option does not obtain information for statements that access remote objects.

**Reopt(VARS)**

Re-determines the access path at run time.

**Prepare**

Prepares dynamic SQL statements that refer to remote objects.

**ImmedWrite**

Immediate writes will be done for updates made to group buffer pool dependent pagesets or partitions.

**Opthint**

Query optimization hints are used for static SQL.

**Encoding**

Lets you select type of language for the package.

**Path**

Lets you select a path that DB2 uses to resolve unqualified user-defined distinct types, functions, and stored procedure names (in CALL statements).

**Flag**

Lets you select all message types or a specified subset to display: informational, warning, error, and completion messages.

**Enable or Disable** system connection types that can use the plan or package, select a **System or Cname** option.
Primary Keys Wizard (DB2 Z/OS)

A primary key is a unique key that is part of a table’s definition. There can be only one primary key for each table, and the columns contained in a primary key cannot have null values. A primary key constraint forbids duplicate values in one or more columns. A table with a primary key will be considered the parent table to a table with a foreign key, which becomes the dependent table.

**Note:** A nullable column cannot be a part of a primary key.

To create a new primary key using a wizard:

1. Open a creation wizard for a primary key. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Primary Keys (DB2 z/OS) - Properties.
   - **Columns** panel - for details, see Primary Keys (DB2 z/OS) - Columns.
   - **Storage** panel - for details, see Primary Keys - Storage - Edit button (manage datasets) and Primary Keys (DB2 z/OS) - Storage - Attributes.
   - **Partitions** panel - for details, see Primary Keys (DB2 z/OS) - Partitions.
   - **Comment** panel - for details, see Adding a Comment to an Object.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Primary Keys (DB2 z/OS) - Properties

When creating or editing a primary key, this tab/panel lets you work with the following settings:
Primary Keys Wizard (DB2 Z/OS)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Schema and Table Name</td>
<td>Choose the owner and name of the table in which the index is being created.</td>
</tr>
<tr>
<td>Schema and Name</td>
<td>Choose the owner and name of the index being created.</td>
</tr>
<tr>
<td>Clustered</td>
<td>Enable or disable clustering.</td>
</tr>
<tr>
<td>Number of Partitions</td>
<td>If you enabled Clustering, specify the number of partitions.</td>
</tr>
<tr>
<td>Buffer Pool</td>
<td>Provide the buffer pool in which this index should reside</td>
</tr>
<tr>
<td>Defer, Close, Copy, and Define</td>
<td>Enable or disable these DB2 options as required.</td>
</tr>
<tr>
<td>Piece Size</td>
<td>The maximum addressability of the dataset for a non-partitioned index.</td>
</tr>
<tr>
<td>Time period policy</td>
<td>This setting is for use with tables set up as business-time tables. For more information, see <a href="#">Tables (DB2 z/OS v10) – Temporal Properties</a>. When selected, a BUSINESS_TIME WITHOUT OVERLAPS option is specified against the column or columns defining the constraint, in the generated DDL. This ensures that values for the constraint columns are unique with respect to the time for the BUSINESS_TIME period. When you select this option, columns specified as business-time begin period and end period are not available as candidates on the Columns tab/panel.</td>
</tr>
</tbody>
</table>

Primary Keys (DB2 z/OS) - Columns

From the Column dropdown, select a column for the primary key and specify a Sort option. To add more columns, click the New button and then follow the steps in the last instruction. Use the Delete button to drop columns.

Primary Keys - Storage - Edit button (manage datasets)

**Note:** Availability differs according to the dataset management options you chose

Choose a data set management option:

- **DB2 will define and manage the data sets on a volume of the default storage group of the database**
- **DB2 will define and manage the data sets on a volume of the specified storage group**
Primary Keys Wizard (DB2 Z/OS)

Select a storage group (a storage group is made up of disk device volumes): Each data set will be defined on a volume listed in the storage group you select.

**Minimum primary space allocation**: 12 kilobytes is the default.

**Minimum secondary space allocation**: 12 kilobytes is the default.

**Note**: If the primary and (118 x) secondary space allocations combine to be greater than 2 gigabytes, more than one data set may eventually be used.

**Erase data sets when index dropped?** If you choose this option, DB2 will overwrite all data with zeros before they are deleted as a security measure.

**User will manage the data sets on a specified VCAT catalog-name** Enter or select the VCAT. Do not select this option for an index on a declared temporary table.

### Primary Keys (DB2 z/OS) - Storage - Attributes

When creating or editing a primary key, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storage Group, Primary Space Allocation, Secondary Space Allocation, Erase, and VCAT catalog</td>
<td>The ability to set these options depends on the dataset management options you chose.</td>
</tr>
<tr>
<td>Free Page</td>
<td>One free page exists for every x pages. The x specifies how often to leave a page of free space when index entries are created from executing a DB2 utility or creating an index for a table with pre-existing rows. (0-255)</td>
</tr>
<tr>
<td>Percent Free</td>
<td>The percentage of free space you want to leave in every page when entries are added to an existing index. The default is 10%.</td>
</tr>
<tr>
<td>GBP Cache</td>
<td>This option is available only in a data-sharing environment. ALL: As pages are read, all of them will be cached in the group buffer pool. CHANGED: Updated pages are cached to the group buffer pool. NONE: No pages will be cached.</td>
</tr>
</tbody>
</table>

### Primary Keys (DB2 z/OS) - Partitions

Displays the default settings for the number of partitions you specified on the Properties pane. Select a partition and click the Edit button to modify details for that partition.
Procedures Wizard (DB2 Z/OS)

Procedures are a reusable block of PL/SQL, stored in the database, that applications can call. Procedures streamline code development, debugging, and maintenance by being reusable. Procedures enhance database security by letting you write procedures granting users execution privileges to tables rather than letting them access tables directly.

To create a new procedure using a wizard:

1. Open a creation wizard for a procedure. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Procedures (DB2 z/OS) - Properties.
   - Parameters panel - for details, see Procedures (DB2 z/OS) - Parameters.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Important Notes

- If you are creating a SQL routine procedure, you must have the latest DB2 fixpack installed on your OS/390 Client. If you do not have the latest fixpack installed, the SQL routine procedure creation will fail.

Procedures (DB2 z/OS) - Properties

When creating or editing a procedure, this tab/panel lets you work with the following settings:
### Procedures Wizard (DB2 Z/OS)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Schema, Name, and Specific Name</strong></td>
<td>Select the schema that is to own the procedure, provide a name for the procedure, and provide the Specific Name for the procedure.</td>
</tr>
<tr>
<td><strong>Language</strong></td>
<td>The database manager will call the procedure accordingly assuming the program is designed to run in the server’s environment. Assemble: a stored procedure written in Assembler C: a stored procedure written in C or C++ COBOL: a stored procedure written in COBOL CompJ AVA: CompJ AVA is no longer supported. Stored procedures should alternatively be written in J AVA. JAVA PLI: A stored procedure written in PL/I. REXX (Restructured Extended Executor Language) - Don’t use this language when SQL parameter style is in effect. To specify REXX, the general parameter style or general with nulls. SQL</td>
</tr>
<tr>
<td><strong>SQL Access Level</strong></td>
<td>MODIFIES SQL DATA (Default): The procedure can support any SQL statement except those that cannot be supported in procedures. CONTAINS SQL DATA: Only SQL statements that neither modify nor read SQL data can be executed in the procedure. READS SQL DATA Some SQL statements that don’t modify SQL data can be included in the procedure NO SQL: Only SQL statements with a data access classification of NO SQL can be executed. Don’t select this option for a JAVA procedure that uses a .jar.</td>
</tr>
<tr>
<td><strong>WLM Environment</strong></td>
<td>Specify a Workload Management Environment (Required if Language is JAVA/CompJ AVA/REXX, the Procedure contains a LOB parameter, or Security is set to ‘USER’ or ‘DEFINER’).</td>
</tr>
<tr>
<td><strong>WLM For Nested</strong></td>
<td>Self-explanatory</td>
</tr>
</tbody>
</table>

### Procedures (DB2 z/OS) - Parameters

For each parameter for this function, use the New button to add a new parameter, provide a name for the parameter, and in the Attributes area, select a Type, specify a Parameter Mode of INPUT, OUTPUT, or INPUT_OUTPUT, and if appropriate, the Precision, Scale, and Size options.
Stogroups Wizard (DB2 Z/OS)

Stogroups are storage groups. You create them on the current server. Storage from the named sets of volumes you create can be allocated at a later date for tablespaces or index spaces.

To Open the Stogroup Wizard

1. On the Navigator/Explorer, find the datasource where you want to add the new Storage Group.
2. Expand the Storage branch, right-click Stogroup, and select New.

The table below describes the fields you will encounter as you complete the Stogroup Wizard.

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the name of the Stogroup?</td>
<td>Enter a name for the storage group.</td>
</tr>
<tr>
<td>VCAT</td>
<td>This is the integrated catalog facility catalog, or volume catalog. Name the catalog or choose one from the drop-down list if it is available.</td>
</tr>
<tr>
<td>Select the volumes in the Stogroup</td>
<td>Specify a set of volumes that may exist on the system but may not be in use by other storage groups.</td>
</tr>
<tr>
<td>Select All</td>
<td>Selects all listed volumes.</td>
</tr>
<tr>
<td>Unselect All</td>
<td>Unselects all listed volumes.</td>
</tr>
<tr>
<td>Add</td>
<td>Opens the Add Volume Dialog Box.</td>
</tr>
<tr>
<td>Remove</td>
<td>Deletes all selected volumes from the list.</td>
</tr>
</tbody>
</table>

Add Volume Dialog Box

The table below describes the options and functionality on the Add Volume dialog:

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter one or more volumes to add to the stogroup</td>
<td>Type the names of the volumes (separated by spaces) to add to the stogroup.</td>
</tr>
<tr>
<td>Check</td>
<td>Click to see if any additional information is available about the volumes you typed. Opens the Volumes Info Dialog Box.</td>
</tr>
<tr>
<td>Or select volumes for the list</td>
<td>Lets you select volumes.</td>
</tr>
</tbody>
</table>

Volumes Info Dialog Box

The table below describes the options and functionality on the Volume Info dialog:
### Stogroups Wizard (DB2 Z/OS)

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Volumes</td>
<td>Lets you select volumes.</td>
</tr>
<tr>
<td>OK</td>
<td>Click to add volumes to Stogroup Wizard.</td>
</tr>
</tbody>
</table>
Synonyms Wizard (DB2 Z/OS)

A synonym is an alternative name you can create for a table or view. Using a synonym can make it easier for you to remember that table or view instead of having to think about the possibly cumbersome formal name (for example, a show dog may have a formal name that incorporates all his ancestors, but will answer to the name Spot around the house).

To create a new synonym using a wizard:

1. Open a creation wizard for a synonym. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Synonyms (DB2 z/OS) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Synonyms (DB2 z/OS) - Properties

When creating or editing a synonym, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schema</td>
<td>Select the schema that is to own the synonym.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the synonym.</td>
</tr>
<tr>
<td>Referenced Object Owner</td>
<td>Select the owner of the object to which you are creating a synonym.</td>
</tr>
<tr>
<td>Referenced Object Type</td>
<td>Select the type of object (TABLE, VIEW) to which you are creating a synonym.</td>
</tr>
<tr>
<td>Referenced Object Name</td>
<td>Select the specific object to which you are creating a synonym.</td>
</tr>
</tbody>
</table>
Tables Wizard (DB2 Z/OS)

All data in a database is stored in a tabular format, that is a collection of rows and columns. Tables, therefore are fundamental to whatever database you are administering.

To create a new table using a wizard:

1. Open a creation wizard for a table. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Tables (DB2 z/OS) - Properties.
   - **Columns** panel - for details, see Tables (DB2 z/OS) - Columns.
   - **Indexes** panel - for details, see Tables (DB2 z/OS) - Indexes.
   - **Temporal Properties** panel - for details, see Tables (DB2 z/OS v10) - Temporal Properties.
   - **Constraints** panel - for details, see Tables (DB2 z/OS) - Constraints.
   - **Comment** panel - for details, see Adding a Comment to an Object.
   - **Permissions** panel - Setting Permissions or Privileges for an Object
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.

The table that follows describes the fields you may encounter as you complete the Table Wizard.

### Tables (DB2 z/OS) - Properties

Select the **Schema**, provide a **Name**, and provide or select other table properties.

### Tables (DB2 z/OS) - Columns

For each column in the table, click the **Add Column** button to create a column, provide a **Name** for the column and provide or select the remaining column attributes.

Use the **Delete** button to drop a selected column.

Use the arrow buttons to reposition the columns.

**Row Properties** (V10) settings are available when you select a **Type** of TIMESTAMP. These settings are used in conjunction with settings on the **Temporal Properties** tab in setting up system and application temporal tables. For more information, see Tables (DB2 z/OS v10) - Temporal Properties.

Specific settings are:
Tables Wizard (DB2 Z/OS)

- **As Row Begin** - adds a GENERATED ALWAYS AS ROW BEGIN option to the column specification, used to track when a row is current.

- **As Row End** - adds a GENERATED ALWAYS AS ROW END option to the column specification.

- **Transaction Start ID** - adds a GENERATED ALWAYS AS TRANSACTION START ID option to the column specification indicating that this column captures the start times for transactions that affect rows.

A column can have only one of the three settings selected.

When you select a **Row Properties** setting, the **Scale** value and if appropriate, the **Allow Nulls**, **Default Value**, and **Expression** settings are automatically adjusted for compatibility with row generation. Similarly, if one of the three **Row Properties** settings is selected for a column, and any of the **Scale**, **Allow Nulls**, **Default Value**, or **Expression** settings are modified, then the selected **Row Properties** setting is cleared.

Tables (DB2 z/OS) - Indexes

Click **Add** to open the **Indexes Wizard (DB2 Z/OS)**.

Tables (DB2 z/OS v10) - Temporal Properties

This tab/panel lets you specify temporal properties to a table, designating it as a table that records the period of time when a row is valid.

**Note**: Before using this object action, consult DB2 LUW documentation for details on setup and use of the temporal tables feature. For more information, see Accessing Third Party Documentation.

This tab/panel has the following controls:

- **System-time table** - selecting this option creates a table with the PERIOD SYSTEM_TIME clause, designating it as a system-period temporal table. This option is available if the table has three columns of type TIMESTAMP, and the following prerequisites have been met:

  - At least one TIMESTAMP-typed column has the **As Row Begin** property selected
  - At least one TIMESTAMP-typed column has the **As Row End** property selected
  - At least one TIMESTAMP-typed column has the **Transaction Start ID** property selected

For details on column definitions, see Tables (DB2 z/OS) - Columns.

The **Row-begin column**, **Row-end column**, and **Transaction Start ID column** controls are automatically populated with the columns having the corresponding property.

When you select this option, in the generated DDL, the **Row-begin column** and **Row-end column** values are used as the PERIOD SYSTEM_TIME column parameters, defining the system period.
Tables Wizard (DB2 Z/OS)

- **Business-time table** - selecting this option creates a table with the PERIOD BUSINESS_TIME clause, designating it as an application-period temporal table. This option is available if the table has two columns of type DATE or TIMESTAMP, for which no Row Properties have been assigned.

The **Begin column** and **End Column** controls are automatically populated with the valid candidate columns from the table’s column list and the first distinct column pair is automatically chosen for convenience.

- **Use history table** - this set of controls is only active when **Business-time table** is selected. It lets you associate a history table. When you select **Use history table**, the Owner and Name controls are activated, letting you identify the history table to associate with this table.

Note that a constraint created on a business-time table can enforce the uniqueness of the data for any point in business time via the **Time period policy** property that has been added in the constraint wizards. For details, see the following topics:

- **Primary Keys (DB2 z/OS) - Properties**
- **Unique Keys (DB2 z/OS) - Properties**

**Tables (DB2 z/OS) - Constraints**

Selecting a constraint type and clicking **Add** opens the object wizard for that object type. For details see:

- **Foreign Keys Wizard (DB2 Z/OS)**
- **Primary Keys Wizard (DB2 Z/OS)**
- **Unique Keys Wizard (DB2 Z/OS)**
- **Create Synonym**
Tablespaces establish connections between the physical storage devices of your database system and the logical containers or tables being used to store data. In essence, a tablespace is a storage structure that can hold tables, indexes, large objects, and long data.

**Note:** To change the encoding scheme for a database after it is created to utilize a different coded character set identifier (CCSID) that supports the Euro symbol, all data must be unloaded and reloaded. For more information regarding the encoding scheme, contact your System administrator.

**To Open the Tablespace Wizard**

1. On the Navigator/Explorer, find the datasource where you want to add the new Tablespace.
2. Expand the Storage branch, right-click **Tablespaces**, and select **New**.
3. Use the following table as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see *Tablespaces (DB2 z/OS) - Properties*.
   - **Permissions** panel - *Setting Permissions or Privileges for an Object*
   - **DDL View** panel - for details, see *Previewing the DDL Generated to Create the New Object*.
4. Finally, use the **Execute** button to create the object.

**Tablespaces (DB2 z/OS) - Properties**

When creating or editing a tablespace, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Group</th>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creation</td>
<td>Name and Database</td>
<td>Provide a name and select an associated database.</td>
</tr>
<tr>
<td></td>
<td>Database type</td>
<td>Lets you select a REGULAR or WORKFILE database type.</td>
</tr>
<tr>
<td></td>
<td>Creation type</td>
<td>Lets you select among PARTITIONED, SEGMENTED, RANGE-PARTITIONED UNIVERSAL, PARTITION-BY-GROWTH UNIVERSAL, and LOB options. Refer to DB2 z/OS product documentation for detailed information on these types and other required settings. For more information, see <em>Accessing Third Party Documentation</em>.</td>
</tr>
</tbody>
</table>
### Tablespace management

**Management type**

Lets you select how you want the tablespace managed: DEFAULT STORAGE GROUP, STORAGE GROUP, or VCAT CATALOG-NAME.

**Storage group**, Minimum primary space allocation, Minimum secondary space allocation, and Erase rule

If you selected a Management type of STORAGE GROUP, select a storage group, specify minimum space allocations, and specify whether data sets are to be erased when the tablespace is dropped.

**VCatName**

If you selected a Management type of VCAT catalog-name, select a catalog name.

### Bufferpool

**Buffer Pool**

Select the buffer pool where the tablespace is to reside.

### Partitions and size

**Number of partitions**

If you selected a Creation Type of PARTITIONED or RANGE-PARTITIONED UNIVERSAL, specify the number of partitions.

**Partition size (DSSIZE)**

If you did not select a Creation Type of SEGMENTED, select a partition size.

**Segment size**

If you selected a Creation Type of SEGMENTED, PARTITION-BY GROWTH, or RANGE-PARTITIONED UNIVERSAL, select the number of pages that are to be assigned to each segment of the tablespace.

**Max rows per page**

Specify the number of rows (1-255) that can be placed on each data page.

### Space Management

**Free space portion of each page (%)**

If you did not select a Creation Type of LOB, specify the percentage of each page to be left as free space when a tablespace is reloaded or reorganized.

**Free page frequency**

If you did not select a Creation Type of LOB, specify how often to leave a free page when a tablespace is reloaded or reorganized.

### Other parameters

**GBPCACHE**

Select a group buffer pool cache scheme of CHANGED, ALL, SYSTEM, or NONE.

**Compress**

Enable this setting to allow compression.

**Track modified pages**

Enable this setting to track modified pages in the space map pages.

**Encoding scheme**

Select an encoding scheme of EBCDIC, UNICODE, ASCII, or NONE.

**Log**

Enabling this check box specifies that changes to a LOB column are to be written to the log.
## Tablespaces Wizard (DB2 Z/OS)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Define</strong></td>
<td>Enabling this check box specifies that tablespace data sets are defined when the tablespace is created. Otherwise, data sets are not created until data is inserted.</td>
</tr>
<tr>
<td><strong>Member Cluster</strong></td>
<td>Enable this setting to manage space for inserts on a member-by-member basis.</td>
</tr>
<tr>
<td><strong>Close rule</strong></td>
<td>Enable this setting to specify CLOSE YES, dictating the data set close priority.</td>
</tr>
<tr>
<td><strong>Lock Size</strong></td>
<td>Specify a lock size of ANY, TABLESPACE, PAGE, or ROW.</td>
</tr>
<tr>
<td><strong>Maximum locks</strong></td>
<td>Specify the number of locks that are allowed before escalating.</td>
</tr>
</tbody>
</table>
Triggers Wizard (DB2 Z/OS)

All data in a database is stored in a tabular format, that is a collection of rows and columns. Tables, therefore are fundamental to whatever database you are administering.

To create a new trigger using a wizard:

1. Open a creation wizard for a trigger. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Triggers (DB2 z/OS) - Properties.
   - Column Selection panel - for details, see Triggers (DB2 z/OS) - Column Selection.
   - Definition panel - for details, see Triggers (DB2 z/OS) - Definition.
3. Finally, use the Execute button to create the object.

Triggers (DB2 z/OS) - Properties

When creating or editing a trigger, this tab/panel lets you work with the following settings:
Triggers Wizard (DB2 Z/OS)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table and Schema Name</td>
<td>Choose the owner and name of the table for which the trigger is being created.</td>
</tr>
<tr>
<td>Table Name</td>
<td>Choose the owner and name of the trigger being created.</td>
</tr>
<tr>
<td>Trigger Timing</td>
<td>BEFORE: These triggers serve as extensions to the constraint subsystem and are most often used to validate input data, generate values for newly inserted rows, and read from other tables for cross-reference purposes. Note: Before triggers must be created as a For Each Row. AFTER: Such a trigger is run after the integrity constraint validations; they can be used to modify operations in the database or be used for activities beyond the database, like supporting an alert notification.</td>
</tr>
<tr>
<td>Trigger Events</td>
<td>An INSERT trigger must be associated with an INSERT statement. For example, if a data load operation doesn’t include an INSERT statement, the trigger will not be invoked. An UPDATE trigger can be associated with specific columns of the base table and will only be activated if those columns are updated.</td>
</tr>
<tr>
<td>Trigger Type</td>
<td>STATEMENT: (only fires once). ROW (fires for each affected row): The trigger runs as many times as there are rows in the affected section. If the set of affected rows is empty, the trigger doesn’t run.</td>
</tr>
<tr>
<td>Old Table Alias</td>
<td>Type the name of a temporary table of rows as they exist before they’re updated or deleted.</td>
</tr>
<tr>
<td>New Table Alias</td>
<td>Type a name for a temporary table of rows as they exist after they’re inserted or updated.</td>
</tr>
<tr>
<td>Old Row Alias</td>
<td>Type a name for the rows as they are before they’ve been deleted or updated.</td>
</tr>
<tr>
<td>New Row Alias</td>
<td>Type a name for the rows as they are after they’ve been inserted or updated.</td>
</tr>
</tbody>
</table>

Triggers (DB2 z/OS) - Column Selection

If you chose UPDATE as the Trigger Event, select the columns, select the check box beside each column that is to fire the trigger.

Triggers (DB2 z/OS) - Definition

Complete the CREATE TRIGGER outline provided by typing or pasting the body of the trigger.
Unique Keys Wizard (DB2 Z/OS)

A unique key constraint is a key for which no two of its values can be equal and no values can be null. A table can have a number of unique constraints, but it cannot have more than one unique constraint on the same set of columns. If you are creating a unique key constraint on a table that already exists (as opposed to creating a unique key at the time the table is first generated), a unique index must already exist on the columns of the unique key you want to constrain. If no unique index exists, the Index Wizard will open as you complete the Create Unique Key Constraint dialog.

To create a new unique key using a wizard:

1. Open a creation wizard for a unique key. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Unique Keys (DB2 z/OS) - Properties.
   - Columns panel - for details, see Unique Keys (DB2 z/OS) - Columns.
   - Storage panel - for details, see Unique Keys (DB2 z/OS) - Storage - Edit button (manage datasets) and Unique Keys (DB2 z/OS) - Storage - Attributes.
   - Partitions panel - for details, see Unique Keys (DB2 z/OS) - Partitions.
   - Comment panel - for details, see Adding a Comment to an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Unique Keys (DB2 z/OS) - Properties

When creating or editing a primary key, this tab/panel lets you work with the following settings:
Unique Keys Wizard (DB2 Z/OS)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Schema and Table Name</td>
<td>Choose the owner and name of the table in which the unique key is being created.</td>
</tr>
<tr>
<td>Schema and Name</td>
<td>Choose the owner and name of the index being created.</td>
</tr>
<tr>
<td>Clustered</td>
<td>Enable or disable clustering.</td>
</tr>
<tr>
<td>Number of Partitions</td>
<td>If you enabled Clustering, specify the number of partitions.</td>
</tr>
<tr>
<td>Buffer Pool</td>
<td>Provide the buffer pool in which this unique key should reside</td>
</tr>
<tr>
<td>Defer, Close, Copy, and Define</td>
<td>Enable or disable these DB2 options as required.</td>
</tr>
<tr>
<td>Piece Size</td>
<td>The maximum addressability of the dataset for a non-partitioned index.</td>
</tr>
<tr>
<td>Time period policy</td>
<td>This setting is for use with tables set up as business-time tables. For more information, see Tables (DB2 z/OS v10) - Temporal Properties. When selected, a BUSINESS_TIME WITHOUT OVERLAPS option is specified against the column or columns defining the constraint, in the generated DDL. This ensures that values for the constraint columns are unique with respect to the time for the BUSINESS_TIME period. When you select this option, columns specified as business-time begin period and end period are not available as candidates on the Columns tab/panel.</td>
</tr>
</tbody>
</table>

Unique Keys (DB2 z/OS) - Columns

From the Column dropdown, select a column for the unique key and specify a Sort option. To add more columns, click the New button and then follow the steps in the last instruction. Use the Delete button to drop columns.

Unique Keys (DB2 z/OS) - Storage - Edit button (manage datasets)

Note: Availability differs according to the dataset management options you chose

Choose a data set management option:

DB2 will define and manage the data sets on a volume of the default storage group of the database

DB2 will define and manage the data sets on a volume of the specified storage group
Select a storage group (a storage group is made up of disk device volumes): Each data set will be defined on a volume listed in the storage group you select.

**Minimum primary space allocation:** 12 kilobytes is the default.

**Minimum secondary space allocation:** 12 kilobytes is the default.

**Note:** If the primary and (118 x) secondary space allocations combine to be greater than 2 gigabytes, more than one data set may eventually be used.

**Erase data sets when index dropped?** If you choose this option, DB2 will overwrite all data with zeros before they are deleted as a security measure.

**User will manage the data sets on a specified VCAT catalog-name** Enter or select the VCAT. Do not select this option for an index on a declared temporary table.

### Unique Keys (DB2 z/OS) - Storage - Attributes

**Note:** Availability differs according to the dataset management options you chose

When creating or editing a unique key, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storage Group, Primary Space Allocation, Secondary Space Allocation, Erase, and VCAT catalog</td>
<td>The ability to set these options depends on the dataset management options you chose.</td>
</tr>
<tr>
<td>Free Page</td>
<td>One free page exists for every x pages. The x specifies how often to leave a page of free space when index entries are created from executing a DB2 utility or creating an index for a table with pre-existing rows. (0-255)</td>
</tr>
<tr>
<td>Percent Free</td>
<td>The percentage of free space you want to leave in every page when entries are added to an existing index. The default is 10%.</td>
</tr>
<tr>
<td>GBP Cache</td>
<td>This option is available only in a data-sharing environment. ALL: As pages are read, all of them will be cached in the group buffer pool. CHANGED: Updated pages are cached to the group buffer pool. NONE: No pages will be cached.</td>
</tr>
</tbody>
</table>

### Unique Keys (DB2 z/OS) - Partitions

Displays the default settings for the number of partitions you specified on the Properties pane. Select a partition and click the **Edit** button to modify details for that partition.
User Datatypes Wizard (DB2 Z/OS)

A datatype is a named set of valid values that can be manipulated by a set of operations. There are intrinsic datatypes, which are predefined and always available, and derived datatypes. A derived datatype is a user-defined datatype, which can include both intrinsic and previously derived datatypes. The User Datatype Wizard lets you create a derived datatype without knowing the underlying commands.

To create a new user datatype using a wizard:

1. Open a creation wizard for a user datatype. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see User Datatypes (DB2 z/OS) - Properties.
   - **Comment** panel - for details, see Adding a Comment to an Object.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

User Datatypes (DB2 z/OS) - Properties

When creating or editing a user datatype, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Owner</strong></td>
<td>Select the owner of the user datatype.</td>
</tr>
<tr>
<td><strong>Datatype</strong></td>
<td>Provide a name for the datatype.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Select the base datatype.</td>
</tr>
<tr>
<td><strong>Size</strong></td>
<td>Provide the size of the datatype.</td>
</tr>
<tr>
<td><strong>For Data</strong></td>
<td>Select the MIXED, SBCS, or BIT option for the datatype.</td>
</tr>
<tr>
<td><strong>CCSID</strong></td>
<td>Select the NONE, ASCII, EBCDIC, or UNICODE option for the datatype.</td>
</tr>
</tbody>
</table>
Users Wizard (DB2 Z/OS)

Users have authorization to use a database and its objects, and the User Wizard gives you an easy way to add new ones.

To create a new user using a wizard:

1. Open a creation wizard for a user. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Users (DB2 z/OS) - Properties.
   - Object Permissions and System Permissions panels - Setting Permissions or Privileges for an Object
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Users (DB2 z/OS) - Properties

When creating or editing a user datatype, this tab/panel lets you provide the user Name.
A view gives you a new way of looking at data in a results table. Views behave like tables because you can query views and perform data manipulation operations on them. However, views do not actually store any data. Instead, they depend on data contained in their base tables. Columns added to the base table(s) after the view is created are not included in the result set. Views are thus handy tools for controlling access to a table. You can allow someone to see portions of data without allowing that user to see the table in its entirety. For example, you can create a view that will permit a user to see employee names in a table without allowing access to the Social Security numbers of that same table.

The wizard itself is a single panel. After you complete the wizard, the View Editor opens so you can complete the definition of the view, choose the columns to show in the view, the dependencies, and access privileges to the view.

**To create a new view using a wizard:**

1. Open a creation wizard for a view. For details, see *Opening an Object Wizard*.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see *Views (DB2 z/OS) - Properties*.
   - **Definition** panel - for details, see *Views (DB2 z/OS) - Definition*.
3. Finally, use the **Execute** button to create the object.

**Views (DB2 z/OS) - Properties**

When creating or editing a view, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the view. The owner of the view must have SELECT privileges for the tables in the CREATE view statement or DBADM authority on the database that contains the table.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the view.</td>
</tr>
<tr>
<td>Check Type</td>
<td><strong>CHECK_NONE</strong> - No search conditions must be satisfied for insert or update operations. <strong>CHECK_LOCAL</strong> - Update and insert operations on view must satisfy the search conditions of the view and underlying views that are defined with a check option. Furthermore, every updatable view that is directly or indirectly defined on view inherits those search conditions (the search conditions of view and all underlying views of that are defined with a check option) as a constraint on insert or update operations. <strong>CHECK CASCADED</strong> - Update and insert operations on the view must satisfy the search conditions of view and all underlying views, regardless of whether the underlying views were defined with a check option. Furthermore, every updatable view that is directly or indirectly defined on view inherits those search conditions (the search conditions of view and all underlying views) as a constraint on insert or update operations.</td>
</tr>
</tbody>
</table>

**Views (DB2 z/OS) - Definition**

Complete the CREATE VIEW statement by typing or pasting in the relevant query.
Microsoft SQL Server Object Wizards

You create SQL Server objects using the following wizards:

- Alerts Wizard (SQL Server)
- Asymmetric Keys Wizard (SQL Server)
- Backup Devices Wizard (SQL Server)
- Certificate Wizard (SQL Server)
- Databases Wizard (SQL Server)
- Database Triggers Wizard (SQL Server)
- Defaults Wizard (SQL Server)
- Extended Procedures Wizard (SQL Server)
- Foreign Keys Wizard (SQL Server)
- Full-text Catalogs Wizard (SQL Server)
- Full-text Indexes Wizard (SQL Server)
- Functions Wizard (SQL Server)
- Indexes Wizard (SQL Server)
- Jobs Wizard (SQL Server)
- Linked Servers Wizard (SQL Server)
- Logins Wizard (SQL Server)
- Operators Wizard (SQL Server)
- Partition Functions Wizard (SQL Server)
- Partition Schemes Wizard (SQL Server)
- Primary Keys Wizard (SQL Server)
- Procedures Wizard (SQL Server)
- Remote Servers Wizard (SQL Server)
- Roles Wizard (SQL Server)
- Rules Wizard (SQL Server)
- Schema Wizard (SQL Server)
- Sequences Wizard (SQL Server)
- Server Triggers Wizard (SQL Server)
Microsoft SQL Server Object Wizards

- Symmetric Keys Wizard (SQL Server)
- Synonyms Wizard (SQL Server)
- Tables Wizard (SQL Server)
- Triggers Wizard (SQL Server)
- Unique Keys Wizard (SQL Server)
- User Messages Wizard (SQL Server)
- Users Wizard (SQL Server)
- User Datatypes Wizard (SQL Server)
- Views Wizard (SQL Server)
Alerts Wizard (SQL Server)

The Alerts Wizard lets you build and submit an `sp_add_alert` call to create a SQL Agent Alert. You can create event-based, performance-based, or WMI-based alerts. Job-based and operator-based responses are available.

**Note:** For an overview of SQL Agent service support, see [SQL Server Agent](#).

**To create a new alert using a wizard:**

1. Open an object creation wizard for an alert. For details, see [Opening an Object Wizard](#).
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details see [Alerts (SQL Server) - Properties](#).
   - **Response** panel - for details see [Alerts (SQL Server) - Response](#).
   - **DDL View** panel - for details, see [Previewing the DDL Generated to Create the New Object](#).
3. Finally, use the **Execute** button to create the object.

For information on related SQL Agent elements, see the following topics:

- [Jobs Wizard (SQL Server)](#)
- [Operators Wizard (SQL Server)](#)

**Alerts (SQL Server) - Properties**

When creating or editing an alert, this tab/panel lets you select an alert type and provide details on the type selected. It has the following settings:

<table>
<thead>
<tr>
<th>Category</th>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creation</td>
<td>Name</td>
<td>Provide a name for the alert.</td>
</tr>
<tr>
<td></td>
<td>Enabled</td>
<td>Select this check box to enable the alert.</td>
</tr>
<tr>
<td></td>
<td>Type</td>
<td>Select an alert type of SQL SERVER EVENT ALERT, SQL SERVER PERFORMANCE CONDITION ALERT, or WMI EVENT ALERT</td>
</tr>
<tr>
<td>Alert definition</td>
<td>If you selected a <strong>Type</strong> of SQL SERVER EVENT ALERT, select or provide the following details</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Error #</td>
<td>Type a valid, native or user-defined error number.</td>
</tr>
<tr>
<td></td>
<td>Error Description</td>
<td>Displays the textual description for the <strong>Error #</strong> you specified.</td>
</tr>
</tbody>
</table>
Alerts Wizard (SQL Server)

**Severity**
Select a severity to be associated/displayed for this alert.

**Database**
If you want to restrict this alert to be reported on a specific database, select a specific database.

**Event Description**
Provide a textual description to be displayed with the alert.

If you selected a *Type* of SQL SERVER PERFORMANCE CONDITION ALERT, select or provide the following details

**Object**

**Counter**
Select a counter specific to the performance **Object** you selected.

**Instance**
If a specific instance is available for the **Object** and **Counter** you selected, select an instance.

**Alert if counter and Value**
Use these settings to select the relational operator (<, =, or >) and value that make up the condition for which the alert is generated.

If you selected a *Type* of WMI EVENT ALERT, select or provide the following details

**Namespace**
Type the WMI namespace for the WMI Query Language (WQL) statement that identifies which WMI event will trigger this alert.

**Query**
Type the WQL statement that identifies the event that this alert responds to.

**Alerts (SQL Server) - Response**

When creating or editing an alert, this tab/panel lets you specify details of responses to the alert. It lets you specify a job to be executed as well as details of email, pager or net send notifications. You work with the following settings:

<table>
<thead>
<tr>
<th>Category</th>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Job Properties</strong></td>
<td><strong>Execute Job</strong></td>
<td>Select this check box to have a job executed on this alert.</td>
</tr>
<tr>
<td></td>
<td><strong>Job Name</strong></td>
<td>If you selected <strong>Execute Job</strong>, select the specific job to execute.</td>
</tr>
</tbody>
</table>
Include alert error text in

Use the Email, Pager, and Net send controls to specify whether a textual description of the SQL Server error is to be included as part of the notification message for the target media.

Additional Properties

Notification message

Use this control to add an optional additional message that will be sent to the operator as part of the notification.

Delay Between Responses

The wait period, in seconds, between responses to the alert.

Operators to notify

The list displays all defined operators. Use the Email, Pager, and Net send controls to select the operators and the media by which they will be contacted for this alert.

Note: The New Job and New Operator buttons let you open the Jobs Wizard and Operators Wizard, respectively. For details, see Jobs Wizard (SQL Server) and Operators Wizard (SQL Server).
Asymmetric Keys Wizard (SQL Server)

This wizard lets you build and submit a CREATE ASYMMETRIC KEY statement with options corresponding to the contained private and public keys.

To create a new asymmetric key using a wizard:

1. Open a creation wizard for an asymmetric key. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties panel** - Asymmetric Keys (SQL Server) - Properties.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Asymmetric Keys (SQL Server) - Properties

When creating or editing an asymmetric key, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Availability and description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Authorization</strong></td>
<td>The name of the user that will own the certificate.</td>
</tr>
<tr>
<td><strong>Owner</strong></td>
<td>The name for the certificate.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>The name for the certificate.</td>
</tr>
<tr>
<td><strong>Use Existing Keys</strong></td>
<td>Selected, a WITH ALGORITHM option variation of the CREATE ASYMMETRIC KEY statement is generated. Deselected, a FROM FILE, FROM EXECUTABLE FILE, FROM ASSEMBLY, or FROM PROVIDER option variation of the CREATE ASYMMETRIC KEY statement is generated.</td>
</tr>
<tr>
<td><strong>Provider Name</strong></td>
<td>Available if Use Existing Keys is not selected. Lets you provide a FROM PROVIDER argument value, specifying an Extensible Key Management provider and name.</td>
</tr>
<tr>
<td><strong>Key Algorithm</strong></td>
<td>Available if Use Existing Keys is not selected. Lets you select a WITH ALGORITHM value of RSA_512, RSA_1024, or RSA_2048, specifying the key length.</td>
</tr>
<tr>
<td><strong>Key Name In Provider</strong></td>
<td>Available if Use Existing Keys is not selected, after Provider Name is entered. Lets you provide a PROVIDER_KEY_NAME value, specifying the key name from the external provider.</td>
</tr>
<tr>
<td><strong>Creation Disposition</strong></td>
<td>Lets you select a CREATION_DISPOSITION value of OPEN_EXISTING or CREATE_NEW, specifying whether the asymmetric key is mapped to an existing EKM key or a new key is created on the EKM device.</td>
</tr>
<tr>
<td><strong>File</strong></td>
<td>Available if Use Existing Keys is selected. Let you provide FROM FILE, FROM EXECUTABLE FILE, FROM ASSEMBLY, or FROM PROVIDER option values, respectively.</td>
</tr>
<tr>
<td><strong>Executable File</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Assembly</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Provider Name</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Encryption Password</strong></td>
<td>Available if Use Existing Keys is not selected and after Subject is provided. Lets you provide an ENCRYPTION BY PASSWORD = clause value, specifying the password used to encrypt the private key.</td>
</tr>
</tbody>
</table>
Backup Devices Wizard (SQL Server)

The Backup Device Wizard lets you add a disk or tape backup device to a SQL Server instance. Backup devices store backups of databases and transaction logs.

Before you can dump a database or its transaction log, first link to a backup device that stores the resulting backup file.

To create a new backup device using a wizard:

1. Open a creation wizard for a backup device. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Backup Devices (SQL Server) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Backup Devices (SQL Server) - Properties

When creating or editing a backup device, this tab panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Lets you provide a logical name for the backup device.</td>
</tr>
<tr>
<td>Device Type</td>
<td>DISK and TAPE are supported.</td>
</tr>
<tr>
<td>Physical Name</td>
<td>The physical name of the device. This value can be any simple file name (sqltable.dat for example) or full path (a:\sqltable.dat for example) that is recognized by the operating system.</td>
</tr>
</tbody>
</table>
Certificate Wizard (SQL Server)

This wizard lets you build and submit a CREATE CERTIFICATE statement, adding a certificate to a database.

To create a new certificate using a wizard:

1. Open a creation wizard for a certificate. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Certificates (SQL Server) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Certificates (SQL Server) - Properties

When creating or editing a certificate, this tab/panel lets you work with the following settings:
## Certificate Wizard (SQL Server)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Availability and description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Owner</strong></td>
<td>The name of the user that will own the certificate.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>The name for the certificate.</td>
</tr>
<tr>
<td><strong>Use Existing Keys</strong></td>
<td>Lets you choose between EXISTING KEYS and GENERATE NEW KEYS options.</td>
</tr>
<tr>
<td><strong>Active For Begin Dialog</strong></td>
<td>Lets you select ON/Off values for an ACTIVE FOR BEGIN_DIALOG = option.</td>
</tr>
<tr>
<td><strong>Subject</strong></td>
<td>Available if <strong>Use Existing Keys</strong> is not selected.</td>
</tr>
<tr>
<td></td>
<td>Lets you provide a WITH SUBJECT = clause value, referring to a field in the certificate metadata.</td>
</tr>
<tr>
<td><strong>StartDate</strong> and <strong>ExpiryDate</strong></td>
<td>Available if <strong>Use Existing Keys</strong> is not selected and after <strong>Subject</strong> is provided.</td>
</tr>
<tr>
<td></td>
<td>Lets you provide START_DATE = and EXPIRY_DATE = values, defining the period that the certificate is valid</td>
</tr>
<tr>
<td><strong>Assembly</strong></td>
<td>Available if <strong>Use Existing Keys</strong> is selected.</td>
</tr>
<tr>
<td></td>
<td>These controls let you select among FROM ASSEMBLY =, FROM FILE =, FROM EXECUTABLE FILE = clauses and provide the relevant signed assembly, path to a DER-encoded certificate file, or path to a private key file.</td>
</tr>
<tr>
<td><strong>ExecutableFile</strong></td>
<td>Available if <strong>Use Existing Keys</strong> is selected.</td>
</tr>
<tr>
<td><strong>File</strong></td>
<td>Lets you provide a WITH PRIVATE KEY (FILE =... clause value, specifying that the certificate's private key is loaded.</td>
</tr>
<tr>
<td><strong>PrivateKeyFile</strong></td>
<td>Available if <strong>Use Existing Keys</strong> is selected.</td>
</tr>
<tr>
<td></td>
<td>Lets you provide a DECRYPTION BY PASSWORD = clause value, specifying the password used to decrypt a private key retrieved from file.</td>
</tr>
<tr>
<td><strong>Encryption Password</strong></td>
<td>Available if <strong>Use Existing Keys</strong> is not selected and after <strong>Subject</strong> is provided.</td>
</tr>
<tr>
<td></td>
<td>Lets you provide an ENCRYPTION BY PASSWORD = clause value, specifying the password used to encrypt the private key.</td>
</tr>
<tr>
<td><strong>DecryptionPassword</strong></td>
<td>Available if <strong>Use Existing Keys</strong> is not selected. Also available if <strong>Use Existing Keys</strong> is selected and after an <strong>Assembly</strong> or <strong>PrivateKeyFile</strong> value is provided.</td>
</tr>
<tr>
<td></td>
<td>Lets you provide a DECRYPTION BY PASSWORD = clause value, specifying the password used to decrypt a private key retrieved from file.</td>
</tr>
</tbody>
</table>
Databases Wizard (SQL Server)

The Database Wizard presents you with a different set of options based on your server version to create the database accurately on each platform.

**Tip:** Microsoft SQL Server recommends that you do not create any user objects, such as tables, views, stored procedures, or triggers, in the master database. The master database includes the system tables that store the system information used by SQL Server, such as configuration option settings.

**To create a new database using a wizard:**

1. Open a creation wizard for a database. For details, see [Opening an Object Wizard](#).

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:

   - **Options** panel - for details, see [Databases (SQL Server) - Options](#).
   - **Placement** panel - for details, see [Databases (SQL Server) - Placement](#).
   - **Transaction Log** panel - for details, see [Databases (SQL Server) - Transaction Log](#).
   - **DDL View** panel - for details, see [Previewing the DDL Generated to Create the New Object](#).

3. Finally, use the **Execute** button to create the object.

**Databases (SQL Server) - Options**

When creating or editing a database, this tab/panel lets you work with the following settings:
## Databases Wizard (SQL Server)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Provide a name for the database.</td>
</tr>
<tr>
<td>Attach existing OS files</td>
<td>To create a database from an existing set of operating system files, there must be a <code>&lt;filespec&gt;</code> entry for the first PRIMARY file. The PRIMARY filegroup contains all the database system tables. Primary files have a <code>.mdf</code> extension.</td>
</tr>
<tr>
<td>Compatible Level</td>
<td>Select a version compatibility level.</td>
</tr>
<tr>
<td>Properties group</td>
<td>Select the following settings: ANSI null default, ANSI nulls, ANSI padding, ANSI warnings, auto create statistics, auto update statistics, autoclose, autoshrink, concat null yields null, cursor close on commit, arithabort, <code>db chaining</code>, <code>dbo use only</code>, default to local cursor, merge publish, numeric roundabout, offline, published, quoted identifier, read only, recursive triggers, select into/bulkcopy/pin sort, single user, subscribed, torn page detection, and <code>trunc log on chkpt</code>.</td>
</tr>
</tbody>
</table>

### Databases (SQL Server) - Placement

Indicate the file where you want the database to live. For example, a new Books database could include author and title filegroups.

By default, when you open the Wizard and click the **Placement** tab, a filegroup definition, using the name you provided for the database and default settings, is displayed. For each filegroup to be added, click the **New** button, provide a **Device File Name** for the filegroup, and use the **File Group Properties** and **Device File Properties** groups to provide the attributes of the filegroup.

Use the Delete button to delete a selected filegroup.

### Databases (SQL Server) - Transaction Log

The transaction log file is a required file for each database. This file holds the log information to recover the database. There can be multiple log files for a database, but there has to be at least one. Traditionally the log file extension has been `.ldf`.

By default, when you open the Wizard and click the **Transaction Log** tab, a transaction log file definition, using the name derived from the name you provided for the database and with default settings, is displayed. For each file to be added, click the **New** button, provide a **Device File Name**, and use the **Log Device Properties** group to provide the attributes of the file.

Use the Delete button to delete a selected file.

**Note:** As you complete the wizard, be aware that the Primary file contains startup information for the database and is also used to store data. The transaction log files hold the information used to recover the database.
Database Triggers Wizard (SQL Server)

This wizard builds and submits a CREATE TRIGGER... ON DATABASE statement, letting you create a DDL trigger with database scope, that fires in response to selected DDL events. The wizard builds basic syntax only, letting you provide the actions and conditions SQL making up the main body of the trigger.

**Note:** Before working with database triggers, consult Microsoft SQL Server documentation for general information on DDL triggers as well as specifics such as FOR/AFTER argument details, valid actions and conditions, and supported events. For more information, see [Accessing Third Party Documentation](#).

To create a new database trigger using a wizard:

1. Open a creation wizard for a database trigger. For details, see [Opening an Object Wizard](#).

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see [Database Triggers (SQL Server) - Properties](#).
   - **Trigger Events** panel - for details, see [Database Triggers (SQL Server) - Trigger Events](#).
   - **Definition** panel - for details, see [Previewing the DDL Generated to Create the New Object](#).

3. Finally, use the **Execute** button to create the object.

**Note:** In order to fire in response to specified events, a database trigger must be enabled. For information on enabling and disabling a database trigger, see [Database Triggers Editor (SQL Server)](#) and [Change Status (SQL Server DDL triggers)](#).

Database Triggers (SQL Server) - Properties

When creating or editing a database trigger, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Provide a name for the DDL trigger.</td>
</tr>
<tr>
<td>Trigger Timing</td>
<td>Use this control to specify a FOR/AFTER argument option. The specific events for the argument are provided on the Trigger Events tab/panel.</td>
</tr>
<tr>
<td>Encrypted</td>
<td>Select this check box to add a WITH ENCRYPTION argument to the generated DDL. This prevents the trigger from being published as part of a SQL Server replication.</td>
</tr>
</tbody>
</table>

**Database Triggers (SQL Server) - Trigger Events**

When creating or editing a database trigger, this tab/panel lets you specify the FOR/AFTER argument appearing in the generated CREATE TRIGGER... ON DATABASE syntax. For each event that is to fire this trigger, select the associated check box.
Defaults Wizard (SQL Server)

When bound to a column or user-defined object, a default ensures that a specific value will be inserted into the column where the object will be bound if no explicit value is given.

The Default Wizard lets you name the default and specify its value.

To create a new default using a wizard:

1. Open a creation wizard for a default. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Defaults (SQL Server) - Properties.
   - Dependencies panel - Defaults (SQL Server) - Dependencies.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Defaults (SQL Server) - Properties

When creating or editing a default, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schema</td>
<td>Select the schema that is to own the default.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the default.</td>
</tr>
<tr>
<td>Value</td>
<td>Provide the value of the default.</td>
</tr>
</tbody>
</table>

Defaults (SQL Server) - Dependencies

From the Type dropdown, choose Column or Datatype, and if you chose Column, choose a Table from the Table dropdown. The list on the left is populated with candidate columns or datatypes. To move a candidate from the list on the left to the dependencies column on the right, select the candidate and click Add. Remove columns or datatypes from the dependencies list on the right by selecting the column or datatype and clicking Remove.
Extended Procedures Wizard (SQL Server)

Extended Procedures are dynamic link libraries that can be used to load and execute application routines written in other programming languages, such as C or Visual Basic. Extended Procedures function and appear in the same manner as SQL Server stored procedures in that you can pass parameters to them and obtain results.

Extended stored procedures provide a method for calling procedural language functions from within the Adaptive Server.

**Note:** Extended procedures can only be created in the Master database.

**To create a new Extended procedure using a wizard:**

1. Open a creation wizard for an extended procedure. For details, see *Opening an Object Wizard*.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - *Extended Procedures (SQL Server) - Properties*.
   - **DDL View** panel - for details, see *Previewing the DDL Generated to Create the New Object*.
3. Finally, use the **Execute** button to create the object.

Extended Procedures (SQL Server) - Properties

When creating or editing an extended procedure, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Owner</strong></td>
<td>Select the owner of the extended procedure.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the extended procedure.</td>
</tr>
<tr>
<td><strong>Library</strong></td>
<td>Provide the name of the DLL containing the extended procedure.</td>
</tr>
</tbody>
</table>
Foreign Keys Wizard (SQL Server)

Foreign keys are unique values that refer to specific columns of other tables. Thus, a foreign key links two tables together. The Foreign Key Wizard makes it easy for you to create a relational link between two tables, thereby speeding queries and giving you faster access to data. The column in the initial table, the parent table, is called the primary key. The corresponding column in the (child) table that references the primary key, is the foreign key. Foreign keys can also refer to columns within the same table.

To create a new Foreign Key using a wizard:

1. Open a creation wizard for a foreign key. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Foreign Keys (SQL Server) - Properties.
   - Column Mapping panel - Foreign Keys (SQL Server) - Column Mapping.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Foreign Keys (SQL Server) - Properties

When creating or editing a foreign key, this tab/panel lets you work with the following settings:
## Setting Description

### Table Owner and Table Name
Select the owner and name of the table for which the foreign key is being created.

### Name
Provide a name for the foreign key.

### Enabled
Enables or disables the foreign key.

### With NOCHECK
Specifies whether the data in the table is validated against a newly added or re-enabled foreign key.

### Not For Replication
Replication copies and distributes data and database objects from one database to another and then synchronizes information between databases for consistency.

### Delete Rule
If you choose the CASCADE option, all rows containing data involved with the foreign key will be deleted after a delete operation.

### Update Rule
If you choose the CASCADE option, all rows containing data involved with the foreign key will be deleted after an update operation.

## Foreign Keys (SQL Server) - Column Mapping

Under **Referenced Table**, choose the **Owner** and then the **Name** of the referenced, or parent, table.

Under the **Main Table**, select check boxes corresponding to the columns that are to reference columns in the referenced table. Then, under **Referenced Table**, select the corresponding column check boxes.
Full-text Catalogs Wizard (SQL Server)

This wizard builds and submits a CREATE FULLTEXT CATALOG statement. This lets you add a full-text catalog to a database, specifying accent sensitivity and an owner, and letting you define the catalog as the default full-text catalog. You can also provide filegroup and root directory details.

Along with full-text indexes, full-text catalogs facilitate full-text searching. For related information, see Full-text Indexes Wizard (SQL Server).

Note: Full-text catalogs cannot be created in the master catalog.

Note: Before working with full-text catalogs, consult Microsoft SQL Server documentation for general information on full-text searching and detailed information on topics such as restrictions on where these objects can be created, required permissions, virtual object and filegroup considerations, and the relationship with full-text indexes and the default collation. For more information, see Accessing Third Party Documentation.

To create a new full-text catalog using a wizard:

1. Open a creation wizard for a full-text catalog. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Full-text Catalogs (SQL Server) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Full-text Catalogs (SQL Server) - Properties

When creating or editing a full-text catalog, this tab/panel lets you work with the following settings:
### Setting | Description
--- | ---
**Name** | Provide a name for the catalog.  
**Filegroup** | Selecting a filegroup adds an explicit ON FILEGROUP clause, specifying the selected filegroup to which the catalog will belong. If not specified, the new catalog will be part of the default filegroup used for all full-text catalogs.  
**Path** | Specifying a path adds an explicit IN PATH clause, specifying the root directory for the catalog. If no path is specified, the new catalog will be located in the default directory specified during setup.  
**Accent Sensitive** | Lets you specify a WITH ACCENT_SENSITIVITY = ON/OFF clause, reflecting the selected/deselected status of the check box.  
**Default** | Select this check box to add an AS DEFAULT argument, specifying that this catalog is the default full-text catalog. If an existing full-text catalog is currently specified as the default, this catalog becomes the new default.  
**Authorization Owner** | Select a user or role to add an AUTHORIZATION argument that sets the owner of the full-text catalog.
Full-text Indexes Wizard (SQL Server)

This wizard lets you build and submit a CREATE FULLTEXT INDEX statement, adding a full-text index for a table or indexed view. Along with full-text catalogs, full-text indexes facilitate full-text searching.

**Note:** Full-text indexes cannot be created in the master catalog.

**Note:** Before working with full-text indexes, consult Microsoft SQL Server documentation for general information on full-text searching and detailed information on topics such as required permissions, column specification details, recommended datatype, and XML considerations. For more information, see Accessing Third Party Documentation.

**To create a new full-text index using a wizard:**

1. Open a creation wizard for a full-text index. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Full-text Indexes (SQL Server) - Properties.
   - **Columns** panel - for details, see Full-text Indexes (SQL Server) - Columns.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the **Execute** button to create the object.

Full-text Indexes (SQL Server) - Properties

When creating or editing a full-text index, this tab/panel lets you work with the following settings:
Full-text Indexes Wizard (SQL Server)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent Type</td>
<td>Select table or indexed view.</td>
</tr>
<tr>
<td>Parent Schema</td>
<td>The parent's owning schema.</td>
</tr>
<tr>
<td>Parent Name</td>
<td>Select the name of the table or indexed view on which the index is to be created.</td>
</tr>
<tr>
<td>Key Index</td>
<td>Select the unique key index on the table or view that will be used as the value for the KEY INDEX argument.</td>
</tr>
<tr>
<td>Full-text Catalog Name</td>
<td>Select an existing full-text catalog. For information on creating full-text catalogs, see Full-text Catalogs Wizard (SQL Server). If you do not select a catalog, SQL Server will assign the index to the default full-text catalog, generating an error if no default exists.</td>
</tr>
<tr>
<td>Filegroup Name (SQL Server 2008 ^)</td>
<td>Select the filegroup that the index is to be created on. Specifying no filegroup results in SQL Server default behavior, placing the index in the same filegroup as the base table or view for a non-partitioned table or in the PRIMARY filegroup for a partitioned table.</td>
</tr>
<tr>
<td>Change Tracking</td>
<td>Select a CHANGE_TRACKING argument value of MANUAL, AUTO, OFF, or OFF, NO POPULATION to specify whether changes to columns covered by the full-text index will be propagated to the full-text index.</td>
</tr>
<tr>
<td>Stoplist (SQL Server 2008 ^)</td>
<td>Select a STOPLIST argument value of OFF to specify that no stoplist be associated with the index or SYSTEM to specify that the default full-text system STOPLIST be used for this index.</td>
</tr>
</tbody>
</table>

Full-text Indexes (SQL Server) - Columns

When creating or editing a full-text index, this tab/panel lets you specify the columns that make up the index:

- For each column to include in the full-text index, select the associated **Indexed** check box.
- Optionally, select a language from the associated **Language** column.
- For varbinary(max) and image columns, provide a TYPE COLUMN argument filename extension.
**Functions Wizard (SQL Server)**

Functions are subroutines that you define so you can reuse code without having to reinvent the wheel each time. You can use functions to determine the best methods for controlling access and manipulation of the underlying data contained in an object. A function returns a value, unlike a stored procedure, which does not.

- To create a user-defined function, you need CREATE ANY privileges or IMPLICIT_SCHEMA authority on the database if the schema does not already exist.

**To create a new function using a wizard:**

1. Open a creation wizard for a function. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Functions (SQL Server) - Properties.
   - **Definition** panel - for details, see Functions (SQL Server) - Definition.
3. Finally, use the **Execute** button to create the object.

### Functions (SQL Server) - Properties

When creating or editing a function, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Owner</strong></td>
<td>Select the owner of the function.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the function.</td>
</tr>
<tr>
<td><strong>Schema</strong></td>
<td>Choose whether the function is bound to database objects that it references.</td>
</tr>
<tr>
<td><strong>Encryption</strong></td>
<td>Choose whether SQL Server encrypts table columns that contain the text of the CREATE FUNCTION statement.</td>
</tr>
</tbody>
</table>

### Functions (SQL Server) - Definition

Complete the CREATE FUNCTION outline provided by typing or pasting the body of the function.
Indexes Wizard (SQL Server)

Like an index in a book, a table index helps you get at the data you want without having to read through the whole table. Indexes can exist on single column or on multiple columns. Indexes appear in the form of B-trees. And, as for books, you can have multiple indexes for a single table. You can also create indexes for a view.

To create a new index using a wizard:

1. Open a creation wizard for an index. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Indexes (SQL Server) - Properties.
   - Columns panel - Indexes (SQL Server) - Columns.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Indexes (SQL Server) - Properties

When creating or editing an index, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parent Type</strong></td>
<td>Select TABLE or VIEW.</td>
</tr>
<tr>
<td><strong>Parent Owner</strong></td>
<td>Select the owner of the table or view.</td>
</tr>
<tr>
<td><strong>Parent Name</strong></td>
<td>Select the specific table or view containing the columns you want to index.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the index.</td>
</tr>
<tr>
<td><strong>Build Online</strong></td>
<td>Enabling this feature specifies that the ONLINE=ON clause is used when creating this object and can subsequently be used when rebuilding or dropping this object.</td>
</tr>
<tr>
<td><strong>Max degree of parallelism</strong></td>
<td>Lets you specify a MAXDOP index operation value, limiting the number of processors used in parallel plan execution.</td>
</tr>
<tr>
<td><strong>Index Type</strong></td>
<td>Select UNIQUE or NONUNIQUE. An index is unique when no two rows are permitted to have the same index value. (Note: A clustered index on a view must be unique.) If an INSERT or UPDATE statement creates a duplicate value, the operation may fail.</td>
</tr>
<tr>
<td><strong>Clustered</strong></td>
<td>A clustered index is one in which the physical order of rows matches the order of indexed rows. A table or view can only have one clustered index at a time. In a nonclustered index, the physical order of rows is independent of the indexed order of rows. For an indexed view, you can only create a nonclustered index if there is already a clustered index extant. With this check box enabled, subsequent rebuild and drop operations offer an online option.</td>
</tr>
<tr>
<td><strong>Ignore Duplicate Key</strong></td>
<td>This option controls what happens when an attempt is made to insert a duplicate key value into a column that is part of a unique clustered index. If the option is selected and an INSERT statement that creates a duplicate key is executed, SQL Server issues a warning and ignores the duplicate row. If not selected, SQL Server issues an error message and rolls back the entire INSERT statement.</td>
</tr>
<tr>
<td><strong>Statistics Recompute</strong></td>
<td>Enabling this feature means queries involving the table run at the optimal level as distribution statistics are updated automatically when the index is created. If you disable this option, you can compromise query performance.</td>
</tr>
<tr>
<td><strong>Partitioned</strong></td>
<td>When selected, an ON clause is added to the CREATE TABLE statement, letting you specify a Partition Scheme, partitioning this table.</td>
</tr>
<tr>
<td><strong>Partition Scheme</strong></td>
<td>This property is only available if the Partitioned check box is selected. Select the partition scheme that specifies the filegroup mapping for this table. For information on creating partition schemes, see Partition Schemes Wizard (SQL Server).</td>
</tr>
<tr>
<td><strong>Partition Column</strong></td>
<td>This property is only available if the Partitioned check box is selected. Select the column that the index will be partitioned against.</td>
</tr>
</tbody>
</table>
Indexes Wizard (SQL Server)

Filegroup

This property is only available if the **Partitioned** check box is not selected. Select an existing, named filegroup to have the index stored on the specified filegroup. Select PRIMARY to have the index stored on the default database filegroup.

Fill Factor

Specifies the percentage that the Database Engine should make the leaf level of each index page when the index is created or rebuilt.

Pad Index

Enable or disable padding of index pages.

Sort in TempDB

Select to store the intermediate index sort results in tempdb. This option may reduce the time needed to create an index if tempdb is on a different set of disks than the user database, but it increases the amount of disk space used to create an index. In addition to the space required in the user database to create the index, tempdb must have about the same amount of additional space to hold the intermediate sort results.

Allow Row Locks and Allow Page Locks

NOTE: You cannot reorganize an index (primary key, or unique key) that has an **Allow Page Locks** property set to FALSE. For information on reorganizing indexes, see [Reorganize (SQL Server indexes, primary keys, and unique keys)](Reorganize (SQL Server indexes, primary keys, and unique keys)).

Indexes (SQL Server) - Columns

From the **Column** dropdown, select a column for the index and specify a **Sort** option. To add more columns, click the **New** button and then follow the steps in the last instruction. Use the Delete button to drop columns.
Jobs Wizard (SQL Server)

This wizard lets you create SQL Agent jobs. It lets you specify a category, set up associated notifications, create a step structure, set up schedules, work with associated alerts, and define a single or multiple server targets for the job.

Note: For an overview of SQL Agent service support, see SQL Server Agent.

To create a new job using a wizard:

1. Open an object creation wizard for a job. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details see Jobs (SQL Server) - Properties.
   - Steps panel - for details see Jobs (SQL Server) - Steps.
   - Schedules panel - for details see Jobs (SQL Server) - Schedules.
   - Alerts panel - for details see Jobs (SQL Server) - Alerts.
   - Target panel - for details see Jobs (SQL Server) - Target.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

For information on related SQL Agent elements, see the following topics:

- Alerts Wizard (SQL Server)
- Operators Wizard (SQL Server)

Jobs (SQL Server) - Properties

When creating or editing a SQL Agent job, this tab panel provides most settings of an sp_add_job call, letting you specify an enabled/disabled status and select a category, as well as specify notify and delete levels for the job. This tab has the following settings:

<table>
<thead>
<tr>
<th>Category</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creation</td>
<td>Owner and Name</td>
</tr>
<tr>
<td></td>
<td>Let you provide basic identification details.</td>
</tr>
<tr>
<td></td>
<td>Category</td>
</tr>
<tr>
<td></td>
<td>Lets you select the category to which the job belongs.</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>Lets you provide a textual description for the job.</td>
</tr>
<tr>
<td></td>
<td>Enabled</td>
</tr>
<tr>
<td></td>
<td>Lets you specify whether the job is enabled or disabled.</td>
</tr>
</tbody>
</table>
Notifications Each subcategory lets you specify when notifications should be sent or jobs deleted (NEVER, WHEN JOB SUCCCEEDS, WHEN JOB FAILS, or WHEN JOB COMPLETES).

The Email, Page, and Net send subcategories let you select the specific operator to which notifications are directed. For information on creating operators, see Operators Wizard (SQL Server).

The Windows application event log subcategory lets you select when an entry is placed in the Microsoft Windows application log for this job.

The Job Deletion subcategory lets you select when a job is deleted.

Jobs (SQL Server) - Steps

When creating or editing a job, this tab/panel lets you work with the steps for the job. You can use it to create one or more sp_add_jobstep calls that will be included as part of the job definition DDL.

To add a step to the job

1. Click the Add Step button, provide a Name for the step and press TAB or ENTER. The step is added to the step list with a set of default properties.

2. Modify the default properties using the table below as a guide.

Note: Properties available differ by the subsystem Type you select.
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is start step</td>
<td>Lets you designate this step as the first step in the job. Note that at least one step must have this check box selected. If you deselect this check box, the change does not actually take effect until you select the check box in another step.</td>
</tr>
<tr>
<td>Type</td>
<td>Lets you select the subsystem used by the SQL Server Agent service to execute the step: ACTIVESCRIPTING, CMDEXEC, DISTRIBUTION, SNAPSHOT, LOGREADER, MERGE, QUEUEREADER, ANALYSISQUERY, ‘ANALYSISCOMMAND, DTS, POWERSHELL (SQL Server 2008 only), or TSQL.</td>
</tr>
<tr>
<td>Database</td>
<td>The name of the database in which to execute the step.</td>
</tr>
<tr>
<td>Database user name</td>
<td>The user account to use when executing the step.</td>
</tr>
<tr>
<td>Command</td>
<td>The commands to be executed by the SQLServerAgent service through subsystem.</td>
</tr>
<tr>
<td>On success action</td>
<td>The job action to perform (QUIT WITH SUCCESS, QUIT WITH FAILURE, GO TO NEXT STEP, GO TO STEP: [N] STEPNAME) if the step succeeds.</td>
</tr>
<tr>
<td>Retry attempts</td>
<td>The number of retry attempts to use if the step fails.</td>
</tr>
<tr>
<td>Retry interval</td>
<td>The duration, in minutes, between retry attempts.</td>
</tr>
<tr>
<td>On fail action</td>
<td>The job action to perform (QUIT WITH SUCCESS, QUIT WITH FAILURE, GO TO NEXT STEP, GO TO STEP: [N] STEPNAME) if the step fails.</td>
</tr>
<tr>
<td>Output file</td>
<td>The name of the file in which the output of this step is saved</td>
</tr>
<tr>
<td>Append output to file</td>
<td>Lets you set the flags that control how the output file is written.</td>
</tr>
<tr>
<td>Log to table (overwrite)</td>
<td></td>
</tr>
<tr>
<td>Log to table (append)</td>
<td></td>
</tr>
<tr>
<td>and Output to history</td>
<td></td>
</tr>
</tbody>
</table>

To modify a job step

1. Select a step from the step list, and modify properties accordingly.

To delete a step from the job

1. Select a step from the step list and click **Delete**. If you delete the step that currently has the **Is start step** check box selected, the next lower step in the list becomes the first step. If there was no step below the deleted step, the first step in the list has its **Is start step** check box selected.

To change the order for a step

1. Select a step from the step list, and use the arrow buttons to move the step up or down one position.
Jobs (SQL Server) - Schedules

When creating or editing a job, this tab/panel lets you manage the schedules for a job. Specifically, you can:

- Create new schedules for this job
- Add schedules that were defined in other job definitions
- Delete schedules currently associated with the current job definition
- Display all jobs using a selected schedule

To add a schedule

1. Click **New**, provide a **Name** for the schedule and press TAB or ENTER. DBArtisan adds the schedule to the schedule list with a set of default properties.

2. Select a frequency **Type**: **START AUTOMATICALLY WHEN SQL SERVER AGENT STARTS, START WHENEVER THE CPUS BECOME IDLE, ONE TIME, DAILY, WEEKLY, MONTHLY, or MONTHLY RELATIVE TO FREQUENCY INTERVAL**.

3. Use the **Enabled** check box to enable or disable the schedule.

4. If you selected a **Type** of **ONE TIME ONLY**, use the **One-time occurrence** controls to provide the **Date** and **Time** of the one-time occurrence.

5. If you selected a **Type** of **DAILY, WEEKLY, MONTHLY, or MONTHLY RELATIVE TO FREQUENCY INTERVAL**, use the table below as a guide to providing details in the **Frequency**, **Daily Frequency**, and **Duration** property groups.

<table>
<thead>
<tr>
<th>Property group</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>Daily</td>
<td>Lets you specify the recurrence frequency, in days.</td>
</tr>
<tr>
<td></td>
<td>Weekly</td>
<td>Lets you specify the recurrence frequency, in weeks, and the specific weekdays on which the job is to execute.</td>
</tr>
<tr>
<td></td>
<td>Monthly</td>
<td>Lets you specify the recurrence frequency, in months, and the specific day of the month on which the job will execute.</td>
</tr>
<tr>
<td></td>
<td>Monthly relative to frequency interval</td>
<td>Lets you specify the recurrence frequency, in months, and a relative weekday (such as the second Sunday) on which the job is to execute.</td>
</tr>
</tbody>
</table>
**Daily Frequency**

For the specific days on which the job is to execute, this group lets you specify whether the job is to execute once per day or several times per day. If you select the *Occurs once* check box, use the *at* control to specify the schedule time. If you deselect the *Occurs once* check box, use the remaining controls to specify an hourly recurrence frequency, and a start and end time within the day when the schedule is active.

**Duration**

Use these controls to specify the start and end dates for a fixed duration schedule. For an open-ended schedule, provide a start date and select the *No end date* check box.

---

**To delete a schedule from the schedule list**

1. Select a schedule from the schedule list and click **Remove**.

**To copy an already existing schedule definition to the current job**

1. Click **Pick**. A *Pick schedule for job* dialog opens. The *Available schedules* list shows all schedules defined on this datasource.
2. Select the schedule that is to be added to the schedule list for this job definition and click **OK**.

**To display all jobs currently using a schedule in the schedule list**

1. Select a schedule from the schedule list and click **Jobs in schedule**. A *Jobs in schedule* dialog opens, showing all jobs currently using the selected schedule.

---

**Jobs (SQL Server) - Alerts**

When creating or editing a job, this tab/panel provides a convenient way to work with SQL Agent alerts associated with this job. On opening, this tab provides a list of all alerts that specify this job as the target job to be executed in response to those alerts. When you execute the job that creates or edits this job, DDL to create all alerts on this tab is submitted.

**Note:** Alerts cannot be created for multi-target jobs. They will be rejected by the server.

Manage the alerts list as follows:

- Click **Add** to create a new alert to be added to the list. This opens the Alert Wizard, with the *Execute Job* check box selected and the *Job Name* box specifying the current job, both uneditable. For information on using the Alert Wizard, see [Alerts Wizard (SQL Server)](#).
- Select an alert and click **Edit** to open an editor on the selected alert. The *Execute Job* check box and the *Job Name* box specifying the current job are both uneditable. For information on using the Alert Wizard, see [Alerts Editor (SQL Server)](#).
- Select an alert and click **Remove** to drop the selected alert from the alert list. DDL to create or alter the alert is not submitted when you execute the job that
creates or edits this job. For existing alert definitions, this does not delete the definition nor does it modify the **Execute Job** or **Job Name** controls.

**Jobs (SQL Server) - Target**

When creating or editing a job, this tab/panel lets you specify a target server or servers for the job. The default setting, **Target Local Server**, specifies that the job will be executed on the local server. The **Target Multiple Servers** setting is only available in multiserver operation domains, with the selectable server names populated from the `systargetservers` table.

**Note:** Alerts cannot be created for multi-target jobs. They will be rejected by the server.

**To target a job at one or more servers in a multiple server environment**

1. Select **Target Multiple Servers**.
2. Select the check box associated with each server on which the job will be executed.
A linked server object represents a database system other than Microsoft SQL Server. The links are created through OLE DB datasources. OLE DB is a COM-based application programming interface (API) for accessing data. OLE DB supports accessing data stored in any format (databases, spreadsheets, text files, and so on) for which an OLE DB provider is available. With a linked server you can execute commands against OLE DB datasources on different servers. Linked servers let you issue distributed queries, commands, and so on.

The wizard prompts you to provide much of the same information you give when you initially register a server.

**To create a new linked server using a wizard:**

1. Open a creation wizard for a linked server. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Linked Servers (SQL Server) - Properties.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

**Linked Servers (SQL Server) - Properties**

When creating or editing a linked server, this tab/panel lets you work with the following settings:
Linked Servers Wizard (SQL Server)

**Group** | **Settings and descriptions**
---|---
**General** | If defining a linked server defined through Microsoft SQL Server, set the *Is SQL Server* check box. The name must be the server’s network name. Any tables retrieved from the server are from the default database defined for the login on the linked server. If defining a linked server not defined through Microsoft SQL Server, clear the *Is SQL Server* check box and use the following options to provide OLE DB details: *Product Name* - The product name of the OLE DB datasource to which you are linking. *Datasource* - The name of the OLE DB provider managing access to the linked server. *OLE DB Provider Name* - The name of the OLE DB provider managing access to the specified linked server. *Provider Location* - The OLE DB location property corresponding to the linked server. *Provider Connection String* - The OLE DB provider-specific connection string that identifies a unique datasource. *Catalog* - The name of the catalog to be used when making a connection to the OLE DB provider.

**Server Options** | *Data Access Server* - Lets you specify whether queries against this server are enabled. *RPC Out Server* - Lets you select the server with RPC encryption. *RPC* - Enables RPC encryption from the server. *Collation Compatible Server* - Indicates Change Distributed Query execution against linked servers. If you select this option, Microsoft SQL Server assumes that all characters in the linked server are compatible with the local server, with regard to character set and collation sequence (or sort order). This option is for Microsoft SQL Server 8.0 or later. *Lazy Schema Validation* - This option lets you optimize performance by ensuring the query processor does not request metadata for any of the linked tables until data is actually needed from the remote member table. This option is for Microsoft SQL Server 8.0 or later. *Use Remote Collation* and *Collation Name* - Let you indicate that the linked server should use remote collation and select the name of the collation. This option is for Microsoft SQL Server 8.0 or later. *Query Timeout* - Type the query timeout value. This option is for Microsoft SQL Server 8.0 or later. *Connection Timeout* - Type the connection timeout value. This option is for Microsoft SQL Server 8.0 or later.
Logins Wizard (SQL Server)

The Login wizard lets you build and submit a CREATE LOGIN statement, adding a new SQL Server, Windows, certificate-based, or asymmetric key-based login. The Login wizard also lets you:

- Add the login to fixed server roles
- Create user accounts for the login on selected databases

To create a new login using a wizard:

1. Open a creation wizard for a login. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Logins (SQL Server) - Properties.
   - Server Roles panel - for details, see Logins (SQL Server) - Server Roles.
   - Users panel - for details, see Logins (SQL Server) - Users.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Logins (SQL Server) - Properties

When creating or editing a login, this tab/panel lets you work with the following properties:
## Logins Wizard (SQL Server)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specifies a name for this login.</td>
</tr>
<tr>
<td>Default Database</td>
<td>Lets you specify a DEFAULT_DATABASE argument, specifying a default database for this login.</td>
</tr>
<tr>
<td>Default Language</td>
<td>Lets you specify a DEFAULT_LANGUAGE argument, specifying a default language for this login.</td>
</tr>
<tr>
<td>Account Type</td>
<td>Lets you select one of the following login types: STANDARD - (SQL Server logins) if you select this type, you must also provide Password and Check Policy values. NTGROUP or NTUSER - (Windows logins) if you select one of these types, you must also provide a Domain value. CERTIFICATE - (certificate-mapped logins) if you select this type, you must also provide a Certificate value. ASYMMETRIC KEY - (asymmetric key-mapped logins) if you select this type, you must also provide an Asymmetric Key value.</td>
</tr>
<tr>
<td>Password</td>
<td>This is only available for an Account Type of STANDARD. It lets you provide a password for the login.</td>
</tr>
<tr>
<td>Check Policy</td>
<td>This is only available for an Account Type of STANDARD. If selected, login policies defined on the server apply to this login.</td>
</tr>
<tr>
<td>Check Expiration</td>
<td>This is only available if Check Policy is selected. If selected, password expiration policies are applied to this login.</td>
</tr>
<tr>
<td>Must Change</td>
<td>This is only available if Check Expiration is selected. If selected, the user will be prompted to change the password on the first login.</td>
</tr>
<tr>
<td>Domain</td>
<td>This is only available for an Account Type of NTUSER or NTGROUP. Lets you specify the domain name value that will be specified with the loginName argument ([&lt;domainName&gt;&lt;loginName&gt;]).</td>
</tr>
<tr>
<td>Certificate</td>
<td>This is only available for an Account Type of CERTIFICATE. It lets you specify the name of a certificate that is to be associated with this login. It lets you specify the name of a certificate that is to be associated with this login.</td>
</tr>
<tr>
<td>Asymmetric Key</td>
<td>This is only available for an Account Type of ASYMMETRIC KEY. It lets you specify the name of an asymmetric key that is to be associated with this login.</td>
</tr>
</tbody>
</table>

## Logins (SQL Server) - Server Roles

When creating or editing a login, this tab/panel builds `sp_addsrvrolemember` procedure calls that will be submitted along with the `CREATE LOGIN` statement issued by this wizard/editor. This lets you add the login as a member of one or more fixed server roles (or common user-defined roles when selecting multiple databases) by selecting the check boxes associated with those roles.

For information on editing fixed server roles, see [Roles Editor (SQL Server)]( Roles Editor (SQL Server)).
Logins Wizard (SQL Server)

Logins (SQL Server) - Users

When creating or editing a role, this tab/panel lets you build CREATE USER... FOR LOGIN statements that will be submitted with the CREATE LOGIN statement issued with this wizard/editor. Maintain database user accounts for a login as follows:

- Add a user account for this login to a database by selecting a database from the Databases where the Login does NOT have a User Account and clicking the Add button. This opens the SQL Server User wizard, letting you define a new user on that database. For more information, see Users Wizard (SQL Server).

- Remove a user account for this login from a database by selecting a database from the Databases where the Login HAS a User Account and clicking the Remove button.
Operators Wizard (SQL Server)

This wizard lets you create an SQL Agent operator. It also lets you assign a set of notifications sent to the operator for selected SQL Agent alerts.

**Note:** For an overview of SQL Agent service support provided by DBArtisan, see SQL Server Agent.

**To create a new operator using a wizard:**

1. Open an object creation wizard for an operator. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details see Operators (SQL Server) - Properties.
   - **Notifications** panel - for details see Operators (SQL Server) - Notifications.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the **Execute** button to create the object.

For information on related SQL Agent elements, see the following topics:

- Jobs Wizard (SQL Server)
- Alerts Wizard (SQL Server)

Operators (SQL Server) - Properties

When creating or editing a SQL Agent operator, this tab/panel lets you identify the operator, set an enabled/disabled status, specify the operators contact information, and set a pager duty schedule. Offering controls to build a basic `sp_add_operator` call, it has the following settings:

<table>
<thead>
<tr>
<th>Property group</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Creation</strong></td>
<td>Name</td>
<td>Provide a name for the operator.</td>
</tr>
<tr>
<td></td>
<td>Enabled</td>
<td>Set the status of this operator to enabled or disabled.</td>
</tr>
<tr>
<td></td>
<td>Email</td>
<td>Type the operator’s email address.</td>
</tr>
<tr>
<td></td>
<td>Pager Address</td>
<td>Type the operator’s pager address.</td>
</tr>
<tr>
<td></td>
<td>Net Send Address</td>
<td>Type the operator’s net send address.</td>
</tr>
</tbody>
</table>
Pager on duty

**Monday** through **Sunday**

Select the days that this operator is available for

Pages.

**Operators (SQL Server) - Notifications**

When creating or editing an operator, this tab lets you select the SQL Agent alerts for which this operator will be notified. The selections are submitted as a set of **sp_add_notification** calls made after the **sp_add_operator** call used to create the operator or submit operator definition changes.

To assign one or more alerts to the operator currently being defined

1. Select one or more of the **Email**, **Pager**, or **Net Send** check boxes associated with an alert.

**Note:** When editing an operator, this tab displays the status of the most recent attempts to notify this operator by email, pager and net send.
Partition Functions Wizard (SQL Server)

The Partition Functions Wizard lets you build and submit a CREATE PARTITION FUNCTION statement, specifying a range, input parameter type, and boundary values. Once created, the partition function can be referenced by the partition scheme used to create a partitioned table or index.

**Note:** Before creating a partition function, consult Microsoft SQL Server documentation for detailed information on topics such as type restrictions and boundary value usage. For more information, see [Accessing Third Party Documentation](#).

**To create a new partition function using a wizard:**

1. Open a creation wizard for a partition function. For details, see [Opening an Object Wizard](#).
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties panel** - for details, see [Partition Functions (SQL Server) - Properties](#).
   - **DDL View** panel - for details, see [Previewing the DDL Generated to Create the New Object](#).
3. Finally, use the **Execute** button to create the object.

For related information, see the following topics:

- [Partition Schemes Wizard (SQL Server)](#)
- [Indexes Wizard (SQL Server)](#)
- [Tables Wizard (SQL Server)](#)

**Partition Functions (SQL Server) - Properties**

When creating or editing a partition function, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Provide a name for the partition function.</td>
</tr>
<tr>
<td>Input Parameter Type</td>
<td>Select the data type of the column used for partitioning.</td>
</tr>
<tr>
<td>Range</td>
<td>Select to which side of each functional value interval (LEFT, RIGHT) the functional value belongs, when interval values are sorted in ascending order from left to right.</td>
</tr>
<tr>
<td>Function Values</td>
<td>Lets you specify the boundary values to include as FOR VALUES arguments to the CREATE PARTITION FUNCTION statement. Each boundary value is a constant expression that can reference variables. The set of values provided define the partition points for an index or table partitioned using this function. Use the New, Delete, Up, and Down buttons to create and maintain the value list.</td>
</tr>
</tbody>
</table>
Partition Schemes Wizard (SQL Server)

The Partition Scheme Wizard builds and submits a CREATE PARTITION SCHEME statement, letting you specify a partition function and a file group mapping. Once created, the partition scheme can be referenced when creating a partitioned table or index.

**Note:** Before creating a partition scheme, consult Microsoft SQL Server documentation for detailed information on topics such as the relationship between the partition function and filegroups specified. For more information, see Accessing Third Party Documentation.

To create a new partition wizard using a wizard:

1. Open a creation wizard for a partition scheme. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Partition Schemes (SQL Server) - Properties.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

For related information, see the following topics:

- Partition Functions Wizard (SQL Server)
- Indexes Wizard (SQL Server)
- Tables Wizard (SQL Server)

Partition Schemes (SQL Server) - Properties

When creating or editing a partition scheme, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the partition scheme.</td>
</tr>
<tr>
<td><strong>Partition Function</strong></td>
<td>Select the partition function that specifies the range, input parameter type, and boundary values for this partition scheme.</td>
</tr>
<tr>
<td><strong>Filegroup Name</strong></td>
<td>Lets you specify the names of the filegroups to store the partitions specified by the selected <strong>Partition Function</strong>. Consult Microsoft SQL Server documentation for details on the relation ship between filegroups and partitions. For more information, see <a href="#">Accessing Third Party Documentation</a>. Use the New, Delete, Up, and Down buttons to create and maintain the value list.</td>
</tr>
</tbody>
</table>
Primary Keys Wizard (SQL Server)

Primary key constraints make sure that no duplicate values or NULLS are entered in the columns you specify. You can use primary key constraints to enforce uniqueness and referential integrity. A table can only have a single primary key constraint.

The dialog box lets you specify the owner and table on which you want to place the primary key constraint.

To create a new primary key using a wizard:

1. Open a creation wizard for a primary key. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Primary Keys (SQL Server) - Properties.
   - Columns panel - Primary Keys (SQL Server) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Primary Keys (SQL Server) - Properties

When creating or editing a primary key, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table Owner</strong> and <strong>Table Name</strong></td>
<td>Choose the owner and name of the table in which the primary key is being created.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name of the primary key being created.</td>
</tr>
<tr>
<td><strong>Build Online</strong></td>
<td>Enabling this feature specifies that the ONLINE=ON clause is used when creating this object and can subsequently be used when rebuilding or dropping this object.</td>
</tr>
<tr>
<td><strong>Max degree of parallelism</strong></td>
<td>Lets you specify a MAXDOP index operation value, limiting the number of processors used in parallel plan execution.</td>
</tr>
<tr>
<td><strong>Clustered</strong></td>
<td>Enable or disable clustering. With this check box enabled, subsequent rebuild and drop operations offer an online option.</td>
</tr>
<tr>
<td><strong>File Group</strong></td>
<td>If you do not specify a filegroup, Microsoft SQL Server creates the index in the default filegroup.</td>
</tr>
<tr>
<td><strong>Fill Factor</strong></td>
<td>This specifies how full each index page that’s storing data should be. The fill factor is a percentage value between 0 and 100.</td>
</tr>
</tbody>
</table>

**Primary Keys (SQL Server) - Columns**

From the **Column** dropdown, select a column for the primary key and specify a **Sort** option. To add more columns, click the **New** button and then follow the steps in the last instruction. Use the Delete button to drop columns.
Procedures Wizard (SQL Server)

Procedures are a reusable block of PL/SQL, stored in the database, that applications can call. Procedures streamline code development, debugging, and maintenance by being reusable. Procedures enhance database security by letting you write procedures granting users execution privileges to tables rather than letting them access tables directly.

The Procedure Wizard lets you:

- Name the procedure and specify its body.
- Specify any execution options and you can encrypt the stored procedure text in syscomments.

To create a new procedure using a wizard:

1. Open a creation wizard for a procedure. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Procedures (SQL Server) - Properties.
   - Definition panel - for details, see Procedures (SQL Server) - Definition.
3. Finally, use the Execute button to create the object.

Procedures (SQL Server) - Properties

When creating or editing a procedures, this tab/panel lets you work with the following settings:
Procedures Wizard (SQL Server)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the procedure.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the procedure</td>
</tr>
<tr>
<td>Procedure Number</td>
<td>Optionally, provide a procedure number. By using a number, you can group procedures of the same name together. This also enables you to drop them using only one DROP PROCEDURE statement. So, the procedures bill;1, bill;2, bill;3, etc. will be dropped simultaneously when the time comes.</td>
</tr>
<tr>
<td>Replication</td>
<td>This option creates a procedure that is used as a stored procedure filter and is executed only during replication.</td>
</tr>
<tr>
<td>Recompile</td>
<td>The plan for this procedure will not be cached and the procedure is recompiled when it is run. This option is appropriate when you’re using atypical or temporary values and you don’t want to override the execution plan cached in memory.</td>
</tr>
<tr>
<td>Encryption</td>
<td>If you select this option, SQL Server will encrypt the syscomments table entry containing the text of the CREATE PROCEDURE statement. It keeps the procedure from being published as part of replication.</td>
</tr>
</tbody>
</table>

Procedures (SQL Server) - Definition

Complete the CREATE PROCEDURE outline provided by typing or pasting the body of the procedure.
Remote Servers Wizard (SQL Server)

Remote Servers are servers on a network that you can access through your local server. Instead of logging directly into a remote server, you can log into your local server and execute a remote procedure call to it.

**Note:** Only stored procedures are allowed against remote servers. You can use a linked server to execute distributed queries and stored procedures.

**Before beginning**

Before you can set up a remote server, you first configure both the local and remote servers to accept remote access. To configure the Microsoft SQL Servers for remote access, you need to log into each server. The table below describes the parameters you need to configure on each server:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Access</td>
<td>1 (enabled)</td>
</tr>
<tr>
<td>Remote Connections</td>
<td>Number of remote connections required</td>
</tr>
<tr>
<td>Remote Logins</td>
<td>Number of remote logins required</td>
</tr>
<tr>
<td>Remote Sites</td>
<td>Number of remote sites required</td>
</tr>
</tbody>
</table>

After setting these server configuration parameters, shutdown and restart the server so the new values can take effect.

**To create a new remote server using a wizard:**

1. Open a creation wizard for a remote server. For details, see [Opening an Object Wizard](#).

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:

   - Properties panel - for details, see [Remote Servers (SQL Server) - Properties](#).
   - DDL View panel - for details, see [Previewing the DDL Generated to Create the New Object](#).

3. Finally, use the Execute button to create the object.

**Remote Servers (SQL Server) - Properties**

When creating or editing a remote server, this tab/panel lets you work with the following settings:
## Remote Servers Wizard (SQL Server)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name for the remote server.</td>
</tr>
<tr>
<td>Server Type</td>
<td>Lets you specify a server type of LOCAL or REMOTE. The local server routes all commands to the remote server. To communicate with a remote server, you log into a local server and submit your remote procedure calls for remote servers. The remote server receives remote procedure calls from the local server and processes them accordingly.</td>
</tr>
<tr>
<td>Publication Server</td>
<td>Select if the server is to publish data for replication.</td>
</tr>
<tr>
<td>Distribution Server</td>
<td>Select if the server is to manage the distribution database.</td>
</tr>
<tr>
<td>Subscription Server</td>
<td>This option applies if you want to deploy a subscription management application from the remote server.</td>
</tr>
<tr>
<td>Publisher/Subscriber</td>
<td>Select if the server is both a subscriber and publisher of replicated data.</td>
</tr>
<tr>
<td>Collation Compatible</td>
<td>Select if the server is to be collation compatible.</td>
</tr>
<tr>
<td>RPC Out Server</td>
<td>Select if the server is to serve as a RPC Out server.</td>
</tr>
</tbody>
</table>
Roles Wizard (SQL Server)

Roles are sets of user privileges you associate with access to objects within a database. Roles streamline the process of granting permissions. You can use roles to grant sets of permissions and privileges to users and groups. Roles can help you comply with Sarbanes Oxley regulations by limiting which users can have access to what privileges, for example a Human Resources Role versus an Accounting Role.

To create a new role using a wizard:

1. Open a creation wizard for a role. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Roles (SQL Server) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

After you click Finish and the role has been created, the Roles Editor open. You can then assign object and system privileges to the role and determine which users can take part in the role. For more information, see Roles Editor (SQL Server).

Roles (SQL Server) - Properties

When creating or editing a role, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name used to reference the role.</td>
</tr>
<tr>
<td>RoleType</td>
<td>The value can be NONE, APPLICATION, or STANDARD.</td>
</tr>
<tr>
<td>Authorization Owner</td>
<td>Only required with a Role Type of STANDARD.</td>
</tr>
<tr>
<td>Password</td>
<td>Only required with a Role Type of APPLICATION.</td>
</tr>
</tbody>
</table>
Rules promote data integrity by allowing you to validate the values supplied to a table column. They are reusable objects that you can bind to table columns or user datatypes. Check constraints are similar to rules, and are in fact the preferred way of restricting data. A column or user-defined data type can have only one rule bound to it, but a column can have both a rule and one or more check constraints associated with it. Notes that a rule cannot apply to data already existing in the database at the time you’re creating the rule and can’t be bound to a system-created data type. If you create a new rule when one already exists, the new rule will override the previous one.

To create a new rule using a wizard:

1. Open a creation wizard for a rule. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Rules (SQL Server) - Properties.
   - Dependencies panel - Rules (SQL Server) - Dependencies.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Rules (SQL Server) - Properties

When creating or editing a rule, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the Owner of the rule.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the rule.</td>
</tr>
<tr>
<td>Restriction</td>
<td>Type the condition. The rule restriction is the condition that defines the rule and can be any expression valid in a WHERE clause and can include such elements as arithmetic operators, relational operators, and predicates (for example, IN, LIKE, BETWEEN).</td>
</tr>
</tbody>
</table>

Rules (SQL Server) - Dependencies

From the Type dropdown, choose Column or Datatype, and if you chose Column, choose a Table from the Table dropdown. The list on the left is populated with candidate columns or datatypes. To move a candidate from the list on the left to the dependencies column on the right, select the candidate and click Add. Remove columns or datatypes from the dependencies list on the right by selecting the column or datatype and clicking Remove.
Schema Wizard (SQL Server)

This wizard lets you create a schema on Microsoft SQL Server.

To create a new schema using a wizard:

1. Open a creation wizard for a schema. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Schema (SQL Server) - Properties.
   - Permissions panel - Setting Permissions or Privileges for an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Schema (SQL Server) - Properties

When creating or editing a schema, this tab/panel lets you provide a Name and select the Owner of the schema.

Schema (SQL Server) - Permissions

For each specific permission to be granted, select the cell corresponding to the name and specific permission, and click the Grant button. To revoke a privilege, select a cell showing a Granted permission and click Revoke.
**Sequences Wizard (SQL Server)**

This wizard builds and submits a CREATE SEQUENCE statement.

**To create a new full-text catalog using a wizard:**

1. Open a creation wizard for a sequence. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Full-text Catalogs (SQL Server) - Properties.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

**Sequences (SQL Server) - Properties**

When creating or editing a sequence, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Schema and Name</strong></td>
<td>Lets you provide identification for the sequence.</td>
</tr>
<tr>
<td><strong>Start With</strong></td>
<td>Lets you provide a START WITH argument value, specifying the first value to be returned by the sequence.</td>
</tr>
<tr>
<td><strong>Increment By</strong></td>
<td>Lets you provide an INCREMENT BY argument value, specifying the value by which to increment (or decrement if negative) the sequence object for each call to the NEXT VALUE FOR function.</td>
</tr>
<tr>
<td><strong>Minimum Value and Maximum Value</strong></td>
<td>Lets you provide MINVALUE and MAXVALUE argument values, specifying the bounds for this sequence.</td>
</tr>
<tr>
<td><strong>Cycle</strong></td>
<td>If selected, a CYCLE argument is generated, specifying that sequence values should restart from the minimum value (or maximum for descending sequences) or throw an exception when the minimum/maximum value is exceeded. If unselected, the default NO CYCLE is assumed.</td>
</tr>
<tr>
<td><strong>Cache and Cache Size</strong></td>
<td>If <strong>Cache</strong> is unselected, a NO CACHE argument is generated. If <strong>Cache</strong> is selected, a CACHE argument is generated. A CACHE argument value can be provided using the Cache Size control, and if no Cache Size value is provided, SQL Server will generate a value.</td>
</tr>
<tr>
<td><strong>Data Type Schema, Data Type Name, and Data Type Precision</strong></td>
<td>These controls let you build an AS argument, specifying datatype details for the new sequence. If no values are selected/provided, SQL Server will, by default, generate a sequence object of type BIGINT. After selecting a <strong>Data Type Schema</strong>, the <strong>Data Type Name</strong> dropdown is populated with user datatypes created from a base datatype of BIGINT, TINYINT, SMALLINT, INT, BIGINT, DECIMAL, or NUMERIC. <strong>Data Type Precision</strong> is a read-only field displaying the precision of the selected user datatype. <strong>NOTE</strong>: You can use system types if you select a <strong>Data Type Schema</strong> of SYS.</td>
</tr>
</tbody>
</table>

After creation, the Sequences Editor lets you view the current value of the sequence and whether the maximum value has been exceeded. For details, see [Sequences Editor (SQL Server)](https://docs.microsoft.com/en-us/sql/scripting/sequences).
Server Triggers Wizard (SQL Server)

This wizard builds and submits a CREATE TRIGGER... ON ALL SERVER statement, letting you create a DDL trigger with server scope, that fires in response to either a logon or selected DDL events. The wizard builds basic syntax only, letting you provide the actions and conditions SQL making up the main body of the trigger.

**Note:** Before working with server triggers, consult Microsoft SQL Server documentation for general information on DDL triggers as well as specifics such as FOR/AFTER argument details, valid actions and conditions, and supported events. For more information, see Accessing Third Party Documentation.

To create a new server trigger using a wizard:

1. Open an object creation wizard for a server trigger. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Server Triggers (SQL Server) - Properties.
   - Trigger Events panel - for details, see Server Triggers (SQL Server) - Properties.
   - Definition panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

**Note:** In order to fire in response to logons or specified events, a server trigger must be enabled. For information on enabling and disabling a server trigger, see Server Triggers Editor (SQL Server) and Change Status (SQL Server DDL triggers).

Server Triggers (SQL Server) - Properties

When creating or editing a server trigger, this tab/panel lets you work with the following settings:
### Server Triggers Wizard (SQL Server)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the DDL trigger.</td>
</tr>
<tr>
<td><strong>Trigger Timing</strong></td>
<td>Use this control to specify a FOR/AFTER argument option. If the Fire On Logon check box is not selected, the specific events for the argument are provided on the Trigger Events tab/panel.</td>
</tr>
<tr>
<td>Fire On Logon</td>
<td>If selected, the CREATE TRIGGER statement is created with a FOR/AFTER LOG ON argument, associating the DDL trigger with a user logon. If deselected, the trigger is associated with the event(s) selected on the Trigger Events tab/panel.</td>
</tr>
<tr>
<td>Encrypted</td>
<td>Select this check box to add a WITH ENCRYPTION argument to the generated DDL. This prevents the trigger from being published as part of a SQL Server replication.</td>
</tr>
</tbody>
</table>

### Server Triggers (SQL Server) - Trigger Events

When creating or editing a database trigger, this tab/panel lets you select the FOR/AFTER argument DDL events that will fire this trigger.

**Note:** This tab/panel is only available if the Fire On Logon check box is deselected. For more information, see [Server Triggers (SQL Server) - Properties](#).
Symmetric Keys Wizard (SQL Server)

This wizard lets you build and submit a CREATE SYMMETRIC KEY statement.

To create a new symmetric key using a wizard

1. Open a creation wizard for a symmetric key. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Symmetric Keys (SQL Server) - Properties.
   - Encryption Mechanisms panel - Symmetric Keys (SQL Server) - Encryption Mechanisms.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Symmetric Keys (SQL Server) - Properties

When creating or editing an asymmetric key, this tab/panel lets you work with the following settings:
### Symmetric Keys Wizard (SQL Server)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Authorization Owner</strong></td>
<td>The name of the user that will own the symmetric key.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>The name for the symmetric key</td>
</tr>
<tr>
<td><strong>Provider Name</strong></td>
<td>Lets you provide a FROM PROVIDER argument value, specifying an Extensible Key Management provider and name.</td>
</tr>
<tr>
<td><strong>Key Algorithm</strong></td>
<td>Lets you select a WITH ALGORITHM value of DES, AES_192, RC2, RC4_128, DESX, AES_128, TRIPLE_DES, or TRIPLE_DES_3KEY, specifying the encryption algorithm.</td>
</tr>
<tr>
<td><strong>Pass Phrase</strong></td>
<td>Lets you provide a KEY_SOURCE argument value, specifying a pass phrase from which to derive the key.</td>
</tr>
<tr>
<td><strong>Identity Phrase</strong></td>
<td>Lets you provide an IDENTITY_VALUE argument value, specifying an identity phrase from which to generate a GUID that tags data encrypted with a temporary key.</td>
</tr>
<tr>
<td><strong>Key Name In Provider</strong></td>
<td>Lets you provide a PROVIDER_KEY_NAME value, specifying the key name from the external provider.</td>
</tr>
<tr>
<td><strong>Creation Disposition</strong></td>
<td>Lets you select a CREATION_DISPOSITION value of OPEN_EXISTING or CREATE_NEW, specifying whether the symmetric key is mapped to an existing EKM key or a new key is created on the EKM device.</td>
</tr>
</tbody>
</table>

For context information such as opening the wizard or editor for this object type, see [Synonyms Wizard (SQL Server)](https://docs.microsoft.com/en-us/sql-server).  

### Symmetric Keys (SQL Server) - Encryption Mechanisms

When creating or editing a symmetric key, this tab/panels lets you provide an ENCRYPTION BY... argument, and indicate the specific asymmetric key, symmetric keys, or certificate used to encrypt the key being created or the password from which to derive a TRIPLE_DES key.

The **Used Encryption Mechanisms** lists the symmetric key, asymmetric key, certificate, or password options currently included in the ENCRYPTION BY argument. Selecting ASYMMETRIC KEYS, CERTIFICATES, PASSWORD, or SYMMETRIC KEYS from the **Encryption Type** dropdown displays the list of available elements of that type in the **Existing Encryption Mechanisms** list.

#### To specify encrypting mechanisms for a symmetric key

1. From the **Encryption Type** dropdown, select an option among ASYMMETRIC KEYS, CERTIFICATES, PASSWORD, or SYMMETRIC KEYS.
2. Take one of the following actions:
Symmetric Keys Wizard (SQL Server)

- Select CERTIFICATE or ASYMMETRIC KEY from the Encryption Type dropdown to display elements of that type in the Existing Encryption Mechanisms list. Select a specific certificate or asymmetric key and click Add to move that element to the Used Encryption Mechanisms list.

- Select SYMMETRIC KEY from the Encryption Type dropdown to display elements of that type in the Existing Encryption Mechanisms list. Select a specific symmetric key and click Add to open the Open Key dialog. For more information on opening and decrypting the key, see Opening a Symmetric Key.

- Select PASSWORD from the Encryption Type dropdown and click Add to open the Add Password dialog. That dialog lets you add an ENCRYPTION BY PASSWORD argument. Use the Password control to provide the ENCRYPTION BY PASSWORD value. Click OK to add the password to the Used Encryption Mechanisms list.

3. Repeat step 1 and step 2 to add more encrypting mechanisms for this symmetric key.

To remove an encryption mechanism from an asymmetric key

1. Select an item from the Used Encryption Mechanisms list.
2. Click Remove.

For context information such as opening the wizard or editor for this object type, see Synonyms Wizard (SQL Server).

For information on creating asymmetric keys or certificates to be used with the encryption method for this key, see Asymmetric Keys Wizard (SQL Server) and Certificate Wizard (SQL Server).

Opening a Symmetric Key

When specifying a symmetric keys as the encryption mechanism, you must decrypt the symmetric key and make it available for use. The Open Key dialog lets you build an OPEN SYMMETRIC KEY that will precede the CREATE SYMMETRIC KEY statement submitted to create or edit a symmetric key.

Use the Certificate control to provide a DECRYPTION BY CERTIFICATE value and the Password control to provide a WITH PASSWORD value. Click Open Key to add the symmetric key to the Used Encryption Mechanisms list.

Note: This functionality is available for Microsoft SQL Server only.

To open a symmetric key

1. Open a creation wizard or editor for a symmetric key. For details, see Opening an Object Wizard and Opening an Object Editor.
2. Select the Encryption Mechanisms tab.
3. Select **Symmetric Keys** from the **Encryption Type** dropdown, select a symmetric key from the **Existing Encryptions Mechanisms** list, and then click **Add**.

The **Open Key** dialog opens.

4. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Lets you work with the following settings:</td>
</tr>
<tr>
<td><strong>Decryption Mechanism and Certificate/Symmetric Key/Asymmetric Key/Password</strong></td>
<td>These controls let you build the DECRYPTION BY option, specifying the decryption mechanism and the specific certificate, asymmetric key, symmetric key or password to be used.</td>
</tr>
<tr>
<td><strong>Password</strong></td>
<td>Lets you provide the BY PASSWORD or WITH PASSWORD values for a <strong>Decryption Mechanism</strong> of CERTIFICATE, ASYMMETRIC KEY, or PASSWORD.</td>
</tr>
</tbody>
</table>

**Preview**  Displays the DDL that will execute the object action. For details, see **Preview**.

5. Click **Open Key** to dismiss the dialog and return to the Symmetric Key wizard or editor.
Synonyms Wizard (SQL Server)

This wizard builds and submits a CREATE SYNONYM statement, letting you build a one-part name that can be used in SQL statements instead of a fully-qualified, multi-part name.

To create a new synonym using a wizard:

1. Open a creation wizard for a synonym. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Synonyms (SQL Server) - Properties.
   - **Permissions** panel - Setting Permissions or Privileges for an Object
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the **Execute** button to create the object.

Synonyms (SQL Server) - Properties

When creating a synonym, this tab/panel lets you provide a synonym name and fully qualify the object name that it references. When editing a synonym, this tab/panel lets you view the synonym definition.

**Note:** Before creating or editing a synonym, consult Microsoft SQL Server documentation for information on topics such as support for specific function and procedure types, and three-part and four-part name restrictions. For assistance, see Accessing Third Party Documentation.

The following table describes the available settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Schema and Name</strong></td>
<td>Use these setting to select an owner and type the one-part name that will be used to reference.</td>
</tr>
<tr>
<td><strong>Server, Database,</strong></td>
<td>Use these setting to select the specific object to which the synonym is to refer. Optionally, you can use the server, database, and owner type, referenced object type, and owner settings to construct a partially-qualified to fully-qualified name for the object. The user interface will allow you to construct all valid, multi-part name variations (for example: server, database, owner, object, database, owner, object, owner, object, server...object).</td>
</tr>
<tr>
<td><strong>Referenced Object</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type, Referenced Object</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Owner, and Referenced Object Name</strong></td>
<td></td>
</tr>
</tbody>
</table>
Tables Wizard (SQL Server)

A table is a column-based arrangement of data in which the content of one column has a bearing on the other column(s). So, for example, a table might have a column for authors, another column for the books each author has written, and a third for the number of copies each title by a given author has sold. The data moves across the columns in rows.

You must have CREATE TABLE permissions to generate a new table.

Note: Before working with tables, consult Microsoft SQL Server documentation for general information on filegroups as well as specifics on CREATE TABLE... FILESTREAM and FILETABLE arguments. For more information, see Accessing Third Party Documentation.

To create a new table using a wizard:

1. Open a creation wizard for a table. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Dependencies panel - Tables (SQL Server) - Properties.
   - Columns panel - Tables (SQL Server) - Columns.
   - Indexes panel - Tables (SQL Server) - Indexes.
   - Constraints panel - Tables (SQL Server) - Constraints.
   - Permissions panel - Setting Permissions or Privileges for an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Tables (SQL Server) - Properties

When creating or editing a table, this tab/panel lets you work with the following settings:
### Tables Wizard (SQL Server)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Schema</strong></td>
<td>Select the owner of the table.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the table.</td>
</tr>
<tr>
<td><strong>ANSI NULLS option</strong></td>
<td>By setting this option, you are setting ANSI_NULLS, ANSI_PADDING, ANSI_WARNINGS, and QUOTED_IDENTIFIER to on so the table can be used in an Indexed View.</td>
</tr>
<tr>
<td><strong>Partitioned</strong></td>
<td>When selected, an ON clause is added to the CREATE TABLE statement, letting you specify a <strong>Partition Scheme</strong>, partitioning this index.</td>
</tr>
<tr>
<td><strong>Partition Scheme</strong></td>
<td>This property is only available if the <strong>Partitioned</strong> check box is selected. Select the partition scheme that specifies the filegroup mapping for this index. For information on creating partition schemes, see <strong>Partition Schemes Wizard (SQL Server)</strong>.</td>
</tr>
<tr>
<td><strong>Filegroup</strong></td>
<td>This property is only available if the <strong>Partitioned</strong> check box is not selected. Select an existing, named filegroup to have the table stored on the specified filegroup. Select PRIMARY to have the table stored on the default database filegroup.</td>
</tr>
<tr>
<td><strong>Text Image Filegroup</strong></td>
<td>Select an existing, named filegroup to have text, ntext, image, xml, varchar(max), nvarchar(max), varbinary(max), and CLR user-defined type columns stored on the specified filegroup. Select PRIMARY to have columns of those types stored on the default database filegroup.</td>
</tr>
<tr>
<td><strong>Filestream On</strong></td>
<td>This lets you specify the filegroup for FileStream data, specifying a FILESTREAM_ON argument to the generated DDL. This control is only available if a filegroup that can contain filestreams is available in the database. For more on filegroups, see <strong>Databases Wizard (SQL Server)</strong>.</td>
</tr>
<tr>
<td><strong>As Filetable properties</strong></td>
<td><strong>As Filetable</strong> lets you add an AS FILETABLE argument to the generated DDL, specifying that the table is created as a FileTable. The <strong>Columns</strong>, <strong>Indexes</strong>, and <strong>Constraints</strong> tabs/panels are disabled when this control is selected. <strong>Filetable Collate Filename</strong> lets you provide a FILETABLE_COLLATE_FILENAME argument value, specifying the name of the collation used. If no value is provided, the default collation for the database is used. <strong>Filetable Directory Name</strong> lets you provide a FILETABLE_DIRECTORY argument value, specifying a FileTable directory name. If no value is provided, the name of the filetable is used. <strong>Filetable PK Constraint Name</strong> lets you provide a FILETABLE_PRIMARY_KEY_CONSTRAINT_NAME argument value, specifying the name used for the primary key constraint automatically created on the FileTable. If this value is not provided, a system-generated name is used. <strong>Filetable StreamID Unique Constraint Name</strong> lets you provide a FILETABLE_STREAMID_UNIQUE_CONSTRAINT_NAME argument value, specifying the name used for the unique key constraint automatically created on the FileTable. If this value is not provided, a system-generated name is used. <strong>Filetable Fullpath Unique Constraint Name</strong> lets you provide a FILETABLE_FULLPATH_UNIQUE_CONSTRAINT_NAME argument value, specifying the name used for the unique constraint automatically created on the parent_path_locator and name columns in the FileTable. If this value is not provided, a system-generated name is used.</td>
</tr>
</tbody>
</table>
Tables (SQL Server) - Columns

Use the Add Column button to add the columns for the table. After providing a Name for a new column, you can modify column properties in the Property/Value list. Available properties depend on the datatype you choose as well as on the property values you select:

- **Computed** and **Computed Expression** - Let you define a column as a computed column and provide the computed column expression.
- **Type** - Lets you select a datatype (depending on the type, additional properties such as **Size**, **Width**, and **Scale** may be available).
- **Identity Column** - Select this check box to define the column as an identity column.
- **Allow Nulls** - Select this check box to allow nulls in this column.
- **Default Collation** - available for text/character datatypes, lets you specify a default collation.
- **Default Value** - Lets you type a constant value or select a function returning a constant value to serve as the default for the column.
- **Default Binding** and **Rule Binding** - Let you bind a rule or default to a column.
- **Is Sparse** - Available to columns that allow NULL values, optimizes storage of the column for null values. This property does apply to the following data types: text, ntext, image, timestamp, user-defined data type, geometry, or geography. Columns with default values, default or rule bindings, cannot be defined as sparse. Computed columns cannot be defined as Sparse, but the columns in the computed expression can be Sparse columns.

Optionally, you can select a column and modify its values or select a column and Delete it.

**Note:** If you create a table with a Column datatype = text, you can set the storage and image values on the Storage tab of the Tables Editor Storage tab. When you have a text datatype, the Storage tab displays a Text In Row box where you can specify the maximum size to be stored.

**Note:** Because the smalldatetime datatype stores dates and time with less precision than the datetime datatype, before outputting you use the CAST or CONVERT functions to convert any boxes with the smalldatetime datatype to either VARCHAR or datetime datatypes. For more information, see SQL Server Books Online, Transact-SQL Reference.

**Note:** This tab/panel is not available if As Filetable is selected. For details, see Tables (SQL Server) - Properties.
Tables (SQL Server) - Indexes

Click Add to open the Index Wizard. For details, see Indexes Wizard (SQL Server).

Note: This tab/panel is not available if As Filetable is selected. For details, see Tables (SQL Server) - Properties.

Tables (SQL Server) - Constraints

Selecting a constraint type and clicking Add opens the object wizard for that object type. For details see:

- Primary Keys Wizard (SQL Server)
- Unique Keys Wizard (SQL Server)
- Foreign Keys Wizard (SQL Server)
- Create Synonym

Note: This tab/panel is not available if As Filetable is selected. For details, see Tables (SQL Server) - Properties.
Triggers are a special type of procedure that automatically fire when defined data modification operations (insert, update, or delete) occur on a target table or view. Triggers fire after an insert, update or delete, but belong to the same transaction as the data modification operation. Triggers can be implemented to enforce business rules or referential data integrity.

Important Notes

- For more information on the syntax for Trigger bodies, consult the Microsoft SQL Server Transact-SQL Documentation.

To create a new trigger using a wizard:

1. Open a creation wizard for a trigger. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Triggers (SQL Server) - Properties.
   - Definition panel - for details, see Triggers (SQL Server) - Definition.
3. Finally, use the Execute button to create the object.

Note: You can use the Trigger Editor opens to create dependencies or alter the trigger statement.

Triggers (SQL Server) - Properties

When creating or editing a trigger, this tab/panel lets you work with the following settings:
### Triggers Wizard (SQL Server)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent Type</td>
<td>Select the TABLE or VIEW on which the trigger is to be created.</td>
</tr>
<tr>
<td>Parent Schema</td>
<td>Select the owner of the table or view on which the trigger is to be created.</td>
</tr>
<tr>
<td>Parent Name</td>
<td>Select the specific table or view in which the trigger is to be created.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the trigger.</td>
</tr>
<tr>
<td>Trigger Timing</td>
<td>INSTEAD OF: This is the only option for a View trigger. An INSTEAD OF trigger fires in place of the triggering statement and will not make changes to the data unless the conditions of the INSTEAD OF statement are met first. So, your UPDATE execution statement is replaced by an INSTEAD OF UPDATE statement as a way to enforce particular business rules you establish. AFTER: An AFTER trigger fires following the successful completion of the triggering action. So, for example, the trigger would fire after an UPDATE statement has executed and after constraints have been checked and verified.</td>
</tr>
<tr>
<td>Fire On Insert</td>
<td>An INSERT trigger must be associated with an INSERT statement. For example, if a data load operation doesn't include an INSERT statement, the trigger won't be invoked.</td>
</tr>
<tr>
<td>Fire On Update</td>
<td>An UPDATE trigger can be associated with specific columns of the base table and will only be activated if those columns are updated.</td>
</tr>
<tr>
<td>Fire On Delete</td>
<td>A DELETE trigger is associated with a DELETE operation.</td>
</tr>
<tr>
<td>Encrypted</td>
<td>If you choose to encrypt the trigger, the trigger can't be published as part of SQL Server replication.</td>
</tr>
</tbody>
</table>

4. Finally, use the **Execute** button to create the object.

## Triggers (SQL Server) - Definition

Complete the CREATE TRIGGER outline provided by typing or pasting the body of the trigger.
Unique Keys Wizard (SQL Server)

Unique keys can enforce logical keys that are not chosen as the primary key. In other words, you can use a unique key to ensure no duplicate values are entered in specific columns that are not a part of the primary key. Although you can only attach one primary key to a table, you can attach multiple unique keys. Also, you can use unique keys on columns that allow null values.

To create a new unique key using a wizard:

1. Open a creation wizard for a unique key. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Unique Keys (SQL Server) - Properties.
   - Columns panel - Unique Keys (SQL Server) - Columns.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Unique Keys (SQL Server) - Properties

When creating or editing a unique key, this tab-panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table Owner</strong> and <strong>Table Name</strong></td>
<td>Choose the owner and name of the table in which the unique key is being created.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name of the unique key being created.</td>
</tr>
<tr>
<td><strong>Build Online</strong></td>
<td>Enabling this feature specifies that the ONLINE=ON clause is used when creating this object and can subsequently be used when rebuilding or dropping this object.</td>
</tr>
<tr>
<td><strong>Max degree of parallelism</strong></td>
<td>Lets you specify a MAXDOP index operation value, limiting the number of processors used in parallel plan execution.</td>
</tr>
<tr>
<td><strong>Clustered</strong></td>
<td>Enable or disable clustering. With this check box enabled, subsequent rebuild and drop operations offer an online option.</td>
</tr>
<tr>
<td><strong>File Group</strong></td>
<td>If you do not specify a filegroup, Microsoft SQL Server creates the unique key in the default filegroup.</td>
</tr>
<tr>
<td><strong>Fill Factor</strong></td>
<td>This specifies how full each index page that’s storing data should be. The fill factor is a percentage value between 0 and 100.</td>
</tr>
</tbody>
</table>

**Unique Keys (SQL Server) - Columns**

From the **Column** dropdown, select a column for the primary key and specify a **Sort** option. To add more columns, click the **New** button and then follow the steps in the last instruction. Use the Delete button to drop columns.
User Messages Wizard (SQL Server)

The User Message wizard lets you create multiple-language versions of user messages, such as errors and warnings, associated with a single message number. Key properties include the severity level and whether the message is automatically written to the NT Event Log.

Note: The user messages node only displays under the master database.

To create a new user message using a wizard:

1. Open a creation wizard for a user message. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:

   - Properties panel - for details, see User Messages (SQL Server) - Properties.
   - Information panel - for details, see User Messages (SQL Server) - Information.
   - Object Permissions and System Permissions panels - Setting Permissions or Privileges for an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

User Messages (SQL Server) - Properties

When creating or editing a user message, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message Number</td>
<td>Lets you specify a message number. The number must be greater than 50,000. The wizard automatically loads a value one higher than the currently highest used message number, but you can override the value.</td>
</tr>
<tr>
<td>Severity</td>
<td>Lets you select a predefined severity level between 001 and 025. The levels and their meanings are indicated in the User Message editor.</td>
</tr>
<tr>
<td>Write to NT Event Log</td>
<td>Lets you specify that the message is always written to the Windows NT Event Log.</td>
</tr>
</tbody>
</table>

User Messages (SQL Server) - Information

Lets you create the different language versions of the text for the message. The first version must be created in us_english. Click the Add new text for the user message.
button, and in the dialog box that opens, select a **Language** of us_english and provide the **Message Text**.

You can subsequently use the same process to create each different language version of the us_english message.

**Note:** You cannot create two versions of a message for the same language.

This tab/panel also lets you edit and delete messages.
Users Wizard (SQL Server)

The User Wizard lets you create a user who will then have access to the database where you are registering him or her. You can also identify the appropriate user group and the system privileges you want to assign to the new user.

To create a new user using a wizard:

1. Open a creation wizard for a user. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Users (SQL Server) - Properties.
   - Roles panel - Users (SQL Server) - Roles.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Users (SQL Server) - Properties

When creating or editing a user, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login Name</td>
<td>Select the server login associated with this user.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide the user name.</td>
</tr>
</tbody>
</table>

Users (SQL Server) - Roles

For each role to be assigned to the user, select the check box beside that role.
User Datatypes Wizard (SQL Server)

User datatypes promote domain consistency by streamlining the definition of commonly used table columns in a database. You can build a customized datatype from system datatypes and bind defaults and rules to it to enhance integrity. When you reference the user datatype in a column, the column assumes all of the properties of the user datatype.

To create a new user datatype using a wizard:

1. Open a creation wizard for a user datatype. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - User Datatypes (SQL Server) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

User Datatypes (SQL Server) - Properties

When creating or editing a user datatype, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the user datatype.</td>
</tr>
<tr>
<td>Datatype</td>
<td>Provide a name for the datatype.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the base datatype.</td>
</tr>
<tr>
<td>Size</td>
<td>Provide the size of the datatype.</td>
</tr>
<tr>
<td>Allow Nulls</td>
<td>Null has no explicitly assigned value. Null is not equivalent to zero or blank. A value of null is not considered to be greater than, less than, or equivalent to any other value, including another value of null.</td>
</tr>
<tr>
<td>Default Binding</td>
<td>Defaults promote data integrity by supplying a default value to a column if the user does not explicitly provide one. They are reusable objects that you can bind to user datatypes.</td>
</tr>
<tr>
<td>Rule Binding</td>
<td>Rules promote data integrity by allowing you to validate the values supplied to a column. They are reusable objects that you can bind to user datatypes.</td>
</tr>
</tbody>
</table>
Views Wizard (SQL Server)

Views are SQL queries stored in the system catalog that customize the display of data contained in one or more tables. Views behave like tables because you can query views and perform data manipulation operations on them. However, views do not actually store any data. Instead, they depend on data contained in their base tables.

To create a new view using a wizard:

1. Open a creation wizard for a view. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Views (SQL Server) - Properties.
   - **Definition** panel - for details, see Views (SQL Server) - Definition.
3. Finally, use the **Execute** button to create the object.

Views (SQL Server) - Properties

When creating or editing a view, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Owner</strong></td>
<td>Select the owner of the view. The owner of the view must have SELECT privileges for the tables in the CREATE view statement or DBADM authority on the database that contains the table.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the view.</td>
</tr>
<tr>
<td><strong>Encryption</strong></td>
<td>If you select this option, the view will not be published with SQL Server replication.</td>
</tr>
<tr>
<td><strong>Schema Binding</strong></td>
<td>When you specify this option, the base table or tables cannot be modified in a way that would affect the view definition. The view definition itself must first be modified or dropped to remove dependencies on the table that is to be modified</td>
</tr>
<tr>
<td><strong>Check Condition</strong></td>
<td>When a row is modified through a view, this option makes sure the data remains visible through the view after the modification is committed.</td>
</tr>
<tr>
<td><strong>Owner</strong></td>
<td>Select the owner of the view. The owner of the view must have SELECT privileges for the tables in the CREATE view statement or DBADM authority on the database that contains the table.</td>
</tr>
</tbody>
</table>

Views (SQL Server) - Definition

Complete the CREATE VIEW statement by typing or pasting in the relevant query.
MySQL object wizards

You create MySQL objects using the following wizards:

- Databases wizard (MySQL)
- Foreign Keys wizard (MySQL)
- Functions wizard (MySQL)
- Indexes, Primary Keys, or Unique Keys wizard (MySQL)
- Tables wizard (MySQL)
- Users wizard (MySQL)
Databases wizard (MySQL)

The MySQL Database Wizard lets you build and execute a basic CREATE DATABASE statement and grant privileges on the database.

To create a new database using a wizard:

1. Open a creation wizard for a database. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Databases - Properties
   - Privileges panel - Setting Permissions or Privileges for an Object
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Databases - Properties

When creating or editing database, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database Name</td>
<td>The database name you choose can be up to 64 characters long. Feel free to use all alphabetic characters or mix in some special or numeric characters. But a name cannot be exclusively special or numeric characters.</td>
</tr>
<tr>
<td>Default Character Set</td>
<td>This is the character set for a language or alphabet. If you do not make a selection from the drop-down list (click the arrow to see the choices), the database will use the server’s default character set.</td>
</tr>
<tr>
<td>Collation</td>
<td>The collation encodes the rules governing character used for a language (like Greek) or an alphabet. The database will use the server’s default collation unless you specify otherwise.</td>
</tr>
</tbody>
</table>

Note: It’s possible to create databases with different character sets and collations on the same MySQL server.
Foreign Keys wizard (MySQL)

The MySQL Foreign Keys Wizard lets you build and execute an ALTER TABLE statement with an ADD CONSTRAINT option implementing a foreign key.

The wizard makes it easy for you to create a relational link between two tables, thereby speeding queries and giving you faster access to data. By using the Create Foreign Key Wizard you obviate the need for remembering the code underlying the creation process.

To create a new foreign key using a wizard:

1. Open a creation wizard for a foreign key. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Foreign Keys - Properties
   - Column Mapping panel - for details, see Foreign Keys - Column Mapping
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Foreign Keys - Properties

When creating or editing a foreign key, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Group</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constraint</td>
<td>name</td>
<td>The constraint name must be unique. You can either rely on MySQL to assign a</td>
</tr>
<tr>
<td>Name</td>
<td>System Generated</td>
<td>unique name or you can specify one.</td>
</tr>
<tr>
<td></td>
<td>User Specified</td>
<td></td>
</tr>
<tr>
<td>Constraint</td>
<td>State</td>
<td>Lets you specify ON UPDATE and ON DELETE values of NO ACTION, CASCADE,</td>
</tr>
<tr>
<td>State</td>
<td>On Update and On</td>
<td>RESTRICT, or SET NULL.</td>
</tr>
<tr>
<td></td>
<td>Delete</td>
<td></td>
</tr>
</tbody>
</table>

Foreign Keys - Column Mapping

1. Under Referenced Table, choose the Database and then the referenced, or parent, Table.

2. Under the Main Table, select the referencing Table.

3. Under the Main Table, select the check box corresponding to the referring column and then under Referenced Table, select the check box corresponding to the referenced column.
Functions wizard (MySQL)

The MySQL Functions Wizard lets you build and submit a CREATE FUNCTION declaration, specifying a return type and the owning library.

Note: Functions must be written in C or C++, your operating system must support dynamic loading, and you must have compiled mysqld dynamically (not statically).

To create a new function using a wizard:

1. Open a creation wizard for a function. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Functions - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Functions - Properties

When creating or editing a function, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function Name</td>
<td>In 64 characters or less, you can name your function.</td>
</tr>
<tr>
<td>Return Value</td>
<td>STRING, REAL (also known as Double), INTEGER</td>
</tr>
<tr>
<td>Shared Object Library</td>
<td>Identify the file that holds the library where your functions are stored.</td>
</tr>
<tr>
<td>Aggregate</td>
<td>Check the box if the function you are creating will collapse a large amount of data into a single output, or aggregate the data.</td>
</tr>
</tbody>
</table>
Indexes, Primary Keys, or Unique Keys wizard (MySQL)

The Indexes Wizard, Primary Keys Wizard, and Unique Keys wizard offer the same steps in creating these MySQL objects.

To create a new index, primary key, or unique key using a wizard:

1. Open a creation wizard for an index, primary key, or unique key. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Indexes, Primary Keys, or Unique Keys - Properties
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object. For more information, see Previewing the DDL Generated to Create the New Object.

Indexes, Primary Keys, or Unique Keys - Properties

When creating or editing an index, primary key, or unique key, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Select the table on which you want to create the object.</td>
</tr>
<tr>
<td>Index Name</td>
<td>Provide a name of up to 64 alphanumeric characters.</td>
</tr>
<tr>
<td>Constraint Type</td>
<td>Primary: Each record of a table is identified as uniquely and relates to a foreign key in another table. Unique: Ensures that there is no duplication between values in columns where you place this constraint. Full Text: Enables the search for several words in arbitrary order in a table. Spatial: Allows you to find records that are defined by location, or geometry types.</td>
</tr>
<tr>
<td>Index Storage Type</td>
<td>Hash: Used for equality comparisons. Only whole keys can be used to search for a row. BTree: Tree data structure that keeps data sorted. BTrees grow from the bottom up as elements are inserted. RTree: Tree data structure used for spatial indexes and access to multidimensional information.</td>
</tr>
<tr>
<td>Specify Columns in Index</td>
<td>Columns are listed by name and datatype and whether or not they are nullable. As you check selections, the sort order is identified.</td>
</tr>
</tbody>
</table>
Tables wizard (MySQL)

The MySQL Table Wizard lets you create a basic table definition.

To create a new table using a wizard:

1. Open a creation wizard for a table. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Tables - Properties
   - Columns panel - for details, see Tables - Columns
   - Indexes panel - for details, see Tables - Indexes
   - Foreign Keys panel - for details, see Tables - Foreign Keys
   - MERGE tables panel - for details, see Tables - MERGE Tables
   - Privileges panel - for details, see Setting Permissions or Privileges for an Object
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object
3. Finally, use the Execute button to create the object.

Tables - Properties

When creating or editing a table, this tab/panel lets you work with the following properties:

Note: Prior to working with MySQL table properties, you should have a detailed understanding of MySQL table creation options. For access to MySQL documentation, see Accessing Third Party Documentation.
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table Name</strong></td>
<td>Provide a unique name of up to 64 characters.</td>
</tr>
<tr>
<td><strong>Storage Type</strong></td>
<td>Lets you select a storage engine value of MyISAM, InnoDB, BerkeleyDB, ISAM, MRG_MyISAM, HEAP, or MEMORY.</td>
</tr>
<tr>
<td><strong>Row Format</strong></td>
<td>Lets you select a row format of DEFAULT (returns the default value if there is one), FIXED (each row is stored with a fixed number of bytes), DYNAMIC (data records have variable length), or COMPRESSED (each record is compressed separately).</td>
</tr>
<tr>
<td><strong>Create via SELECT</strong></td>
<td>When you create a table using a SELECT command, the individual columns take their data types from the SELECT command, and don’t have to be declared explicitly. Attributes, however, are not carried over.</td>
</tr>
<tr>
<td><strong>Unique Key Violations</strong></td>
<td>When you try to insert or update a row that causes a violation, you can choose to IGNORE the violation and continue processing the next row. Or, you can choose REPLACE, which is equivalent to an insert statement if a violation occurs. The row will be replaced with the new data.</td>
</tr>
<tr>
<td><strong>Default Character Set</strong></td>
<td>This is the character set for a language or alphabet.</td>
</tr>
<tr>
<td><strong>Default Collation</strong></td>
<td>The collation encodes the rules governing character used for a language (like Greek) or an alphabet.</td>
</tr>
<tr>
<td><strong>Auto-increment</strong></td>
<td>You can specify the initial value used for the auto-increment sequence. This is possible only for MyISAM tables and for InnoDB tables built in MySQL versions 5.0.3 or greater. For InnoDB tables built in versions prior to 5.0.3, you can manually insert a dummy row with a value one less than the desired value after creating the dummy table; you then delete the dummy row.</td>
</tr>
<tr>
<td><strong>Comment</strong></td>
<td>Enter a descriptive comment.</td>
</tr>
<tr>
<td><strong>Min Rows</strong> and <strong>Max Rows</strong></td>
<td>Note that if you set the value for either parameter at 0, MySQL removes the setting. MySQL will take care of the row settings in this case.</td>
</tr>
<tr>
<td><strong>Average Row Length</strong></td>
<td>The average length (compressed or uncompressed) of table rows in the table space.</td>
</tr>
<tr>
<td><strong>Pack Keys</strong></td>
<td>This setting is only enabled for a <strong>Storage Type</strong> of MyISAM. It lets you specify a PACK KEYS option value of 0 (keys packing disabled), 1 (smaller indexes), or DEFAULT (pack long columns only).</td>
</tr>
<tr>
<td><strong>Check Sum</strong></td>
<td>This setting is only enabled for a <strong>Storage Type</strong> of MyISAM. When selected the CREATE TABLE statement is issued with a CHECKSUM = 1 option. When deselected, the CREATE TABLE statement is issued with a CHECKSUM = 0 option.</td>
</tr>
</tbody>
</table>
Delay Key Write

This setting is only enabled for a Storage Type of MyISAM. When selected, the CREATE TABLE statement is issued with a DELAY_KEY_WRITE = 1 option. When deselected, the CREATE TABLE statement is issued with a DELAY_KEY_WRITE = 0 option.

Tables - Columns

When creating or editing a table, this tab/panel lets you modify the table's column setup, as follows:

- Use the Add Column button to add the columns to the table. After providing a Name for a new column, you can select a Type and modify other Datatype properties corresponding to the type you selected. When selected, the Allow Nulls property corresponds to a CREATE TABLE with a NULL attribute, while unselected it corresponds to a NOT NULL attribute. When available the Default Value property corresponds to a DEFAULT attribute.
- Modify a column definition by selecting the column from the column list and modifying values under Column Attributes.
- Delete a column definition by selecting the column from the column list and clicking Delete.
- Use the arrow buttons to change the position of a selected column.

Tables - Indexes

When creating or editing a table, this tab/panel lets you build an associated PRIMARY KEY, UNIQUE KEY, FULL TEXT, or SPATIAL clause that will be included with the CREATE TABLE statement.

- Use the Insert a New Index button to add an index. In the Index field, type a name for the index, select a Constraint Type of PRIMARY KEY, UNIQUE KEY, FULL TEXT, or SPATIAL, and select an Index Type of BTREE, HASH, or RTREE as appropriate to the constraint type. Under Specify Columns in Index, select the column or columns that are to make up the index.
- Modify an index definition by selecting the index from the list and modifying the Index name, Constraint Type, Index Type or the columns making up the index.
- Delete an index by selecting the index from the list and clicking the Remove button.

Tables - Foreign Keys

When creating or editing a table, this tab/panel lets you work with foreign keys for a table:

Note: This tab/panel is only available for a table with a Storage Type property value of INNODB.
Use the Insert a New Foreign Key button to add a foreign key. Provide a Foreign Key Name, select the referenced database and table from the Ref. Database and Ref. Table dropdowns, and select On Delete and On Update actions of NONE, CASCADE, DEFAULT, SET NULL, NO ACTION, or RESTRICT. Under Main Table, select the foreign key column and then under Referenced Table, select the column that the foreign key is to reference.

Modify a foreign key definition by selecting the foreign key from the list and changing the name, referenced database or table, delete or update actions, or the column specifications.

Delete a foreign key by selecting the key from the list and clicking the Remove the selected foreign key button.

Tables - MERGE Tables

When creating or editing a table, this tab/panel lets you work with a collection of identical MyISAM tables that are to be used as a single table.

Note: This tab/panel is only available for a table with a Storage Type property value of MRG_MyISAM.

Use the New button to add a MyISAM table to the collection, selecting a table from the associated dropdown.

Use the Delete button to remove a selected MyISAM table from the collection.

Use the arrow buttons to change the ordering position of a selected table.
Users wizard (MySQL)

The MySQL Users Wizard lets you provide basic identification, grant privileges, and specify valid host information for a user definition.

To create a new user using a wizard:

1. Open a creation wizard for a user. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **User Information** panel - for details, see Users - User Information
   - **User Hosts** panel - for details, see Users - User Hosts
   - **System Privileges** and **Object Privileges** panels - for details, see Setting Permissions or Privileges for an Object
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object

3. Finally, use the **Execute** button to create the object.

Users - User Information

When creating or editing a user definition, this tab/panel lets you work with the following settings:
Users wizard (MySQL)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>The name of the new user. At this time, the name cannot exceed 16 characters, although the field accepts 34. The discrepancy cannot be enforced, so we urge you to show a little restraint. This is the name that is displayed in the User branch of the Navigator/Explorer tree. If you leave this field blank and complete the process, you create an &lt;anonymous&gt; user. Only one anonymous user per datasource is allowed.</td>
</tr>
<tr>
<td>Full Name</td>
<td>OPTIONAL. At this time, the name cannot exceed 16 characters, although the field accepts 34. If you entered a nickname or an alias in the user name field, you can display the user’s true identity here.</td>
</tr>
<tr>
<td>Description</td>
<td>OPTIONAL. Write a brief description of the user if you want.</td>
</tr>
<tr>
<td>Email</td>
<td>OPTIONAL. The new user’s email address.</td>
</tr>
<tr>
<td>Contact Information</td>
<td>OPTIONAL. The new user’s title, address, phone number or whatever contact information you want to include.</td>
</tr>
<tr>
<td>User Icon</td>
<td>OPTIONAL. If you want to identify your new user by color or pattern, you can use the icon editor to make a distinguishing mark. You can assign groups of users the same icon or assign each user his or her own icon. This tool helps you distinguish users at a glance. Note: If you don’t want to use the head that’s preloaded, simply click the red X and start designing your own with the other tools.</td>
</tr>
</tbody>
</table>

Users - User Hosts

When creating or editing a user definition, this tab/panel lets you specify the valid hosts from which the user can connect to the server.

- Add a new host to the list by clicking the New button. Use the associated dropdown to select a valid host-name value (such as localhost or %), overwriting the text as necessary to provide a specific quoted identifier. Provide a password in the Password and Confirm fields and click Apply.

  **Note:** Click Apply To All to assign the current password for each host currently in the list.

- Remove a selected host from the list by clicking the Delete button.
Oracle Object Wizards

You create Oracle objects using the following wizards:

- Clusters Wizard (Oracle)
- Database Links Wizard (Oracle)
- Directories Wizard (Oracle)
- Disk Groups Wizard (Oracle)
- Foreign Keys Wizard (Oracle)
- Functions Wizard (Oracle)
- Indexes Wizard (Oracle)
- Oracle Job Queue Wizard (Oracle)
- Jobs wizard (Oracle)
- Libraries Wizard (Oracle)
- Materialized Views Wizard (Oracle)
- Materialized View Logs Wizard (Oracle)
- Outlines Wizard (Oracle)
- Packages Wizard (Oracle)
- Primary Keys Wizard (Oracle)
- Procedures Wizard (Oracle)
- Programs wizard (Oracle)
- Profiles Wizard (Oracle)
- Redo Log Groups Wizard (Oracle)
- Roles Wizard (Oracle)
- Rollback Segments Wizard (Oracle)
- Schedules Wizard (Oracle)
- Sequences Wizard (Oracle)
- Synonyms Wizard (Oracle)
- Tables Wizard (Oracle)
- Tablespaces Wizard (Oracle)
- Triggers Wizard (Oracle)
Oracle Object Wizards

- Object Types Wizard (Oracle)
- Unique Keys Wizard (Oracle)
- Users Wizard (Oracle)
- Views Wizard (Oracle)
Clusters Wizard (Oracle)

The Cluster Wizard lets you create a cluster. A cluster is a schema object that has one or more tables that all have one or more common columns. Rows of one or more tables that share the same value in these common columns are stored together in the database. The related columns of tables stored in a cluster are known as the cluster key.

Important Notes

- To create a cluster, you need the CREATE CLUSTER or CREATE ANY CLUSTER system privilege.

To Open the Cluster Wizard

1. On the Navigator/Explorer, find the schema where you want to add the new cluster.
2. On the Cluster branch, right-click and select New.

OR

1. On the main toolbar, click Datasource and scroll to Objects
2. Click Clusters and then click New from the toolbar.

The tables below describe the fields you may encounter as you complete the wizard.
<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Who owns the cluster?</td>
<td>Pick an owner</td>
</tr>
<tr>
<td>What is the name of the cluster?</td>
<td>Type a unique name</td>
</tr>
<tr>
<td>On which tablespace do you want to create the cluster?</td>
<td>Self-explanatory</td>
</tr>
<tr>
<td>Add columns that are in this cluster. These are the columns that are common between the tables you are “clustering”</td>
<td><strong>Add</strong> or <strong>Edit</strong> Button - For more information, see <a href="#">Adding or modifying a cluster column</a>. <strong>Drop</strong> Button - Drops the column.</td>
</tr>
<tr>
<td>What is the size of this cluster?</td>
<td>This is the estimated number of bytes/KB/MB required by an average cluster key and its associated rows. Do not exceed the size of a data block.</td>
</tr>
<tr>
<td>What is the cluster type?</td>
<td>Index: Rows having the same cluster key value are stored together. Each separate cluster key is stored only once in each data block. An indexed cluster is helpful if your clustered tables might grow unpredictably. Hash: Rows with the same hash key value are stored together. This is helpful if the tables are static.</td>
</tr>
<tr>
<td>If this is a hash cluster, what is the number of hash keys?</td>
<td>Type the number of hash keys. Oracle will round the value up to the nearest prime number.</td>
</tr>
<tr>
<td>If this is a hash cluster, what is the hash function?</td>
<td>Oracle uses a hash function to generate a distribution of numeric values, called hash values, which are based on specific cluster key values. The key of a hash cluster, like the key of an index cluster, can be a single column or composite key (multiple column key). To find or store a row in a hash cluster, Oracle applies the hash function to the row’s cluster key value. The resulting hash value corresponds to a data block in the cluster, which Oracle then reads or writes on behalf of the issued statement. Default is the Oracle internal hash function, otherwise specify the hash expression you want to use.</td>
</tr>
<tr>
<td>How many transaction entries are allowed for each data block in the cluster?</td>
<td>Each transaction that updates a data block requires a transaction entry. Initial (1-255): The initial parameter ensures that a minimum number of concurrent transactions can update a data block, avoiding the overhead of allocating a transaction entry dynamically. Maximum (1-255): The maximum parameter limits concurrency on a data block.</td>
</tr>
<tr>
<td>What is the percent of space reserved for future updates?</td>
<td>Percent Free (0-99): This sets the percentage of a data block to be reserved for possible row updates that are included in the block. The value you set is the percent kept free.</td>
</tr>
</tbody>
</table>
Clusters Wizard (Oracle)

**What is the minimum percentage of used space that Oracle maintains for each data block?**

The storage parameter lets you tune performance by minimizing the occurrence of row migration and chaining caused by update operations that extend the length of rows stored on the data block. **Percent Used (1-99)**

**How large are the cluster’s extents?**

The unit of space allocated to an object whenever the object needs more space. **Initial Extent** - The initial space extent (in bytes) allocated to the object. **Next Extent** - The next extent (in bytes) that the object will attempt to allocate when more space for the object is required.

**Specify the number of free lists**

Free lists are lists of data blocks that have space available for inserting rows. Identifying multiple free lists can reduce contention for free lists when concurrent inserts take place and potentially improve the performance of the cluster. **Free Lists**: The default and minimum value is 1; this option should be set higher if multiple processes access the same data block.

**Specify the number of free list groups (specify only if you are using the parallel server option)**

This is the number of groups of free lists for the database objects being created.

**Define a default buffer pool for this cluster**

Default - Select to retain the default. Keep - Select to retain the object in memory to avoid I/O conflicts.

**Oracle’s parallel query option**

The parallel server query option lets you process queries using many query server processes running against multiple CPUs, which provides substantial performance gains such as reducing the query completion time.

**Choosing Cache**

Cache: This keeps the data block in memory by placing it at the most recently used end. This option is useful for small lookup tables. No Cache

---

**Adding or modifying a cluster column**

The **Add or Modify Cluster Column** dialog lets you manage cluster columns. You can open the dialog in the Oracle Cluster Wizard.

The table below describes the options and functionality on the **Add or Modify Cluster Column** dialog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Name</td>
<td>Lets you type the column name.</td>
</tr>
<tr>
<td>Datatype</td>
<td>Lets you select the datatype for the cluster. If you select CHAR, RAW or VARCHAR2, in the Width box, type the width value. If you select NUMBER, in the Width box, type the width value and in the Scale box, type the scale value.</td>
</tr>
</tbody>
</table>

**Completing the Add or Modify Cluster Column Dialog Box**
Clusters Wizard (Oracle)

To complete this dialog, do the following:

1. In the **Add Cluster Column** dialog, in the **ColumnName** box, type the column name.

2. Click the **Datatype** list, click the datatype for the cluster.
   - If you clicked CHAR, RAW or VARCHAR2, in the **Width** box, type the width value.
   - If you clicked NUMBER, in the **Width** box, type the width value and in the **Scale** box, type the scale value.

3. Click the **Add** button.

4. To continue adding columns to the cluster, repeat steps 1-3.

5. When you finish adding columns, click **Close**.

The **Add Cluster Column** dialog closes.

For more information, see *Adding or modifying a cluster column*. 
Database Links Wizard (Oracle)

A database link specifies a communication path from one database to another. If you’re creating a link to a remote database, a database session is established in the remote database on behalf of the local application request. By creating either a public or private database link, you can determine which schema on the remote database the link will establish connections to by creating fixed, current, and connected database links. By creating a link you can reuse connectivity instructions each time you connect to the remote database.

To Open the Database Link Wizard

1. On the Navigator/Explorer, find the schema where you want to add the new database link.
2. On the Database Links branch, right-click and select New.

OR

1. On the main toolbar, click Datasource and scroll to Objects
2. Click Database Links and then click New from the toolbar.

The table that follows describes the fields you will encounter as you complete the wizard.

Note: To create a public database link, you need CREATE PUBLIC DATABASE LINK privileges.

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the name of the database link?</td>
<td>Create a unique name</td>
</tr>
<tr>
<td>Should the database link be made public?</td>
<td>A public link is a link on a local database that’s accessible to all users on that database. If you keep the database link private by selecting No, a link is created in a specific schema of the local database and only the owner of the link can use it to access database objects in the corresponding remote database.</td>
</tr>
<tr>
<td>What is the name of the remote user?</td>
<td>Self-explanatory</td>
</tr>
<tr>
<td>What is the remote user’s password?</td>
<td>Create a password for the remote user.</td>
</tr>
<tr>
<td>What is the connection string?</td>
<td>Self-explanatory.</td>
</tr>
</tbody>
</table>
Disk Groups Wizard (Oracle)

This wizard builds a CREATE DISKGROUP statement with redundancy and state properties, the associated disks and their properties, and attribute templates.

Note: This functionality is available as of Oracle 10g.

Note: Before working with disk groups, consult Oracle documentation for general information on disk groups and ASM instances, and details on ASM operation and related permissions requirements. For more information, see Accessing Third Party Documentation.

To create a disk group using a wizard

1. On a connected Oracle datasource, expand the Instance and ASM nodes.
2. Right-click the Disk Groups node and select Create from the context menu.

Note: If this is the first time you have initiated a disk group action since connecting, you are prompted to choose between a connection to the ASM instance or to continue using the default datasource connection. For details on the implications, see Manage ASM Connection.

3. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Disk Groups (Oracle) - Properties.
   - Disks panel - for details, see Disk Groups (Oracle) - Disks.
   - Templates panel - for details, see Disk Groups (Oracle) - Templates.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

4. Finally, use the Finish button to create the object.

The Disk Groups Editor has properties and options over and above those in the Disk Groups Wizard. For details, see Disk Groups Editor (Oracle).

Disk Groups (Oracle) - Properties

When creating or editing a disk group, this tab/panel lets you work with the following settings:
### Disk Groups Wizard (Oracle)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the disk group</td>
</tr>
<tr>
<td><strong>Redundancy Type</strong></td>
<td>Lets you select a REDUNDANCY clause value of NORMAL, EXTERNAL, or HIGH,</td>
</tr>
<tr>
<td><strong>Group State After Creation</strong> (labelled <strong>Group State</strong> when editing an existing disk group)</td>
<td>Lets you select an initial disk group state of MOUNTED or DISMOUNTED. By default the disk group is MOUNTED after creation. If you select DISMOUNTED, an ALTER statement is executed to change the state of the disk group to DISMOUNTED after creation.</td>
</tr>
<tr>
<td><strong>Allocation Unit Size</strong></td>
<td>Specify the size of the allocation unit for the disk group.</td>
</tr>
<tr>
<td><strong>Compatibility</strong> (available as of Oracle 11gR1)</td>
<td>Specify the ASM instance minimum software version.</td>
</tr>
<tr>
<td><strong>Database Compatibility</strong></td>
<td>Specify the database instance minimum software version.</td>
</tr>
<tr>
<td><strong>ADVM Compatibility</strong> (available as of Oracle 11gR2)</td>
<td>Lets you add an ATTRIBUTE ‘COMPATIBLE.ADVM’ =... clause, specifying whether the disk group can contain ASM columns.</td>
</tr>
</tbody>
</table>

### Disk Groups (Oracle) - Disks

When creating or editing a disk group, this tab/panel lets you manage the disks of the disk group and their properties.

**To add a disk to the group**

1. Click **Add**, select an entry from the **Disks** dropdown, optionally provide a **Name** for the disk, and press TAB or ENTER.

The disk is added to the **Path** list on the left, with default attribute values.

2. Proceed to edit the disk attributes.

3. Add more disks as necessary.

**To edit disk attributes**

1. Select the disk in the **Path** list on the left. The controls in the **Property/Values** list are updated with values of the selected disk.

2. Use the following table as a guide to providing additional property values.
Disk Groups Wizard (Oracle)

<table>
<thead>
<tr>
<th>Property or group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size</td>
<td>Specify a disk size in KB, MB, or GB.</td>
</tr>
<tr>
<td>Failure Group</td>
<td>Specify the failure group to which the disk is to be added.</td>
</tr>
<tr>
<td>Type (available as of Oracle 11GR1)</td>
<td>Lets you select a REGULAR or QUORUM failure group or disk qualifier. If QUORUM is specified at creation, the QUORUM keyword will be specified in any subsequent ALTER statements that will affect the disk or the failgroup.</td>
</tr>
<tr>
<td>Force</td>
<td>If selected, the disk is added to the disk group even if the disk is already a member of a different disk group.</td>
</tr>
</tbody>
</table>

To delete a disk from the disk group

1. Select a disk from the Path list.
2. Click Delete.

Disk Groups (Oracle) - Templates

When creating or editing a disk group, this tab/panel lets you manage disk group template clauses submitted with the CREATE/ALTER DISKGROUP statement. Each template is a named set of attributes applied to files on the disk group.

Note: Only custom templates need to be added when creating a disk group. The System Templates (CONTROL, DATAFILE, ONLINELOG, ARCHIVELOG, TEMPFILE, BACKUPSET, PARAMETERFILE, DATAGUARDCONFIG, FLASHBACK, CHANGETRACKING, DUMPSET, XTRANSPORT, and AUTOBACKUP) are automatically created for the disk group when the group is created. For more information, see Disk Groups Editor (Oracle).

To add a template to the list of disk template clauses for this disk group

1. Click the New button. The Add new template dialog opens.
2. Use the following table as a guide to providing information on this dialog:
Disk Groups Wizard (Oracle)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the template.</td>
</tr>
<tr>
<td><strong>Stripe</strong></td>
<td>Select COARSE to stripe files every 1MB. Select FINE to stripe files every 128KB.</td>
</tr>
<tr>
<td><strong>Redundancy</strong></td>
<td>Select a redundancy level of UNPROTECTED, MIRROR, PARITY, or HIGH.</td>
</tr>
<tr>
<td><strong>Primary Region</strong> and <strong>Mirror Region</strong> (available as of Oracle 11GR2)</td>
<td>Let you add an ATTRIBUTE disk region clause of HOT/COLD and MIRROR/HOT/MIRROR/COLD values to the template definition.</td>
</tr>
</tbody>
</table>

3. Click **OK**.

To modify a template already in the list

1. Select the template and click the **Edit** button. The **Edit template** dialog opens.
2. Use the table above as a guide to providing information on this dialog.
3. Click **OK**.

To delete a template from the list

1. Select the template and click the **Drop** button. You are prompted to verify.
2. Click **Yes**.
Directories Wizard (Oracle)

A directory object specifies an alias for a directory on the server file system where external binary file LOBs and external table data are located. The wizard completes a CREATE DIRECTORY statement from the information you supply. The Directory Wizard prompts you to name the directory and provide the full-qualified directory path.

To Open the Directories Wizard

1. On the Navigator/Explorer, find the Datasource where you want to create a directory and expand the Storage node.

2. Right-click Directories and select New.

The table that follows describes the fields you will encounter as you complete the wizard.

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the name of the directory?</td>
<td>Type a meaningful name for the directory.</td>
</tr>
<tr>
<td>What is the directory path?</td>
<td>Type the full path name of the outside operating system directory that you want to alias in the directory (for example, /Video/Library/G_Rated). NOTE: Oracle trusts that directory you’re specifying exists. The onus is on you to make sure it’s valid and in the correct format (as required by your operating system).</td>
</tr>
</tbody>
</table>

After you have created the Directory, you can give other users Read or Write privileges by opening the new Directory on the Directories node, and making changes at the Privileges tab.
Foreign Keys Wizard (Oracle)

A foreign key value in one table (child table) refers to a primary key value in another table (parent table). For example, the Author Name column in a publisher’s database may be the primary key for a table of addresses that includes the Author Name column. If an author isn’t included in the parent table, you can’t add the address to the dependent address table. So foreign keys enforce referential integrity between tables by verifying the existence of foreign key values in the parent table before letting you insert or update foreign key values in the child table. In other words, a foreign key is an integrity constraint that requires each value in one table’s column to match a value in a related table’s data.

To create a new foreign key using a wizard:

1. Open a creation wizard for a foreign key. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Foreign Keys (Oracle) - Properties.
   - Column Mapping panel - Foreign Keys (Oracle) - Column Mapping.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Foreign Keys (Oracle) - Properties

When creating or editing a foreign key, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Owner</td>
<td>The owner of the table where the foreign key is being created.</td>
</tr>
<tr>
<td>Table Name</td>
<td>This is the table where the foreign key link originates—the child table.</td>
</tr>
<tr>
<td>Name</td>
<td>Lets you select a constraint name. System Generated Name - DB2 automatically generates a name. User Specified Constraint Name - You type the name.</td>
</tr>
<tr>
<td>Enabled</td>
<td>Enable or disable the foreign key. Enabled ensures that all data modifications to a given table (or tables) satisfy the conditions of the constraints. When disabled, the constraint is temporarily not operational.</td>
</tr>
<tr>
<td>Delete Rule</td>
<td>Select an action: NO ACTION - ensures that referenced values cannot be updated or deleted if to do so would violate referential integrity. CASCADE permits a referenced row in a child table to be deleted/updated if it is deleted/updated in the parent table. A row in the child table is SET NULL when rows in the parent table are deleted/updated.</td>
</tr>
</tbody>
</table>

**Foreign Keys (Oracle) - Column Mapping**

Under **Referenced Table**, choose the **Owner** and then the **Name** of the referenced, or parent, table.

Under the **Main Table**, select check boxes corresponding to the columns that are to reference columns in the referenced table. Then, under **Referenced Table**, select the corresponding column check boxes.
Functions Wizard (Oracle)

Functions are subroutines that you define and are useful for reusing application logic. You can use functions to determine the best methods for controlling access and manipulation of the underlying data contained in an object. A function returns a value, unlike a procedure, which does not.

To create a new function using a wizard:

1. Open a creation wizard for a function. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Functions (Oracle) - Properties.
   - Definition panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Functions (Oracle) - Properties

When creating or editing a function, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the function.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the function.</td>
</tr>
</tbody>
</table>

Functions (Oracle) - Definition

Complete the CREATE FUNCTION outline provided by typing or pasting the body of the function.
Indexes Wizard (Oracle)

Indexes are optional structures associated with tables. You can create indexes specifically to speed SQL statement execution on a table. When properly used, indexes are the primary means of reducing disk I/O. Indexes are logically and physically independent of the data in the associated table. Unique Indexes guarantee that no two rows of a table have duplicate values in the columns that define the index.

Note: The Index Wizard varies slightly in content based on the version of Oracle to which you are connected.

Note: To create indexes in your own schema, you need INDEX privileges on the target table. To create indexes in other schema, you need CREATE ANY INDEX privileges.

Note: You can place a unique key constraint on an Index-O rganized table.

Tip: Index-organized tables take up less storage space and quickly access table rows. Index-organized tables stores rows in primary key order reducing the amount of storage space needed.

Tip: An advantage of using index-organized tables is that the tables use less memory because key columns are not duplicated in the table and index. The remaining non-key columns are stored in the index structure.

To create a new index using a wizard:

1. Open a creation wizard for an index. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Indexes (Oracle) - Properties.
   - Columns panel - Indexes (Oracle) - Columns.
   - Storage panel - Indexes (Oracle) - Storage.
   - Partition panel - Indexes (Oracle) - Partition.
   - Definition panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Indexes (Oracle) - Properties

When creating or editing an index, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table Owner and Table Name</strong></td>
<td>Choose the owner and name of the table in which the index is being created.</td>
</tr>
<tr>
<td><strong>Owner and Name</strong></td>
<td>Choose the owner and provide the name of the index being created.</td>
</tr>
<tr>
<td><strong>Index Type</strong></td>
<td><strong>NONUNIQUE</strong> - In a non-unique index, the ROWID is treated as part of the key. Oracle treats a constraint as deferrable. <strong>UNIQUE</strong> - Select if the index is a unique constraint. The values in the indexed columns must be distinct. <strong>BITMAP</strong> - Widely used in data warehousing environments. The environments typically have large amounts of data and ad hoc queries, but a low level of concurrent DML transactions.</td>
</tr>
<tr>
<td><strong>No Sort</strong></td>
<td>Enable this feature if the rows in the table already stored in ascending order. This increases the speed of the index creation process. Oracle does not sort the rows.</td>
</tr>
<tr>
<td><strong>Logging</strong></td>
<td>Enabling logs this operation to the redo file.</td>
</tr>
<tr>
<td><strong>Reverse</strong></td>
<td>Enabling this feature stores the bytes of the index block in reverse order and excludes the ROWID. The ROWID is a globally unique identifier for a row in a database. It is created at the time the row is inserted into a table, and destroyed when it is removed from a table.</td>
</tr>
<tr>
<td><strong>Function-Based</strong></td>
<td>Permits the results of known queries to be returned much more quickly. When you select this option, you are asked for the expression that governs the function-based index you are creating.</td>
</tr>
<tr>
<td><strong>Invisible (Oracle 11g)</strong></td>
<td>Adds an INVISIBLE keyword to the DDL generated to create or edit this index. The optimizer ignores an invisible index unless the OPTIMIZER_USE_INVISIBLE_INDEXES is set to TRUE at the session or system level.</td>
</tr>
<tr>
<td><strong>No Parallel Execution</strong></td>
<td>The parallel server query option lets you process queries, using many query server processes, running against multiple CPUs. This option provides substantial performance gains such as reduction of the query completion time. After creation, ALTER INDEX for NOPARALLEL execution - when you use multiple query servers and you select this option, the parallel query option remains in place, but parallel processing will be removed. If, for example, multiple users on numerous nodes are modifying the same small set of data, the cost of synchronization from the parallel processing may have an unnecessarily large drag on throughput.</td>
</tr>
<tr>
<td><strong>Parallel Degree</strong></td>
<td>The value you select indicates the number of query server processes that should be used in the operation.</td>
</tr>
<tr>
<td><strong>Parallel Instances</strong></td>
<td>The value you select indicates how you want the parallel query partitioned between the Parallel Servers.</td>
</tr>
</tbody>
</table>

**Indexes (Oracle) - Columns**
Indexes Wizard (Oracle)

From the **Column** dropdown, select a column for the index and specify a **Sort** option. To add more columns, click the **New** button and then follow the steps in the last instruction. Use the Delete button to drop columns.

**Indexes (Oracle) - Storage**

When creating or editing an index, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data Block Storage</strong></td>
<td>Select the <strong>DEFAULT Tablespace</strong> only if you are creating a local partitioned index and want the partitions in the same tablespace as the partitions in the underlying table. (Each partition of a local index is associated with one partition of the table. Oracle can then keep the index partitions in sync with table partitions.) A transaction entry is needed for each INSERT, UPDATE, DELETE, etc. statement that accesses one or more rows in the block. Transaction entries in many operating systems require approximately 23 bytes. <strong>Percent Free</strong> identifies how much space you want to allocate for new rows or updates to existing rows. <strong>Initial Transactions</strong> ensures that a minimum number of concurrent transactions can update an index block, avoiding the overhead of allocating a transaction entry dynamically. <strong>Maximum Transactions</strong> limits concurrency on an index block.</td>
</tr>
<tr>
<td><strong>Extents</strong></td>
<td>An extent is the unit of space allocated to an object whenever the object needs more space. <strong>Initial Extent</strong> - The initial space extent (in bytes) allocated to the object. <strong>Next Extent</strong> - The next extent (in bytes) that the object will attempt to allocate when more space for the object is required. <strong>Percentage Increase</strong> - Lets you type the percentage. NOTE: You should be careful when setting Percent Increase because it magnifies how an object grows and, therefore, can materially affect available free space in a tablespace. <strong>Minimum Extents</strong> - For a dictionary managed tablespace, this is the total number of extents to be allocated when the index is first created. For a locally managed tablespace, this is simply the initial amount of space allocated. <strong>Maximum Extents</strong> - For a dictionary managed tablespace, this is the total number of extents that can ever be allocated to the index. In a locally managed tablespace, the database will automatically manage the extents.</td>
</tr>
<tr>
<td><strong>Freelists</strong></td>
<td><strong>Free lists</strong> let you manage the allocation of data blocks when concurrent processes are issued against the index. You can potentially improve the performance of the index by identifying multiple free lists, which can reduce contention for free lists when concurrent inserts take place. The default and minimum value is 1. You should increase this number if multiple processes access the same data block. <strong>Free List Groups</strong> is the number of groups of free lists. NOTE: This option is only applicable for the parallel server option.</td>
</tr>
<tr>
<td><strong>Buffer Pool</strong></td>
<td><strong>DEFAULT</strong> - Choose this if you want to use the default bufferpool. <strong>KEEP</strong> - Use this to retain the object in memory to avoid I/O conflicts. This type of bufferpool stores frequently referenced data blocks in a separate cache. <strong>RECYCLE</strong> - Select this option to save cache space by ridding data blocks from memory as soon as they are no longer in use.</td>
</tr>
</tbody>
</table>

**Indexes (Oracle) - Partition**

Clicking **Create Partition** opens a wizard that lets you create a partition.
Oracle Job Queue Wizard (Oracle)

This wizard lets you build and submit a DBMS_JOB.SUBMIT call, creating a once-only or scheduled job, optionally submitted as broken.

To create a new job queue using a wizard:

1. Open a creation wizard for a job queue. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Job Queues (Oracle) - Properties.
   - **Definition** panel - for details, see Job Queues (Oracle) - Definition.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the **Execute** button to create the object. For more information, see Previewing the DDL Generated to Create the New Object.

Job Queues (Oracle) - Properties

When creating or editing a job, this tab/panels lets you work with the following settings:
<table>
<thead>
<tr>
<th>Option</th>
<th>Availability and Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Parse</td>
<td>Specifies the value of the NO_PARSE flag. If deselected, the associated procedure is parsed on submission. If selected, the associated procedure is parsed the first time the job is executed.</td>
</tr>
<tr>
<td>Submit as disabled</td>
<td>If selected, the DBMS_JOB.SUBMIT call generated to create the job, is followed by a DBMS_JOB.BROKEN call. Marking the job as broken, this disables the job and in order to execute the job, you must use the Run Job object action. For details, see Run Job (job queues).</td>
</tr>
<tr>
<td>Next Date</td>
<td>Use this control to open a calendar that lets you select a date for the job to run with a default time of midnight. You can then modify the time value.</td>
</tr>
<tr>
<td>Run Again</td>
<td></td>
</tr>
<tr>
<td>Every</td>
<td>Only available if Run Again is selected and Use Custom Expression is not selected.</td>
</tr>
<tr>
<td>Time Unit</td>
<td></td>
</tr>
<tr>
<td>Use Custom Expression and Custom Expression</td>
<td>Only available if Run Again is selected. Custom Expression becomes available when Use Custom Expression is selected.</td>
</tr>
</tbody>
</table>

**Job Queues (Oracle) - Definition**

When creating or editing a job, the tab/panel lets you provide the DBMS_JOB.SUBMIT call’s WHAT parameter, specifying the name of the PL/SQL procedure to run.
Jobs wizard (Oracle)

This wizard builds and submits a call to DBMS_SCHEDULER.CREATE_JOB with optional DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE, DBMS_SCHEDULER.SET_ATTRIBUTE, and DBMS_SCHEDULER.ENABLE calls. This lets you create a fully-specified job.

**Note:** This functionality is available as of Oracle 10g.

**Note:** Before working with jobs, consult Oracle documentation for general information on DBMS_SCHEDULER. For more information, see Accessing Third Party Documentation.

To create a job using a wizard

1. In DBArtisan, on a connected Oracle datasource, expand the Instance and Scheduler nodes, right-click the Jobs node and select Create from the context menu.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Jobs (Oracle) - Properties.
   - Action panel - for details, see Jobs (Oracle) - Action.
   - Arguments panel - for details, see Jobs (Oracle) - Arguments.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Finish button to create the object.

**Jobs (Oracle) - Properties**

When creating or editing a job, this tab/panel lets you work with the following settings:
**Group**

**Settings and Description**

**Creation**
Lets you provide an **Owner** and **Name** for the job.

**Attributes**
Lets you provide **Enabled**, **Description** (COMMENTS), and **Job Class** (JOB_CLASS) attributes.

**Schedule**
Lets you select a **Schedule Type** of IMMEDIATE, ONCE, REPEATING, or specified SCHEDULE. Depending on your selection, the following settings may be available:
- **Repeat Interval** - corresponds to a REPEAT_INTERVAL attribute. Calendaring syntax, as described in Oracle DBMS_SCHEDULER documentation, can be typed free-form, and will be passed directly to the server. For information on third-party documentation access, see Accessing Third Party Documentation. **Start Date** and **End Date** - correspond to START_DATE and END_DATE attributes.

**Properties**
The **Auto Drop** setting corresponds to a CREATE_JOB AUTO_DROP attribute. Other settings result in one or more DBMS_SCHEDULER.SET_ATTRIBUTE calls being generated with RESTARTABLE, JOB_PRIORITY, MAX_RUNS, MAX_FAILURES, FAILED_RUNS, STOP_ON_WINDOW_CLOSE, INSTANCE_STICKINESS, or JOB_WEIGHT attributes specified, as appropriate.

### Jobs (Oracle) - Action

When creating or editing a job, this tab/panel lets you specify a JOB_ACTION attribute for the DBMS_SCHEDULER.CREATE_JOB call, specifying the job action for the job.

**To specify a job action**

1. From **Job Type**, select one of PLSQL BLOCK, STORED PROCEDURE, EXECUTEABLE, or CHAIN.
2. Based on your **Job Type** selection, provide additional details as follows:
   - **PLSQL BLOCK** - Type or paste the SQL to be executed.
   - **STORED PROCEDURE** - Provide the **Procedure Owner** and **Procedure Name**.
   - **EXECUTEABLE** - Use the browse button to locate the executable.
   - **PROGRAM** - Provide the **Program Owner** and **Program Name**.
   - **CHAIN** - Provide the **Chain Owner** and **Chain Name**.

### Jobs (Oracle) - Arguments

When creating or editing a job, if you selected an **Action** tab choice of PROGRAM, EXECUTEABLE, or STORED PROCEDURE, this tab/panel lets you manage parameters to be passed.
**Note:** If you provide arguments with an *Action* tab choice of PROGRAM, the provided arguments override those specified in the program definition. For details, see *Programs wizard (Oracle)*.
Libraries Wizard (Oracle)

Libraries are an object type that represent a call to an operating system shared library cache. After the call is made, libraries can be used by SQL or PL/SQL to link to external procedures or functions. Libraries are only to be used on operating systems that support shared libraries and dynamic linking. Libraries serve as pointers or aliases to physical operating system shared library files and do not exist as a physical object; rather they rely on the physical existence of the files in the external operating system library to which they refer. To access the function or procedures stored in the library, you need execute privileges at the operating system level where the shared library resides.

- To create a library in your own schema, you need CREATE ANY LIBRARY privileges. To use the functions or procedures stored in the library, you need object EXECUTE privileges on the library.

To Open the Library Wizard

1. On the Navigator/Explorer, find the datasource where you want to create a Library and expand the Schema node.

2. Right-click the Libraries node, and select New.

The table that follows describes the fields you may encounter using this wizard:

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Who owns the library?</td>
<td>Self-explanatory.</td>
</tr>
<tr>
<td>What is the name of the library?</td>
<td>Self-explanatory.</td>
</tr>
<tr>
<td>What is the file specification?</td>
<td>Lets you type the file name and location. You must type the complete location (for example, D:\Embarcadero\ETLIB21D.DLL).</td>
</tr>
</tbody>
</table>
Materialized Views Wizard (Oracle)

A materialized view gives you indirect access to table data by storing a query’s results in a separate schema object. Essentially, a materialized view is a database object that contains the results of a query.

The Materialized View Wizard lets you:

- Specify the materialized view owner and to name the materialized view.
- Specify the materialized view's refresh configuration.
- Place the materialized view on a tablespace and specify the query that should be used to populate the materialized view.
- Specify how Oracle should allocate data blocks to store the materialized view.
- Specify how Oracle should manage the growth of the materialized view.
- Specify if Oracle updates the materialized view, register an existing table, and specify how to populate a materialized view.
- Specify if the data for the materialized view is cached, if you want the updates logged, and to specify a number of threads for a parallel operation.
- Specify rollback segments, and enable query rewrites.

To Open the Materialized View Wizard

1. On the Navigator/Explorer, find the datasource where you want to create a Materialized View and expand the Schema node.
2. Right-click the Materialized Views node, and select New.

The table that follows describes the fields you may encounter as you complete the wizard:
<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Who owns the materialized view?</td>
<td>Self-explanatory</td>
</tr>
<tr>
<td>What is the name of the materialized view?</td>
<td>Self-explanatory.</td>
</tr>
<tr>
<td>How should the materialized view be refreshed?</td>
<td>Fast - Using the information logged on the materialized view logs or a partition maintenance operation, the refresh applies incremental changes. See Fast Refresh Requirements for more information. Complete - This refresh recalculates the materialized view's defining query. Force - Applies fast refresh when feasible, otherwise uses a complete refresh. Never - Materialized view will not be refreshed with the optional refresh mechanisms.</td>
</tr>
<tr>
<td>Choose a refresh mechanism</td>
<td>On Demand - This option requires that all refreshes be manually executed. On Commit - Select to refresh the materialized view whenever Oracle processes a transaction. Only select this option for materialized views on single table aggregates and materialized views containing joins. Automatically - Select to refresh the materialized view automatically. In the On this date: boxes select a time and date, and then select a refresh amount and a unit of time.</td>
</tr>
<tr>
<td>Where do you want to place the materialized view?</td>
<td>Select the tablespace where you want the materialized view placed.</td>
</tr>
<tr>
<td>What is the materialized view query?</td>
<td>Type the SQL query to be used to populate and to refresh the materialized view.</td>
</tr>
<tr>
<td>Select a refresh method</td>
<td>Primary Key - A primary key's values uniquely identify the rows in a table. Changes are propagated according to row changes as identified by the primary key value of the row. Only one primary key can be defined for each table. The primary key of the master table is the basis for this refresh option, which is the default option. ROWID - A globally unique identifier for a row in a database based on the physical row identifiers. A RowID is created at the time the row is inserted into a table, and destroyed when it is removed from a table. ROWID materialized views cannot contain distinct or aggregate functions or GROUP BY subqueries, joins and set operations.</td>
</tr>
<tr>
<td>How many transaction entries are allowed for each datablock in the materialized view?</td>
<td>A transaction is a logical unit of work that contains one or more SQL statements. Each transaction that updates a data block requires a transaction entry. Initial (1-255) - Ensures that a minimum number of concurrent transactions can update a data block, avoiding the overhead of allocating a transaction entry dynamically. Maximum (1-255) - Limits concurrency on a data block.</td>
</tr>
<tr>
<td>What is the percent of space reserved for future updates?</td>
<td>Percent Free (0 99) - This sets the percentage of a data block to be reserved for possible row updates that are included in the block. The value you set is the percent kept free.</td>
</tr>
</tbody>
</table>
### Materialized Views Wizard (Oracle)

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the minimum percentage of used space that Oracle maintains for</td>
<td>Percent Used (0-99) - Set the amount of space to be used for each datablock. NOTE: The sum of percent free and the percent used cannot exceed 100.</td>
</tr>
<tr>
<td>each datablock?</td>
<td></td>
</tr>
<tr>
<td>How large are the materialized views extents?</td>
<td>The unit of space allocated to an object whenever the object needs more space. An extent is a specific number of contiguous data blocks set aside for storing a specific type of information. Initial Extent (KB) - The initial space extent (in bytes) allocated to the object. Next Extent - The next extent (in bytes) that the object will attempt to allocate when more space for the object is required.</td>
</tr>
<tr>
<td>How many extents should be allocated to the materialized view?</td>
<td>Minimum Extents - The appropriate minimum extents value for the object. Maximum Extents - The appropriate maximum extents value for the object.</td>
</tr>
<tr>
<td>What is the growth rate for sizing additional materialized views?</td>
<td>Percent Increase - Magnifies how an object grows and can materially affect available free space in a tablespace. Select a value in the corresponding box.</td>
</tr>
<tr>
<td>Can the materialized view be updated?</td>
<td>Yes/No</td>
</tr>
<tr>
<td>Do you want to register a prebuilt table to the view?</td>
<td>Yes/No. This option is particularly useful for registering large materialized views in a data warehousing environment.</td>
</tr>
<tr>
<td>Should the materialized view be immediately filled?</td>
<td>Yes/No: Select Yes if you want the materialized view populated immediately or during the next refresh operation.</td>
</tr>
<tr>
<td>Should data for the materialized view be cached?</td>
<td>Yes/No: Select if you want Oracle to put data you access frequently at the most recently used end of the list in the buffer cache when a full table scan is performed. This option is useful for small lookup tables.</td>
</tr>
<tr>
<td>Do you want updates to be logged?</td>
<td>Yes/No</td>
</tr>
<tr>
<td>Do you want to specify the number of threads used in a parallel operation?</td>
<td>Parallel processes means that multiple processes work simultaneously to run a single statement. This can cut the amount of time it takes to get a response. Specify the degree of parallelism if you so desire. If you leave the default at 1, the operation will not be &quot;parallelized.&quot;</td>
</tr>
<tr>
<td>Would you like to specify rollback segments to be used for the</td>
<td>A rollback segment temporarily stores old data that has changed in a SQL statement transaction until it is committed. The “before” image of the database, as it were. Local Rollback Segment - Default indicates that Oracle will select the rollback segment to use on the local machine. Master Rollback Segment - Specify the remote rollback segment used at the remote master site for the individual materialized view.</td>
</tr>
<tr>
<td>materialized view refresh?</td>
<td></td>
</tr>
<tr>
<td>Is the materialized view eligible for query rewrite?</td>
<td>Select to enable the materialized view for query rewrite. Only enable query rewrite if expressions in the statement are repeatable.</td>
</tr>
</tbody>
</table>
Do you want to partition this materialized view? Yes/No Partitioning methods available are: Range: Data is mapped to partitions based on ranges of column values. This is the default. Composite: Based on the range method of partitioning, you can create subpartitions within each partition. Hash: Data is distributed evenly over a specified number of partitions. Data need not fit into a logical range. List: You control explicitly how rows map to partitions. List partitions allow you to group and organize unrelated sets of data.

Do you want to enable Row Movement? Yes/No Enabling row movement allows you to specify whether Oracle can move a table row when you are compressing a table or performing an update on partitioned data.

Select the partitioning columns Self-explanatory

Select the subpartitioning method Self-explanatory

Select the subpartitioning columns Self-explanatory

Hash Partitioning methods None Partition Definition: Specify number of partitions and (optionally) tablespaces Specify individual partitions by name and (optionally) tablespaces

Create list/ordered list of partitions Self-explanatory The Add Partition dialog may open.

Specify number of subpartitions Self-explanatory Click Add, Insert, or Edit to open a dialog that lets you work with subpartition properties.

Select the default tablespaces to contain the subpartitions (optional) Self-explanatory

Materialized View Logs Wizard (Oracle)

Materialized view logs are tables that maintain a history of modifications to the master table, and they are used to refresh simple materialized views. When you create a materialized view log, Oracle automatically creates a log table to track data changes in the master table and a log trigger to maintain the data in the log table. A log can refresh the materialized view incrementally and is therefore often less time-consuming than a complete refresh.

The Materialized View Log Wizard lets you:

- Specify the materialized view log owner and master table.
- Select refresh types and select column filters.
- Specify how Oracle should allocate data blocks to store the materialized view log.
- Specify how Oracle should manage the growth of the materialized view.
- Specify if you want the data for the materialized view log cached, if you want updates logged, and to enable parallel query.
- Specify if you want the log to hold new values.

To Open the Materialized View Logs Wizard

1. On the Navigator/Explorer, find the datasource where you want to create a Materialized View Log and expand the Schema node.
2. Right-click the Materialized View Log node, and select New.

The table that follows describes the fields you may encounter as you complete the wizard:
## Required Information

<table>
<thead>
<tr>
<th>Question</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Who owns the materialized view log’s master table?</td>
<td>Self-explanatory</td>
</tr>
<tr>
<td>Which table will serve as the materialized view log’s master table?</td>
<td>Self-explanatory</td>
</tr>
<tr>
<td>On which tablespace do you want to place the log?</td>
<td>Self-explanatory</td>
</tr>
<tr>
<td>Which refresh types would you like to use?</td>
<td>Primary Key - The log records changes to the master table based on the primary key of affected rows. A primary key’s values uniquely identify the rows in a table. Changes are propagated according to row changes as identified by the primary key value of the row. Only one primary key can be defined for each table. The primary key of the master table is the basis for this refresh option, which is the default option. ROWID - The log records changes to the master table based on the RowID of the affected rows. A ROWID is a globally unique identifier for a row in a database based on the physical row identifiers. A ROWID is created at the time the row is inserted into a table, and destroyed when it is removed from a table. ROWID materialized views cannot contain distinct or aggregate functions or GROUP BY subqueries, joins and set operations.</td>
</tr>
<tr>
<td>Optional: Select any filter column(s) to be recorded in the materialized view log.</td>
<td>A filter column is a column whose values you want to be recorded in the materialized view log for any rows that are changed. You can specify only one primary key, one ROWID, and one filter column list per materialized view log.</td>
</tr>
<tr>
<td>How many transaction entries are allowed for each data block in the materialized view log?</td>
<td>A transaction is a logical unit of work that contains one or more SQL statements. Each transaction that updates a data block requires a transaction entry. Initial (1-255) - Ensures that a minimum number of concurrent transactions can update a data block, avoiding the overhead of allocating a transaction entry dynamically. Maximum (1-255) - Limits concurrency on a data block.</td>
</tr>
<tr>
<td>What is the percent of space reserved for future updates?</td>
<td>Percent Free (0-99) - This sets the percentage of a data block to be reserved for possible row updates that are included in the block. The value you set is the percent kept free.</td>
</tr>
<tr>
<td>What is the minimum percentage of used space that Oracle maintains for each data block?</td>
<td>Percent Used (0-99) - Set the amount of space to be used for each datablock. NOTE: The sum of percent free and the percent used cannot exceed 100.</td>
</tr>
<tr>
<td>How large are the materialized view log’s extents?</td>
<td>Initial Extent (KB) - The default is the value specified for the tablespace where the materialized view log resides.</td>
</tr>
</tbody>
</table>
Materialized View Logs Wizard (Oracle)

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Should the data for a materialized view log be cached?</td>
<td>Yes/No - Select Yes if you want Oracle to put data you access frequently at the most recently used end of the least recently used list in the buffer cache when a full table scan is performed. This option is useful for small lookup tables. No indicates that your most frequently accessed data blocks are put at the least recently used end of the least recently used list of the buffer cache.</td>
</tr>
<tr>
<td>Do you want updates to be logged?</td>
<td>Yes/No</td>
</tr>
<tr>
<td>Do you want to enable parallel query for the log?</td>
<td>Degree. The integer is number of parallel threads used in the parallel operation. The Parallel server query option lets you process queries using many query server processes running against multiple CPUs. This option provides substantial performance gains such as reduction of the query completion time.</td>
</tr>
<tr>
<td>Should the log hold new values?</td>
<td>Yes/No - Yes indicates both old and new values should be saved in the materialized view log. No disables recording of new values in the log. This is the default.</td>
</tr>
</tbody>
</table>
Outlines Wizard (Oracle)

Outlines are a set of results for the execution plan generation of a particular SQL statement. When you create an outline, plan stability examines the optimization results using the same data used to generate the execution plan. That is, Oracle uses the input to the execution plan to generate an outline, and not the execution plan itself.

**Note:** To create an outline, you must have CREATE ANY OUTLINE system privileges.

To create a new outline using a wizard:

1. Open a creation wizard for an outline. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - Outlines (Oracle) - Properties.
   - **Definition** panel - Outlines (Oracle) - Definition.
   - **DDL** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Outlines (Oracle) - Properties

When creating or editing an outline, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stored Outline Name</td>
<td>Provide a unique name for the outline.</td>
</tr>
<tr>
<td>Category</td>
<td>The category is a name you want to use to group stored outlines. (You can type over the word Default that appears automatically.)</td>
</tr>
</tbody>
</table>

Outlines (Oracle) - Definition

Type the SQL statement you want to store as an outline.

**Note:** The only SQL statements possible with stored outlines are SELECT, DELETE, UPDATE, INSERT...SELECT, and CREATE TABLE...AS SELECT.
Packages Wizard (Oracle)

A package is a collection of related program objects stored together in the database. A package specification or package header, declares variables, constants, etc., that are visible outside the package's immediate scope. The package body defines objects declared by the specification but are not visible to applications outside the package. Packages contain all the information needed to process SQL statements from a single source file. You can use packages to process and call batches of SQL.

To Open the Package Wizard

1. On the Navigator/Explorer, find the datasource where you want to create a package and expand the Schema node.

2. Right-click the Packages node, and select New.

You're asked to name an owner for the package and give it a name. When you click Finish, the Packages editor opens to the header tab where you indicate any package specifications and create the package body. For more information, see Package Bodies Editor (Oracle).
Primary Keys Wizard (Oracle)

Primary key (constraint)s are a set of table columns that can uniquely identify every row of a table. No fields that are a part of the primary key can have null values, and each table can have only one primary key.

To create a new primary key using a wizard:

1. Open a creation wizard for a primary key. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - Primary Keys (Oracle) - Properties.
   - **Columns** panel - Primary Keys (Oracle) - Columns.
   - **Storage** panel - Primary Keys (Oracle) - Storage.
   - **Partition** panel - Primary Keys (Oracle) - Partition.
   - **DDL** panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the **Execute** button to create the object.

Primary Keys (Oracle) - Properties

When creating or editing a primary key, this tab/panel lets you work with the following settings:
Primary Keys Wizard (Oracle)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Owner and Table Name</td>
<td>Choose the owner and name of the table in which the primary key is being created.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the primary key being created.</td>
</tr>
<tr>
<td>No Sort</td>
<td>Enable this feature if the rows in the table already stored in ascending order. This increases the speed of the index creation process. Oracle does not sort the rows.</td>
</tr>
<tr>
<td>Logging</td>
<td>Enabling logs this operation to the redo file.</td>
</tr>
<tr>
<td>Reverse</td>
<td>Enabling this feature stores the bytes of the index block in reverse order and excludes the ROWID. The ROWID is a globally unique identifier for a row in a database. It is created at the time the row is inserted into a table, and destroyed when it is removed from a table.</td>
</tr>
<tr>
<td>Validate</td>
<td>Enabling this option indicates that existing data is checked against the constraint when the primary key is enabled. Leaving it disabled indicates that only new data is to be checked against the constraint.</td>
</tr>
<tr>
<td>Deferrable</td>
<td>Dictates whether constraint checking can be deferred until the end of a transaction.</td>
</tr>
<tr>
<td>Deferred</td>
<td>This option is enabled only if you enabled the Deferrable option. Select IMMEDIATE to have the constraint checked at the end of every DDL statement. Select DEFERRED to have the constraint checked only at the end of a transaction.</td>
</tr>
<tr>
<td>Enabled</td>
<td>Enables or disables the primary key.</td>
</tr>
</tbody>
</table>

Primary Keys (Oracle) - Columns

From the **Column** dropdown, select a column for the index and specify a **Sort** option. To add more columns, click the **New** button and then follow the steps in the last instruction. Use the **Delete** button to drop columns.

Primary Keys (Oracle) - Storage

When creating or editing a primary key, this tab/panel lets you work with the following settings:
### Primary Keys Wizard (Oracle)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data Block Storage</strong> group</td>
<td>Select the <strong>DEFAULT Tablespace</strong> only if you are creating a local partitioned index and want the partitions in the same tablespace as the partitions in the underlying table. (Each partition of a local index is associated with one partition of the table. Oracle can then keep the index partitions in sync with table partitions.) A transaction entry is needed for each INSERT, UPDATE, DELETE, etc. statement that accesses one or more rows in the block. Transaction entries in many operating systems require approximately 23 bytes. <strong>Percent Free</strong> identifies how much space you want to allocate for new rows or updates to existing rows. <strong>Initial Transactions</strong> ensures that a minimum number of concurrent transactions can update an index block, avoiding the overhead of allocating a transaction entry dynamically. <strong>Maximum Transactions</strong> limits concurrency on an index block.</td>
</tr>
<tr>
<td><strong>Extents</strong> group</td>
<td>An extent is the unit of space allocated to an object whenever the object needs more space. <strong>Initial Extent</strong> - The initial space extent (in bytes) allocated to the object. <strong>Next Extent</strong> - The next extent (in bytes) that the object will attempt to allocate when more space for the object is required. <strong>Percentage Increase</strong> - Lets you type the percentage. NOTE: You should be careful when setting Percent Increase because it magnifies how an object grows and, therefore, can materially affect available free space in a tablespace. <strong>Minimum Extents</strong> - For a dictionary managed tablespace, this is the total number of extents to be allocated when the index is first created. For a locally managed tablespace, this is simply the initial amount of space allocated. <strong>Maximum Extents</strong> - For a dictionary managed tablespace, this is the total number of extents that can ever be allocated to the index. In a locally managed tablespace, the database will automatically manage the extents.</td>
</tr>
<tr>
<td><strong>Freelists</strong> group</td>
<td><strong>Free lists</strong> let you manage the allocation of data blocks when concurrent processes are issued against the index. You can potentially improve the performance of the index by identifying multiple free lists, which can reduce contention for free lists when concurrent inserts take place. The default and minimum value is 1. You should increase this number if multiple processes access the same data block. <strong>Free List Groups</strong> is the number of groups of free lists. NOTE: This option is only applicable for the parallel server option.</td>
</tr>
<tr>
<td><strong>Buffer Pool</strong></td>
<td><strong>DEFAULT</strong> - Choose this if you want to use the default bufferpool. <strong>KEEP</strong> - Use this to retain the object in memory to avoid I/O conflicts. This type of bufferpool stores frequently referenced data blocks in a separate cache. <strong>RECYCLE</strong> - Select this option to save cache space by ridding data blocks from memory as soon as they are no longer in use.</td>
</tr>
</tbody>
</table>

### Primary Keys (Oracle) - Partition

Clicking **Create Partition** opens a wizard that lets you create a partition.
Procedures Wizard (Oracle)

Procedures are a reusable block of PL/SQL, stored in the database, that applications can call. Procedures streamline code development, debugging, and maintenance by being reusable. Procedures enhance database security by letting you write procedures granting users execution privileges to tables rather than letting them access tables directly. Procedures do not return values, unlike functions.

Note: To create a procedure in your own schema, you need CREATE PROCEDURE privileges. To create a procedure in someone else’s schema, you need CREATE ANY PROCEDURE privileges.

To create a new procedure using a wizard:

1. Open a creation wizard for a procedure. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Procedures (Oracle) - Properties.
   - Definition panel - for details, see Procedures (Oracle) - Definition.

3. Finally, use the Execute button to create the object.

Procedures (Oracle) - Properties

When creating or editing a procedure, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the procedure.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the procedure</td>
</tr>
</tbody>
</table>

Procedures (Oracle) - Definition

Complete the CREATE PROCEDURE outline provided by typing or pasting the body of the procedure.
Profiles Wizard (Oracle)

Profiles are a mechanism for allocating system and database resources to users. In essence, a profile is a set of limits with a name attached to them. If the profile is active, Oracle will limit use and resources to the limits defined by the profile.

The Profile Wizard lets you:

- Name the profile.
- Set composite limit.
- Set session limits for SGA shared pool.
- Set limits on total connection time per session and Idle time per session.
- Set limits on concurrent sessions per user, CPU time per session, and data blocks read per session.
- Set limits on CPU time per call, and number of data blocks read for a call to process an SQL statement.
- Set the number of failed login attempts, and the days an account locks.

Note: To create a profile, you need the CREATE PROFILE system privilege.

The Default option is subject to the limit specified for that particular resource. The default profile initially permits unlimited resources. Limits to the default profile can be made using an Alter statement.

The Unlimited option allows the user with that profile to take use unlimited amounts of that resource.

The Other options take on the resource limits that you indicate.

To Open the Profile Wizard

1. On the Navigator/Explorer, find the datasource where you want to create a procedure and expand the Security node.
2. Right-click the Profile node, and select New.

The table that follows describes the fields you may encounter as you complete the wizard.
### Required Information

<table>
<thead>
<tr>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the name of the profile?</td>
<td>Write a name that’s 30 characters or less</td>
</tr>
<tr>
<td>What is the composite limit on resources per session?</td>
<td>You can set a single composite limit for all resource limits in a profile in addition to setting specific resource limits for a profile. Explicit and composite limits can peacefully coexist. The limit that is reached first stops the session’s activity. Service units are a weighted sum of CPU per session, connect time, logical reads per session, and private SGA. Default/Unlimited/Other (service units)</td>
</tr>
<tr>
<td>What is the limit on the amount of private space a session can allocate in the shared pool of the SGA?</td>
<td>This limit only applies if you are using Shared Server architecture. Default/Unlimited/Other (KB)</td>
</tr>
<tr>
<td>What is the limit on the total connection time per session?</td>
<td>The total elapsed time limit for a session Default/Unlimited/Other (Minutes)</td>
</tr>
<tr>
<td>What is the limit on idle time per session?</td>
<td>Permitted periods of continuous inactive time during a session, expressed in minutes. Long-running queries and other operations are not subject to this limit. Default/Unlimited/Other (Minutes)</td>
</tr>
<tr>
<td>What is the limit on concurrent sessions per user?</td>
<td>Default/Unlimited/Other</td>
</tr>
<tr>
<td>What is the limit on CPU time per session?</td>
<td>Default/Unlimited/Other (Hundredths of a Second)</td>
</tr>
<tr>
<td>What is the limit on data blocks read per session?</td>
<td>Default/Unlimited/Other</td>
</tr>
<tr>
<td>What is the limit on CPU time per call?</td>
<td>The limit on a parse, execute, or fetch. Default/Unlimited/Other (Hundredths of a Second)</td>
</tr>
<tr>
<td>What is the limit on the number of data blocks read for a call to process a SQL statement?</td>
<td>This is the number of logical reads per call. Default/Unlimited/Other</td>
</tr>
<tr>
<td>How many failed login attempts will be allowed before an account is locked?</td>
<td>Default/Unlimited/Other</td>
</tr>
<tr>
<td>How long will an account be locked after the specified number of failed login attempts?</td>
<td>Default/Unlimited/Other (Days)</td>
</tr>
</tbody>
</table>
### Profiles Wizard (Oracle)

<table>
<thead>
<tr>
<th>Question</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the lifetime of the password?</td>
<td>Default/Unlimited/Other (Days)</td>

</tbody>
</table>
**Programs wizard (Oracle)**

This wizard builds and submits a call to `DBMS_SCHEDULER.CREATE_PROGRAM` with optional `DBMS_SCHEDULER.DEFINE_PROGRAM_ARGUMENT` calls, letting you create a program.

**Note:** This functionality is available as of Oracle 10g.

**Note:** Before working with jobs, consult Oracle documentation for general information on `DBMS_SCHEDULER`. For more information, see [Accessing Third Party Documentation](#).

**To create a program using a wizard**

1. In DBArtisan, on a connected Oracle datasource, expand the `Instance` and `Scheduler` nodes, right-click the `Programs` node and select `Create` from the context menu.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Action panel** - for details, see [Programs (Oracle) - Action](#).
   - **Arguments panel** - for details, see [Programs (Oracle) - Arguments](#).
   - **DDL View panel** - for details, see [Previewing the DDL Generated to Create the New Object](#).

3. Finally, use the **Finish** button to create the object.

**Programs (Oracle) - Action**

When creating or editing a job, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Group</th>
<th>Settings and Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Creation</strong></td>
<td>Lets you provide an <strong>Owner</strong> and <strong>Name</strong> for the job as well as ENABLED and <strong>COMMENTS (Description)</strong> attribute values</td>
</tr>
<tr>
<td><strong>Type of Program</strong></td>
<td>The <strong>Type of Program</strong> setting lets you choose among EXECUTABLE, STORED PROCEDURE, or PLSQL Block. Depending on your choice, take one of the following actions: PLSQL BLOCK - Type or paste the SQL to be executed. STORED PROCEDURE - Provide the <strong>Procedure Owner</strong> and <strong>Procedure Name</strong>. EXECUTEABLE - Use the browse button to locate the executable.</td>
</tr>
</tbody>
</table>

**Programs (Oracle) - Arguments**

When creating or editing a program, if you selected an Action tab choice of EXECUTABLE or STORED PROCEDURE, this tab/panel lets you manage parameters to be passed.
Redo Log Groups Wizard (Oracle)

A redo log makes it possible to replay SQL statements because a redo log stores all changes made to a database as they occur. If something unanticipated happens to a datafile, you can restore a backed-up datafile and use the redo log to bring the datafile back to the state it was in before the unanticipated activity. The redo log can consist of two parts: the online redo log and the archived redo log. In archive log mode, redo log files will not be overwritten unless they have been archived somewhere. Each log is a member of the group.

**Note:** Redo should not be confused with Undo, which is a transaction based process.

If you find that you have problems with redo log group availability and Oracle consistently has to wait for redo log groups to become free, you can create additional redo log groups. DBArtisan lets you create additional redo log groups to ensure that there is always a recycled redo log group available.

The Redo Log Group Wizard lets you:

- Assign a number to the new redo log group and determine the file size for the group members.
- Choose a thread for the redo log group for Oracle Parallel Server.
- Add redo log members with the Add Redo Log Member dialog.

**To Open the Redo Log Wizard**

1. On the Navigator/Explorer, find the datasource where you want to create a redo log and expand the *Storage* node.
2. Right-click the *Redo Log Groups* node, and select *New*.

The table that follows describes the fields you may encounter as you complete the wizard.
### Required Information

<table>
<thead>
<tr>
<th>Description</th>
<th>Required Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do you want to use Oracle Managed Files (OMF) for the redo log group? You must be set up to use OMF to use this option.</td>
<td>Lets you specify to use Oracle Managed Files to automatically create the redo log group. Oracle automatically creates and removes operating system files as you create and drop storage objects.</td>
</tr>
<tr>
<td>What is the group number for the redo log group?</td>
<td>When numbering your redo log groups, it is better not to skip numbers (e.g., 5, 10, 15). Skipping numbers causes Oracle to consume extra space in the control files of the database.</td>
</tr>
<tr>
<td>What file size should the group’s redo log members be? Note: All members of the group must be the same. With OMF, you can let Oracle assign a size or enter it manually.</td>
<td>size in KB or MB</td>
</tr>
<tr>
<td>To which thread should the redo log group be added? For this option to be available, you need to be using Oracle with the parallel server option in parallel mode.</td>
<td>OPTIONAL: If you are using Oracle Parallel Server, type the thread. A thread is an operating system component that allows the logic of multiuser applications to be performed as several separate, asynchronous execution paths. Threads help ensure that work is being performed for some user connections even when other connections are blocked (for example, when waiting for a disk read or write operation to complete).</td>
</tr>
<tr>
<td>Add redo log group members</td>
<td>The name of each group member should be a file name. For example, D:\ORACLE\ORADATA\FINANCEDB\REDO02.LOG is a valid group member name. If you do not specify a full path, DBArtisan creates files in either the default or current directory of the database server.</td>
</tr>
</tbody>
</table>
Roles Wizard (Oracle)

The Role Wizard constructs the necessary CREATE ROLE statement from the information that you have supplied. The Role Wizard lets you specify a name for the role and whether or not the role should be identified.

**Note:** To create a role, you need the CREATE ROLE system privilege.

**To Open the Role Wizard**

1. On the Navigator/Explorer, find the datasource where you want to create a role and expand the Security node.
2. Right-click the Roles node, and select New.

The table that follows describes the fields you may encounter as you complete the wizard.

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the name of the role?</td>
<td>Self-explanatory.</td>
</tr>
<tr>
<td>How should the role be identified?</td>
<td>Not identified - Selecting this means the role you are creating will be enabled immediately. Identified: If this is your choice, you're indicating one of the following authorization methods will be followed: Globally - Select to indicate that Oracle permits access to the user by obtaining user name and password information from the security domain central authority. Externally - Select to indicate that Oracle should verify the database user name against an existing operating system user name. Password - Select to indicate that Oracle should identify the role with the password you provide. In the Password box, type the password for the user.</td>
</tr>
</tbody>
</table>

For information on activating and deactivating roles for the current login in the current session, see Role Activation.
Rollback Segments Wizard (Oracle)

Rollback segments manage all transactions in your Oracle databases. A transaction is a read, modify, and write cycle for an Oracle database. A rollback entry is made for all transactions unless a particular clause is specified. So, a rollback segment is a transaction log that consists of a pre-update image value and transaction status, among other things. The rollback segments maintain read consistency among concurrent users in a database and if the transaction fails for any reason, the old image is taken from the rollback segment. By maintaining a history of data changes, rollback segments can rollback uncommitted transactions so that data is rolled back to the prior state. SYS owns all rollback segments no matter who created them and are not accessible to users, just Oracle.

Oracle, it should be mentioned, strongly recommends that you use automatic undo management to simplify managing databases. Tuning rollback segments is a manual process that has largely been deprecated by Oracle, but it is supported for backward compatibility reasons.

The Rollback Segment Wizard lets you:

- Name the rollback segment and to place it online or off-line.
- Place the rollback segment on a tablespace.
- Specify the initial next and optimal extent size as well a the minimum and maximum number of extents that should be allocated to the rollback segment.

Note: This wizard is not available if auto-UNDO management is enabled.

Tip: Make sure enough rollback segments exist on a database to handle the imposed workload. One rule of thumb is to create one rollback segment for every four concurrent users.

To Open the Rollback Segment Wizard

1. On the Navigator/Explorer, find the datasource where you want to create a rollback segment and expand the Storage node.
2. Right-click the Rollback Segments node, and select New.

The table that follows describes the fields you may encounter as you complete the wizard.
<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the name of the rollback segment?</td>
<td>Self-explanatory.</td>
</tr>
<tr>
<td>Should this rollback segment be made public?</td>
<td>Yes - A public rollback segment can be brought online by any instance in a parallel server. Public rollback segments form a pool of rollback segments that can be used by any instance that needs one. No - This is the default. A private rollback segment can only be acquired by the instance specifying the segment in its initialization file.</td>
</tr>
<tr>
<td>Do you want to place the rollback segment to be online following its creation?</td>
<td>Online - To be useful, a rollback segment must be online. Offline - You may want to take rollback segments offline if you want to take a tablespace offline and it contains rollback segments that you want to keep from being used.</td>
</tr>
<tr>
<td>On which tablespace do you want to place this rollback segment?</td>
<td>Self-explanatory. Oracle suggests that you create one or more tablespaces specifically to hold all rollback segments. This way, the data contained in the rollback segments is held apart from other data types.</td>
</tr>
<tr>
<td>What extent sizes do you want to assign to this rollback segment?</td>
<td>Initial size (KB) Next size (KB) Optimal size (KB) Null/Default</td>
</tr>
<tr>
<td>What are the minimum and maximum number of extents to allocate to the rollback segment?</td>
<td>Minimum Maximum</td>
</tr>
</tbody>
</table>
Schedules Wizard (Oracle)

This wizard builds and submits a call to DBMS_SCHEDULER.CREATE_SCHEDULE call, letting you create a schedule.

**Note:** This functionality is available as of Oracle 10g.

**Note:** Before working with jobs, consult Oracle documentation for general information on DBMS_SCHEDULER. For more information, see [Accessing Third Party Documentation](#).

**To create a schedule using a wizard**

1. In DBArtisan, on a connected Oracle datasource, expand the **Instance** and **Scheduler** nodes, right-click the **Schedules** node and select **Create** from the context menu.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see [Schedules (Oracle) - Properties](#).
   - **DDL View** panel - for details, see [Previewing the DDL Generated to Create the New Object](#).

3. Finally, use the **Finish** button to create the object.

**Schedules (Oracle) - Properties**

When creating or editing a job, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Group</th>
<th>Settings and Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Creation</strong></td>
<td>Lets you provide an <strong>Owner</strong> and <strong>Name</strong> for the schedule.</td>
</tr>
</tbody>
</table>

**Attributes**
- **Description** - corresponds to a COMMENT attribute.
- **Repeat Interval** - corresponds to a REPEAT_INTERVAL attribute. Calendaring syntax, as described in Oracle DBMS_SCHEDULER documentation, can be typed free-form, and will be passed directly to the server. For information on third-party documentation access, see [Accessing Third Party Documentation](#). **Start Date** and **End Date** - correspond to START_DATE and END_DATE, attributes.
Sequences Wizard (Oracle)

Sequences are programmable database objects that provide numbers in sequence for input to a table. A sequence can be used to automatically generate primary key values for tables. Once defined, a sequence can be made available to many users. When you create a sequence, you can define its initial value, increment interval, and maximum value.

The Sequence Wizard lets you:

- Specify the name and owner of the sequence.
- Set both the value of the sequence, and an interval and ranges for incrementing it.
- Cache the sequence, cycle the sequence when it reaches its minimum or maximum values, and guarantee that Oracle generates sequence numbers in the order of request.

**Note:** To create a sequence, it must belong to your schema or you need CREATE SEQUENCE privilege.

**To Open the Sequence Wizard**

1. On the Navigator/Explorer, find the datasource where you want to create a rollback segment and expand the Schema node.
2. Right-click the **Sequences** node, and select **New**.

The table that follows describes the fields you may encounter as you complete the wizard.
# Sequences Wizard (Oracle)

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Who owns the sequence?</td>
<td>Self-explanatory.</td>
</tr>
<tr>
<td>What is the sequence name?</td>
<td>Self-explanatory.</td>
</tr>
<tr>
<td>What is the first sequence number to be generated?</td>
<td>Start with: Pick an integer.</td>
</tr>
<tr>
<td>What is the interval between sequence numbers?</td>
<td>Increment by: Positive numbers will generate ascending values, and a negative number will generate descending numbers</td>
</tr>
<tr>
<td>What is the sequence’s minimum value?</td>
<td>The default is 1 for ascending sequences; This integer value can have 28 or fewer digits. None Minimum value - Identify how low the sequence can go.</td>
</tr>
<tr>
<td>What is the sequence’s maximum value?</td>
<td>For descending values, the default is 1. Lets you specify the maximum value the sequence can generate. This integer value can have 28 or fewer digits. None Maximum value - Indicate the highest sequence value that will be allowed.</td>
</tr>
<tr>
<td>Should Oracle preallocate sequence numbers and cache them for faster access?</td>
<td>This is the number of sequence values you want to specify in the SGA buffers. This speeds access, but cached numbers are erased when the database is shut down. The default value is 20. Yes Number of values No</td>
</tr>
<tr>
<td>Should the sequence continue to generate values after reaching either its maximum or minimum value?</td>
<td>If you say no, the sequences will automatically recycle to the minimum value when you’ve hit the maximum for ascending sequences and vice versa for descending sequence values. Yes No</td>
</tr>
<tr>
<td>Should the sequence numbers be generated in the order of request?</td>
<td>This may be required when sequences are required for timestamping. But generally, because sequences are naturally ordered, this is only necessary for if you use Oracle RAC clusters for parallel mode. Yes No</td>
</tr>
</tbody>
</table>
Snapshots and Snapshot Logs Wizards (Oracle)

Oracle has replaced the snapshot functionality with materialized views. Refer to the Materialized Views Wizard (Oracle) and Materialized View Logs Wizard (Oracle).
Synonyms are alternate names for database objects to be used as a reference by users or applications. A synonym offers you security and convenience so that you can refer to an object without revealing who owns it or what database it belongs to. Synonyms Depending on the platform, you can define synonyms on tables, views, sequences, procedures, functions, packages, and materialized views. If an underlying object needs to be renamed or moved, it’s easy enough to redefine the synonym without having to modify any applications based on the synonym.

**Note:** To create a private synonym, you need CREATE SYNONYM privileges. To create a public synonym, you need CREATE PUBLIC SYNONYM privileges.

**To create a new synonym using a wizard:**

1. Open a creation wizard for a synonym. For details, see [Opening an Object Wizard](#).
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties panel** - [Synonyms (Oracle) - Properties](#).
   - **Definition panel** - for details, see [Previewing the DDL Generated to Create the New Object](#).
3. Finally, use the **Execute** button to create the object.

**Synonyms (Oracle) - Properties**

When creating or editing a synonym, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Owner and Name</strong></td>
<td>Choose the owner and provide a name for the synonym being created.</td>
</tr>
<tr>
<td><strong>Referenced Object Owner</strong></td>
<td>Select the owner of the object to which the synonym is to refer.</td>
</tr>
<tr>
<td><strong>Referenced Object Type</strong></td>
<td>Select the type of the object to which the synonym is to refer.</td>
</tr>
<tr>
<td><strong>Referenced Object Name</strong></td>
<td>Select the specific object to which the synonym is to refer.</td>
</tr>
<tr>
<td><strong>Database Link</strong></td>
<td>If the object resides on a remote database, select a database link.</td>
</tr>
</tbody>
</table>
Tables Wizard (Oracle)

Tables are the most basic data storage units for Oracle. As you might expect, data is stored in rows and columns. The Table Wizard constructs the necessary CREATE TABLE statement from the information that you supply. The Table Wizard varies slightly in content based on the version of Oracle on the target datasource. But in all cases, you name columns and determine column width or precision and scale depending on the column’s data type. A row collects the column information that corresponds to a single record.

You can set rules for the columns to live by, and these are called integrity constraints. For example, if you select NOT NULL, that column will have to have a value in each row.

Also, before beginning, consider what kind of table you want to create as the wizard will ask you to choose:

Heap organized table

This is a basic table where data is stored as an unordered collection, i.e., heap.

Index-organized table

A B-tree index structure stores data, sorted by primary key. Nonkey column values are stored too.

Partitioned table

Data is broken down into smaller, more manageable pieces called partitions or subpartitions. Each partition can be managed individually and operate independent of the other partitions.

Clustered table

This is a table that, once created, is part of a cluster. A cluster is a group of tables that share some data blocks and columns and are often used together. To create a cluster, use the Clusters Wizard (Oracle).

Note: The table wizard panels differ depending on what options you select.

Note: To simplify the process of creating a table, the Table Wizard focuses on creating the basic table definition with a primary key constraint. After you create the basic table definition you can add unique and foreign keys to the table on the Constraints tab of the Tables Editor.

To create a new table using a wizard:

1. Open a creation wizard for a table. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Tables (Oracle) - Properties.
   - Columns panel - for details, see Tables (Oracle) - Columns.
   - Indexes panel (not available with a Row Organization of EXTERNAL) - for details, see Tables (Oracle) - Columns.
Tables Wizard (Oracle)

- **Constraints** panel (not available with a **Row Organization** of EXTERNAL) - for details, see **Tables (Oracle) - Constraints**.

- **Storage** panel (not available with a **Row Organization** of EXTERNAL) - for details, see **Tables (Oracle) - Storage**.

- **IOT Properties** panel (not available with a **Row Organization** of EXTERNAL) - for details, see **Tables (Oracle) - IOT Properties**.

- **Partition** (not available with a **Row Organization** of EXTERNAL) - for details, see **Tables (Oracle) - Partition**.

- **Comment** panel - for details, see **Adding a Comment to an Object**.

- **Permissions** panel - for details, see **Setting Permissions or Privileges for an Object**.

- **DDL View** panel - for details, see **Previewing the DDL Generated to Create the New Object**.

3. Finally, use the **Execute** button to create the object.

**Tables (Oracle) - Properties**

When creating or editing a table, this tab/panel lets you work with the following settings:
Tables Wizard (Oracle)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the table.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the table.</td>
</tr>
<tr>
<td>Cache</td>
<td>Enabling this feature keeps a block in memory by placing it at the most recently used end. This option is useful for small lookup tables.</td>
</tr>
<tr>
<td>Row Movement</td>
<td>Enabling this option permits the migration of a row to a new partition if its key is updated.</td>
</tr>
<tr>
<td>Parallel Degree</td>
<td>A value indicating the number of query server processes that should be used in the operation.</td>
</tr>
<tr>
<td>Parallel Instances</td>
<td>A value indicating how you want the parallel query partitioned between the Parallel Servers.</td>
</tr>
<tr>
<td>Physical group</td>
<td>Choose a Row Organization of INDEX, HEAP, or EXTERNAL. If you chose INDEX or HEAP, enable or disable Logging. If you chose EXTERNAL, provide an External Type, Default Directory, Access Parameters, Reject Limit, and Location.</td>
</tr>
<tr>
<td>Logging</td>
<td>Redo logs minimize the loss of data in the event that an uncontrolled shutdown happens.</td>
</tr>
</tbody>
</table>

Tables (Oracle) - Columns

When creating or editing a table, this tab/panel lets you manage the columns for the table.

**To add a column to the table**

1. Click **Add Column**, provide a **Name** in the **Property/Value** list, and press TAB or ENTER.

   The column is added to the columns list on the left, with default attribute values.

2. Proceed to edit the column attributes.

**To edit column attributes**

3. Select the column in the columns list on the left. The controls in the Property/Values list are updated with values of the selected column.

4. Use the following table as a guide to providing additional property values, noting that availability of a property differs by data type and other property selections.
### Property or group | Description
--- | ---
**Virtual** | Selecting this check box defines the column as an Oracle virtual column, with a value calculated from a column expression. Virtual columns do not use any disk space as there is no data to store, and INSERT/UPDATE operations are not supported. Consult Oracle documentation before working with virtual columns to familiarize yourself with topics such as column expressions and virtual column-specific details such as automatic type conversion. For more information, see Accessing Third Party Documentation. After specifying a column as virtual, use the Default Value box to provide the calculation.

**Datatype** | This group lets you select a valid **Type** for the column. Depending on your selection, additional properties such as **Scale**, **Size**, **Width**, and **Unused** may be available.

**Allow Nulls** | Select this check box to allow nulls in this column.

**Encryption** | Use controls in this group to have the column encrypted using transparent data encryption. Select the **Encrypted** check box to enable transparent data encryption for the column. Type a **Password** value used to build an IDENTIFIED BY clause. The column key will be derived from the value you provide. Select the **Salted** check box to add a SALT option, appending a random ‘salt’ string, to the clear text of the column before encrypting. Leaving the check box unselected adds a NO SALT option. From the Encryption Algorithm dropdown, select an algorithm (AES256, NONE, DES168, AES192, AES128, or DES156) that will be used to build a USING clause.

**Default Value** | If you selected the **Virtual** check box, type a valid Oracle column expression that will calculate the value of the column. Otherwise, either select a pseudocolumn (CURRENT_TIMESTAMP, USER, SYSDATE, or UID) from the dropdown or type an expression resulting in a value that matches the selected **Datatype**.

**Comment** | Lets you add a comment to the column.

**LOB Storage** | This group is available for bfile, blob, clob, and nclob types. Settings include **Segment Name**, **Configuration** properties (Tablespace, Chunk, Percent Version, Enable Storage In Row, Cache, and Logging), and **Storage** properties (Initial Extent, Next Extent, Percent Increase, Minimum Extents, Maximum Extents, Free Lists, and Free List Groups).

---

To delete a column

1. Select a column from the column list on the left.
2. Click **Delete** to remove the column from the table.

To change a column’s ordering position

1. Select a column from the column list on the left.
2. Use the arrow buttons to move the column up or down.
Tables (Oracle) - Indexes

**Note:** This tab/panel is not available with a **Row Organization** of **EXTERNAL**.

Click **Add** to open the Index Wizard. For details, see [Indexes Wizard (Oracle)](#).

Tables (Oracle) - Constraints

**Note:** This tab/panel is not available with a **Row Organization** of **EXTERNAL**.

Selecting a constraint type and clicking **Add** opens the object wizard for that object type. For details see:

- [Primary Keys Wizard (DB2 LUW)](#)
- [Unique Keys Wizard (DB2 LUW)](#)
- [Foreign Keys Wizard (DB2 LUW)](#)

Tables (Oracle) - Storage

**Note:** This tab/panel is not available with a **Row Organization** of **EXTERNAL**.

When creating or editing a table, this tab/panel has the following settings:
<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data Block Storage group</strong></td>
<td><strong>Select the DEFAULT Tablespace</strong> only if you want the partitions in the same tablespace as the partitions in the underlying table. <strong>Percent Free</strong> identifies how much space you want to allocate for new rows or updates to existing rows. <strong>Initial Transactions</strong> ensures that a minimum number of concurrent transactions can update a primary key block, avoiding the overhead of allocating a transaction entry dynamically. <strong>Maximum Transactions</strong> limits concurrency on a primary key block.</td>
</tr>
<tr>
<td><strong>Extents group</strong></td>
<td>An extent is the unit of space allocated to an object whenever the object needs more space. <strong>Initial Extent</strong> - The initial space extent (in bytes) allocated to the object. <strong>Next Extent</strong> - The next extent (in bytes) that the object will attempt to allocate when more space for the object is required. <strong>Percentage Increase</strong> - Lets you type the percentage. <strong>NOTE:</strong> You should be careful when setting Percent Increase because it magnifies how an object grows and, therefore, can materially affect available free space in a tablespace. <strong>Minimum Extents</strong> - For a dictionary managed tablespace, this is the total number of extents to be allocated when the index is first created. For a locally managed tablespace, this is simply the initial amount of space allocated. <strong>Maximum Extents</strong> - For a dictionary managed tablespace, this is the total number of extents that can ever be allocated to the index. In a locally managed tablespace, the database will automatically manage the extents.</td>
</tr>
<tr>
<td><strong>Freelists group</strong></td>
<td><strong>Free lists</strong> let you manage the allocation of data blocks when concurrent processes are issued against the primary key. You can potentially improve the performance of the primary key by identifying multiple free lists, which can reduce contention for free lists when concurrent inserts take place. The default and minimum value is 1. You should increase this number if multiple processes access the same data block. <strong>Free List Groups</strong> is the number of groups of free lists. <strong>NOTE:</strong> This option is only applicable for the parallel server option.</td>
</tr>
<tr>
<td><strong>Buffer Pool</strong></td>
<td><strong>DEFAULT</strong> - Choose this if you want to use the default bufferpool. <strong>KEEP</strong> - Use this to retain the object in memory to avoid I/O conflicts. This type of bufferpool stores frequently referenced data blocks in a separate cache. <strong>RECYCLE</strong> - Select this option to save cache space by ridding data blocks from memory as soon as they are no longer in use.</td>
</tr>
</tbody>
</table>

**Tables (Oracle) - IOT Properties**

**Note:** This tab/panel is not available with a **Row Organization** of EXTERNAL.

Provide compression and space details for an index-organized table.

**Tables (Oracle) - Partition**

**Note:** This tab/panel is not available with a **Row Organization** of EXTERNAL.

Prior to working with partitions, you should be familiar with the material in **Oracle Partitioning**.

Click **Create Partition** to **Partition a table**.
**Oracle Partitioning**

Partitioning your tables lets you get around the problem of supporting large tables. Partitioning lets you break large tables into smaller pieces, which are called partitions. Partitions make the data in your table easier to manage and analyze. Your SQL statements can access the partitions rather than the entire table. Partitions are most useful in data warehouse applications, which store large amounts of data.

The table below describes the types of partitions in Oracle:

<table>
<thead>
<tr>
<th>Partition Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>Use range partitioning to map rows to partitions based on ranges of column values. This type of partitioning is useful when dealing with data that has logical ranges into which it can be distributed; for example, months of the year. Performance is best when the data evenly distributes across the range. If partitioning by range causes partitions to vary dramatically in size because of unequal distribution, you may want to consider one of the other methods of partitioning.</td>
</tr>
<tr>
<td>Hash</td>
<td>Use hash partitioning if your data does not easily lend itself to range partitioning, but you would like to partition for performance and manageability reasons. Hash partitioning provides a method of evenly distributing data across a specified number of partitions. Rows are mapped into partitions based on a hash value of the partitioning key. Creating and using hash partitions gives you a highly tunable method of data placement, because you can influence availability and performance by spreading these evenly sized partitions across I/O devices (striping).</td>
</tr>
<tr>
<td>Composite</td>
<td>Hash partitions partition the table according to a hash function. Composite partitions use both range and hash types, first partitioning the data by a range of values, and then further dividing the partitions into subpartitions by way of a hash function. This option is not available for index-organized tables.</td>
</tr>
<tr>
<td>List</td>
<td>Use list partitioning when you require explicit control over how rows map to partitions. You can specify a list of discrete values for the partitioning column in the description for each partition. This is different from range partitioning, where a range of values is associated with a partition, and from hash partitioning, where the user has no control of the row to partition mapping.</td>
</tr>
</tbody>
</table>

**Partition a table**

The Add partition wizard lets you set up partitions for a table. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
Step | Settings and tasks
--- | ---

**Properties**

Select a **Partition Type** and optionally, a Subpartition Type.

**Columns**

For each column, click the **New** button and select a name from the **Column** dropdown. Use the **Delete** button to drop a selected column.

**Subpartition Columns** (only available with a **Partition Type** of RANGE and **Subpartition Type** of HASH or LIST)

For each column, click the **New** button and select a name from the **Column** dropdown. Use the **Delete** button to drop a selected column.

**Subpartitions** (only available with a **Subpartition Type** of HASH)

Specify a **Default number of partitions**. For each partition, click the **New** button and then select a tablespace from the dropdown.

**Range Definitions** (only available with a **Partition Type** of RANGE)

Click the **New** button to **Add a partition definition**.

**Partition Definition** (only available with a **Partition Type** of HASH)

To specify a partition method other than **None**, take one of the following actions: (1) Select the **Number Of Partitions** radio box, specify the **Number Of Partitions**, and for each partition, click the **New** button and choose a tablespace from the dropdown, or (2) select the **By Partition Name** radio box and for each partition, click the **New** button provide a name and then choose a tablespace from the dropdown.

**List Definitions** (only available with a **Partition Type** of List)

Click **New** to **Add a partition definition**.

---

**Add a partition definition**

Use the following topics as a guide in completing the settings in this wizard:

---

**Partition Definition**

**Name**

Provide a name.

**Tablespace**

Select a tablespace from the dropdown.

**Logging**

Enable or disable logging.

**Subpartitions**

To specify a partition method other than **None**, select the **By Subpartition Name** radio box and for each partition, click the **New** button to open a dialog that lets you provide subpartition values. **NOTE:** When you split a range-list partition, you cannot specify the new partitions’ subpartition information.

**Storage**

Provide or select Data Block Storage, Extents, Freelists, and Buffer Pool values.
Tablespaces are logical storage structures that act as partitions for the database. Each tablespace consists of one or more datafiles which are the physical structures holding the data. You can create a tablespace to store table data and other objects related to table performance such as indexes or large object data. Tablespaces are used to manage large complex databases. Once you have created a tablespace, you can place objects on it.

The Tablespace Wizard lets you:

- Name the tablespace, and specify space management.
- Specify what types of objects are stored on the tablespace, and place the tablespace online or offline.
- Add the datafiles that comprise the tablespace and specify the parameters for the datafiles.
- Specify how Oracle should manage the growth of the tablespace.

**Important Notes**

- For auto-UNDO management to be in effect, set init.ora parameter to undo_management. When set to MANUAL (the default), it disables auto-UNDO management. When to set AUTO, auto-UNDO management is enabled.
- To determine if the undo_management parameter is set to AUTO, use the following query:

  ```sql
  SELECT VALUE 
  FROM SYS.V_$PARAMETER 
  WHERE NAME = 'undo_management'
  
  Note: This parameter cannot be set dynamically via the ALTER SYSTEM or ALTER SESSION.
  
  One of the best ways to avoid fragmentation in a tablespace is to pre-allocate the space that your objects will use. If possible, plan for one to two years' growth for each object and allocate your space accordingly. Having initial empty objects will not affect table scan times as Oracle only scans up to the high-water mark (the last used block) in a table.

  Of all your tablespaces, you want to avoid fragmentation problems in your SYSTEM tablespace the most as this is the major hotbed tablespace for Oracle activities. The easiest way to avoid this is to not allow any user (even the default DBA ID's SYS and SYSTEM) to have access to it. There are three ways to do this:

  - Ensure no user has a DEFAULT or TEMPORARY tablespace assignment of SYSTEM.
To create a new tablespace using a wizard:

1. Open a creation wizard for a tablespace. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - see Tablesspaces (Oracle) - Properties.
   - Datafiles panel - see Tablespaces (Oracle) - Datafiles.
   - DDL panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Tablespaces (Oracle) - Properties

When creating or editing a tablespace, this tab/panel lets you work with the following settings:
### Setting | Description
--- | ---
**Name** | Provide a name for the tablespace.
**Big File** | Selecting this check box results in a CREATE BIGFILE TABLESPACE statement being generated. This results in a large, single file tablespace. Leaving this check box unselected results in a tablespace containing multiple smaller datafiles.
**Type** | Leaving the default PERMANENT selection creates a permanent tablespace, intended to contain schema objects you want to keep on an ongoing basis. The objects are stored in datafiles. The other two options let you generate a CREATE TABLESPACE statement that specifies TEMPORARY or UNDO keywords. An Undo tablespace is a kind of permanent tablespace that holds undo data if your database is operating in automatic undo mode. Oracle recommends the automatic undo mode as the wiser choice than using rollback segments to undo. In a Temporary tablespace, schema objects will last only as long as your session continues.
**Tablespace Group** | This option is only available with a **Type** value of TEMPORARY. If there are currently entries in the SYS.DBA_TABLESPACE_GROUPS table, you can either select an existing group or type the name for a new tablespace group. If there are currently no entries in the SYS.DBA_TABLESPACE_GROUPS table, you can type the name of a new tablespace group to be created. When editing a tablespace, clearing the entry from the **Tablespace Group** box deletes the <tablespace_name, group_name> entry from the SYS.DBA_TABLESPACE_GROUPS table.
**Retention Guarantee** | This option is only available with a **Type** value of UNDO. Selecting this check box specifies that unexpired data should be preserved for all Undo segments of the tablespace, regardless of whether this may force failure of ongoing operations that require space in those segments. Leaving this check box unselected specifies default RETENTION NOGUARANTE behavior. Space currently being used by unexpired undo data in undo segments can be consumed as necessary by ongoing transactions.
**Status** | This option is only available with a **Type** value of PERMANENT. Use this control to specify an ONLINE/OFFLINE clause in the generated DDL. The ONLINE selection makes the tablespace available immediately after creation. The OFFLINE selection results in a table is unavailable immediately after creation.
**Logging** | This option is only available with a **Type** value of PERMANENT. Use this control to specify a LOGGING/NOLOGGING clause in the generated DDL. This sets the default logging attributes of all tables, indexes, materialized views, materialized view logs, and partitions within this tablespace.
**Forc Logging**

This option is only available with a *Type* value of PERMANENT. Selecting this check box specifies that a FORCE LOGGING clause be included in the generated DDL. Changes to all objects in the tablespace (temporary segments excepted) are logged, overriding any NO LOGGING setting for individual objects.

**Compression Type**

This option is only available with a *Type* value of PERMANENT. This lets you select default compression type of ALL OPERATIONS (corresponds to COMPRESS FOR ALL OPERATIONS in the DDL), COMPRESS DIRECT LOAD (corresponds to COMPRESS FOR DIRECT_LOAD OPERATIONS in the DDL) or no compression.

**Flashback**

This option is only available with a *Type* value of PERMANENT. Use this control to specify a FLASHBACK ON/FLASHBACK OFF clause in the generated DDL. Select this check box to put the tablespace in FLASHBACK mode. In FLASHBACK mode, Oracle saves Flashback log data for the tablespace and the tablespace can participate in a FLASHBACK DATABASE operation. If you leave this check box unselected, Oracle does not save Flashback log data for the tablespace. Prior to FLASHBACK DATABASE operations, you must either take datafiles in the tablespace off line or drop them OR take the entire tablespace offline. The database does not drop existing Flashback logs.

**Encrypted and Algorithm**

This option is only available with a *Type* value of PERMANENT. Selecting the Encryption check box enables the Algorithm control. Together, they let you add an ENCRYPTION USING clause to the generated DDL. The Algorithm lets you select from AES 128, AES192, AES256, DES56, DES168, or NO encryption algorithms.

**Locally Managed, Uniform Allocation, Size, Automatic Segment Space Management, and Minimum Extent Size**

These option are only available with a *Type* value of PERMANENT or UNDO. These controls let you work with the extent-related clauses that will be included in the generated DDL. Selecting the Locally Managed check box lets you generate an EXTENT MANAGEMENT LOCAL clause. Subsequently leaving the Uniform Allocation check box deselected adds an AUTOALLOCATE option. Alternatively, selecting the Uniform Allocation check box enables the Size check box, letting you add a UNIFORM SIZE option. Select the Automatic Segment Space Management check box to generate a SEGMENT SPACE MANAGEMENT AUTO or leave it deselected to generate a SEGMENT SPACE MANAGEMENT MANUAL clause. Leaving the Locally Managed check box deselected generates an EXTENT MANAGEMENT DICTIONARY clause. This also enables the Minimum Extent Size control, letting you select a MINIMUM EXTENT clause value.

**Use Default Block Size and Block Size**

Disabling the Use Default Block Size check box enables the Block Size control, generating a BLOCKSIZE clause to specify a nonstandard block size for the tablespace.
When creating or editing a tablespace, this tab/panel lets you build DATAFILE or TEMPFILE clauses that will be submitted with the CREATE TABLESPACE statement creating or editing this tablespace. This lets you manage the files that make up the tablespace.

**To add a datafile**

1. Click **Add**, either select an existing file name from **File Name** dropdown or type the name of a new file, and then press TAB or ENTER.

   The file is added to the datafiles list on the left, with default attribute values.

2. Proceed to edit the datafile attributes.

**To edit datafile attributes**

3. Select the file from the list on the left. The controls in the Property/Values list are updated with values of the selected file.

4. Use the following table as a guide to modifying property values.

<table>
<thead>
<tr>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Size</strong></td>
<td>Lets you specify the SIZE option for the DATAFILE/TEMPFILE clause, to specify the size of the file</td>
</tr>
<tr>
<td><strong>Reuse Existing File</strong></td>
<td>Lets you specify the REUSE option for the DATAFILE/TEMPFILE clause, to specify that an existing file can be reused.</td>
</tr>
<tr>
<td><strong>Auto Extend and Growth Amount</strong></td>
<td>Use these options to select an AUTO EXTEND option for the DATAFILE/TEMPFILE clause. Leaving the <strong>Auto Extend</strong> check box unselected disables the <strong>Growth Amount</strong> disabled and specifies an AUTO EXTEND OFF option in the generated DDL. Selecting the <strong>Auto Extend</strong> check box lets you specify an AUTO EXTEND ON NEXT clause. Selecting <strong>Auto Extend</strong> enables the <strong>Growth Amount</strong> control, letting you specify the size of the next increment of disk space automatically allocated when more extents are required.</td>
</tr>
<tr>
<td><strong>Unlimited and Value</strong></td>
<td>These options are only available with <strong>Auto Extend</strong> selected. They let you specify a MAXSIZE clause. Selecting the <strong>Unlimited</strong> check box lets you specify a MAXSIZE UNLIMITED clause, placing no limit on the size of the file. Leaving the <strong>Unlimited</strong> check box unselected enables the <strong>Value</strong> disabled. This specifies a MAXSIZE clause with a size provide by the <strong>Value</strong> control.</td>
</tr>
</tbody>
</table>

**To delete a datafile**

1. Select a datafile from the column list on the left.

2. Click **Delete** to remove the datafile from the tablespace.
Triggers Wizard (Oracle)

This wizard lets you build and submit a CREATE OR REPLACE TRIGGER statement, creating a trigger to be associated with a table, view, schema, or database. BEFORE, AFTER, and COMPOUND triggers are supported for a variety of DDL, DML, and Database manipulation events.

Important Notes

- To create triggers in your own schema, you need CREATE TRIGGER privileges.
- To create triggers in other schemas, you need CREATE ANY TRIGGER privileges.

To create a new trigger using a wizard:

1. Open a creation wizard for a trigger. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Triggers (Oracle) - Properties.
   - Events panel - for details, see Triggers (Oracle) - Events.
   - Column Selection panel - for details, see Triggers (Oracle) - Column Selection.
   - Action panel - for details, see Triggers (Oracle) - Action.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Triggers (Oracle) - Properties

When creating or editing a trigger, this tab/panel lets you work with the following settings:
### Triggers Wizard (Oracle)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Availability and description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parent Type</strong></td>
<td>Select the type (TABLE, DATABASE, SCHEMA, or VIEW) of element that this trigger is to be associated with.</td>
</tr>
<tr>
<td><strong>Parent Schema, and Parent Name</strong></td>
<td>If available and appropriate, select the specific object for which the trigger is being created.</td>
</tr>
<tr>
<td><strong>Schema and Name</strong></td>
<td>Select a schema and provide a name for the trigger being created.</td>
</tr>
<tr>
<td><strong>Enabled</strong></td>
<td>Deselecting this check box adds a DISABLE clause to the CREATE OR REPLACE TRIGGER statement, disabling the trigger.</td>
</tr>
<tr>
<td><strong>Trigger Timing</strong></td>
<td>BEFORE: These triggers serve as extensions to the constraint subsystem and are most often used to validate input data, generate values for newly inserted rows, and read from other tables for cross-reference purposes. Note: Before triggers must be created as a For Each Row. AFTER: Such a trigger is run after the integrity constraint validations; they can be used to modify operations in the database or be used for activities beyond the database, like supporting an alert notification. COMPOUND (11.1.0.7 ^): These triggers fire at more than one timing point.</td>
</tr>
<tr>
<td><strong>Trigger Type</strong></td>
<td>Not available with a Parent Type of Database or Schema and not available with a Trigger Timing value of COMPOUND.</td>
</tr>
<tr>
<td><strong>Old Table Alias</strong></td>
<td>Not available with a Parent Type of Database or Schema</td>
</tr>
<tr>
<td><strong>New Table Alias</strong></td>
<td>Type the name of a temporary table of rows as they exist before they are updated or deleted.</td>
</tr>
<tr>
<td><strong>When Clause</strong></td>
<td>Type a WHEN clause or open a WHEN CLAUSE wizard to further qualify the trigger behavior.</td>
</tr>
</tbody>
</table>

### Triggers (Oracle) - Events

When creating or editing a trigger, this tab/panel lets you provide BEFORE, AFTER, or FOR clause options.

If you selected a **Parent Type** of **Table** or **View**, select one or more of the INSERT, UPDATE, or DELETE check boxes to specify the events that are to fire the trigger.

If you selected a **Parent Type** of **Database** or **Schema**, select one or more of the ALTER, CREATE, ANALYZE, ASSOCIATE_STATISTICS, AUDIT, COMMENT, DISASSOCIATE_STATISTICS, DROP, GRANT, NOAUDIT, RENAME, REVOKE, TRUNCATE, LOGON, SERVERERROR, or SUSPEND check boxes to specify the events that are to fire the trigger.
Triggers (Oracle) - Column Selection

If you chose UPDATE as the Trigger Event, this tab/panel lets you provide FOR UPDATE OF, BEFORE UPDATE OF, or AFTER UPDATE OF clause options. Select the check box beside each column that is to fire the trigger.

Triggers (Oracle) - Action

If you selected a Trigger Timing value of BEFORE or AFTER, provide the complete body of trigger. Keep the following in mind:

- If the SQL statement you have in mind for a trigger is longer than 60 lines of code, you would be better off creating a stored procedure.
- INSTEAD OF statements can only be used by view triggers.
- BEFORE and AFTER options cannot be used for view triggers.

If you selected a Trigger Timing value of COMPOUND, a compound trigger block template is generated. Customize the generated code provide a valid trigger body.
Object Types Wizard (Oracle)

Types define an abstract data type or object composed of a collection of similar types of data. For example, you can create an object type that defines a full address rather than the pieces of an address, such as city, state and postal code. An object type stores the pieces of an address in a single type, storing them in the same location, and allowing the full address to be accessed and manipulated as single unit rather than multiple units.

To Open the Object Type Wizard

1. On the Navigator/Explorer, find the datasource where you want to create a Type and expand the Schema node.
2. Right-click the Type node, and select New.

The single page wizard asks that you pick an owner for the type and name the type. The fun begins after you make your choices and click Finish. The Object Editor, where you can finalize the object type's creation, opens.

The Object Type Editor's tabs are:

- **Header**: Here you flesh out the specification for the type you’re creating including any methods (a subprogram), attributes, and any parameters or return types for a function.

- **Body**: For every specification, the object type body defines the code for the method. If the object type header declares only attributes, not a method, the body is unnecessary.

You need to create the object type before you can see the following tabs. After you’ve added what you need to the Header and Body pages of the Editor, click Create on the toolbar.

- **Information**: Read-only page that indicates the vital statistics for the object type.

- **Dependencies**: A tree structure displays the objects that depend on the type you have created.

- **Privileges**: Displays individual, group, and role permissions associated with the object type.
Unique Keys Wizard (Oracle)

A unique key constraint requires that every value in a column or set of columns be unique. Thus, no two rows of a table have duplicate values in the column or set of columns you identified. So, for example, you can use a unique key constraint to make sure you haven’t duplicated a social security number in a list of employees.

To create a new unique key using a wizard:

1. Open a creation wizard for a unique key. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Unique Keys (Oracle) - Properties.
   - Columns panel - for details, see Unique Keys (Oracle) - Columns.
   - Storage panel - for details, see Unique Keys (Oracle) - Storage.
   - Partition panel - for details, see Unique Keys (Oracle) - Partition.
   - DDL panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Unique Keys (Oracle) - Properties

When creating or editing a unique key, this tab/panel lets you work with the following settings:
Unique Keys Wizard (Oracle)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table Owner and Table Name</strong></td>
<td>Choose the owner and name of the table in which the unique key is being</td>
</tr>
<tr>
<td></td>
<td>created.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the unique key being created.</td>
</tr>
<tr>
<td><strong>No Sort</strong></td>
<td>Enable this feature if the rows in the table already stored in ascending</td>
</tr>
<tr>
<td></td>
<td>order. This increases the speed of the index creation process. Oracle does</td>
</tr>
<tr>
<td></td>
<td>not sort the rows.</td>
</tr>
<tr>
<td><strong>Logging</strong></td>
<td>Enabling logs this operation to the redo file.</td>
</tr>
<tr>
<td><strong>Reverse</strong></td>
<td>Enabling this feature stores the bytes of the index block in reverse order</td>
</tr>
<tr>
<td></td>
<td>and excludes the ROWID. The ROWID is a globally unique identifier for a row</td>
</tr>
<tr>
<td></td>
<td>in a database. It is created at the time the row is inserted into a table,</td>
</tr>
<tr>
<td></td>
<td>and destroyed when it is removed from a table.</td>
</tr>
<tr>
<td><strong>Validate</strong></td>
<td>Enabling this option indicates that existing data is checked against the</td>
</tr>
<tr>
<td></td>
<td>constraint when the primary key is enabled. Leaving it disabled indicates</td>
</tr>
<tr>
<td></td>
<td>that only new data is to be checked against the constraint.</td>
</tr>
<tr>
<td><strong>Deferrable</strong></td>
<td>Dictates whether constraint checking can be deferred until the end of a</td>
</tr>
<tr>
<td></td>
<td>transaction.</td>
</tr>
<tr>
<td><strong>Deferred</strong></td>
<td>This option is enabled only if you enabled the Deferrable option. Select</td>
</tr>
<tr>
<td></td>
<td>IMMEDIATE to have the constraint checked at the end of every DDL statement.</td>
</tr>
<tr>
<td></td>
<td>Select DEFERRED to have the constraint checked only at the end of a</td>
</tr>
<tr>
<td></td>
<td>transaction.</td>
</tr>
<tr>
<td><strong>Enabled</strong></td>
<td>Enables or disables the primary key.</td>
</tr>
</tbody>
</table>

Unique Keys (Oracle) - Columns

From the **Column** dropdown, select a column for the index and specify a **Sort** option. To add more columns, click the **New** button and then follow the steps in the last instruction. Use the Delete button to drop columns.

Unique Keys (Oracle) - Storage

When creating or editing a primary key, this tab/panel lets you work with the following settings:
## Unique Keys Wizard (Oracle)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data Block Storage group</strong></td>
<td>Select the DEFAULT Tablespace only if you are creating a local partitioned index and want the partitions in the same tablespace as the partitions in the underlying table. Each partition of a local index is associated with one partition of the table. Oracle can then keep the index partitions in synch with table partitions. A transaction entry is needed for each INSERT, UPDATE, DELETE, etc. statement that accesses one or more rows in the block. Transaction entries in many operating systems require approximately 23 bytes. Percent Free identifies how much space you want to allocate for new rows or updates to existing rows. Initial Transactions ensures that a minimum number of concurrent transactions can update an index block, avoiding the overhead of allocating a transaction entry dynamically. Maximum Transactions limits concurrency on an index block.</td>
</tr>
<tr>
<td><strong>Extents group</strong></td>
<td>An extent is the unit of space allocated to an object whenever the object needs more space. Initial Extent - The initial space extent (in bytes) allocated to the object. Next Extent - The next extent (in bytes) that the object will attempt to allocate when more space for the object is required. Percentage Increase - Lets you type the percentage. NOTE: You should be careful when setting Percent Increase because it magnifies how an object grows and, therefore, can materially affect available free space in a tablesapce. Minimum Extents - For a dictionary managed tablesapce, this is the total number of extents to be allocated when the index is first created. For a locally managed tablesapce, this is simply the initial amount of space allocated. Maximum Extents - For a dictionary managed tablesapce, this is the total number of extents that can ever be allocated to the index. In a locally managed tablesapce, the database will automatically manage the extents.</td>
</tr>
<tr>
<td><strong>Freelists group</strong></td>
<td>Free lists let you manage the allocation of data blocks when concurrent processes are issued against the index. You can potentially improve the performance of the index by identifying multiple free lists, which can reduce contention for free lists when concurrent inserts take place. The default and minimum value is 1. You should increase this number if multiple processes access the same data block. Free List Groups is the number of groups of free lists. NOTE: This option is only applicable for the parallel server option.</td>
</tr>
<tr>
<td><strong>Buffer Pool</strong></td>
<td>DEFAULT - Choose this if you want to use the default bufferpool. KEEP - Use this to retain the object in memory to avoid I/O conflicts. This type of bufferpool stores frequently referenced data blocks in a separate cache. RECYCLE - Select this option to save cache space by ridding data blocks from memory as soon as they are no longer in use.</td>
</tr>
</tbody>
</table>

**Unique Keys (Oracle) - Partition**

Clicking **Create Partition** opens a wizard that lets you create a partition.
Users Wizard (Oracle)

Whoever you add as a user will have access to the Oracle database. You also can set up the means by which the database recognizes the user.

**Important Notes**

- To create a user, you need the CREATE USER system privilege.

**To create a new user using a wizard:**

1. Open a creation wizard for a user. For details, see [Opening an Object Wizard](#).

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see [Users (Oracle) - Properties](#).
   - **Roles** panel - for details, see [Users (Oracle) - Roles](#).
   - **Quotas** panel - for details, see [Users (Oracle) - Quotas](#).
   - **DDL** panel - for details, see [Previewing the DDL Generated to Create the New Object](#).

3. Finally, use the **Execute** button to create the object.

Users (Oracle) - Properties

When creating or editing a user, this tab/panel lets you work with the following settings:
Users Wizard (Oracle)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Provide a name for the user.</td>
</tr>
<tr>
<td>Default Tablespace and</td>
<td>Select the default tablespace for objects the user creates and the tablespace to be used for the user’s temporary segments. If you do not specify a default temporary tablespace when creating a user, the assigned tablespace will be that set using the Set Default function. For details, see Set Default.</td>
</tr>
<tr>
<td>Temporary Tablespace</td>
<td></td>
</tr>
<tr>
<td>Profile</td>
<td>The profile you choose affects the amount of database resources available to the user.</td>
</tr>
<tr>
<td>Identified By</td>
<td>REQUIRED_YES - A user identified by password is a local user.</td>
</tr>
<tr>
<td></td>
<td>REQUIRED_EXTERNAL - This is a user who is validated by an external service like an operating system or third-party service. The login authentication is handled by that external entity. REQUIRED_GLOBAL - The user you’re creating is a global user who is authenticated by the enterprise directory service.</td>
</tr>
<tr>
<td>Password</td>
<td>If you specified an Identified By value of REQUIRED_YES, provide a password for the user.</td>
</tr>
<tr>
<td>External Name</td>
<td>If you specified an Identified By value of REQUIRED_EXTERNAL, provide an external name for the user.</td>
</tr>
<tr>
<td>Account Locked</td>
<td>When enabled, the account cannot be altered by anyone but the creator. It also means that after a specified number of failed attempts to access the database, the database will remain closed to the user for a period of time.</td>
</tr>
<tr>
<td>Password Expired</td>
<td>Marks the password as expired, forcing the user to change the password before being allowed to connect to the database.</td>
</tr>
</tbody>
</table>

Users (Oracle) - Roles

For each role to be assigned to the user, select the check box beside that role.

Users (Oracle) - Quotas

To assign a tablespace quota for a user, select a tablespace, select the Other radio button, and provide the value in the Quota box.
Views are SQL queries stored in the system catalog that customize the display of data contained in one or more tables. Views behave like tables because you can query views and perform data manipulation operations on them. However, views do not actually store any data. Instead, they depend on data contained in their base tables. You can use views to help enforce corporate security policies by creating a view that limits information a user can see.

Important Notes

- To create a view in your own schema, you need CREATE VIEW privileges. To create a view in someone else's schema, you need CREATE ANY VIEW privileges.

To create a new view using a wizard:

1. Open a creation wizard for a view. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Views (Oracle) - Properties.
   - Definition panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Views (Oracle) - Properties

When creating or editing a view, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the view. The owner of the view must have SELECT privileges for the tables in the CREATE view statement or DBADM authority on the database that contains the table.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the view.</td>
</tr>
</tbody>
</table>

Views (Oracle) - Definition

This is where you build the query that will display the data you're interested in seeing. The template is CREATE VIEW <name> AS

SELECT: Identify the columns you want to show in the view
FROM: Identify the table(s) you want to draw the data from
WHERE: Write the equivalence you want to view.

You can use the Query Builder to help you write the appropriate SQL statement. For details, see Query Builder.
You create PostgreSQL objects using the following wizards:

- Check Constraints Wizard (PostgreSQL)
- Domains Wizard (PostgreSQL)
- Exclusion Constraints, Primary Keys, and Unique Keys Wizards (PostgreSQL)
- Foreign Keys Wizard (PostgreSQL)
- Functions Wizard (PostgreSQL)
- Indexes Wizard (PostgreSQL)
- Roles Wizard (PostgreSQL)
- Rules Wizard (PostgreSQL)
- Schemas Wizard (PostgreSQL)
- Tables Wizard (PostgreSQL)
- Tablespaces Wizard (PostgreSQL)
- Triggers Wizard (PostgreSQL)
- Types Wizard (PostgreSQL)
- Views Wizard (PostgreSQL)
Check Constraints Wizard (PostgreSQL)

This wizard lets you build and submit an ALTER TABLE... ADD CONSTRAINT... CHECK... statement, adding a constraint to an existing table.

To create a new check constraint using a wizard:

1. Open a creation wizard for a check constraint. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Check Constraints (PostgreSQL) - Properties.
   - Definition panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Check Constraints (PostgreSQL) - Properties

When creating or editing a check constraint, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Schema and Table Name</td>
<td>Identify the table for which the constraint is being created.</td>
</tr>
<tr>
<td>Name</td>
<td>Lets you type the name of the constraint.</td>
</tr>
<tr>
<td>No Inherit</td>
<td>If selected, a NO INHERIT parameter is added to the generated ALTER TABLE statement, letting you create a non-inherited check constraint.</td>
</tr>
<tr>
<td>Is Validated</td>
<td>If not selected, a NOT VALID parameter is added to the generated ALTER TABLE statement, letting you ensure that initial check to verify that all rows satisfy the constraint is not executed.</td>
</tr>
<tr>
<td>Check Condition</td>
<td>Type the check constraint condition. As a convenience, use the Table Columns button to paste in column names as part of the condition.</td>
</tr>
</tbody>
</table>
Domains Wizard (PostgreSQL)

This wizard lets you build and submit a CREATE DOMAIN ... AS... statement, adding a new, datatype-based domain.

**Note:** Before working with this object type, consult PostgreSQL documentation for details on topics such as NULL and default values. For more information, see Accessing Third Party Documentation.

To create a new domain using a wizard:

1. Open a creation wizard for a domain. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - Domains (PostgreSQL) - Properties.
   - **Constraints** panel - Domains (PostgreSQL) - Constraints.
   - **Comment** panel - for details, see Adding a Comment to an Object.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Domains (PostgreSQL) - Properties

When creating or editing a domain, this tab/panel lets you work with the following settings:
Domains Wizard (PostgreSQL)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Owner and Schema</strong></td>
<td>Lets you select the schema and owner of the new domain.</td>
</tr>
<tr>
<td><strong>Datatype</strong></td>
<td>Lets you provide a name for the new domain.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Lets you select the underlying datatype of the new domain.</td>
</tr>
<tr>
<td><strong>Allow Nulls</strong></td>
<td>If unselected, a NOT NULL parameter is included with the generated DDL, generally assuring that the domain cannot take a NULL value.</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Lets you enter a value or expression that defines the default value for columns of this domain type.</td>
</tr>
<tr>
<td><strong>Collation Schema</strong> and <strong>Collation Name</strong></td>
<td>Let you provide the value of a COLLATE parameter, specifying an optional collation for the domain.</td>
</tr>
</tbody>
</table>

Domains (PostgreSQL) - Constraints

When creating or editing domains, this tab/panel lets you manage foreign key, primary key, unique key, exclusion constraints, and check constraints for the domain:

Click **Add** to open the Check Constraints Wizard. Use the wizard to create a new constraint for the domain. See [Check Constraints Wizard (PostgreSQL)](Check Constraints Wizard (PostgreSQL))

Select an existing constraint and click **Edit** to open a wizard that lets you add modify that constraint. See [Check Constraints Editor (PostgreSQL)](Check Constraints Editor (PostgreSQL))

Select a constraint and click **Drop** to drop a constraint from the table.
Exclusion Constraints, Primary Keys, and Unique Keys Wizards (PostgreSQL)

The wizards for creating these object types let you build and submit an ALTER TABLE...ADD CONSTRAINT... statements specific to the object type.

Note: Before working with these object types, consult PostgreSQL documentation. For more information, see Accessing Third Party Documentation.

To create a new exclusion constraint, primary key, or unique key using a wizard

1. Open a creation wizard for the target object type. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Exclusion Constraints, Primary Keys and Unique Keys (PostgreSQL) - Properties.
   - Constraints panel - Exclusion Constraints, Primary Keys, and Unique Keys (PostgreSQL) - Columns.
   - Comment panel - for details, see Adding a Comment to an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Exclusion Constraints, Primary Keys and Unique Keys (PostgreSQL) - Properties

When creating or editing an exclusion constraint, primary key, or unique key, this tab/panel lets you work with the following settings:
Exclusion Constraints, Primary Keys, and Unique Keys Wizards (PostgreSQL)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Availability and Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table Schema</strong> and</td>
<td>Select the schema and name of the parent table.</td>
</tr>
<tr>
<td><strong>Table Name</strong></td>

<td></td>
<td>BUFFERING value (AUTO, ON, or OFF).</td>
</tr>
</tbody>
</table>

Exclusion Constraints, Primary Keys, and Unique Keys (PostgreSQL) - Columns

When creating or editing an exclusion constraint, this tab/panel lets you set up the operators on the columns or expressions that define the exclusion constraint.
**Foreign Keys Wizard (PostgreSQL)**

This wizard lets you build and submit an `ALTER TABLE... ADD CONSTRAINT ..` statement, adding a new, foreign key to an existing table.

**To create a new foreign key using a wizard:**

1. Open a creation wizard for a foreign Key. For details, see [Opening an Object Wizard](#).

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - [Foreign Keys (PostgreSQL) - Properties](#).
   - **Column Mapping** panel - [Foreign Keys (PostgreSQL) - Column Mapping](#).
   - **Comment** panel - for details, see [Adding a Comment to an Object](#).
   - **DDL View** panel - for details, see [Previewing the DDL Generated to Create the New Object](#).

3. Finally, use the **Execute** button to create the object.

**Foreign Keys (PostgreSQL) - Properties**

When creating or editing a domain, this tab/panel lets you work with the following settings:
### Foreign Keys Wizard (PostgreSQL)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table Schema and Table Name</strong></td>
<td>Let you select the table in which the foreign key is being defined.</td>
</tr>
<tr>
<td>Name</td>
<td>Lets you provide the ADD CONSTRAINT parameter value, naming the new foreign key.</td>
</tr>
<tr>
<td>Validate</td>
<td>If not selected, a NOT VALID parameter is included in the generated DDL, specifying that the initial check to verify that all rows satisfy the constraint is not executed.</td>
</tr>
<tr>
<td>Deferrable</td>
<td>If selected, a DEFERRABLE parameter is included in the generated DDL, specifying that checking of constraints can be postponed until the end of the transaction</td>
</tr>
<tr>
<td>Deferred</td>
<td>If IMMEDIATE is not selected, an INITIALLY DEFERRED parameter is added to the generated DDL, ensuring that the constraint is checked at the end of the transaction.</td>
</tr>
<tr>
<td>Delete Rule and Update Rule</td>
<td>Choices correspond to ON DELETE... and ON UPDATE parameter variations added to the generated DDL: CACHE, SET DEFAULT, SET NULL, and RESTRICT.</td>
</tr>
<tr>
<td>Match Full</td>
<td>If selected, a MATCH FULL parameter is added to the generated DDL, ensuring that no column of a multicolumn foreign key can be null unless all foreign key columns are null.</td>
</tr>
</tbody>
</table>

### Foreign Keys (PostgreSQL) - Column Mapping

When creating or editing a foreign key, this tab/panel lets you specify the REFERENCES and FOREIGN KEY parameters of the generated ALTER TABLE... DDL.

1. Under **Main Table**, select the check boxes corresponding to the columns in the current table that are to use values in the referenced table.

2. Under **Referenced Table**, choose the **Owner** and then the **Table** name of the referenced table and then select the check boxes corresponding to the columns in the referenced table whose values are to be used in the main table.
Functions Wizard (PostgreSQL)

This wizard lets you build and submit a CREATE OR REPLACE FUNCTION statement, creating a new function or replacing an existing function.

**Note:** Before working with this object action, consult PostgreSQL documentation for details on CREATE FUNCTION parameter values. For more information, see Accessing Third Party Documentation.

**To create a new function using a wizard:**

1. Open a creation wizard for a function. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - Functions (PostgreSQL) - Properties.
   - **Parameters** panel - Functions (PostgreSQL) - Parameters.
   - **Body** panel - Functions (PostgreSQL) - Body.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the **Execute** button to create the object.

**Functions (PostgreSQL) - Properties**

When creating or editing a domain, this tab/panel lets you work with the following settings:
Functions Wizard (PostgreSQL)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Schema and Name</strong></td>
<td>Let you identify the owning schema and provide a name for the function.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Lets you provide a <code>RETURNS</code> clause value, specifying a valid type (base, composite, domain type, or a reference to the type of a table column) for the value returned by the function.</td>
</tr>
<tr>
<td><strong>Language</strong></td>
<td>Lets you provide a <code>LANGUAGE</code> clause value, specifying a valid language implementation.</td>
</tr>
<tr>
<td><strong>Object File and Link Symbol</strong></td>
<td>Let you specify the AS clause appropriate to dynamically loadable C language functions for which the function name in the C language source code is identical to the name of the SQL function. <strong>Object File</strong> is the name of the file containing the dynamically loadable object. <strong>Link Symbol</strong> is the function name in the C language source code.</td>
</tr>
<tr>
<td><strong>Is Window</strong></td>
<td>If selected, specifies that this C language function is a window function.</td>
</tr>
<tr>
<td><strong>Leakproof</strong></td>
<td>If selected, a <code>LEAKPROOF</code> clause is added to the generated DDL, indicating that the function provides no information about its arguments other than by its return value.</td>
</tr>
<tr>
<td><strong>Execution Cost</strong></td>
<td>Lets you provide a <code>COST</code> clause value, estimating the execution cost in CPU operator cost units.</td>
</tr>
<tr>
<td><strong>Result Rows</strong></td>
<td>Lets you provide a <code>ROWS</code> clause value, estimating the number of rows the function is expected to return.</td>
</tr>
<tr>
<td><strong>Behavior</strong></td>
<td>Lets you select an <code>IMMUTABLE</code>, <code>STABLE</code>, or <code>VOLATILE</code> clause to the generated DDL, indicating the functions behavior with respect to database lookups and ability to make changes to the database.</td>
</tr>
<tr>
<td><strong>Strict</strong></td>
<td>Lets you add a <code>STRICT</code> clause to the generated DDL, specifying whether non-NULL values can be returned if any provided input parameters are NULL.</td>
</tr>
<tr>
<td><strong>Is Security Definer</strong></td>
<td>Lets you add a <code>SECURITY DEFINED</code> clause to the generated DDL, specifying that the function is to execute with the same privileges as the user who created it.</td>
</tr>
</tbody>
</table>

**Functions (PostgreSQL) - Parameters**

When creating or editing a function, this tab/panel lets you build and maintain a list of input/output parameters for the function. For each input or output parameter for this function, use the New button to add a new parameter and then provide a name for the parameter.

To edit a parameter in the attributes list, first select the parameter in the list. Then, in the **Attributes** area, select a **Datatype**, select a **Parameter Mode** (INPUT, OUTPUT, INPUT_OUTPUT, or VARIADIC), and if you chose INPUT, you can optionally provide a **Default** value.

To delete a parameter from the list, select the parameter and click the Delete button.
To reposition a parameter in the list, select the parameter and use the arrow buttons to move the parameter up or down in the list.

**Functions (PostgreSQL) - Body**

When creating or editing a function, this tab/panel lets you build and maintain a valid AS clause value that defines the function. You can use an internal function name, the path to an object file, a SQL query, or text in a procedural language.
Indexes Wizard (PostgreSQL)

This wizard lets you build and submit a CREATE INDEX or CREATE UNIQUE INDEX statement, creating a new index on a table.

To create a new index using a wizard:

1. Open a creation wizard for an index. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - Indexes (PostgreSQL) - Properties.
   - **Columns** panel - Indexes (PostgreSQL) - Columns.
   - **Comment** panel - for details, see Adding a Comment to an Object.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Indexes (PostgreSQL) - Properties

When creating or editing a domain, this tab/panel lets you work with the following settings:
### Indexes Wizard (PostgreSQL)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Availability and Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parent Type</strong></td>
<td>Lets you specify whether the index is being defined for a table or view.</td>
</tr>
<tr>
<td><strong>Table Schema and Table Name</strong></td>
<td>Select the schema and name of the parent table.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the index being created.</td>
</tr>
<tr>
<td><strong>Unique</strong></td>
<td>If selected, CREATE UNIQUE INDEX DDL is generated, enforcing uniqueness. Otherwise simple CREATE INDEX DDL is generated.</td>
</tr>
<tr>
<td><strong>Concurrently</strong></td>
<td>If selected, a CONCURRENTLY parameter is added to the generated DDL, specifying that the index is built without taking any locks that would prevent concurrent inserts, updates, or deletes on the target table.</td>
</tr>
<tr>
<td><strong>Clustered</strong></td>
<td>If selected, an ALTER TABLE... CLUSTER ON... statement is generated following the DDL to generate the index, specifying this index as the default for subsequent cluster operations.</td>
</tr>
<tr>
<td><strong>Tablespace</strong></td>
<td>Lets you optionally select the tablespace on which the index is to be created. If not specified, the default tablespace will be used.</td>
</tr>
<tr>
<td><strong>Index Method</strong></td>
<td>Lets you specify a USING option value of <strong>btree</strong>, hash, gist, gin, or spgist.</td>
</tr>
<tr>
<td><strong>Fill Factor</strong></td>
<td>Lets you add a FILLFACTOR= option value, specifying the percentage that the index method will try to fill index pages.</td>
</tr>
<tr>
<td><strong>Fast Update</strong></td>
<td>Lets you add a FASTUPDATE= ON option, enabling fast update.</td>
</tr>
<tr>
<td><strong>Buffering</strong></td>
<td>Available with an Index Method of gist. Determines whether the buffering build technique is set to ON, OFF, or AUTO.</td>
</tr>
<tr>
<td><strong>IndexPredicate</strong></td>
<td>Lets you provide a WHERE condition that will be used as a constraint expression for a partial index.</td>
</tr>
</tbody>
</table>

### Indexes (PostgreSQL) - Columns

From the Column dropdown, select a column for the index and specify **Sort**, **Collation**, and **Operator Class** option. To add more columns, click the **New** button and then follow the steps in the last instruction. Use the Delete button to drop columns.
Roles Wizard (PostgreSQL)

This wizard lets you build and submit a simple CREATE ROLE statement, defining a new database role.

To create a new role using a wizard:

1. Open a creation wizard for a role. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - Roles (PostgreSQL) - Properties.
   - **Membership** panel - Roles (PostgreSQL) - Membership.
   - **Comment** panel - for details, see Adding a Comment to an Object.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the **Execute** button to create the object.

Roles (PostgreSQL) - Properties

When creating or editing a role, this tab/panel lets you work with the following settings:
### Roles Wizard (PostgreSQL)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Availability and Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Lets you provide the name of the new role.</td>
</tr>
<tr>
<td>Password and Encrypted Password</td>
<td>These items control how the password is created for the new role. The <strong>Password</strong> control lets you provide a password for the new role. If <strong>Encrypted Password</strong> is selected, an ENCRYPTED PASSWORD... parameter is generated. Otherwise, an UNENCRYPTED PASSWORD... parameter is generated.</td>
</tr>
<tr>
<td>Account Expires</td>
<td>Selecting this control enables a calendar widget that lets you select a value for a VALID UNTIL parameter in the generated DDL.</td>
</tr>
<tr>
<td>Connection Limit</td>
<td>Lets you provide the value for a CONNECTION LIMIT parameter, setting a limit on the number of concurrent connections the new role can make.</td>
</tr>
<tr>
<td>Login</td>
<td>This control determines whether a role is allowed to log in. If <strong>Login</strong> is selected, a LOGIN parameter is included in the DDL. Otherwise, a NOLOGIN parameter is included in the DDL.</td>
</tr>
<tr>
<td>Superuser</td>
<td>This control determines whether a role can override all access restrictions within the database. If <strong>Superuser</strong> is selected, a SUPERUSER parameter is included in the DDL. Otherwise, a NOSUPERUSER parameter is included in the DDL.</td>
</tr>
<tr>
<td>Create Database and Create Roles</td>
<td>These controls determine whether a role can create databases or roles, respectively. When selected, CREATEDB or CREATEROLE parameters are added to the generated DDL. Otherwise, NOCREATEDB or NOCREATEDB parameter are included in the DDL.</td>
</tr>
<tr>
<td>Update Catalog</td>
<td>Only available if <strong>Superuser</strong> is selected. By default, this option is selected, dictating that this role can update system catalogs directly. If deslected, an UPDATE pg_catalog.pg_authid SET rolcatupdate=false WHERE rolname=... statement is generated and appended to the CREATE ROLE statement, explicitly disabling catalog update for the new role.</td>
</tr>
<tr>
<td>Replication</td>
<td>This setting determine whether a role can initiate streaming replication or can control backup mode. If <strong>Replication</strong> is selected, a REPLICATION parameter is included in the DDL. Otherwise, a NOREPLICATION parameter is included in the DDL.</td>
</tr>
</tbody>
</table>

### Roles (PostgreSQL) - Membership

When creating or editing a role, this tab/panel lets you append one or more GRANT statements to the generated CREATE ROLE statement, granting membership in the role to other roles. For each GRANT statement to be generated, select a role from the **Groups** list and click **Join** to assign membership in the selected role to the role being created.
Rules Wizard (PostgreSQL)

This wizard lets you build and submit a simple CREATE OR REPLACE RULE statement, defining a new database rule.

To create a new rule using a wizard:

1. Open a creation wizard for a rule. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Rules (PostgreSQL) - Properties.
   - Definition panel - Rules (PostgreSQL) - Definition.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Rules (PostgreSQL) - Properties

When creating or editing a rule, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Availability and Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Lets you provide the name of the new role.</td>
</tr>
<tr>
<td>Parent Type</td>
<td>Select the type (TABLE or VIEW) of element to which this rule is to be applied.</td>
</tr>
<tr>
<td>Parent Schema and Parent Name</td>
<td>Select the schema and name of the parent object.</td>
</tr>
<tr>
<td>Connection Limit</td>
<td>Lets you provide the value for a CONNECTION LIMIT parameter, setting a limit on the number of concurrent connections the new role can make.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the rule being created.</td>
</tr>
<tr>
<td>IsInstead</td>
<td>If unselected, a simple DO clause will be generated for the rule. If selected, a DO INSTEAD clause will be generated. The DO or DO INSTEAD clause command or commands are provided on the Definition tab/panel.</td>
</tr>
<tr>
<td>Event</td>
<td>Lets you select an AS ON event of SELECT, INSERT, UPDATE, or DELETE.</td>
</tr>
</tbody>
</table>

Rules (PostgreSQL) - Definition

When creating or editing a rule, this tab/panel lets you provide the DO or DO INSTEAD clause value, specifying the additional or alternative commands for this rule.
Schemas Wizard (PostgreSQL)

This wizard lets you build and submit a CREATE SCHEMA... AUTHORIZATION... statement, creating a new schema.

To create a new schema using a wizard:

1. Open a creation wizard for a schema. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Schemas (PostgreSQL) - Properties.
   - **Permissions** panel - for details, see Setting Permissions or Privileges for an Object.
   - **Comment** panel - for details, see Adding a Comment to an Object.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Schemas (PostgreSQL) - Properties

When creating or editing a check constraint, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Lets you type the name of the schema.</td>
</tr>
<tr>
<td><strong>Owner</strong></td>
<td>Lets you select the name of the user who will own the schema.</td>
</tr>
</tbody>
</table>
Tables Wizard (PostgreSQL)

This wizard lets you build and submit a CREATE TABLE statement, creating a new table.

To create a new table using a wizard:

1. Open a creation wizard for a table. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Tables (PostgreSQL) - Properties.
   - Ancestors panel - for details, see Tables (PostgreSQL) - Ancestors.
   - Columns panel - for details, see Tables (PostgreSQL) - Columns.
   - Constraints panel - for details, see Tables (PostgreSQL) - Constraints.
   - Permissions panel - for details, see Setting Permissions or Privileges for an Object.
   - Comment panel - for details, see Adding a Comment to an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Tables (PostgreSQL) - Properties

When creating or editing a table, this tab/panel lets you work with the following settings:
## Tables Wizard (PostgreSQL)

### Setting | Description
---|---
**Owner, Schema, and Name** | Lets you provide ownership details and provide a name for the table.  
**Tablespace** | Lets you select a CREATE TABLE... TABLESPACE parameter value, specifying the tablespace in which the new table will be created.  
**With OIDS** | If selected, a WITH (OIDS=TRUE) parameter is added to the generated DDL, specifying that rows of the table will have object identifiers. Otherwise, a WITH (OIDS=FALSE) parameter is added to the generated DDL.  
**Persistence** | Lets you change from the default form of CREATE TABLE statement by selecting either **TEMPORARY** (CREATE TEMPORARY TABLE) or **UNLOGGED** (CREATE UNLOGGED TABLE).  
**Of Type** | Lets you select the value for an OF clause, designating this as a typed table. Any columns defined using the **Ancestors** or **Columns** tab are overwritten when a type is selected.  
**On Commit** | Only available with a Persistence selection of **TEMPORARY**. Lets you change the ON COMMIT... parameter DDL generated between DROP (ON COMMIT DROP), PRESERVE ROWS (ON COMMIT PRESERVE ROWS), and DELETE ROWS (ON COMMIT DELETE ROWS).  
**Fill Factor** | Lets you provide a FILLFACTOR parameter value, an integer expressing a percentage between 10 and 100, dictating the upper limit to which INSERTs can pack table pages.  
**Table Autovacuum... settings** | Lets you enable or disable the autovacuum daemon as well as specify values for parameters used in autovacuum calculations (Threshold, Scale Factor, Analyze Threshold, Analyze Threshold, Cost Delay, Cost Limit, Freeze Min Age, Freeze Max Age, Freeze Table Age, Multixact Freeze Min Age, Multixact Freeze Max Age, and Multixact Freeze Table Age.  
**Toast Table Autovacuum... settings** | Lets you enable or disable the autovacuum daemon for the table’s secondary toast table, as well as specify values for parameters used in autovacuum calculations (Threshold, Scale Factor, Cost Delay, Cost Limit, Freeze Min Age, Freeze Max Age, Freeze Table Age, Multixact Freeze Min Age, Multixact Freeze Max Age, and Multixact Freeze Table Age.  

## Tables (PostgreSQL) - Ancestors

This tab/panel lets you add an INHERITS clause to the generated DDL, building a list of tables from which this table inherits columns. For each table to be added to the list, use the New button to enable a dropdown that lets you select a table. Use the Delete button to remove a selected table from the list.

## Tables (PostgreSQL) - Columns

When creating or editing a table, this tab/panel lets you manage the columns for the table:
To add a column to the table:

1. Use the Add Column dropdown to add a new column (Add Column) to the bottom of the column list or to insert a new column (Insert Column) above the currently selected column in the column list.

2. Provide a Name for the column.

3. Use the following table as a guide to providing additional property values, noting that availability of a property differs by data type and other property selections:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Lets you select the datatype for the column.</td>
</tr>
<tr>
<td>Allow Nulls</td>
<td>If not selected, a NOT NULL argument is added to the column specification.</td>
</tr>
<tr>
<td>Default</td>
<td>Lets you provide a default value for the column.</td>
</tr>
<tr>
<td>Comment</td>
<td>Lets you append a COMMENT ON COLUMN statement to the generated table creation DDL.</td>
</tr>
<tr>
<td>Statistics Target</td>
<td>Lets you append an ALTER TABLE... ALTER COLUMN... SET STATISTICS statement to the generated table creation DDL, setting the per-column statistics-gathering target for ANALYZE operations.</td>
</tr>
<tr>
<td>Storage Mode</td>
<td>Lets you append an ALTER TABLE... ALTER COLUMN... SET STORAGE statement to the generated table creation DDL, with a storage specifier of EXTERNAL, EXTENDED, or MAIN.</td>
</tr>
<tr>
<td>NDistinct Values</td>
<td>Let you append ALTER TABLE... ALTER COLUMN... SET (n_distinct or n_distinct_inherited) statements to the generated table creation DDL. These override the number-of-distinct-values estimates made by ANALYZE operations for the table or its inherited children.</td>
</tr>
<tr>
<td>NDistinct Values Inherited</td>
<td></td>
</tr>
</tbody>
</table>

To edit a column:

- Select the column from the list and edit property values as per the descriptions above.

To drop a column:

- Select the column from the list and click the Delete button.

To reorder the column list:

- Move a selected column up or down the list using the Move Item Up or Move Item Down buttons.

Tables (PostgreSQL) - Constraints

When creating or editing tables, this tab/panel lets you manage foreign key, primary key, unique key, exclusion constraints, and check constraints for the table:
Select a constraint type and click **Add** to open a wizard that lets you add a new constraint of that type to the table.

Select an existing constraint and click **Edit** to open a wizard that lets you add or modify that constraint. The wizards used to add and modify constraints offer functionality identical to the editors and wizards used when creating those object types. For details, see the following topics:

- Check Constraints Wizard (PostgreSQL) and Check Constraints Editor (PostgreSQL)
- Foreign Keys Wizard (PostgreSQL) and Foreign Keys Editor (PostgreSQL)
- Roles Wizard (PostgreSQL) and Roles Editor (PostgreSQL)
- Exclusion Constraints, Primary Keys, and Unique Keys Wizards (PostgreSQL) and Exclusion Constraints, Primary Keys, or Unique Keys Editors (PostgreSQL)

Select a constraint and click **Drop** to drop a constraint from the table.
# Tablespaces Wizard (PostgreSQL)

This wizard lets you build and submit a simple CREATE TABLESPACE statement, registering a new, cluster-wide tablespace.

**To create a new tablespace using a wizard:**

1. Open a creation wizard for a tablespace. For details, see [Opening an Object Wizard](#).

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - [Check Constraints (PostgreSQL) - Properties](#).
   - **Definition** panel - for details, see [Previewing the DDL Generated to Create the New Object](#).

3. Finally, use the **Execute** button to create the object.

## Tablespaces (PostgreSQL) - Properties

When creating or editing a tablespace, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Schema and</td>
<td>Identify the table for which the constraint is being created.</td>
</tr>
<tr>
<td>Table Name</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Lets you type the name of the tablespace.</td>
</tr>
<tr>
<td>Owner</td>
<td>Lets you select the name of the user who will own the tablespace.</td>
</tr>
<tr>
<td>Location</td>
<td>Lets you provide a LOCATION parameter clause, identifying the directory used for the tablespace.</td>
</tr>
<tr>
<td>random_page_code</td>
<td>When either of these settings are assigned values, the generated CREATE TABLESPACE DDL is followed by an ALTER TABLESPACE statement that lets you override the RANDOM_PAGE_COST and SEQ_PAGE_COST configuration parameters.</td>
</tr>
<tr>
<td>and seq_page_cost</td>
<td></td>
</tr>
</tbody>
</table>
Triggers Wizard (PostgreSQL)

This wizard lets you build and submit a CREATE TRIGGER or CREATE CONSTRAINT TRIGGER statement, creating a trigger to be associated with a table or view. Optionally, an ALTER TABLE statement can be generated to control the firing of the trigger.

To create a new trigger using a wizard:

1. Open a creation wizard for a trigger. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Triggers (PostgreSQL) - Properties.
   - Column Selection panel - Triggers (PostgreSQL) - Column Selection.
   - Comment panel - for details, see Adding a Comment to an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Triggers (PostgreSQL) - Properties

When creating or editing a trigger, this tab/panel lets you work with the following settings:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent Type</td>
<td>Select the type (TABLE or VIEW) of element that this trigger is to be associated with.</td>
</tr>
<tr>
<td>Parent Schema and Parent Name</td>
<td>Select the schema and name of the parent object.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the trigger being created.</td>
</tr>
<tr>
<td>Constraint trigger, Referenced Table Schema, and Referenced Table Schema</td>
<td>Selecting the Constraint Trigger control specifies that a CREATE CONSTRAINT TRIGGER statement is generated instead of a CREATE TRIGGER statement. Optionally, you can use the Referenced Table Schema and Referenced Table Schema controls to specify a FOR clause to indicate the referenced table.</td>
</tr>
<tr>
<td>Trigger Type</td>
<td>This control lets you specify a FOR clause, specifying whether the trigger is called once per row modified or once per operation. ROW specifies FOR EACH ROW while STATEMENT (not available if Constraint Trigger is selected) specifies FOR EACH STATEMENT.</td>
</tr>
<tr>
<td>Trigger Timing</td>
<td>Lets you select whether the trigger fires BEFORE or AFTER the operation.</td>
</tr>
<tr>
<td>Trigger Event List</td>
<td>Lets you build a list of events (INSERT, DELETE, UPDATE, and in the case of FOR EACH STATEMENT triggers, TRUNCATE) that cause the trigger to fire.</td>
</tr>
<tr>
<td>Deferrable and Deferred</td>
<td>These controls are only available if Constraint Trigger is selected. Selecting Deferrable generates a DEFERRABLE INITIALLY IMMEDIATE clause. Subsequently selecting Deferred changes the clause to DEFERRABLE INITIALLY DEFERRED.</td>
</tr>
<tr>
<td>Function Schema, Function Name, and Function Arguments</td>
<td>These controls let you specify details of the function to be called when the trigger fires.</td>
</tr>
<tr>
<td>Fire Mode</td>
<td>Optionally, lets you include an ALTER TABLE statement specifying an action of DISABLE TRIGGER, ENABLE ALWAYS TRIGGER, or ENABLE REPLICA TRIGGER. Selecting ORIGIN LOCAL results in no ALTER TABLE statement being appended to the main CREATE TRIGGER/CREATE CONSTRAINT TRIGGER statement.</td>
</tr>
</tbody>
</table>

**Triggers (PostgreSQL) - Column Selection**

If you chose UPDATE as the Trigger Event List option, this tab/panel lets you provide FOR UPDATE OF, BEFORE UPDATE OF, or AFTER UPDATE OF clause options. Select the check box beside each column that is to fire the trigger.
Types Wizard (PostgreSQL)

This wizard lets you build and submit a CREATE TYPE, creating a new data type to be used in the current database. Optionally, an ALTER TABLE statement can be generated to modify a specific type.

To create a new type using a wizard:

1. Open a creation wizard for a type. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel.
   - Range Kind panel.
   - Base Kind panel.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Finish button to create the object.

Types (PostgreSQL) - Properties

When creating or editing a type, this tab/panel lets you work with the following settings:
### Types Wizard (PostgreSQL)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Schema</strong></td>
<td>Schema where the new data type is created.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the data type being created.</td>
</tr>
<tr>
<td><strong>Kind</strong></td>
<td>Indicates the kind of data of the data type being created. Options are <strong>PSEUDO</strong>, <strong>BASE</strong>, <strong>RANGE</strong>, <strong>ENUM</strong> and <strong>COMPOSITE</strong>.</td>
</tr>
</tbody>
</table>

### Types (PostgreSQL) - Range Kind

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SubtypeSchema</strong></td>
<td>Schema where the subtype is registered.</td>
</tr>
<tr>
<td><strong>SubtypeName</strong></td>
<td>Name of the element type that the range type will represent ranges of.</td>
</tr>
<tr>
<td><strong>SubtypeOpClassFunctionSchema</strong></td>
<td>Schema where the subtype operator class is registered.</td>
</tr>
<tr>
<td><strong>SubtypeOpClassFunctionName</strong></td>
<td>Name of a b-tree operator class for the subtype.</td>
</tr>
<tr>
<td><strong>SubtypeCollationSchema</strong></td>
<td>Schema where the collation is registered.</td>
</tr>
<tr>
<td><strong>SubtypeCollationName</strong></td>
<td>Name of an existing collation to be associated with a range type.</td>
</tr>
<tr>
<td><strong>SubtypeCanonicalFunctionSchema</strong></td>
<td>Schema where the canonicalization function is registered.</td>
</tr>
<tr>
<td><strong>SubtypeCanonicalFunctionName</strong></td>
<td>Name of the canonicalization function for the range type.</td>
</tr>
<tr>
<td><strong>SubtypeDiffFunctionSchema</strong></td>
<td>Schema where the difference function is registered.</td>
</tr>
<tr>
<td><strong>SubtypeDiffFunctionName</strong></td>
<td>Name of the difference function for the subtype.</td>
</tr>
</tbody>
</table>

Only **SubtypeName** is required, the other parameters are optional.
Types (PostgreSQL) - Base kind
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InputFunctionSchema</td>
<td>Schema where the input function is registered.</td>
</tr>
<tr>
<td>InputFunctionName</td>
<td>Name of a function that converts data from the type's external textual form to its internal form.</td>
</tr>
<tr>
<td>OutputFunctionSchema</td>
<td>Schema where the output function is registered.</td>
</tr>
<tr>
<td>OutputFunctionName</td>
<td>Name of a function that converts data from the internal form of the type to its external textual form.</td>
</tr>
<tr>
<td>RecvFunctionSchema</td>
<td>Schema where the receive function is registered.</td>
</tr>
<tr>
<td>RecvFunctionName</td>
<td>Name of a function that converts data from the external binary form of the type to its internal form.</td>
</tr>
<tr>
<td>SendFunctionSchema</td>
<td>Schema where the Send function is registered.</td>
</tr>
<tr>
<td>SendFunctionName</td>
<td>Name of a function that converts data from the internal form of the type to its external binary form.</td>
</tr>
<tr>
<td>ModInFunctionSchema</td>
<td>Schema where the type modifier input function is registered.</td>
</tr>
<tr>
<td>ModInFunctionName</td>
<td>Name of a function that converts an array of modifier for the types into internal form.</td>
</tr>
<tr>
<td>ModOutFunctionSchema</td>
<td>Schema where the type modifier output function is registered.</td>
</tr>
<tr>
<td>ModOutFunctionName</td>
<td>Name of a function that converts the internal form of the type's modifier to an external textual form.</td>
</tr>
<tr>
<td>AnalyzeFunctionSchema</td>
<td>Schema where the Analyze function is registered.</td>
</tr>
<tr>
<td>AnalyzeFunctionName</td>
<td>Name of a function that performs statistical analysis for the data type.</td>
</tr>
<tr>
<td>InternalLength</td>
<td>Numeric constant that specifies the length in bytes of the new type's internal representation. The default assumption is that is is variable-length.</td>
</tr>
<tr>
<td>Alignment</td>
<td>The storage alignment requirement of the data type. If specified, it must be char, int2, int4, or double; the default is int4.</td>
</tr>
<tr>
<td>PassByValue</td>
<td>Indicates whether the type can be passed by value or not. By default, is set to false.</td>
</tr>
<tr>
<td>Storage</td>
<td>The storage strategy for the data type. If specified, it must be plain, external, extended, or main; the default is plain.</td>
</tr>
<tr>
<td>Category</td>
<td>The category code (a single ASCII character) for this type. The default is 'U' for &quot;user-defined type&quot;. Other standard category codes can be found in Table 45-45. You may also choose other ASCII characters in order to create custom categories.</td>
</tr>
</tbody>
</table>
IsPreferred

True if this type is a preferred type within its type category, else false. The default is false. Be very careful about creating a new preferred type within an existing type category, as this could cause surprising changes in behavior.

DefaultValue

The default value for the data type. If this is omitted, the default is null.

Delimiter

The delimiter character to be used between values in arrays made of this type.

IsCollatable

Indicates whether the type can use collation information or not. By default is set to false.

ElementSchema

Schema where the element is registered.

ElementName

The type being created is an array; this specifies the type of the array elements.

Only InputFunctionName and OutputFunctionName are required, the other parameters are optional.
Views Wizard (PostgreSQL)

This wizard lets you build and submit a CREATE VIEW or CREATE MATERIALIZED VIEW statement.

To create a new view using a wizard:

1. Open a creation wizard for a view. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - Views (PostgreSQL) - Properties.
   - Definition panel - Views (PostgreSQL) - Definition.
   - Comment panel - for details, see Adding a Comment to an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Views (PostgreSQL) - Properties

When creating or editing a view, this tab/panel lets you work with the following settings:
### Setting | Availability and Description
--- | ---
**Schema** | Lets you select the owner of the new view.

**Name** | Lets you provide the name of the new view.

**Is Materialized** | When selected, a CREATE MATERIALIZED VIEW statement is generated. When unselected, a CREATE VIEW statement is generated.

**Security Barrier** | This setting is only available with **Is Materialized** unselected. If selected, a WITH (security_barrier=true) clause is added to the generated DDL, specifying that the view is to provide row-level security. If unselected, a WITH (security_barrier=false) clause is added.

**Tablespace** | This setting is only available with **Is Materialized** selected. It lets you add a TABLESPACE clause to the generated DDL, specifying the tablespace where the materialized view is to be created.

**Fill Factor** | This setting is only available with **Is Materialized** selected. It lets you add a WITH (fillfactor= ...) clause to the generated DDL, specifying an integer expressing a percentage between 10 and 100, dictating the upper limit to which INSERTs can pack pages.

**With Data** | This setting is only available with **Is Materialized** selected. If selected, a WITH DATA clause is appended to the generated DDL, specifying that the backing query is executed to provide new data. If unselected, a WITH NO DATA clause is appended to the generated DDL, specifying that no new data is generated.

**View Autovacuum... settings** | Lets you enable or disable the autovacuum daemon as well as specify values for parameters used in autovacuum calculations (Threshold, Scale Factor, Analyze Threshold, Analyze Threshold, Cost Delay, Cost Limit, Freeze M in Age, Freeze Max Age, Freeze Table Age, Multixact Freeze M in Age, Multixact Freeze Max Age, and Multixact Freeze Table Age.

**Toast View Autovacuum... settings** | Lets you enable or disable the autovacuum daemon for the table’s secondary toast table, as well as specify values for parameters used in autovacuum calculations (Threshold, Scale Factor, Cost Delay, Cost Limit, Freeze M in Age, Freeze Max Age, Freeze Table Age, Multixact Freeze M in Age, Multixact Freeze Max Age, and Multixact Freeze Table Age.

### Views (PostgreSQL) - Definition

Complete the CREATE VIEW statement by typing or pasting in the relevant query.
You create Sybase ASE objects using the following wizards:

- Aliases Wizard (Sybase ASE)
- Databases Device Wizard (Sybase ASE)
- Databases Wizard (Sybase ASE)
- Data Caches Wizard (Sybase ASE)
- Defaults Wizard (Sybase ASE)
- Dump Devices Wizard (Sybase ASE)
- Extended Procedures Wizard (Sybase ASE)
- Foreign Keys Wizard (Sybase ASE)
- Functions Wizard (Sybase ASE)
- Groups Wizard (Sybase ASE)
- Indexes Wizard (Sybase ASE)
- Logins Wizard (Sybase ASE)
- Primary Keys Wizard (Sybase ASE)
- Procedures Wizard (Sybase ASE)
- Remote Servers Wizard (Sybase ASE)
- Role Wizard (Sybase ASE)
- Rules Wizard (Sybase ASE)
- Segment Wizard (Sybase ASE)
- Tables Wizard (Sybase ASE)
- Triggers Wizard (Sybase ASE)
- Unique Keys Wizard (Sybase ASE)
- User Datatypes Wizard (Sybase ASE)
- User Messages Wizard (Sybase ASE)
- Users Wizard (Sybase ASE)
- Views Wizard (Sybase ASE)
The Alias Wizard lets you map a login to an existing user in the database. You can set up aliases so that multiple users log in to the same account and therefore have the same privileges. You can also set up an alias based on individual log ins and give those users access to the same alias with the advantage that you can track their activity within the database.

To create a new alias using a wizard:

1. Open a creation wizard for an alias. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Aliases (Sybase ASE) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

### Aliases (Sybase ASE) - Properties

When creating or editing an alias, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Provide a name for the alias being created.</td>
</tr>
<tr>
<td>User</td>
<td>Select the user to which the alias refers. The user has to have a valid account on SQL Server but cannot be a user in the current database.</td>
</tr>
</tbody>
</table>
Databases Device Wizard (Sybase ASE)

A database device is part or all of a disk device used for storing a database and its transaction log.

The Database Device Wizard lets you specify basic creation attributes and override many obscure, rarely-used parameters of the DISK INIT statement.

**Note:** Make sure that your Sybase ASE is configured for enough devices that it can accommodate the creation of another device. If not, increase that parameter from the **Server Configuration** dialog. For details, see [Session Recording](#).

To Open the Database Device Wizard

1. On the Navigator/Explorer, find the datasource where you want to add a database device and expand the **Storage** node.

2. Right-click the **Database Devices** node, and select **New**.

3. Use the following topics as a guide to understanding and setting options on the panels of this wizard:

   - **Properties** panel - for details, see [Database Devices (Sybase ASE) - Properties](#).
   - **DDL View** panel - for details, see [Previewing the DDL Generated to Create the New Object](#).

4. Finally, use the **Execute** button to create the object.

Database Devices (Sybase ASE) - Properties

When creating or editing a database device, this tab/panel lets you work with the following DISK INIT command, SP_DISKDEFAULT, or SP_DBEXTEND parameters:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
<td>The abstract name you want to assign to the device. If for any reason the physical device is down, you can redefine the logical name to a new device.</td>
</tr>
<tr>
<td>In-memory</td>
<td>This feature is available as of Sybase ASE 15.5.</td>
<td>Adds a TYPE='inmemory' parameter, creating an in-memory device.</td>
</tr>
<tr>
<td>Device Number</td>
<td></td>
<td>DBArtisan automatically calculates the next open device number and defaults its value in the box. Numbering is sequential.</td>
</tr>
<tr>
<td>Size</td>
<td></td>
<td>In kilobytes, megabyte, gigabytes, or terabytes.</td>
</tr>
<tr>
<td>Cache Name</td>
<td>Available only if In-memory is selected</td>
<td>Lets you select from available in-memory type data caches, to provide a PHYSNAME= parameter value. For information on setting up an in-memory data cache, see Data Caches Wizard (Sybase ASE).</td>
</tr>
<tr>
<td>Physical Name</td>
<td>Available only if In-memory is not selected</td>
<td>Specify the full path for the file, including the hard drive letter or machine name, directory and full file name with the *.DAT extension (for example, D:\SYB\DATA\TEST.DAT)</td>
</tr>
<tr>
<td>Controller Number</td>
<td></td>
<td>Lets you provide a CNTRLTYPE= parameter value. Normally, Sybase ASE uses 0.</td>
</tr>
<tr>
<td>Virtual Address</td>
<td></td>
<td>Lets you provide a VSTART= parameter value, specifying a starting virtual address, or offset, to begin using the database device.</td>
</tr>
<tr>
<td>Default Device</td>
<td></td>
<td>The DISK INIT used to create or edit the device is followed by an EXEC SP_DISKDEFAULT call. This control specifies whether it is called with a defaulton or defaultoff option.</td>
</tr>
<tr>
<td>Dsync</td>
<td></td>
<td>Lets you select a DSYNC= option, specifying whether database writes are made directly to the storage media, or are buffered using operating system files.</td>
</tr>
<tr>
<td>DirectIO</td>
<td></td>
<td>Lets you select a DIRECTIO= option, specifying whether you want to transfer data directly to disk, bypassing the operating system buffer cache.</td>
</tr>
<tr>
<td>Autogrowth</td>
<td>Available only if In-memory is not selected</td>
<td>Enabling Auto Growth results in the DISK INIT being followed by an EXEC SP_DBEXTEND 'SET', 'DEVICE'... call. This lets you set the Growth rate and Maximum Size for the device.</td>
</tr>
</tbody>
</table>
The Database Wizard lets you create a database (a structured collection of data that can be updated or queried) without knowing the underlying commands. Databases can be simple, that is one file with many records and the same fields, or much more complicated with multiple files with different fields.

To create a new database using a wizard:

1. Open a creation wizard for a database. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Databases (Sybase ASE) - Properties.
   - Placement panel - for details, see Databases (Sybase ASE) - Placement.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

**Databases (Sybase ASE) - Properties**

When creating or editing a database, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Category</th>
<th>Setting (and availability)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creation</td>
<td>Database Name</td>
<td>Provide a name for the database.</td>
</tr>
<tr>
<td>Properties</td>
<td>Type</td>
<td>Generate variations on the CREATE DATABASE DDL generated to create the database, as follows: DEFAULT - generates a generic CREATE DATABASE statement. TEMP - generates a CREATE TEMPORARY DATABASE variation. ARCHIVE - generates a CREATE ARCHIVE DATABASE variation.</td>
</tr>
<tr>
<td></td>
<td>In-memory (available with a Type of TEMP or DEFAULT) This feature is available as of Sybase ASE 15.5.</td>
<td>Generates CREATE IN MEMORY DATABASE DDL, indicating that this is an in-memory database. For information setting up data caches and database devices for in-memory databases using DBArtisan, see Data Caches Wizard (Sybase ASE) and Databases Device Wizard (Sybase ASE).</td>
</tr>
</tbody>
</table>
Scratch Database (available with a Type of ARCHIVE)

Lets you provide a WITH SCRATCH_DATABASE parameter value, specifying the name of an existing database that stores information about the archive database.

For Proxy Update (available with a Type of DEFAULT and not available if For Load is selected) This feature is available as of Sybase ASE 12.5.

Adds a FOR PROXY_UPDATE parameter to the generated DDL, forcing resynchronization of proxy tables with the proxy database. For information on how to resynchronize an existing database, see Resynchronize.

For Load (available with a Type of DEFAULT and not available if For Proxy Update is selected)

This option speeds loading by eliminating the step for pre-initializing panels. The for load option is appropriate when creating a database for recovering from media failure or moving a database from one machine to another.

With Override (available with a Type of TEMP or DEFAULT)

Enable this option to specify whether logs and data are to be kept on the same logical device

With Default Location (available with a Type of DEFAULT)

Lets you add a WITH DEFAULT_LOCATION clause value, specifying a storage location for new tables. If you also select For Proxy Update, one proxy table will be automatically created for each remote table or view.

Durability (available with a Type of TEMP or DEFAULT) Relaxed Durability databases are available as of Sybase ASE 15.5.

Lets you select a WITH DURABILITY= parameter value of NO RECOVERY, FULL, or AT SHUTDOWN, specifying the durability level of the database. With In-memory selected, the only valid selection is NO RECOVERY.

Options

The GENERATE... DDL is followed by an sp_dboption call for each option selected in this group.

With a Type of ARCHIVE single user - generates a sp_dboption call specifying the SINGLE USER option, restricting database access to one user at a time.

With a Type of TEMP or DEFAULT

In addition to the single user option, the following sp_dboption database options are available: abort tran on log full, allow nulls by default, auto identity, dbo use only, ddl in tran, identity in nonunique index, no chkpt on recovery, no free space acctg, read only, select into/bulkcopy/pllsort, single user, trunc log on chkpt, and unique auto_identity index. For Sybase ASE 15.0 databases, scratch database, async log service option, and delayed commit options are available.
Databases (Sybase ASE) - Placement

In the Fragment Properties area provide or select values for the default fragment: Device Name, Size for the fragment, and a Device Type value of DATA ONLY, LOG ONLY, or DATA AND LOG. For databases with a Properties tab/panel Type selection of ARCHIVE, no LOG ONLY Device Type selection is available.

If necessary use the New button to add a new fragment and repeat the steps above to provide details for that fragment. Use the Delete button to drop a fragment.
Data Caches Wizard (Sybase ASE)

This wizard lets you build and submit an sp_cacheconfig call, creating a new data cache. One or more sp_bindcache calls can also be built and submitted simultaneously, letting you bind databases, tables, indexes, text object, or image object to the new data cache. For each object bound, you can specify sp_cachestrategy parameters, letting you select caching strategies for those objects.

To create a new data cache using a wizard

1. Open an object creation wizard for a data cache. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Data Caches (Sybase ASE) - Properties.
   - **Objects** panel - for details, see Data Caches (Sybase ASE) - Objects.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the **Execute** button to create the object.

On creating a data cache, all space is allocated to the logical page size memory pool. You can subsequently use the Data Cache Editor to subdivide the data cache into additional pools with larger I/O sizes. For details, see Data Cache Editor (Sybase ASE).

Data Caches (Sybase ASE) - Properties

When creating or editing a data cache, this tab/panel lets you work with settings corresponding to sp_cacheconfig parameters:

<table>
<thead>
<tr>
<th>Category</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creation</td>
<td>Name</td>
<td>Lets you provide a name for the cache.</td>
</tr>
<tr>
<td>General</td>
<td>Type</td>
<td>Lets you specify a cache type parameter value of MIXED, INMEMORY, or LOGONLY. The In-memory databases feature is available as of Sybase ASE 15.5.</td>
</tr>
<tr>
<td></td>
<td>Policy (not available with a Type of INMEMORY)</td>
<td>Lets you specify a replacement policy of STRICT or RELAXED.</td>
</tr>
<tr>
<td></td>
<td>Status</td>
<td>Displays the current status of the cache: ACTIVE, PENDING ACTIVE, or PENDING DELETE. You can only change a mixed data cache if it does not have any non-log objects bound to it.</td>
</tr>
</tbody>
</table>
Partitions

Lets you specify the number of partitions to be created for the cache. Selecting a legal value (1 - 64, in powers of 2) adds that `sp_cacheconfig cache_partition` parameter value to the DDL generated to create the data cache.

Size

**Configured Size**

Lets you specify the size of the cache after the server is restarted. Consult Sybase documentation for details on this property. See [Accessing Third Party Documentation](#).

**Run Size**

Displays the size that the cache is currently using. For the default cache, this is the amount of all cache space not explicitly configured for another cache.

---

**Data Caches (Sybase ASE) - Objects**

When creating or editing a data cache, this tab/panel lets you manage the objects bound to the data cache. You use it to bind and unbind objects and to specify the caching strategy for each bound object.

The **Objects** list on the left displays objects currently bound to the data cache. Specific objects are grouped under the **Databases**, **Tables**, and **Index** subfolders.

The **Property/Value** list on the right lets you work with caching strategy parameters for a selected table or index. Consult Sybase documentation for information on the **Apply to text only** (applies to indexes only), **Prefetch Strategy**, and **MRU Replacement Strategy** caching strategies. See [Accessing Third Party Documentation](#).

Maintain the **Objects** list as follows:

- **Adding a new database, table, or index to the bound objects list** - click the **Bind** button. This opens a Bind wizard. For detailed information, see [Binding Databases, Indexes, or Tables to a Sybase ASE Data Cache](#). Use this process repeatedly to bind objects of different types.

- **Enabling or disabling caching strategy options for an object** - select an object from the **Objects** list and use the check box associated with a strategy to enable or disable that strategy.

- **Removing an object from the bound objects list** - select the object in the **Objects** list and click **Unbind**.

---

**Binding Databases, Indexes, or Tables to a Sybase ASE Data Cache**

When creating or editing a data cache, the Bind Wizard lets you select the specific objects that are to be bound to the cache.

To **bind one or more databases, tables or indexes to a data cache**
1. Open the Data Cache Wizard or Data Cache Editor and select the Objects tab. For more information, see Data Caches Wizard (DBArtisan - Sybase ASE) or Data Cache Editor (Sybase ASE).

2. Click Bind to open the Bind Wizard.

3. From the Objects dropdown select Entire Database, Tables, or Indexes.

4. If you selected Tables, or Indexes, from the Databases dropdown select the database containing the specific table or index.

5. If you selected Tables, optionally select the Bind text or image from table objects check box to bind storage of text and images from the table to this cache.

6. Click Objects in the navigation frame to display the Objects panel.

7. Select the check box associated with each specific object that is to be bound to the cache.

8. Click Finish.
Defaults Wizard (Sybase ASE)

Here you create a default for table column or user-defined datatype in the event that no value is available when the data is inserted. The default value you specify will be inserted only in the current database. You can then bind the default to a specific column or user-datatype.

**To create a new default using a wizard:**

1. Open a creation wizard for a default. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Defaults (Sybase ASE) - Properties.
   - **Dependencies** panel - for details, see Defaults (Sybase ASE) - Dependencies.
   - **DDL View** panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Defaults (Sybase ASE) - Properties

When creating or editing a default, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Owner</strong></td>
<td>Select the schema that is to own the default.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the default.</td>
</tr>
<tr>
<td><strong>Value</strong></td>
<td>Provide the value of the default.</td>
</tr>
</tbody>
</table>

Defaults (Sybase ASE) - Dependencies

From the **Type** dropdown, choose Column or Datatype, and if you chose **Column**, choose a Table from the **Table** dropdown. The list on the left is populated with candidate columns or datatypes. To move a candidate from the list on the left to the dependencies column on the right, select the candidate and click **Add**. Remove columns or datatypes from the dependencies list on the right by selecting the column or datatype and clicking **Remove**.
Dump Devices Wizard (Sybase ASE)

Your system writes its memory image to a dump device so you can retrieve data if your system crashes. All load and dump operations require that you name a device before the operation will complete. When you create a new dump device, ASE adds a row to the sysdevices table in the master database. Sybase recommends that you back up the master database before you create a new device and again after you have created the device. Be sure you have enough disk space on the physical drive to perform these operations.

To create a new dump device using a wizard:

1. Open an object creation wizard for a dump device. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Dump Devices (Sybase ASE) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Dump Devices (Sybase ASE) - Properties

When creating or editing a dump device, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>This is the device’s logical name.</td>
</tr>
<tr>
<td>Physical Name</td>
<td>The device or file name that is recognized by the operating system. (For example, a:sqltable.dat).</td>
</tr>
<tr>
<td>Device Type</td>
<td>Select TAPE or DISK.</td>
</tr>
</tbody>
</table>
Extended Procedures Wizard (Sybase ASE)

Extended stored procedures provide a method for calling external procedural language functions from within the Adaptive Server. A procedural language is a language capable of calling a C language function or manipulating C language datatypes.

To create a new extended procedure using a wizard:

1. Open a creation wizard for an extended procedure. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Extended Procedures (Sybase ASE) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Extended Procedures (Sybase ASE) - Properties

When creating or editing an extended procedure, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the extended procedure.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide the name of the procedure.</td>
</tr>
<tr>
<td>Library Name</td>
<td>Provide the name of the library containing the procedure.</td>
</tr>
</tbody>
</table>
Foreign Keys Wizard (Sybase ASE)

Foreign keys are used to relate information from one table to another. Foreign keys are unique values that refer to specific columns of other tables. Thus, a foreign key links two tables together. The Foreign Key Wizard makes it easy for you to create a relational link between two tables, thereby speeding queries and giving you faster access to data. The column in the initial table, the parent table, is called the primary key. The corresponding column in the (child) table that references the primary key, is the foreign key. Foreign keys can also refer to columns within the same table.

To create a new foreign key using a wizard:

1. Open a creation wizard for a foreign key. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:

   - Properties panel - for details, see Foreign Keys (Sybase ASE) - Properties.
   - Column Mapping panel - for details, see Foreign Keys (Sybase ASE) - Column Mapping.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Foreign Keys (Sybase ASE) - Properties

When creating or editing a foreign key, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Owner</td>
<td>Select the owner of the referring, or child, table</td>
</tr>
<tr>
<td>Table Name</td>
<td>Select the name of the referring, or child, table.</td>
</tr>
<tr>
<td>Match Full</td>
<td>Specify a referential integrity option.</td>
</tr>
</tbody>
</table>

Foreign Keys (Sybase ASE) - Column Mapping

Under Referenced Table, choose the Owner and then the Name of the referenced, or parent, table.

Under the Main Table, select check boxes corresponding to the columns that are to reference columns in the referenced table. Then, under Referenced Table, select the corresponding column check boxes.
The Functions Wizard creates and submits a CREATE FUNCTION command. This lets you create a user-defined function, a saved Transact-SQL routine that returns a specified value. The wizard collects basic identifying information and generates basic CREATE FUNCTION statement syntax, letting you provide the body of the function.

**Note:** This functionality is supported for Sybase ASE 12.5.

To create a new function using a wizard:

1. Open a creation wizard for a function. For details, see [Opening an Object Wizard](#).
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties panel** - for details, see [Functions (SQL Server) - Properties](#).
   - **Definition panel** - for details, see [Functions (SQL Server) - Definition](#).
3. Finally, use the **Execute** button to create the object.

### Functions (Sybase ASE) - Properties

When creating or editing a function, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Owner</strong></td>
<td>Select the owner of the function.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>Provide a name for the function.</td>
</tr>
</tbody>
</table>

### Functions (Sybase ASE) - Definition

Complete the CREATE FUNCTION outline provided by typing or pasting the body of the function.
Groups Wizard (Sybase ASE)

A group is a collection of privileges that the DBA assigns to designated users.

To create a new group using a wizard:

1. Open a creation wizard for a group. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Groups (Sybase ASE) - Properties.
   - Object Permissions and System Permissions panels - see Setting Permissions or Privileges for an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

After you click Finish and Execute, use the Group Editor to assign users to the new group. For details, see Groups Editor (Sybase ASE).

Groups (Sybase ASE) - Properties

When creating a group, this panel lets you provide a name for the group.
Indexes Wizard (Sybase ASE)

Like an index in a book, a table index helps you get at the data you want without having to read through the whole table. Indexes can exist on single column or on multiple columns. Indexes appear in the form of B-trees. And, as for books, you can have multiple indexes for a single table.

To create a new index using a wizard:

1. Open a creation wizard for an index. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Indexes (Sybase ASE) - Properties.
   - Columns panel - for details, see Indexes (Sybase ASE) - Columns.
   - Partition panel - for details, see Indexes (Sybase ASE) - Partition.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Indexes (Sybase ASE) - Properties

When creating or editing an index, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Owner, Table Name, and Name</td>
<td>Select or provide identifying information.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Provide or select values for the following Sybase options: Index Type, Clustered, Ignore Duplicate Key, Ignore Duplicate Rows, and Maximum Rows Per Page properties.</td>
</tr>
<tr>
<td>Storage</td>
<td>Provide or select values for the following Sybase options: Reserve Page Gap, Segment Name, Fill Factor, Prefetch Strategy, and MRU Replacement Strategy.</td>
</tr>
</tbody>
</table>

Indexes (Sybase ASE) - Columns

Select a column from the Columns dropdown and specify a Sort option.

Use the New button to add more columns to the index. Use the Delete button to remove selected columns from the index.
Indexes (Sybase ASE) - Partition

Click **Add** to open the Index Partition wizard (Sybase ASE).

Index Partition wizard (Sybase ASE)

The Sybase ASE Index Partition wizard can be opened from the following editors and wizards:

- Indexes Wizard (Sybase ASE)
- Indexes Editor (Sybase ASE)

Use the following topics as a guide to understanding and setting the options on this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Select a Locality.</td>
</tr>
<tr>
<td>Partition Definitions</td>
<td>Click the Define a new partition button to open a dialog that lets you provide a name, select a segment, click the New button to add values, and then Add the partition definition.</td>
</tr>
</tbody>
</table>

When finished, click the **Finish** button.
Logins Wizard (Sybase ASE)

The Login wizard lets you build and submit an `sp_addlogin` or CREATE LOGIN call, adding a new login with a basic set of specified database, language, and password properties. An additional `sp_locklogin` call can be issued to lock the new login. The Login wizard also lets you:

- Grant roles to the login
- Create user accounts on databases for the role, optionally with an alias or by changing ownership

To create a new login using a wizard:

1. Open a creation wizard for a login. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Logins (Sybase ASE) - Properties.
   - Roles panel - for details, see Logins (Sybase ASE) - Roles.
   - Users panel - for details, see Logins (Sybase ASE) - Users.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Note: Login triggers, configured for individual logins, are also supported. For details, Logins Editor (Sybase ASE).

Logins (Sybase ASE) - Properties

When creating or editing a login, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Group</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creation</td>
<td>Name</td>
<td>The user login name.</td>
</tr>
<tr>
<td></td>
<td>Full Name</td>
<td>The full name of the user, an optional but useful identifier.</td>
</tr>
<tr>
<td></td>
<td>Suid (version 15.7 ^)</td>
<td>Lets you optionally add a SUID parameter to the generated DDL, specifying a system user ID.</td>
</tr>
<tr>
<td>General</td>
<td>Default Database</td>
<td>The database where the user starts each session.</td>
</tr>
<tr>
<td></td>
<td>Default language</td>
<td>The language in which prompts and messages are displayed.</td>
</tr>
</tbody>
</table>
Logins Wizard (Sybase ASE)

**Profile** (version 15.7 ^)

Lets you add a LOGIN PROFILE parameter: ignore eliminates profile binding while selecting a login profile (if available) binds the profile to this login.

**Locked or Account Locked**

If selected, the sp_addlogin or CREATE LOGIN call is immediately followed by an sp_locklogin call, locking the new login and effectively disabling it.

**NOTE:** After creating a login, this group also displays an assigned Login trigger. For details, see Logins Editor (Sybase ASE).

**Authentication Password**

The initial password for the new user.

**Password expiration**

The duration, in days, before the password expires.

**Minimum password length**

The minimum number of characters a password can contain.

**Maximum login attempts**

The maximum number of login attempt failures before the login is suspended.

**Authentication mechanism**

Lets you select ASE, LDAP, PAM, or ANY authentication.

**Exempt Inactive Lock (version 15.7 ^)**

When selected, an EXEMPT INACTIVE LOCK TRUE parameter is added to the generated DDL, exempting the login from being locked due to inactivity.

Logins (Sybase ASE) - Roles

When creating or editing a login, this tab/panel lets you grant roles to the login by selecting the the check boxes associated with those roles.

For information on creating roles in DBArtisan, see Role Wizard (Sybase ASE).

For information on activating and deactivating roles for the current login in the current session, see Role Activation.

Logins (Sybase ASE) - Users

When creating or editing a login, this tab/panel lets you maintain database user accounts for a login as follows:

- Add a user account for this login to a database by selecting a database from the Databases where the Login does NOT have a User Account and clicking the Add button. This opens the Add User dialog letting you provide additional details. For more information, see Adding a login account to a database.

- Remove a user account for this login from a database by selecting a database from the Databases where the Login HAS a User Account and clicking the Remove button.
Adding a login account to a database

When adding a user account for a login to a database, the **Add user** dialog lets you provide details on the method used (**sp_adduser**, **sp_addalias**, or **sp_changedbowner**). Use the following table as a guide to setting options in this dialog:

<table>
<thead>
<tr>
<th>Setting or Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>User Type</strong></td>
<td>Lets you select the method by which the user account will be added to the database: USER (<strong>sp_adduser</strong>), ALIAS (<strong>sp_addalias</strong>) or DBO (<strong>sp_changedbowner</strong>).</td>
</tr>
<tr>
<td><strong>Creation</strong></td>
<td><strong>Login Name</strong> - displays the user name from the Master database. If you selected a <strong>User Type</strong> of USER, the following settings are available: <strong>User Name</strong> - is a new name for the user in the target database. <strong>Group Name</strong> - lets you select a group in the target database to which the user will be added.</td>
</tr>
<tr>
<td><strong>Alias</strong></td>
<td><strong>LoginUserName</strong> - If you selected a <strong>User Type</strong> of ALIAS, this control lets you select the database user name to alias the login name to.</td>
</tr>
<tr>
<td><strong>dbo</strong></td>
<td><strong>TransferAliasesAndPermissions</strong> - If you selected a <strong>User Type</strong> of DBO, this control lets you transfer aliases and their permissions to the new database owner.</td>
</tr>
</tbody>
</table>

For more information, see [Logins Editor (Sybase ASE)](LoginsEditorSybaseASE).
Primary Keys Wizard (Sybase ASE)

Primary key constraints make sure that no duplicate values or NULLS are entered in the columns you specify. You can use primary key constraints to enforce uniqueness and referential integrity. A table can only have a single primary key constraint.

To create a new primary key using a wizard:

1. Open a creation wizard for a primary key. For details, see Opening an Object Wizard.  
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Primary Keys (Sybase ASE) - Properties.  
   - Columns panel - for details, see Primary Keys (Sybase ASE) - Columns.  
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.  
3. Finally, use the Execute button to create the object.

Primary Keys (Sybase ASE) - Properties

Provide or select the following:

- The Table Owner and Table Name of the table for which to create the index.
- A Name for the Index.
- Whether the index is Clustered.
- The Maximum Rows Per Page.
- A Reserve Page Gap.
- A Segment Name.
- A Fill Factor value.

Primary Keys (Sybase ASE) - Columns

Use the Column dropdown to choose a column name and choose a Sort option for that column. Use the New button to add an additional column to the index or use the Drop button to delete selected columns.
Procedures are a reusable block of PL/SQL, stored in the database, that applications can call. Procedures streamline code development, debugging, and maintenance by being reusable. Procedures enhance database security by letting you write procedures granting users execution privileges to tables rather than letting them access tables directly.

To create a new procedure using a wizard:

1. Open a creation wizard for a procedure. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Procedures (Sybase ASE) - Properties.
   - Definition panel - for details, see Procedures (Sybase ASE) - Definition.
3. Finally, use the Execute button to create the object.

Procedures (Sybase ASE) - Properties

When creating or editing a procedure, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the procedure.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide the name of the procedure.</td>
</tr>
<tr>
<td>Procedure Number</td>
<td>Provide a procedure number if you want to group identically-named procedures.</td>
</tr>
<tr>
<td>Recompile</td>
<td>Optionally, enable this feature to prevent Sybase ASE from saving a plan for the procedure.</td>
</tr>
</tbody>
</table>

Procedures (Sybase ASE) - Definition

Complete the provided CREATE PROCEDURE statement by typing or pasting the body of the procedure.
Remote Servers Wizard (Sybase ASE)

Remote Servers are servers on a network that you can access through your local server. Instead of logging directly into a remote server, you can log into your local server and execute a remote procedure call to it.

**Note:** Only stored procedures are allowed against remote servers. You can use a linked server to execute distributed queries and stored procedures.

**Before beginning**

- Before you can set up a remote server, you first configure both the local and remote servers to accept remote access. To configure the Microsoft SQL Servers for remote access, you need to log into each server. The table below describes the parameters you need to configure on each server:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Access</td>
<td>1(enabled)</td>
</tr>
<tr>
<td>Remote Connections</td>
<td>Number of remote connections required</td>
</tr>
<tr>
<td>Remote Logins</td>
<td>Number of remote logins required</td>
</tr>
<tr>
<td>Remote Sites</td>
<td>Number of remote sites required</td>
</tr>
</tbody>
</table>

- After setting these server configuration parameters, shut down and restart the server so the new values can take effect. When you have configured both servers, proceed to the steps below.

**To create a new remote server using a wizard:**

1. Open an object creation wizard for a remote server. For details, see [Opening an Object Wizard](#).

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see [Remote Servers (Sybase ASE) - Properties](#).
   - **DDL View** panel - for details, see [Previewing the DDL Generated to Create the New Object](#).

3. Finally, use the **Execute** button to create the object.

**Remote Servers (Sybase ASE) - Properties**

When creating or editing a remote server, this tab/panel builds an `sp_addserver` stored procedure call and a set of `sp_serveroption` calls defining and configuring a remote server. It lets you work with the following settings:
## Setting Description

**Name**  
Provide a name for the remote server.

**Network Name**  
Optionally, provide the server’s physical/network name?

**Server Type**  
Select a server type of LOCAL or REMOTE.

**Timeout Inactive Connections**  
(only available with a **Server Type** of REMOTE)  
Indicate whether SQL server should time out inactive physical connections with this remote server.

**Network Password Encryption**  
(only available with a **Server Type** of REMOTE)  
Indicate whether encryption should be used to protect passwords sent to this remote server.

**Security Model**  
(only available with a **Server Type** of REMOTE)  
Security Model A: This is equivalent to the level of security in release 11.0.x and prior releases. Security Model B: Implements security using DCE, Kerberos, or NT LAN Manager.

**Security Mechanism**  
(only available with a **Server Type** of REMOTE)  
Specify a security mechanism.

**Message Integrity**  
(only available with a **Server Type** of REMOTE and a **Security Model** of SECURITY MODEL B)  
If enabled, messages between the servers are checked for tampering.

**Message Confidentiality**  
(only available with a **Server Type** of REMOTE and a **Security Model** of SECURITY MODEL B)  
If enabled, messages between the local and remote servers are encrypted.

**Mutual Authentication**  
(only available with a **Server Type** of REMOTE and a **Security Model** of SECURITY MODEL B)  
If enabled, the local server authenticates the remote server by retrieving and verifying the remote server credentials using the security mechanism. The credentials of both servers are authenticated and verified.
Role Wizard (Sybase ASE)

Roles are sets of user privileges you associate with access to objects within a database. Roles streamline the process of granting permissions. You can use roles to grant sets of permissions and privileges to users and groups. Roles can help you comply with Sarbanes Oxley regulations by limiting which users can have access to what privileges, for example a Human Resources Role versus an Accounting Role.

To create a new role using a wizard:

1. Open an object creation wizard for a role. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Roles (Sybase ASE) - Properties.
   - Object Permissions and System Permissions panels - see Setting Permissions or Privileges for an Object.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

After creating a role, you can use the Roles Editor to assign the role to logons or other roles. For details, see Roles Editor (Sybase ASE).

For information on activating and deactivating roles for the current login in the current session, see Role Activation.

Roles (Sybase ASE) - Properties

When creating or editing a role, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Settings</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the role?</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password, if any, that must be entered to activate the role (seven characters is the default).</td>
</tr>
<tr>
<td>Password Expiration</td>
<td>Enter the time, in days, after which users must change the password</td>
</tr>
<tr>
<td>Minimum Password Length</td>
<td>Enter the minimum password length, if any.</td>
</tr>
<tr>
<td>Maximum Failed Logins</td>
<td>Enter the minimum number of login attempts, if any, after which the role is locked out.</td>
</tr>
</tbody>
</table>
Rules Wizard (Sybase ASE)

Rules promote data integrity by allowing you to validate the values supplied to a table column. They are reusable objects that you can bind to table columns or user datatypes. Check constraints are similar to rules, and are in fact the preferred way of restricting data. A column or user-defined data type can have only one rule bound to it, but a column can have both a rule and one or more check constraints associated with it. Not that a rule cannot apply to data already existing in the database at the time you’re creating the rule and can’t be bound to a system-created data type. If you create a new rule when one already exists, the new rule will override the previous one.

To create a new rule using a wizard:

1. Open a creation wizard for a rule. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Rules (Sybase ASE) - Properties.
   - Dependencies panel - for details, see Rules (Sybase ASE) - Dependencies.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

Rules (Sybase ASE) - Properties

When creating or editing a rule, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Owner</strong> and <strong>Name</strong></td>
<td>Select an <strong>Owner</strong> and provide a <strong>Name</strong> for the rule.</td>
</tr>
<tr>
<td><strong>Restriction</strong></td>
<td>Type the condition. The rule restriction is the condition that defines the rule and can be any expression valid in a WHERE clause and can include such elements as arithmetic operators, relational operators, and predicates (for example, IN, LIKE, BETWEEN).</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Choose STANDARD_RULE, AND_ACCESS_RULE, or OR_ACCESS_RULE.</td>
</tr>
</tbody>
</table>

Rules (Sybase ASE) - Dependencies

From the **Type** dropdown, choose Column or Datatype, and if you chose Column, choose a Table from the **Table** dropdown. The list on the left is populated with candidate columns or datatypes. To move a candidate from the list on the left to the dependencies column on the right, select the candidate and click Add. Remove
columns or datatypes from the dependencies list on the right by selecting the column or datatype and clicking **Remove**.
Segment Wizard (Sybase ASE)

This wizard lets you build and submit an sp_addsegment procedure call, optionally followed by sp_dbextend 'set', 'database'... and sp_dbextend 'set', 'threshold'... calls. This defines a segment on a database device, and specifies the size by which to grow the database, its maximum size, and a free space level.

To create a new segment using a wizard:

1. **Opening an Object Wizard** for a segment.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Segments (Sybase ASE) - Properties.
   - Location panel - for details, see Segments (Sybase ASE) - Location.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object. For more information, see Previewing the DDL Generated to Create the New Object.

The Segments Editor opens. You can extend the segment and see the objects stored in the segment. For more information, see Segments Editor (Sybase ASE).

Segments (Sybase ASE) - Properties

When creating or editing a segment, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Provide a Name for the segment.</td>
</tr>
<tr>
<td>Grow By</td>
<td>Provide an sp_dbextend 'set', 'database'... growth rate parameter value, specifying the rate at which the segment grows each time threshold procedures are run.</td>
</tr>
<tr>
<td>Threshold Free Space</td>
<td>Provide an sp_dbextend 'set', 'threshold'... free space parameter value, specifying when the threshold procedure is installed on the segment.</td>
</tr>
<tr>
<td>Max Size</td>
<td>Provide an sp_dbextend 'set', 'database'... maximum segment size parameter value.</td>
</tr>
</tbody>
</table>

Segments (Sybase ASE) - Location

When creating a segment, this tab/panel lets you select the database device for the segment. Select a device from the Available Devices list and click Place to include the device in the Used Devices list.
Similarly, when editing a segment, this tab/panel lets you extend a segment by adding additional devices. Select a device from the Available Devices list and click Extend to include the device in the Used Devices list.
Tables Wizard (Sybase ASE)

A table is a column-based arrangement of data in which the content of one column has a bearing on the other column(s). So, for example, a table might have a column for authors, another column for the books each author has written, and a third for the number of copies each title by a given author has sold. The data moves across the columns in rows.

**Note:** You must have CREATE TABLE permissions to generate a new table.

To create a new table using a wizard:

1. Open a creation wizard for a table. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties** panel - for details, see Tables (Sybase ASE) - Properties.
   - **Columns** panel - for details, see Tables (Sybase ASE) - Columns.
   - **Indexes** panel - for details, see Tables (Sybase ASE) - Indexes.
   - **Constraints** panel - for details, see Tables (Sybase ASE) - Constraints.
   - **Partitions** panel - for details, see Tables (Sybase ASE) - Partition.
   - **Permissions** panel - for details, see Tables (Sybase ASE) - Permissions.
   - **DDL View** panel - for details, see Previewing theDDL Generated to Create the New Object.
3. Finally, use the **Execute** button to create the object.

Tables (Sybase ASE) - Properties

When creating or editing a table, this tab/panel lets you work with the following settings:
Tables Wizard (Sybase ASE)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the table.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the table</td>
</tr>
<tr>
<td>Segment Name</td>
<td>Specify the segment on which you want to place the table.</td>
</tr>
<tr>
<td>Maximum Rows Per Page</td>
<td>Specifying a number allows you to override the default. The default, 0, creates indexes with full pages and nonclustered indexes with full leaf pages. This number can be changed at any time.</td>
</tr>
<tr>
<td>Reserve Page Gap</td>
<td></td>
</tr>
<tr>
<td>Identity Gap</td>
<td>Specify the size of the identity gap for the table.</td>
</tr>
<tr>
<td>MRU Replacement Strategy</td>
<td>When enabled, new pages are read into the least recent end of the page chain. When pages reach the most recent end of the chain, the pages are flushed.</td>
</tr>
<tr>
<td>Prefetch Strategy</td>
<td>Enabling this feature allows you to fetch as many as eight 2K data pages simultaneously instead of one at a time (the default).</td>
</tr>
<tr>
<td>Lock Scheme</td>
<td>Select a locking scheme of ALLPAGES, DATAPAGES, or DATAROWS.</td>
</tr>
<tr>
<td>Expected Row Size</td>
<td>If you specified a Lock Scheme of DATAROWS or DATAPAGES, provide an expected row size</td>
</tr>
</tbody>
</table>

Tables (Sybase ASE) - Columns

For each column in the table, click the Add Column button to create a column, provide a Name for the column and provide or select the remaining column attributes.

Use the Delete button to drop a selected column.

Use the arrow buttons to reposition the columns.

Note: Because the smalldatetime datatype stores dates and time with less precision than the datetime datatype, before outputting you use the CAST or CONVERT functions to convert any boxes with the smalldatetime datatype to either VARCHAR or datetime datatypes.

Tables (Sybase ASE) - Indexes

Click Add to open the Index Wizard. For details, see Indexes Wizard (Sybase ASE).

Tables (Sybase ASE) - Constraints

Selecting a constraint type and clicking Add opens the object wizard for that object type. For details see:
Tables Wizard (Sybase ASE)

- Primary Keys Wizard (Sybase ASE)
- Unique Keys Wizard (Sybase ASE)
- Foreign Keys Wizard (Sybase ASE)
- Create Synonym

Tables (Sybase ASE) - Partition

Click Add to open the Table Partition Wizard. For details, see Table Partition wizard for Sybase ASE.

Tables (Sybase ASE) - Permissions

Set up the user permissions for this table.

Table Partition wizard for Sybase ASE

See the following topics for information on editors and wizards that let you open the Sybase ASE Table Partition Wizard:

- Tables Wizard (Sybase ASE)
- Tables Editor (Sybase ASE)

Use the following topics as a guide to understanding and setting the options on this wizard:
### Step Properties

Select a **Partition Type** of ROUNDROBIN, RANGE, HASH, or LIST.

### Step Columns (not available with a **Partition Type** of ROUNDROBIN)

For each column, click the **Insert a new column** button to create a column, provide a **Name** for the column and provide or select the remaining column attributes. Use the **Delete** button to drop a selected column. Use the arrow buttons to reposition the columns.

### Step Partition Definition (only available with a **Partition Type** of HASH or ROUNDROBIN)

Take one of the following actions: (1) Select the **Number Of Partitions** radio box, specify the **Number Of Partitions**, and for each partition, click the **New** button and choose a tablespace from the dropdown, or (2) select the **By Partition Name** radio box and for each partition, click the **New** button provide a name and then choose a tablespace from the dropdown.

### Step Range Definitions (only available with a **Partition Type** of RANGE)

Click the **Define a new partition** button to open a dialog that lets you provide a name, select a segment and **Add** the partition definition.

### Step List Definitions (only available with a **Partition Type** of LIST)

Click the **Define a new partition** button to open a dialog that lets you provide a name, select a segment, click the **New** button to add values, and then **Add** the partition definition.

When finished, click the **Finish** button.
Triggers Wizard (Sybase ASE)

The Triggers Wizard lets you build and submit a CREATE TRIGGER command, selecting a parent object type of table or view, and selecting the triggering events for the trigger. Depending on whether you are creating a trigger for a view or a table, the Wizard generates customizable CREATE TRIGGER syntax as follows:

- **Tables** - The wizard generates a FOR INSERT, UPDATE, DELETE trigger code template (all supported Sybase ASE versions)
- **Views** - The wizard generates an INSTEAD OF trigger code template (Sybase ASE 15.0.2)

In both cases, you provide the SQL statements that are to make up the body of the FOR or INSTEAD OF trigger.

**To create a new trigger using a wizard:**

1. Open a creation wizard for a trigger. For details, see [Opening an Object Wizard](#).
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - **Properties panel** - for details, see [Triggers (Sybase ASE) - Properties](#).
   - **Definition panel** - for details, see [Triggers (Sybase ASE) - Definition](#).
3. Finally, use the **Execute** button to create the object.

Triggers (Sybase ASE) - Properties

When creating or editing a trigger, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parent Type</strong>, <strong>Parent Owner</strong>, and <strong>Parent Name</strong></td>
<td>Provide or select details on the target table or view.</td>
</tr>
<tr>
<td><strong>Owner</strong> and <strong>Name</strong></td>
<td>Select the owner and provide a name for the trigger being created.</td>
</tr>
<tr>
<td><strong>Fire On Insert</strong>, <strong>Fire On Update</strong>, and <strong>Fire On Delete</strong></td>
<td>Enable the events that fire the trigger. An INSERT trigger must be associated with an INSERT statement. For example, if a data load operation doesn’t include an INSERT statement, the trigger won’t be invoked. An UPDATE trigger can be associated with specific columns of the base table and will only be activated if those columns are updated. A DELETE trigger fires automatically after items in the table are deleted.</td>
</tr>
</tbody>
</table>

**Note:** For triggers with a table parent type, the editor lets you enable and disable the trigger, after creation. For details, see [Triggers Editor (Sybase ASE)](#).
Triggers (Sybase ASE) - Definition

Complete the CREATE TRIGGER statement by typing or pasting in content.

- See the Microsoft SQL Server Transact-SQL documentation for information on the syntax for Trigger bodies. For more information, see Accessing Third Party Documentation.
Unique Keys Wizard (Sybase ASE)

Unique keys can enforce logical keys that are not chosen as the primary key. In other words, you can use a unique key to ensure no duplicate values are entered in specific columns that are not a part of the primary key. Although you can only attach one primary key to a table, you can attach multiple unique keys. Also, you can use unique keys on columns that allow null values.

To create a new unique key using a wizard:

1. Open a creation wizard for a unique key. For details, see Opening an Object Wizard.

2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Unique Keys (Sybase ASE) - Properties.
   - Columns panel - for details, see Unique Keys (Sybase ASE) - Columns.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.

3. Finally, use the Execute button to create the object.

Important Notes

- If you are creating a non-clustered index constraint, you should place it on a separate segment from the target table.

Unique Keys (Sybase ASE) - Properties

Provide or select the following:

- The Table Owner and Table Name of the table for which to create the index.
- A Name for the Index.
- Whether the index is Clustered.
- The Maximum Rows Per Page.
- A Reserve Page Gap.
- A Segment Name.
- A Fill Factor value.

Unique Keys (Sybase ASE) - Columns

Use the Column dropdown to choose a column name and choose a Sort option for that column. Use the New button to add an additional column to the index or use the Drop button to delete selected columns.
User Datatypes Wizard (Sybase ASE)

User datatypes promote domain consistency by streamlining the definition of commonly used table columns in a database. You can build a customized datatype from system datatypes and bind defaults and rules to it to enhance integrity. When you reference the user datatype in a column, the column assumes all of the properties of the user datatype.

To create a new user datatype using a wizard:

1. Open a creation wizard for a user datatype. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see User Datatypes (Sybase ASE) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

User Datatypes (Sybase ASE) - Properties

When creating or editing a user datatype, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Datatype</td>
<td>Provide a name for the datatype.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the base datatype.</td>
</tr>
<tr>
<td>Size</td>
<td>Provide the size of the datatype.</td>
</tr>
<tr>
<td>Allow Nulls</td>
<td>Null has no explicitly assigned value. Null is not equivalent to zero or blank. A value of null is not considered to be greater than, less than, or equivalent to any other value, including another value of null.</td>
</tr>
<tr>
<td>Identity</td>
<td>This allows you to specify whether or not you want to limit access to the new datatype based on the user’s privileges.</td>
</tr>
<tr>
<td>Default Binding</td>
<td>Defaults promote data integrity by supplying a default value to a column if the user does not explicitly provide one. They are reusable objects that you can bind to user datatypes.</td>
</tr>
<tr>
<td>Rule Binding</td>
<td>Rules promote data integrity by allowing you to validate the values supplied to a column. They are reusable objects that you can bind to user datatypes.</td>
</tr>
</tbody>
</table>
User Messages Wizard (Sybase ASE)

A user message let’s you write the error message users will see when a user-defined event transpires. The User Message Wizard lets you multiple language versions of a user message, specifying the message numbers, specifying the text for each language version, and binding the message to one or more integrity constraints.

To create a new user message using a wizard:

1. Open a creation wizard for a user message. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see User Messages (Sybase ASE) - Properties.
   - Information panel - for details, see User Messages (Sybase ASE) - Information.
   - Bindings panel - for details, see User Messages (Sybase ASE) - Bindings.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

User Messages (Sybase ASE) - Properties

When creating or editing a user message, this tab/panel lets you provide the message number parameter for the sp_addmessage system procedure calls that will create each language-based version of this user message.

To specify the message number for this user message

In the Message Number box, type a unique message number (20000 or greater).

User Messages (Sybase ASE) - Information

For each language in which the user message is to be available, the User Message Wizard/Editor builds a sp_addmessage system procedure call. This tab/panel manages the language and message text parameters for each sp_addmessage call.

To add a language version of the user message

1. Click the Add new text for the user message button. The Create User Message Text dialog opens.
2. From the Language dropdown, select the language for the message.
3. In the Message Text box, type the text of the message.
4. Click **OK**.

**To edit an existing language version of the message**

1. Select the version from the **Language/Message** list.
2. Click the **Modify user message text** button. The **Edit User Message Text** dialog opens.
3. In the **Message Text** box, replace the text of the message.
4. Click **OK**.

**To delete an existing language version of the message**

1. Select the version from the **Language/Message** list.
2. Click the **Remove user message text** button and verify when prompted.

**User Messages (Sybase ASE) - Bindings**

When creating or editing a user message, this tab/panel manages one or more **sp_bindmsg** system procedure calls that will be issued with the **sp_addmessage** calls that create or edit a user message. This lets you bind the user message to, or unbind the user message from foreign keys or check constraints.

**To bind a user message to an integrity constraint**

1. From the **Constraint Type** dropdown, select the type of integrity constraint (**Check Constraints** or **Foreign Keys**) to which you are binding the user message.
2. Select one or more check constraints or foreign keys from the list on the left and click **Bind**.

**To unbind a user message from a currently bound integrity constraint**

1. Select one or more check constraints or foreign keys from the list on the right and click **Unbind**.
Users Wizard (Sybase ASE)

The User Wizard lets you create a user who will then have access to the database where you are registering him or her. You can also identify the appropriate user group and the system privileges you want to assign to the new user.

To create a new user using a wizard:

1. Open a creation wizard for a user. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Users (Sybase ASE) - Properties.
   - DDL View panel - for details, see Previewing the DDL Generated to Create the New Object.
3. Finally, use the Execute button to create the object.

You can use the User Editor to assign System and Object privileges as well as create an alias.

Users (Sybase ASE) - Properties

When creating or editing a user, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login Name</td>
<td>Choose a login ID from the drop-down list.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide the user name.</td>
</tr>
<tr>
<td>Group Name</td>
<td>Specify a group for the user.</td>
</tr>
</tbody>
</table>
Views Wizard (Sybase ASE)

Views are SQL queries stored in the system catalog that customize the display of data contained in one or more tables. Views behave like tables because you can query views and perform data manipulation operations on them. However, views do not actually store any data. Instead, they depend on data contained in their base tables. Views can only be

To create a new view using a wizard:

1. Open a creation wizard for a view. For details, see Opening an Object Wizard.
2. Use the following topics as a guide to setting properties and performing tasks as you pass through the wizard panels:
   - Properties panel - for details, see Views (Sybase ASE) - Properties.
   - Definition panel - for details, see Views (Sybase ASE) - Definition.
3. Finally, use the Execute button to create the object.

You can use the User Editor to assign System and Object privileges as well as create an alias.

Views (Sybase ASE) - Properties

When creating or editing a view, this tab/panel lets you work with the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Select the owner of the view.</td>
</tr>
<tr>
<td>Name</td>
<td>Provide a name for the view.</td>
</tr>
<tr>
<td>Check Type</td>
<td>When enabled, when a row is modified through a view, this option makes sure the data remains visible through the view after the modification is committed.</td>
</tr>
</tbody>
</table>

Views (Sybase ASE) - Definition

Complete the CREATE VIEW statement by typing or pasting in the relevant query.
Modifying objects using editors

An Object editor is a tabbed dialog box that stores information about existing server and database types and objects, and lets you modify those items. For an introduction to object editors, see Overview and common usage of object editors.

Note: Availability of editors for specific object type varies from DBMS to DBMS. Similarly, functionality offered for an editor for an object type common to two or more DBMS, will differ from DBMS to DBMS.

See the following topics for information the object editors available for each supported platform:

- IBM DB2 for Linux, Unix, and Windows Object Editors
- IBM DB2 for z/OS Object Editors
- Microsoft SQL Server Object Editors
- MySQL Object Editors
- Oracle Object Editors
- PostgreSQL Object Editors
- Sybase ASE Object Editors
Overview and common usage of object editors

An Object editor lets you view and modify settings and properties of existing object types and servers on a datasource. It also lets you add new resources and provides access to related, datasource management facilities. For example, the Tables editor lets you add or insert, edit, or drop columns, work with permissions to work with that table, access information on physical storage and the distribution of data and indexes across table spaces, and so on.

Each tab on the Object editor lets you perform a logical task or collection of logical tasks for that object type. The Object editor toolbar has a set of commands common to all object types and also includes a Command menu with commands specific to the object type you are currently working with. For example:

In order to work with object editors, you must be familiar with the following tasks:

- Opening an Object Editor on a server or database object.
- Viewing and Modifying Object Properties using functionality common to all object editors as well as object-specific functionality available to specific object editors.
- Previewing and Submitting Object Editor Changes to effect your changes to the datasource.
Opening an Object Editor

Object editors are accessed from the Datasource Navigator/Explorer pane of the main window.

To open an Object editor on a specific database object in DBArtisan

1. Connect to the datasource with the database object to be edited. For more information, see Datasource and Server Management.

2. On the Datasource Navigator/Explorer, expand the target datasource.

3. Continue to expand folders under the datasource until the type of object you want to view or modify is visible.

4. On the Datasource Navigator/Explorer, click on the specific type of object that you want to view or modify.

All objects of that type on the datasource are displayed.

5. In the Navigator/Explorer, right-click the specific object you want to view or modify, and then select Open.

An editor for that object type opens on the object you selected.

For information on editing objects, see Viewing and Modifying Object Properties.
Viewing and Modifying Object Properties

There are two categories of tasks you can perform using an Object editor:

- Work with Tasks and Settings of Specific Object Types
- Work with Tasks and Settings Common to Object Editors

Work with Tasks and Settings of Specific Object Types

Many of the tasks you perform using an Object editor are specific to the object type you are working with. For example, the Triggers editor lets you work directly with SQL code for the trigger while the Tables editor lets you work with columns of the table. Object-specific tasks are documented in the topics for specific Object editors provided later in this chapter.

Work with Tasks and Settings Common to Object Editors

The following tasks can be performed against many of the supported Object editors:

- Using the object editor toolbar
- Opening Another Object in the Same Object Editor Explorer
- Viewing the SQL/DDL for an Object
- Working with Privileges and Permissions
- Working with Object Dependencies
- Adding a Comment to an object

Using the object editor toolbar

The Object editor toolbar appears above the tabs of the Object editor.

![Object Editor Toolbar]

It provides the following functions:

- **Create** - Launches an object creation wizard. For more information, see Creating objects.
Viewing and Modifying Object Properties

- **Alter** - Enabled when a property of the current database has been modified. Opens a dialog that lets you preview the SQL code that will effect the modification and then submit the change. For more information, see Preview.

- **Drop** - Lets you drop one or more database objects and remove their definition from the system catalog. For more information, see Drop.

- **Extract** - Lets you extract data from one database to another database and extract the statements required to create objects into an Interactive SQL window. For more information, see Extract.

- **Migrate (DBArtisan)** - Lets you move object schema between DBMS or servers by copying the DDL between the source and target databases. For details, see Migrate.

- **Report** - Lets you generate detailed or summary reports on database objects. For details, see Report.

- **Command Menu** - Provides menu commands specific to the object being viewed or modified. For a listing of commands available, see the topic for the specific Object editor, later in this chapter.

- **Refresh** - Refreshes or clears Object editor contents.

- **Close** - Closes the Object editor and if appropriate, prompts you to verify any changes.

Commands on the Object editor toolbar are disabled if they do not apply to the object type being viewed or modified.

Opening Another Object in the Same Object Editor

Explorer

When an object editor is open, the area between the object editor toolbar and the tabs has one or more dropdown lists. For example:

<table>
<thead>
<tr>
<th>Owner</th>
<th>DSN8910</th>
<th>Table</th>
<th>EMP</th>
<th>Constraint</th>
<th>PERSON</th>
</tr>
</thead>
</table>

These lists allow you to qualify any object of the same type as the object currently displayed in the Object editor, and display information for that object in the current Object editor. The number of, and specific dropdown lists, differ according to the type of Object editor but there are always sufficient controls to uniquely identify another object of the same type.

To display the information for another object of the same type

- Use the dropdown lists to specify a different object.
Viewing and Modifying Object Properties

Viewing the SQL/DDL for an Object

The object editors for most object types feature a DDL tab that lets you view an object’s underlying SQL code.

To view the underlying DDL/SQL for a database object

1. Open an editor on an object type for which DDL code can be displayed. For details, see Opening an Object Editor.

See the topics for specific Object editors later in this chapter for information on whether that object type supports display of underlying SQL code.

2. Click the DDL tab.

Working with Privileges and Permissions

When you open an Object editor on an object with associated privileges, the Permissions (or Object Permissions or System Permissions) tab for that editor displays the relevant privileges and lets you make changes accordingly:

For database objects such as tables or procedures, to which permissions or privileges are granted, a Permissions tab lets you manage permissions or privileges to that object from all grantees, such as users or groups, on that datasource. The tab has a navigation area, a command area, and a display area.

The Navigation area lets you change the content of the Display area to view more specific privilege details. For example, when viewing privileges for a database object such as a table, the dropdown lists in the navigation area, if present, let you drill down to populate the display area with privileges for a lower level component, such as a particular column. Similarly, when viewing privileges for a grantee such as a user, the Object Permissions tab’s Navigation area lets you populate the display area with that user’s permissions on specific object types, such as tables or procedures.
Viewing and Modifying Object Properties

The Display area shows privilege details for an object or grantee. When viewing privileges for a grantee such as a user or role, the display area shows privileges for that recipient on objects currently qualified by the current selection in the Navigation area. When viewing privileges for an object such as a table, the display area shows the privileges for all grantees. Each cell in the Display area corresponds to a specific permissions and a cell representing a granted permission shows a distinctive icon.

The Command area lets you initiate granting or revocation of permissions.

**To view or modify privileges using an Object editor**

1. Open an editor on a database object with associated privileges or permissions. For details, see [Opening an Object Editor](#).
2. Click the **Permissions** (or **Privileges** or **Object Privileges** or **System Privileges**) tab.
3. Use the dropdown lists in the navigation area, if present, to populate the Display area with details for more specific or different permissions.
4. In the Display area, select a cell corresponding to a specific permission.
5. Use the Command area controls to grant or revoke permissions.
6. Submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).

**Working with Object Dependencies**

For objects such as views and procedures, whose definition references other objects, such as tables, you can view all dependencies. The Object editors for referencing or referenced objects have a **Dependencies** tab that shows all dependencies for an object.
In addition to letting you view dependencies, Object editors let you drop a referencing or referenced object, or open an Object editor on that object.

To manage dependences for an object

1. Open an editor on a database object with referencing or referenced objects. For details, see Opening an Object Editor.

See the object editor descriptions in subsequent topics to verify that an Object editor supports display of dependencies.

2. Click the Dependencies tab.

The Dependency Name area lists all referenced or referencing objects. Objects are grouped according to their object type.

3. Optionally, select a referenced or referencing object in the right pane and either:
   - Use the Edit button to open an Object editor on that object
   - Use the Drop button to initiate dropping that object.

Adding a Comment to an object

The object editors for certain object types feature a Comment tab that lets you add an explanatory note to specific object definitions. Comments are stored in the REMARKS column of the object’s system catalog.

To add a comment to an object

1. Open an editor on an object type that permits comments. For details, see Opening an Object Editor.

2. Click the Comment tab.
3. In the **Comment** area, type an explanatory note of up to 254 characters long.

**Note:** Right-clicking in the **Comment** area opens a context menu that lets you perform edit text operations such as search, selection, copying and pasting, as well as coding-specific operations such as enabling/disabling line numbers and indenting lines.

4. Submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Previewing and Submitting Object Editor Changes

After you use an Object editor to modify the settings or properties of a database object, you can preview the SQL that will be executed to effect those changes on the datasource. You can then submit the SQL for execution on the server.

To preview and submit object editor changes to a database object

1. Click the Alter button on the Object editor toolbar. For details, see Overview and common usage of object editors.

A Preview: Alter dialog opens.

2. Use one of the following options to submit and execute your changes:
   - **Execute** button - executes the changes immediately.
   - **Schedule** button - opens a dialog that lets you schedule the change. For more information, see Scheduling.

   o **Batch** button - (IBM DB2 for z/OS only) lets you specify the job cards used to execute the changes as a batch job. For information on how to check status, see Database Monitor.
IBM DB2 for Linux, Unix, and Windows Object Editors

An Object Editor is offered for all supported IBM DB2 or Linux, Unix, and Windows objects. To see an Editor for a specific object, click the corresponding link below:

- Aliases Editor (IBM DB2 LUW)
- Bufferpool Editor (IBM DB2 LUW)
- Check Constraints Editor (IBM DB2 LUW)
- Databases Editor (IBM DB2 LUW)
- Event Monitor Editor (IBM DB2 LUW)
- Foreign Keys Editor (IBM DB2 LUW)
- Functions Editor (IBM DB2 LUW)
- Groups Editor (IBM DB2 LUW)
- Indexes Editor (IBM DB2 LUW)
- Materialized Query Tables Editor (IBM DB2 LUW)
- Packages Editor (IBM DB2 LUW)
- Nodegroups Editor (IBM DB2 LUW)
- Primary Keys Editor (IBM DB2 LUW)
- Procedures Editor (IBM DB2 LUW)
- Sequences Editor (IBM DB2 LUW)
- Structured Types Editor (IBM DB2 LUW)
- Tables Editor (IBM DB2 LUW)
- Tablespaces Editor (IBM DB2 LUW)
- Triggers Editor (IBM DB2 LUW)
- Unique Keys Editor (IBM DB2 LUW)
- User Datatypes Editor (IBM DB2 LUW)
- Users Editor (IBM DB2 LUW)
- Views Editor (IBM DB2 LUW)

For access to object editors for different supported DBMS platforms and an introduction to editor usage, see Modifying objects using editors.
Aliases Editor (IBM DB2 LUW)

The Aliases Editor lets you view basic alias properties, change the comment associated with an alias, and view the DDL that will be issued to alter the alias definition.

To edit an alias

1. Open an editor on the alias. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>In addition to the owning Schema, this tab lets you view the Target Owner, Target Type, and Target Name, of the referenced object.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Bufferpool Editor (IBM DB2 LUW)

The Bufferpool editor lets you manage the basic properties, nodegroups, and partitions size of a bufferpool.

To edit a bufferpool

1. Open an editor on the bufferpool. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Deferred - controls IMMEDIATE or DEFERRED update of the bufferpool. Page size - displays the current page size. Automatic Size and Number of Pages - Lets you specify the size of the bufferpool. You can use the Automatic Size option to enable resizing based on self-tuning or you can specify a fixed Number of Pages. No. of Block Pages and Block Size - Let you specify NUMBLOCKPAGES and BLOCKSIZE values.</td>
</tr>
<tr>
<td>Nodegroups</td>
<td>Displays all defined nodegroups and lets you associate nodegroups with this bufferpool by selecting the relevant check boxes.</td>
</tr>
<tr>
<td>Partitions</td>
<td>Displays all partitions for the bufferpool. Optionally you can click in the Size field of an entry to activate editing and provide a new size.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Check Constraints Editor (IBM DB2 LUW)

The Check Constraints Editor lets you modify and enable/disable check constraints.

To edit a check constraint:

1. Open an editor on the check constraint. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Use the Enabled control to enable/disable the check constraint. You can also edit the condition in the Check Condition box. The Table Column button opens a dialog that lets you select and paste column names into the check condition expression.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Databases Editor (IBM DB2 LUW)

The Databases Editor lets you manage database tablespace placement details and modify configuration parameters for the database.

To edit a database

1. Open an editor on the database. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Placement</td>
<td>Select a tablespace and click the <strong>Edit</strong> button to open an object editor on that tablespace. For more information, see Tablespaces Editor (IBM DB2 LUW).</td>
</tr>
<tr>
<td>Options</td>
<td>Lets you modify the DB2 Database Manager configuration file parameters for the database. Select a parameter and click the <strong>Edit</strong> button to open a dialog that lets you change the current value. <strong>NOTE:</strong> To set database options for all future databases, set the database options on the model database.</td>
</tr>
<tr>
<td>DDL</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Event Monitor Editor (IBM DB2 LUW)

The event monitor editor lets you manage the event types associated with an event monitor, modify the condition for each event type, and specify where and how records are written.

To edit an event monitor

1. Open an editor on the event monitor. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with the following settings: Auto Start - lets you specify whether the event monitor is activated each time the database starts. Target Type - lets you specify where the output is written: FILE, PIPE, or TABLE. If you specify a Target Type of TABLE, you also have options to provide a Buffer Size and specify whether the event monitor is to be Blocked. If you specify a Target Type of PIPE, you must also specify the Target named pipe identifier. If you specify a Target Type of FILE, you also have options to provide a Buffer Size and whether the event monitor is to be Blocked. You also specify a Write Mode of APPEND or REPLACE, provide a Max Files value and a Max File Size value.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you modify the Event Types used to construct the CREATE EVENT MONITOR statement FOR clause. The base set of event types is BUFFERPOOLS, CONNECTIONS, DATABASE, DEADLOCKS, DEADLOCK WITH DETAILS, STATEMENTS, TABLES, TABLESPACES, and TRANSACTIONS. For IBM DB2 for Linux, Unix, and Windows version 9.0, DEADLOCK WITH DETAILS HISTORY and DEADLOCKS WITH DETAILS HISTORY VALUES event types are available. For IBM DB2 for Linux, Unix, and Windows version 9.5, ACTIVITIES, THRESHOLD VIOLATIONS, and STATISTICS event types are available. NOTE: If your choices are all from the DEADLOCKS... types, you can also specify Deadlock Monitoring of Global or Local. If you select Local, specify the Database Partitions the event monitor is to run against.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Available only for CONNECTION, STATEMENT, and TRANSACTION Event Types, this tab lets you modify a condition used to determine which CONNECTION, STATEMENT, or TRANSACTION the event monitor will collect data for.</td>
</tr>
<tr>
<td>DDL</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Foreign Keys Editor (IBM DB2 LUW)

The Foreign Keys Editor lets you manage column mapping for a foreign key, modify update and delete rule actions, and specify a NOT ENFORCED value.

To edit a foreign key

1. Open an editor on the foreign key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Mapping</td>
<td>The existing column mapping for the foreign key is represented by selected columns in the Main Table and Referenced Table lists. Additional candidates in the Referenced Table list are indicated by enabled column check boxes. If necessary, use the Table dropdown in the Referenced Table group to choose a new table for this foreign key. Select or deselect columns in the Main Table list and Referenced Table list to form the referential constraint between the two tables.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you modify the Delete Rule (NO ACTION, RESTRICT, CASCADE, SET NULL) and Update Rule (NO ACTION, RESTRICT) actions. This tab also lets you deselect the Enforced check box to specify a NOT ENFORCED option.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Functions Editor (IBM DB2 LUW)

The Functions Editor lets you manage the body, inputs and outputs, and properties for a function.

To edit a function

1. Open an editor on the function. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays the Language, Return Type, External Name, SQL Access Level, Origin, Threadsafe, Fenced, Scratchpad, Scratchpad Length, Allow Parallel, Final Call, Parameter Style, Inherit Special Registers, DBInfo, Deterministic, External Action, Called on Null Input, and Parameter CCSID properties.</td>
</tr>
</tbody>
</table>
| Parameters         | Lets you manage function parameters. On opening, this tab shows the existing parameters. Optionally you can:

  - Select a parameter from the list, modify the Type and if appropriate, the Precision, Size, and Scale of the parameter.

  - Click the New button, provide a name for the new parameter and modify its attributes.

  - Select a parameter and click the Drop button to delete the parameter.

  - Select a parameter and use the arrow buttons to reorder the parameter list.

Return Scalar (only available for functions created with a Function Type of EXTERNAL SCALAR, SOURCED or TEMPLATE and for SQL Function Type functions with an explicit Return Type of SCALAR)

Let's you change the Type of a return scalar and depending on the type specified, modify the Precision, Scale, and Size of the return scalar.

Return Columns (only available for functions created with a Function Type of OLEDB and EXTERNAL TABLE and for SQL Function Type functions with an explicit Return Type of TABLE or ROW)

Let's you manage return columns for a function. On opening, this tab shows the existing columns. Optionally you can:

  - Select a column from the list, modify the Type and if appropriate, the Precision, Size, and Scale of the parameter. You can also specify that the return column is to be treated As Locator.
Click the New button, provide a name for the new column and modify its attributes.

Select a parameter and click the Drop button to delete the parameter.

Select a parameter and use the arrow buttons to reorder the parameter list.

**Body**

Lets you edit the body of the function.

**Comment**

For details on using this tab, see [Adding a Comment to an object](#).

**Dependencies**

For details on using this tab, see [Working with Object Dependencies](#).

**Permissions**

For details on using this tab, see [Working with Privileges and Permissions](#).

**DDL View**

For details on using this tab, see [Viewing the SQL/DDL for an Object](#).

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Groups Editor (IBM DB2 LUW)

The group editor lets you manage privileges for a group.

To edit a group

1. Open an editor on the group. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object Permissions and System Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Indexes Editor (IBM DB2 LUW)

The Index Editor lets you manage columns and properties, and view space details for an index.

**Note:** IBM DB2 for Windows, Unix, and Linux, lets you segregate Include columns; columns that are to be part of the index but not part of the unique key.

**To edit an index**

1. Open an editor on the index. For details, see [Opening an Object Editor](#).

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Columns</strong></td>
<td>Lets you manage columns that make up the index. On opening, this tab shows the existing columns. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Change the <strong>Sort</strong> order of a column.</td>
</tr>
<tr>
<td></td>
<td>Click the <strong>New</strong> button and select a column name from the dropdown, to add a column to the index.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click the <strong>Drop</strong> button to delete the column from the index.</td>
</tr>
<tr>
<td></td>
<td>Select a column and use the arrow buttons to reorder the columns in the index.</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you work with properties in the following categories:</td>
</tr>
<tr>
<td><strong>Attributes</strong></td>
<td>Lets you view the <strong>Defined By</strong> property. Lets you set the <strong>Index Type</strong> (UNIQUE or NONUNIQUE), specify the index as <strong>Clustered</strong>, <strong>Allow Reverse Scans</strong>, and <strong>Compression</strong>.</td>
</tr>
<tr>
<td><strong>Include</strong></td>
<td>Lets you Include columns that are to be part of the index but not part of the unique key. On opening, the tab shows a listing of the Include columns currently defined as part of this index. Optionally, take one of the following actions:</td>
</tr>
<tr>
<td><strong>Columns</strong></td>
<td>Click the <strong>New</strong> button to add a new column to the index.</td>
</tr>
<tr>
<td></td>
<td>Select an existing column and click the <strong>Delete</strong> button to delete that column.</td>
</tr>
<tr>
<td><strong>Space</strong></td>
<td>Lets you view the following property groups:</td>
</tr>
<tr>
<td><strong>Attributes</strong></td>
<td><strong>Make Unique</strong>, <strong>System Required</strong>, <strong>Total Keys</strong>, <strong>Page Fetch Pairs</strong>, and <strong>Distinct Keys</strong></td>
</tr>
</tbody>
</table>
Indexes Editor (IBM DB2 LUW)

Statistics
- Index Level
- Cluster Ratio
- Cluster Factor
- Leaf Pages
- Sequential Pages
- Density

Cards
- First Key
- First 2 Keys
- First 3 Keys
- First 4 Keys
- Full Keys

Comment
For details on using this tab, see Adding a Comment to an object.

Permissions
For details on using this tab, see Working with Privileges and Permissions.

DDL View
For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Materialized Query Tables Editor (IBM DB2 LUW)

The Materialized Query Tables Editor lets you manage the columns, base query and options for a materialized query table, and work with storage and performance settings.

To edit a materialized query table

1. Open an editor on the materialized query table. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Displays the currently defined columns for the materialized Query Table. Optionally, you can Add, Insert, or Edit columns for the materialized query table.</td>
</tr>
<tr>
<td>Definition</td>
<td>Base Query - Lets you view the query that this materialized query table is based on.</td>
</tr>
<tr>
<td></td>
<td>Materialized Query Table Options - Lets you specify an immediate or deferred Refresh, and explicitly set a Materialized Query Table as Enabled or Disabled or go with the Default. This tab also displays whether the Materialized Query Table is maintained by the system or by a user.</td>
</tr>
<tr>
<td>Performance</td>
<td>Tablespaces - Displays Table Tablespace, Index Tablespace, and Long Tablespace settings for the materialized query table.</td>
</tr>
<tr>
<td></td>
<td>Log Options - Lets you select logging options: InitiallyLogged Data Capture - Lets you select none or change to Include Longvar Columns. NOTE: If you select the Data Capture option, the table name / column name cannot be longer than 18 bytes.</td>
</tr>
<tr>
<td></td>
<td>Options - Let you set the Percent Free, Locksize, Append, and Volatile settings for the materialized query table.</td>
</tr>
<tr>
<td></td>
<td>Partition Columns - Use the Add and Delete buttons to manage the partition columns for the materialized query table.</td>
</tr>
<tr>
<td>Space</td>
<td>Page Information - Lets you view Row Count and Num. of Overflow Rows values.</td>
</tr>
<tr>
<td></td>
<td>Row Information - Lets you view Num. of Pages with Rows, Num. of Pages, Percent Free values.</td>
</tr>
</tbody>
</table>
Materialized Query Tables Editor (IBM DB2 LUW)

Comment  For details on using this tab, see Adding a Comment to an object.

Permissions For details on using this tab, see Working with Privileges and Permissions.

Dependencies For details on using this tab, see Working with Object Dependencies.

DDL View  For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Nodegroups Editor (IBM DB2 LUW)

The nodegroup editor lets you add partitions to, and delete partitions from the nodegroup.

To edit a nodegroup

1. Open an editor on the nodegroup. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Partitions</td>
<td>Use the Join Nodegroup and Leave Nodegroups buttons to move partitions between the Partitions Not in Nodegroup and Partitions in Nodegroup lists.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Packages Editor (IBM DB2 LUW)

The Packages Editor lets you view contents and settings for a package.

To edit a package

1. Open an editor on the package. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Lets you view the following settings: Binder, Definer, Default Schema, Degree, Function Path, Language Level, SQL Math Warn, SQL Warn, Buffered Inset, Status, Code Page, Total Sections, Multi-node Bound, Intra-partition, Query Optimization, Cursor Blocking, Isolation Level, Date Time Format, Last Bind Time, Explicit Bind Time, Explain Level, Explain Snapshot, and Explain Mode.</td>
</tr>
<tr>
<td>Statements</td>
<td>Shows the contents of a package statement. Optionally, you can select a statement and click Explain to copy the statement to an ISQL Editor window. For more information, see Using the SQL Editor.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Primary Keys Editor (IBM DB2 LUW)

The Primary Keys Editor lets you manage columns and properties for a primary key, and view space usage/allocation details.

To edit a primary key

1. Open an editor on the primary key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Displays the columns that make up the primary key. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Select a column and use the Delete key to remove the column from the primary key.</td>
</tr>
<tr>
<td></td>
<td>Select a column and use the arrow keys to reorder the columns in the primary key.</td>
</tr>
<tr>
<td>Properties</td>
<td>Displays the owning Table Schema and Table Name, the Name of the primary key, a Defined By property, and Percent Free and Minimum Percent Used properties.</td>
</tr>
<tr>
<td>Space</td>
<td>Lets you view the following property groups:</td>
</tr>
<tr>
<td>Attributes</td>
<td>Make Unique, System Required, Total Keys, Page Fetch Pairs, and Distinct Keys</td>
</tr>
<tr>
<td>Statistics</td>
<td>Index Level, Cluster Ratio, Cluster Factor, Leaf Pages, Sequential Pages, and Density</td>
</tr>
<tr>
<td>Cards</td>
<td>First Key, First 2 Keys, First 3 Keys, First 4 Keys, and Full Keys</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Procedures Editor (IBM DB2 LUW)

The Procedures Editor lets you manage the body and parameters for a procedure.

To edit a procedure

1. Open an editor on the procedure. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you modify the following settings: SQL Access Level (MODIFIES SQL DATA, CONTAINS SQL, READS SQL DATA, NO SQL), number of Result Sets, External Action, New Save Point, Inherit Special Registers, Deterministic, and Parameter CCSID. Lets you view the following settings: Language (C, COBOL, JAVA, OLE, SQL CLR), External Name, Threadsafe, Fenced, Parameter Type (GENERAL, DB2, GENERAL WITH NULLS, SQL), Program Type (MAIN, SUB and not enabled for a Parameter Style of SQL), and DBInfo.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Lets you manage procedure parameters. On opening, this tab shows the existing parameters. Optionally you can: Select a parameter from the list, modify the Type, and if appropriate, the Precision, Size, and Scale of the parameter. You can also set the Parameter Mode to INPUT, OUTPUT, or INPUT_OUTPUT. Click the New button, provide a name for the new parameter and modify its attributes. Select a parameter and click the Drop button to delete the parameter. Select a parameter and use the arrow buttons to reorder the parameter list. <strong>NOTE:</strong> You cannot use host variables in the CALL statement for the name of the procedure.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Body</td>
<td>Lets you modify the body of the procedure.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Sequences Editor (IBM DB2 LUW)

The Sequences Editor lets you manage cycle numbers, increments, the datatype, and other options for a sequence.

To edit a sequence

1. Open an editor on the sequence. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Definition</strong></td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td><strong>Parameters</strong></td>
<td><strong>Increment By</strong> - Lets you specify the interval between sequence numbers. This integer value can be any positive or negative integer, but it cannot be 0. This value can have 28 or fewer digits. The absolute of this value must be less than the difference of MAXVALUE and MINVALUE. If this value is negative, then the sequence descends. If the increment is positive, then the sequence ascends. If you omit this clause, the interval defaults to 1.</td>
</tr>
<tr>
<td><strong>Minimum Value</strong></td>
<td><strong>Minimum Value</strong> - Lets you specify the minimum value of the sequence. This integer value can have 28 or fewer digits.</td>
</tr>
<tr>
<td><strong>Maximum Value</strong></td>
<td><strong>Maximum Value</strong> - Lets you specify the maximum value the sequence can generate. This integer value can have 28 or fewer digits.</td>
</tr>
<tr>
<td><strong>Next Sequence Numbers</strong></td>
<td>Lets you work with sequence cycle numbers.</td>
</tr>
<tr>
<td><strong>Sequence Datatype</strong></td>
<td>Lets you specify the datatype and width for the sequence.</td>
</tr>
<tr>
<td><strong>Options</strong></td>
<td>Lets you specify <strong>Cache Size</strong>, <strong>Cycle When Reach Max/Min</strong>, and <strong>Generate Numbers in Order</strong> (useful when you are using the sequence number as a timestamp) values.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Structured Types Editor (IBM DB2 LUW)

The Structured Types Editor lets you manage the attributes, methods and body for a structured type.

To edit a structured type

1. Open an editor on the structured type. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays the initially-defined values for the following properties: Instantiable, Final Type, With Function Access, Without Comparisons, Inline Length, Supertype Schema, Supertype Name, Cast (Source as Ref) With, Cast (Ref as Source) With, Reference Using, Size, Precision, and Scale. For details on these properties, see Structured Types Wizard (DB2 LUW).</td>
</tr>
<tr>
<td>Attributes</td>
<td>Displays the currently defined attributes for the structured type. Optionally, take one of the following actions:</td>
</tr>
<tr>
<td></td>
<td>Select an attribute and change the Datatype in the Property/Value list. Depending on the datatype you choose you can also provide additional datatype options. For details on option availability, see Structured Types Wizard (DB2 LUW).</td>
</tr>
<tr>
<td></td>
<td>Add an attribute by clicking the New button and typing a name for the attribute.</td>
</tr>
<tr>
<td></td>
<td>Select an attribute and click Drop to delete the attribute.</td>
</tr>
<tr>
<td>Methods</td>
<td>This tab lets you initiate creation of method specifications and prepopulate associated method bodies. On opening, this tab lists all method specifications associated with the structured type and for each method, includes name and language details. Optionally, take one of the following actions:</td>
</tr>
<tr>
<td></td>
<td>Click Add to begin the process of adding a new method specification. Similarly, select a method and click Edit to modify the method specification. For more information, see Adding or editing structured type methods.</td>
</tr>
<tr>
<td></td>
<td>Select a method specification and click Drop to delete that method specification from the structured type.</td>
</tr>
</tbody>
</table>
Structured Types Editor (IBM DB2 LUW)

The Create Body and associated controls are available for selected methods for which no method body has yet been defined. They let you prepopulate the method body definition: **External name** - lets you provide a ‘string’ or SQL identifier for a method specified with a Language of C, JAVA, or OLE. **Transform group** - lets you specify the transform group used when invoking the method. This setting is available for methods specified with a Language of C, JAVA, or OLE. **As identifier** - This setting is available for methods specified with a Language of C. When this check box is checked, the method body is created with the external name as provided. Otherwise, the external name provided will appear within quotes in the CREATE METHOD statement on the Body tab. **Inherit isolation level with lock request** - specifies whether the INHERIT clause is specified as INHERIT ISOLATION LEVEL WITHOUT LOCK REQUEST or INHERIT ISOLATION LEVEL WITH LOCK REQUEST. This setting is available for methods specified with a Language of SQL. After specifying options, click Create Body to work with the CREATE METHOD statement you generated on the editor’s Body tab.

**Body**

Lets you view and modify the CREATE METHOD statement generated with your choices on the Methods tab.

**DDL View**

For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.

**Adding or editing structured type methods**

The Add Method and Edit Method wizards let you work with the methods of a structured type. They let you specify basic properties, parameter and return value details for methods.

**To add or edit a structured type method:**

1. Open an editor on a structured type. For details, see Opening an Object Editor.

2. Navigate to the Methods panel, and then open a wizard using one of the following techniques:

   - Click Add to create a new method
   - Select an existing method and click Edit.

3. Use the following table as a guide to understanding and modifying the settings on the tabs of this wizard:
<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>When adding a method this pane lets you specify a <strong>Name</strong>, <strong>Specific Name</strong>, <strong>Language</strong> (OLE, SQL, JAVA, C), and <strong>SQL Access Level</strong> (CONTAINS SQL, READS SQL DATA, NO SQL). When editing a method, these properties are for display only.</td>
</tr>
<tr>
<td>Advanced (available after clicking the Advanced button on the Properties pane)</td>
<td>Lets you select or enable the following <strong>ADD METHOD options:</strong> <strong>Deterministic</strong>, <strong>External Action</strong>, <strong>Called on NULL Input</strong>, <strong>DBINFO</strong>, <strong>Fenced</strong>, <strong>Allow Parallel</strong>, <strong>Scratchpad</strong>, <strong>Scratchpad Length</strong>, <strong>Parameter Style</strong> (SQL, DB2GENERAL), and <strong>Final Call</strong>.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Lets you work with input parameters:</td>
</tr>
<tr>
<td></td>
<td>- Add a parameter by clicking the <strong>New</strong> button and typing a name for the parameter.</td>
</tr>
<tr>
<td></td>
<td>- Select a parameter and change the <strong>Datatype</strong> in the Property/Value list. Depending on the datatype you choose you can also provide <strong>Precision</strong>, <strong>Size</strong>, and <strong>Scale</strong> options.</td>
</tr>
<tr>
<td></td>
<td>- Delete a selected parameter by clicking the <strong>Delete</strong> button.</td>
</tr>
<tr>
<td></td>
<td>- Order the parameters using the arrow buttons.</td>
</tr>
<tr>
<td>Return</td>
<td>Lets you provide details of the return value of the method:</td>
</tr>
<tr>
<td>Return Datatype</td>
<td>- Lets you specify the base <strong>Type</strong> of the return value.</td>
</tr>
<tr>
<td></td>
<td>- Depending on the datatype you choose you can also provide <strong>Precision</strong>, <strong>Size</strong>, and <strong>Scale</strong> options.</td>
</tr>
<tr>
<td>Cast Datatype</td>
<td>- This group lets you optionally use the CAST FROM form of the <strong>ADD METHOD RETURN clause</strong>. It lets you have the method return a different datatype, cast from the datatype specified in the <strong>Return Datatype group</strong>. This feature must be <strong>Enabled</strong> and provide the same type options as the <strong>Return Datatype group</strong>.</td>
</tr>
<tr>
<td></td>
<td>An <strong>As Locator</strong> option specifies that the method return a LOB locator instead of the actual value. The option is only available for LOB and LOB-based datatypes. <strong>As Locator</strong> applies to a LOB type in the <strong>Cast Datatype group</strong>, if specified. Otherwise it applies to a LOB type in the <strong>Return Datatype group</strong>.</td>
</tr>
</tbody>
</table>

4. When ready click **Finish**.
Tables Editor (IBM DB2 LUW)

The Tables Editor lets you manage basic properties, columns, dimension columns, distribution key columns, partitions, tablespaces, and constraints for a table.

Tip: Before modifying a table, familiarize yourself with the material in Altering Tables for IBM DB2 LUW for Linux, Unix, and Windows.

To edit a table

1. Open an editor on the table. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Displays the currently defined columns in the table. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Select a column, and in the Property/Value list modify property values for that column.</td>
</tr>
<tr>
<td></td>
<td>Click Add Column, provide a name for the new column, and set property values for the column.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click Delete to remove the column from the table.</td>
</tr>
<tr>
<td>Properties</td>
<td>Displays the Name, Created, Last Run Stats, Invalidate Time, and Defined By properties. Lets you set Percent Free, Lock Size, Append Data, Volatile, Compress, Row Compression, Security Policy, Restrict Drop, LogIndex Build, CCSID, Do not initially log, and Data Capture properties.</td>
</tr>
<tr>
<td>Status</td>
<td>Lets you view the following statistics: Total Number of Rows, Number of Overflow Rows, Number of Pages With Rows, Number of Pages, Table Status, Row Organization, Row Type Schema, Row Type Name, Access Mode, Active Blocks, Avg Compressed Row Size, Avg Row Compression Ratio, Code Page, Percent Of Pages Saved, Last Regenerated Time, and Protection Granularity.</td>
</tr>
<tr>
<td>Partition</td>
<td>This tab provides details on the partition columns and data partitions for the table. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Use the New or Delete buttons to create or drop a partition column or data partition.</td>
</tr>
<tr>
<td></td>
<td>Use the Edit button to edit a data partition.</td>
</tr>
<tr>
<td></td>
<td>Use the Commands menu to attach or detach a data partition.</td>
</tr>
</tbody>
</table>
Tables Editor (IBM DB2 LUW)

**Tablespaces**

- Data Tablespace
- Long Tablespace
- Index Tablespace

[JavaScript:popup.TextPopup(Poptext1,Popfont,9,9,-1,-1)] Lets you view the Database partition Group, Managed By, Page Size, and Extent Size properties. Lets you choose the Name of a tablespace.

**Dimensions**

Lets you group columns to form a dimension:

- Click the New button to add a new column to the dimension for the table.
- Select a column and click the Edit button to modify the dimension column properties.
- Select a column and click the Delete button to drop a column from the dimension.

**Distribution Key Columns**

Lets you group one or more columns to form a distribution key:

- Click the New button to add a new column to the dimension for the table.
- Select a column and click the Edit button to modify the dimension column properties.
- Select a column and click the Delete button to drop a column from the dimension.

**Indexes**

Lets you manage indexes for a table:

- Click Add to open a dialog that lets you add a new index to the table.
- Select an index and click Edit to open a dialog that lets you edit index properties.
- Select an index and click Drop to open a dialog that lets you remove the index from the table.

**Constraints**

Lets you manage primary key, unique key, foreign key, and check constraints for a table. Constraints are grouped by type, under folders:

- Select a constraint type folder and click Add to open a dialog that lets you add a constraint of that type.
- Select a constraint and click Edit to open a dialog that lets you modify the constraint details.
- Select a constraint and click Drop to remove the constraint.
Tables Editor (IBM DB2 LUW)

**Comment**  For details on using this tab, see Adding a Comment to an object.

**Dependencies**  For details on using this tab, see Working with Object Dependencies.

**Permissions**  For details on using this tab, see Working with Privileges and Permissions.

**DDL View**  For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.

Alter Tables for IBM DB2 LUW for Linux, Unix, and Windows

The ALTER TABLE command of Transact-SQL is limited to adding NULL columns to the end of a table and to adding or dropping constraints. Unfortunately, this scenario does not address many requirements of administrators and developers who need to add, delete or modify columns more broadly:

- Add columns anywhere in a table, not just the end
- Add columns that do not permit a NULL value.
- Change the NULL/NOT NULL status of table columns
- Change column datatypes to other compatible types
- Change the length of datatypes
- Delete a column

Due to the limitations of the ALTER TABLE command, the only way to make broader modifications is to write SQL scripts that step through all desired changes. To perform an enhanced table alter, SQL script that completes the following steps is constructed:

1. Renames the existing table so that the original and its data remain intact
2. Builds a CREATE TABLE statement with the new table definition, including declared defaults, primary key and check constraints
3. Builds an INSERT statement to copy data from the original, renamed table to the new one
4. Builds foreign keys on the new table
5. Reapplies any privileges granted on the table
6. Rebuilds all dependencies on the new table, including indexes, triggers, procedures, packages, functions and views. When rebuilding procedures, functions, packages and views, any permissions on them are also rebuilt.
Tablespaces Editor (IBM DB2 LUW)

The Tablespaces Editor lets you manage containers, basic properties, performance, space usage, and associated objects for a tablespace.

To edit a tablespace

1. Open an editor on the tablespace. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Lets you view the Type (REGULAR, LARGE, TEMPORARY, or USER TEMPORARY), Use Automatic Storage, Managed By, and Database Partition Group properties. Lets you modify the Buffer Pool and Drop Recovery properties.</td>
</tr>
<tr>
<td>Performance</td>
<td>Lets you view the Page Size and Extent Size properties. Lets you specify or select the Prefetch Automatic, Overhead, Transfer Rate, and File System Caching properties.</td>
</tr>
<tr>
<td>Automatic Storage</td>
<td>Lets you work with the AutoResize (enables following size settings), Initial Size, Increase Size, Max Size Unlimited, and Max Size (enabled if Max Size Unlimited is not set) attributes. The Initial Size and Max Size values can be provided as kB, mB, or gB values.</td>
</tr>
<tr>
<td>Container</td>
<td>This option is only available for database managed tablespaces. This tab lets you add or delete containers of a tablespace.</td>
</tr>
<tr>
<td></td>
<td>Select an existing container and in the Property/Value list, use the Size controls to RESIZE, EXTEND, or REDUCE the container.</td>
</tr>
<tr>
<td></td>
<td>Add a container by clicking New, and then in the Property/Value list, provide Name, number of DatabasePartitions, Type (DEVICE, FILE) and original Size.</td>
</tr>
<tr>
<td></td>
<td>Click Delete to remove a container.</td>
</tr>
<tr>
<td>Performance</td>
<td>Lets you manage settings in the following categories:</td>
</tr>
<tr>
<td>Page Setting</td>
<td>Lets you view Page Size and Extent Size settings and modify the Prefetch Size setting.</td>
</tr>
<tr>
<td>I/O Setting</td>
<td>Let you modify the Overhead and Transfer Rate settings.</td>
</tr>
<tr>
<td>Dropped Table Settings</td>
<td>Lets you view the Recovery Status.</td>
</tr>
<tr>
<td>Defaults</td>
<td>Lets you view the Nodegroup and specify a Bufferpool.</td>
</tr>
</tbody>
</table>

Embarcadero Technologies
Tablespaces Editor (IBM DB2 LUW)

Comment  For details on using this tab, see Adding a Comment to an object.

Space  Lets you view the table usage and the distribution of space for a tablespace. Specific statistics include Free Pages, Used Pages, Reserved Pages, and Total Pages.

Objects  Lets you manage database objects associated with the tablespace. Objects are organized in a tree structure with folders containing the objects. Optionally, take one of the following actions:

Select an object and click Edit to open an object editor on the selected object.

Select an object and click Drop to initiate dropping the selected object.

Privileges  For details on using this tab, see Working with Privileges and Permissions.

DDL View  For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Triggers Editor (IBM DB2 LUW)

The Triggers Editor lets you view properties for a trigger.

To edit a trigger

1. Open an editor on the trigger. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the Trigger Timing, Trigger Events, Trigger Type, Object Status, Definer, and Function Path properties.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you view and modify the CREATE TRIGGER DDL that will implement your changes.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Unique Keys Editor (IBM DB2 LUW)

The Unique Keys Editor lets you manage columns and basic properties for a unique key, as well as view space details.

To edit a unique key

1. Open an editor on the unique key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Lets you manage columns that make up the unique key. On opening, this tab shows the existing columns. For each column, the datatype (and if applicable the precision in brackets) and whether the table definition permits nulls in the target table column. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Click the New button and select a column name from the dropdown, to add a column to the index.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click the Drop button to delete the column from the index.</td>
</tr>
<tr>
<td>Properties</td>
<td>Displays the owning Table Schema and Table Name, the Name of the primary key, a Defined By property, and Percent Free and Minimum Percent Used properties.</td>
</tr>
<tr>
<td>Space</td>
<td>Lets you view settings in the following categories:</td>
</tr>
<tr>
<td>Attributes</td>
<td>Lets you view Make Unique, System Required, Total Keys, Distinct Keys, and Page Fetch Pairs settings.</td>
</tr>
<tr>
<td>Statistics</td>
<td>Lets you view Index Level, Cluster Ration, Cluster Factor, Leaf Pages, Sequential Pages, and Density settings.</td>
</tr>
<tr>
<td>Cards</td>
<td>Lets you view First Key, First 2 Keys, First 3 Keys, First 4 Keys and Full Keys settings.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
User Datatypes Editor (IBM DB2 LUW)

The User Datatypes Editor lets you manage the basic properties of a user datatype.

To edit a user datatype

1. Open an editor on the user datatype. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays the user Datatype name. Lets you select a new Owner or Type, and depending on the type specified, offers additional type-specific properties such as Size. Also lets you modify the Allow Bit Data property, if appropriate.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Users Editor (IBM DB2 LUW)

The Users editor lets you manage object dependencies and permissions for a user.

To edit a user
1. Open an editor on the user. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays the user Name.</td>
</tr>
<tr>
<td>Objects</td>
<td>Lets you manage database objects associated with the user. Objects are organized in a tree structure with folders containing the objects. Optionally, take one of the following actions: Select an object and click Edit to open an object editor on the selected object. Select an object and click Drop to initiate dropping the selected object.</td>
</tr>
<tr>
<td>Object Permissions and System Permissions</td>
<td>For details on using these tabs, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
**Views Editor (IBM DB2 LUW)**

The Views Editor lets you manage the columns as well as view and modify properties for a view.

**To edit a view**

1. Open an editor on the view. For details, see *Opening an Object Editor*.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays all columns for the view. Details for each column include the <strong>Column Name</strong>, the <strong>Datatype</strong> (and if applicable, with the precision in parentheses), and whether or not <strong>Nulls</strong> are allowed for that column. You can also set the <strong>EnableQueryOptimization</strong> property for the view.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you view and modify the CREATE VIEW DDL that will implement any changes you make in this editor. To modify a view, the existing view is automatically dropped and then recreated.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see <em>Adding a Comment to an object</em>.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see <em>Working with Object Dependencies</em>.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see <em>Working with Privileges and Permissions</em>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see *Previewing and Submitting Object Editor Changes*. 
IBM DB2 for z/OS Object Editors

An Object Editor for all supported IBM DB2 for z/OS objects:

- Aliases Editor (IBM DB2 Z/OS)
- Buffer Pools Editor (IBM DB2 Z/OS)
- Check Constraints Editor (IBM DB2 Z/OS)
- Databases Editor (IBM DB2 Z/OS)
- DBRMs Editor (IBM DB2 Z/OS)
- Foreign Keys Editor (IBM DB2 Z/OS)
- Functions Editor (IBM DB2 Z/OS)
- Indexes Editor (IBM DB2 Z/OS)
- Packages Editor (IBM DB2 Z/OS)
- Plans Editor (IBM DB2 Z/OS)
- Primary Keys Editor (IBM DB2 Z/OS)
- Procedures Editor (IBM DB2 Z/OS)
- Stogroups Editor (IBM DB2 Z/OS)
- Synonyms Editor (IBM DB2 Z/OS)
- Tables Editor (IBM DB2 Z/OS)
- Tablespaces Editor (IBM DB2 Z/OS)
- Triggers Editor (IBM DB2 Z/OS)
- Unique Keys Editor (IBM DB2 Z/OS)
- User Datatypes Editor (IBM DB2 Z/OS)
- Users Editor (IBM DB2 Z/OS)
- Views Editor (IBM DB2 Z/OS)

For access to object editors for different supported DBMS platforms and an introduction to editor usage, see Modifying objects using editors.
Aliases Editor (IBM DB2 Z/OS)

The Aliases Editor lets you view details of an alias definition.

To edit an alias

1. Open an editor on the alias. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>In addition to the owning Schema and Name of the alias, this tab lets you view the Target Owner, Target Type, and Target Name, of the referenced object.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Buffer Pools Editor (IBM DB2 Z/OS)

The buffer pool editor lets you manage basic properties of a buffer pool and view usage details.

To edit a buffer pool

1. Open an editor on the buffer pool. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Lets you work with settings in the following areas:</td>
</tr>
<tr>
<td>Storage</td>
<td>Lets you set the Size (VPSIZE), Type (VPTYPE), Hiperpool Size (HPSIZE), Castout, Page Stealing Algorithm (PGSTEAL) properties.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Lets you set the Sequential Steal (VPSEQT), Parallel Sequential (VPPSEQT), Assisting Parallel Sequential (VPXSEQT), Hiperpool Sequential Steal Threshold (HPSEQT), Deferred Write Threshold (DWQT), and Vertical Deferred Write Threshold (DDWQT) properties</td>
</tr>
<tr>
<td>Usage</td>
<td>Displays space utilization details for each associated database.</td>
</tr>
<tr>
<td>Privileges</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Check Constraints Editor (IBM DB2 Z/OS)

The Check Constraints Editor lets you view definition details and edit a check condition expression.

To edit a check constraint

1. Open an editor on the check constraint. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Lets you view basic identification information on the check constraint: Table Schema and Table Name, the Name of the constraint and the date it was Created. You can also edit the condition in the Check Condition box. The Table Columns button acts as a time saver in editing the condition. It opens a dialog that lets you select and paste column names into the check condition expression.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Databases Editor (IBM DB2 Z/OS)

The Databases Editor lets you manage basic properties, permissions, and object dependencies for a database.

To edit a database

1. Open an editor on the database. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>The Database Creation group lets you view the Name and Group Member properties and set the Type property. The Database Attributes group lets you view the Encoding Scheme, Create Date, and Last Altered properties and lets you set the Tablespace Buffer Pool, Index Buffer Pool, Storage Group, and CCSID properties.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
DBRM Editor (IBM DB2 Z/OS)

The DBRM Editor lets you view into the metadata of each DBRM, view and cross-reference all associated Plans and Packages as well as view and Explain all Package SQL Statements.

To edit a DBRM

1. Open an editor on the DBRM. For details, see Open an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Displays the main contents of the DBRM header information, including the Precompile Timestamp, Language, and Consistency Token, as well as String Delimiter, Katakana Charset, Mixed Character Set, and Decimal Point specifiers.</td>
</tr>
<tr>
<td>Plans</td>
<td>Lists details of the plans containing the DBRM. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Select a plan and click <strong>Edit</strong> to open the Plans editor on the plan. For more information, see Plans Editor (IBM DB2 Z/OS).</td>
</tr>
<tr>
<td></td>
<td>Select a plan and click <strong>Rebind</strong> to initiate rebinding the plan. For more information, see Rebind Plans.</td>
</tr>
<tr>
<td></td>
<td>Select a plan and click <strong>Free</strong> to initiate deleting the plan. For more information, see Drop.</td>
</tr>
<tr>
<td>Packages</td>
<td>Displays a cross-reference to the collections, packages, and plans where the DBRM was bound. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Select a package and click <strong>Edit</strong> to open the Packages editor on the package. For more information, see Packages Editor (IBM DB2 Z/OS).</td>
</tr>
<tr>
<td></td>
<td>Select a package and click <strong>Rebind</strong> to initiate rebinding the package. For more information, see Rebind Packages.</td>
</tr>
<tr>
<td></td>
<td>Select a package and click <strong>Free</strong> to initiate deleting the package. For more information, see Free (Packages).</td>
</tr>
<tr>
<td>Statements</td>
<td>Displays the information about the SQL statements in the DBRM. The information is for programmers reference only. Optionally, click <strong>Explain</strong> to copy the selected statement(s) to an ISQL window. The Explain output displays in the report pane. For more information, see Using the SQL Editor.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Foreign Keys Editor (IBM DB2 Z/OS)

The Foreign Keys Editor lets you manage column mapping and specify a delete rule for a foreign key.

**To edit a foreign key**

1. Open an editor on the foreign key. For details, see *Opening an Object Editor*.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Mapping</td>
<td>The existing column mapping for the foreign key is represented by selected columns in the <strong>Main Table</strong> and <strong>Referenced Table</strong> lists. Additional candidates in the <strong>Referenced Table</strong> list are indicated by enabled column check boxes. If necessary, use the <strong>Table</strong> dropdown in the <strong>Referenced Table</strong> group to choose a new table for this foreign key. Select or deselect columns in the <strong>Main Table</strong> list and <strong>Referenced Table</strong> list to form the referential constraint between the two tables.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you specify a <strong>Delete Rule</strong> (CASCADE, NO ACTION, RESTRICT, SET NULL).</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see <em>Viewing the SQL/DDL for an Object</em>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see *Previewing and Submitting Object Editor Changes*. 
Functions Editor (IBM DB2 Z/OS)

The Functions Editor lets you view and modify properties for a function, manage its inputs and outputs, and modify the code in the body of the function.

To edit a function

1. Open an editor on the function. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with properties in the following categories:</td>
</tr>
<tr>
<td>Identification</td>
<td>Lets you view the Create Timestamp, Schema, Routine ID, and Origin properties. Lets you set the External Name and Collection ID properties.</td>
</tr>
<tr>
<td>Run Time</td>
<td>Lets you view the Result Sets property. Lets you set the WLM Environment, WLM For Nested, ASU Time, and Run Options properties.</td>
</tr>
<tr>
<td>Structure</td>
<td>Lets you view the Language, Parameter Style, Number of LOB Columns, Number of Parameters, and Allow Parallel properties. Lets you set the Program Type, Security Type, SQL Access Level, Inherit Special Registers, Fenced, DBINFO, Deterministic, Called On Null Input, External Action, Stay Resident, Final Call, Scratchpad, and Scratchpad Length properties.</td>
</tr>
<tr>
<td>Run Estimates</td>
<td>Lets you view the Initial I/Os, I/Os Per Invocation, Initial Instructions, and Instructions Per Invocation properties.</td>
</tr>
<tr>
<td>Java Structure</td>
<td>Lets you view the Java Class, Jar ID, Package ID, Method ID, Jar Schema, and Java Signature properties.</td>
</tr>
<tr>
<td>Parameters, Return Columns, and Return Scalar</td>
<td>On opening, these tabs displays the current function parameters, return columns or return scalar. Optionally, take one of the following actions:</td>
</tr>
</tbody>
</table>

Select a parameter, return column, or return scalar in the Attributes area, modify values, as permissible. Attributes differ by the tab you chose but typically include items such as Type, Precision, Scale, As Locator, and Size.

Click the New button to provide datatype and size details for a new parameter, return column, or return scalar.

Select a parameter, return column, or return scalar and click Drop to delete that parameter.
| **Body** | Lets you modify the code in the text area of the tab. |
| **Comment** | For details on using this tab, see Adding a Comment to an object. |
| **Permissions** | For details on using this tab, see Working with Privileges and Permissions. |
| **DDL View** | For details on using this tab, see Viewing the SQL/DDL for an Object. |

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Indexes Editor (IBM DB2 Z/OS)

The Indexes Editor lets you manage basic, storage, and space properties for an index, as well as work with its columns and partitions.

To edit an index

1. Open an editor on the index. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Lets you manage the columns or key-expressions that make up the index. On opening, this tab shows the existing columns/key-expressions.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> Key-expression functionality is only enabled if the Index on Expression setting is enabled on the Properties tab. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Change the Sort order of a column or key-expression.</td>
</tr>
<tr>
<td></td>
<td>If Index on Expression is disabled, click the New button and select a column name from the dropdown to add a column to the index.</td>
</tr>
<tr>
<td></td>
<td>If Index on Expression is enabled, click the New button and type a valid key-expression in the Expression field, to add an expression to the index.</td>
</tr>
<tr>
<td></td>
<td>Select a column or key-expression and click the Drop button to delete the column from the index.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you work with the Buffer Pool, Piece Size, Close, Copy, Compress, Index on Expression, and Padded properties. For more information on these properties, see Indexes (DB2 z/OS) - Properties.</td>
</tr>
<tr>
<td>Storage</td>
<td>Lets you select a dataset management scheme and provide associated attribute values. For details, see Indexes (DB2 z/OS) - Storage.</td>
</tr>
<tr>
<td>Partitions</td>
<td>Lets you work with partitions for the index. For each data partition, the listing shows the storage group, VCAT Catalog, primary and secondary space allocations, and if appropriate, the free space percentage, GBP Cache, limit key value, and erase on delete settings. Optionally, you can select a partition and click the Edit button to open an editor that lets you edit that partition.</td>
</tr>
<tr>
<td>Space</td>
<td>Lets you view the following property groups:</td>
</tr>
<tr>
<td></td>
<td><strong>Attributes</strong> Make Unique, System Required, Total Keys, Page Fetch Pairs, and Distinct Keys</td>
</tr>
<tr>
<td></td>
<td><strong>Statistics</strong> Index Level, Cluster Ratio, Cluster Factor, Leaf Pages, Sequential Pages, Density, DASD Storage, and Data Blocks/Key.</td>
</tr>
<tr>
<td></td>
<td><strong>Cards</strong> First Key and Full Keys</td>
</tr>
</tbody>
</table>
Indexes Editor (IBM DB2 Z/OS)

**Comment**  For details on using this tab, see [Adding a Comment to an object](#).

**DDL View**  For details on using this tab, see [Viewing the SQL/DDL for an Object](#).

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
# Packages Editor (IBM DB2 Z/OS)

The Packages Editor lets you manage properties and bind parameters for a package, as well as view environment information, package contents and associated plans.

## To edit a package

1. Open an editor on the package. For details, see [Opening an Object Editor](#).

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you work with the following properties: Average Size, Bind Time, Consistency Token, Dec31, Decimal Point, Group Member, Katakana CharSet, Language, Mixed Character Set, Operative, Package Size, Package Source, PDS Name, Precompile Timestamp, Release Bound, String Delimiter, SysEntries, Timestamp, and Valid.</td>
</tr>
<tr>
<td><strong>Bind Parameters</strong></td>
<td>Lets you set the Schema Path, Creator, Qualifier, Explain, Validate, Degree, Dynamic Rules, Lock Isolation, Encoding, Page Writes, Resource Release, CurrentData, DB Protocol, Reoptvar, Keep Dynamic, Defer Prepare, SQL Error, and Optimization Hint properties.</td>
</tr>
<tr>
<td><strong>Plan/Packlists</strong></td>
<td>Displays the plans contained in the package if the package was bound individually, or as part of a complete collection ID. Optionally, you can:</td>
</tr>
</tbody>
</table>

   - Select a plan and click **Edit** to open the Plans editor on the plan. For more information, see [Plans Editor (IBM DB2 Z/OS)](#).

   - Select a plan and click **Rebind** to initiate rebinding the plan. For more information, see [Rebind Plans](#).

   - Select a plan and click **Free** to initiate deleting the plan. For more information, see [Drop](#).
Packages Editor (IBM DB2 Z/OS)

**Statements**  Shows the contents of any package statement on the datasource. Optionally, select a statement and click **Explain** to copy the statement to an ISQL Editor window. NOTE: For more information, see [Using the SQL Editor](#).

**Dependencies**  For details on using this tab, see [Working with Object Dependencies](#).

**Privileges**  For details on using this tab, see [Working with Privileges and Permissions](#).

**Environments**  Displays run-time environments information for a package. Use the arrow buttons to move environments between the **Enabled Environments** and **Disabled Environments** lists. To modify a connection, select the environment and click **Edit Connections**. For more information, see [Connection Editor](#).

**Command**  Displays the command that originally built the package.

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).

## Connection Editor

The Connection Editor lets you modify plan and package connections. It is opened from the Packages editor. For more information, see [Packages Editor (IBM DB2 Z/OS)](#).

The table below describes the options and functionality of the Connection Editor:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connections</td>
<td>Displays the connections for the plan or package.</td>
</tr>
<tr>
<td>Add</td>
<td>Click to add the connection.</td>
</tr>
</tbody>
</table>

---

Embarcadero Technologies 978
Plans Editor (IBM DB2 Z/OS)

The Plans Editor lets you manage plan properties, view DBRM information, manage packages and contents, and manage run-time environments for a plan.

To edit a plan

1. Open an editor on the plan. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Definition</strong></td>
<td>Lets you work with the following attribute groups:</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you view the Timestamp, Group Member, Plan Size,</td>
</tr>
<tr>
<td></td>
<td>Average Size, Valid, Operative, Pkg. List Entries, SysEntries, and Release Bound</td>
</tr>
<tr>
<td></td>
<td>properties. Lets you set the Owner, Qualifier, and Current Server properties.</td>
</tr>
<tr>
<td><strong>Bind Parameters</strong></td>
<td>Lets you set the Schema Path, Explain, Validate, Degree,</td>
</tr>
<tr>
<td></td>
<td>Dynamic Rules, Lock Isolation, Resource Acquire, Resource Release, Disconnect,</td>
</tr>
<tr>
<td></td>
<td>Current Data, DB Protocol, Reoptvar, SQL Rules, Keep Dynamic, Defer Prepare,</td>
</tr>
<tr>
<td></td>
<td>Encoding, Page Writes, Flag, Optimization Hint, and Cache Size properties.</td>
</tr>
<tr>
<td><strong>DBRMs</strong></td>
<td>Lists details for each DBRM associated with a plan. Optionally, select a DBRM</td>
</tr>
<tr>
<td></td>
<td>from the list and click <strong>Edit</strong> to open the DBRM editor on that DBRM.</td>
</tr>
<tr>
<td><strong>Packages</strong></td>
<td>Displays details for each package associated with a plan. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Select a package and click <strong>Edit</strong> to open the Package editor on that package.</td>
</tr>
<tr>
<td></td>
<td>For details, see Packages Editor (IBM DB2 Z/OS).</td>
</tr>
<tr>
<td></td>
<td>Select a package and click <strong>Rebind</strong> to open the Rebind Packages dialog.</td>
</tr>
<tr>
<td></td>
<td>Select a package and click <strong>Free</strong> to open the Free (Packages) dialog.</td>
</tr>
<tr>
<td><strong>DBRM/Packages</strong></td>
<td>Displays the entire contents of the plan, DBRMs and packages, in a single display.</td>
</tr>
<tr>
<td></td>
<td>The first column contains either a 'D' for DBRM or 'P' for packages. Optionally,</td>
</tr>
<tr>
<td></td>
<td>take one of the following actions:</td>
</tr>
<tr>
<td></td>
<td>Select a package list entry and click <strong>Edit</strong> to open the Package editor on that</td>
</tr>
<tr>
<td></td>
<td>package. For details, see Packages Editor (Oracle).</td>
</tr>
<tr>
<td></td>
<td>Select a package and click <strong>Rebind</strong> to open the Rebind Packages dialog.</td>
</tr>
<tr>
<td></td>
<td>Select a package and click <strong>Free</strong> to open the Free (Packages) dialog.</td>
</tr>
</tbody>
</table>
**Dependencies** For details on using this tab, see [Working with Object Dependencies](#).

**Privileges** For details on using this tab, see [Working with Privileges and Permissions](#).

**Environments** Displays run-time environments information for a plan. Optionally, you can:

- Use the arrow buttons to move environments between the **Enabled Environments** and **Disabled Environments** lists.

- Select an environment and click **Edit Connections** to open the Connection editor.

**Command** Displays the command that originally built the plan.

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
# Primary Keys Editor (IBM DB2 Z/OS)

The Primary Keys Editor lets you manage primary key columns as well as work with storage, space, and partitions for a primary key.

**Tip:** The refresh button lets you refresh or clear the editor’s contents, and log SQL.

## To edit a primary key

1. Open an editor on the primary key. For details, see [Opening an Object Editor](#).
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Column</strong></td>
<td>Lets you manage columns that make up the primary key. On opening, this tab shows the existing columns. For each column, the listing shows the datatype (and if applicable the precision in brackets) and whether the table definition permits nulls in the target table column. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Change the Sort order of a column.</td>
</tr>
<tr>
<td></td>
<td>Click the <strong>New</strong> button and select a column name from the dropdown, to add a column to the primary key.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click the <strong>Drop</strong> button to delete the column from the primary key.</td>
</tr>
<tr>
<td></td>
<td>Select a column and use the arrow buttons to reorder the columns in the primary key.</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you set <strong>Buffer Pool</strong>, <strong>Close</strong>, <strong>Copy</strong> and <strong>Piece Size</strong> properties.</td>
</tr>
<tr>
<td><strong>Storage</strong></td>
<td>Lets you view <strong>Storage Group</strong> and <strong>VCAT Catalog</strong> properties. Lets you set <strong>Primary Space Allocation</strong>, <strong>Secondary Space Allocation</strong>, <strong>Erase</strong>, <strong>Free Page</strong>, <strong>Percent Free</strong>, and <strong>GBP Cache</strong> properties.</td>
</tr>
<tr>
<td><strong>Partitions</strong></td>
<td>Lets you work with partitions for the primary key.</td>
</tr>
<tr>
<td><strong>Space</strong></td>
<td>Lets you view values in the following property groups:</td>
</tr>
<tr>
<td></td>
<td><strong>Attributes</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Statistics</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Cards</strong></td>
</tr>
</tbody>
</table>
Comment  For details on using this tab, see Adding a Comment to an object.

DDL View  For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Procedures Editor (IBM DB2 Z/OS)

The Procedures Editor lets you manage the properties and input/output parameters of a procedure.

To edit a procedure

1. Open an editor on the procedure. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with properties in the following categories:</td>
</tr>
<tr>
<td>Identification</td>
<td>Lets you view the Schema and Routine ID properties. Lets you set the External Name and Collection ID properties.</td>
</tr>
<tr>
<td>Run Time</td>
<td>Lets you set the Result Sets, WLM Environment, WLM For Nested, ASU Time, and Run Options properties.</td>
</tr>
<tr>
<td>Structure</td>
<td>Lets you view the Language, Number of LOB Columns, Number of Parameters, and DBINFO properties. Lets you set the Program Type, Security Type, SQL Access Level, Parameter Style, Inherit Special Registers, Fenced, Commit on Return, Deterministic, and Stay Resident properties.</td>
</tr>
<tr>
<td>Run Estimates</td>
<td>Lets you view the Initial I/Os, I/Os Per Invocation, Initial Instructions, and Instructions Per Invocation properties.</td>
</tr>
<tr>
<td>Java Structure</td>
<td>Lets you view the Java Class, Jar ID, Package ID, Method ID, Jar Schema, and Java Signature properties.</td>
</tr>
</tbody>
</table>

Parameters

Displays a listing of the existing input/output parameters for the procedure. For the selected parameter, the Datatype list shows details for that parameter, including the Type and Parameter Mode (INPUT, OUTPUT, INPUT_OUTPUT). Depending on the type other parameters such as Size, Precision, or Scale may be available for viewing or modification. Optionally you can:

- Select a parameter and in the Datatype list, modify details for that parameter.
- Click the Add button to add a new parameter, provide a name for the new parameter, and edit the parameter values in the Datatype list.
- Click the Delete button to drop a selected parameter.
- Use the arrow buttons to change the order location of a selected parameter.
Procedures Editor (IBM DB2 Z/OS)

Comment   For details on using this tab, see Adding a Comment to an object.

Body      Lets you modify the SQL code for procedures on the current datasource

Permissions For details on using this tab, see Working with Privileges and Permissions.

DDL View   For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Stogroups Editor (IBM DB2 Z/OS)

The Stogroups Editor lets you view and modify volumes, manage function privileges, and view DDL for a stogroup.

To edit a stogroup

1. Open an editor on the stogroup. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Volume</td>
<td>Shows details on volumes associated with the stogroup. Optionally you can:</td>
</tr>
<tr>
<td>Devices</td>
<td>Click Add to open a dialog that lets you add volumes.</td>
</tr>
<tr>
<td></td>
<td>Select a volume and click Remove to delete the volume.</td>
</tr>
<tr>
<td>Privileges</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Synonyms Editor (IBM DB2 Z/OS)

The Synonyms Editor lets you view base object information and manage database object dependencies for a synonym.

To edit a synonym

1. Open an editor on the synonym. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the owning Schema, the Name of the synonym, and the synonym’s Referenced Object Owner, Referenced Object Type, and the Referenced Object Name.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Tables Editor (IBM DB2 Z/OS)

The Tables Editor lets you: manage columns, basic properties, partitions, indexes, and constraints for a table.

**Note:** Before editing tables, refer to the material in *Altering Tables for IBM DB2 z/OS*.

**To edit a table**

1. Open an editor on the table. For details, see *Opening an Object Editor*.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Displays the currently defined columns in the table. For each column, the</td>
</tr>
<tr>
<td></td>
<td>Property/Value list displays the <strong>Name</strong> and <strong>Type</strong> for the column. In addition,</td>
</tr>
<tr>
<td></td>
<td>depending on the <strong>Type</strong> selected, the list also displays <strong>Size</strong>, <strong>Scale</strong>, <strong>Identity</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Column</strong>, <strong>Allow Nulls</strong>, <strong>Default Value</strong>, <strong>Comment</strong>, and <strong>For Data</strong> property values, as appropriate. The <strong>Statistics</strong> group displays a <strong>Number of Distinct Values in the Column</strong> value. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Select a column, and in the <strong>Property/Value</strong> list modify property values for that column.</td>
</tr>
<tr>
<td></td>
<td>Click <strong>Add Column</strong>, provide a name for the new column, and set property values for the column.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click <strong>Delete</strong> to remove the column from the table.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Table</td>
<td>Lets you view <strong>EditProcedure</strong>, <strong>Table Type</strong>, <strong>Table Status</strong>, <strong>Check Flag</strong>, <strong>DBID</strong>, and <strong>OBID</strong> properties. Lets you set <strong>Volatile</strong>, <strong>Audit</strong>, <strong>RestrictDrop</strong>, <strong>Label</strong>, and <strong>ValidProc</strong> properties.</td>
</tr>
<tr>
<td>Tablespace</td>
<td>Placement lets you select a <strong>Tablespace</strong>.</td>
</tr>
<tr>
<td>Log Options</td>
<td>Lets you select a <strong>Data Capture</strong> option of DATA CAPTURE NONE or DATA CAPTURE CHANGES.</td>
</tr>
<tr>
<td>Statistics</td>
<td>Lets you view the following statistics: <strong>Last Runstats</strong>, <strong>Total number of rows</strong>, <strong>Average Row Length</strong>, <strong>Number of Pages</strong>, <strong>Percent Compressed Rows</strong>, <strong>Max Record Length</strong>, and <strong>DASD storage</strong>.</td>
</tr>
</tbody>
</table>
Tables Editor (IBM DB2 Z/OS)

**Partitions**
Displays existing partition columns and data partitions. Optionally you can add, edit, or delete partition columns and data partitions.

**Indexes**
Displays the list of indexes for the table. Optionally, take one of the following actions:

- Click **Add** to open a dialog that lets you add a new index to the table.
- Select an index and click **Edit** to open a dialog that lets you edit index properties.
- Select an index and click **Drop** to open a dialog that lets you remove the index from the table.

**Constraints**
Displays constraints in a tree structure. The tree contains folders which contain all constraints associated with the target table. The objects are organized in folders based on the type of constraint. Optionally take one of the following actions:

- Select a constraint type folder and click **Add** to open a dialog that lets you add a constraint of that type.
- Select a constraint and click **Edit** to open a dialog that lets you modify the constraint details.
- Select a constraint and click **Drop** to remove the constraint.

**Comment**
For details on using this tab, see [Adding a Comment to an object](#).

**Dependencies**
For details on using this tab, see [Working with Object Dependencies](#).

**Permissions**
For details on using this tab, see [Working with Privileges and Permissions](#).

**DDL View**
For details on using this tab, see [Viewing the SQL/DDL for an Object](#).

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).

**Altering Tables for IBM DB2 z/OS**

The ALTER TABLE command of Transact-SQL is limited to adding NULL columns to the end of a table and to adding or dropping constraints. Unfortunately, this scenario does not address many requirements of administrators and developers who need to add, delete or modify columns more broadly:

- Add columns anywhere in a table, not just the end
- Add columns that do not permit a NULL value.
- Change the NULL/NOT NULL status of table columns
- Change column datatypes to other compatible types
- Change the length of datatypes
- Delete a column

Due to the limitations of the ALTER TABLE command, the only way to make broader modifications is to write SQL scripts that step through all desired changes. To perform an enhanced table alter, an SQL script that completes the following steps is constructed:

1. Renames the existing table so that the original and its data remain intact
2. Builds a CREATE TABLE statement with the new table definition, including declared defaults, primary key and check constraints
3. Builds an INSERT statement to copy data from the original, renamed table to the new one
4. Builds foreign keys on the new table
5. Reapplies any privileges granted on the table
6. Rebuilds all dependencies on the new table, including indexes, triggers, procedures, packages, functions and views. When rebuilding procedures, functions, packages and views, any permissions on them are also rebuilt.
Tablespaces Editor (IBM DB2 Z/OS)

The Tablespaces Editor lets you work with the basic properties and partitions for a tablespace as well as view space details, status, and objects stored on the tablespace.

To edit a tablespace

1. Open an editor on the tablespace. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with properties in the following categories:</td>
</tr>
<tr>
<td>Bufferpool</td>
<td>Buffer Pool</td>
</tr>
<tr>
<td>Partitions and size</td>
<td>Number of partitions, Partition size (DSSIZE), Segment size, and Max rows per page</td>
</tr>
<tr>
<td>Other parameters</td>
<td>GBPCACHE, Compress, Track modified pages, Encoding scheme, Log, Define, Member Cluster, Close rule, Lock Size, and Maximum locks</td>
</tr>
</tbody>
</table>

For more information on these properties, see Tablespace (DB2 z/OS) - Properties.

Partitions Displays a list of partitions for the tablespace. Details for each partition include the storage group, VCAT, primary and secondary space allocations, the free space portion of each page and free page frequency, the group buffer cache scheme, and whether modifications are tracked. Optionally, you can:

- Select a partition and click Edit to open a dialog that lets you modify properties for that partition.
- Select a partition and click Clone to open a dialog that lets you apply the attributes of the selected partition to another partition.

Status Lets you display CLAIMERS, LOCKS, LPL, USE, or WEPR status details

Space Lets you view space usage and allocation details for the tablespace.

Objects Displays the objects stored on the tablespace. Objects are organized in a tree structure with folders containing the objects. Optionally, you can:

- Select an object and click Edit to open an object editor on that object.
- Select an object and click Drop to initiate dropping that object.
Permissions For details on using this tab, see Working with Privileges and Permissions.

DDL For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Triggers Editor (IBM DB2 Z/OS)

The Triggers Editor lets you modify the CREATE TRIGGER statement and manage properties for a trigger.

To edit a trigger

1. Open an editor on the trigger. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the Trigger Timing, Trigger Events, Trigger Type, Object Status, Definer, and Function Path properties.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you modify the CREATE TRIGGER body for a trigger.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Unique Keys Editor (IBM DB2 Z/OS)

The Unique Keys Editor lets you manage columns, basic properties, and partitions for a unique key, as well as view storage details.

To edit a unique key

1. Open an editor on the unique key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column</td>
<td>Lets you manage columns that make up the primary key. On opening, this tab shows the existing columns. For each column, the listing shows the datatype (and if applicable the precision in brackets) and whether the table definition permits nulls in the target table column. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Change the Sort order of a column.</td>
</tr>
<tr>
<td></td>
<td>Click the New button and select a column name from the dropdown, to add a column to the primary key.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click the Drop button to delete the column from the primary key.</td>
</tr>
<tr>
<td></td>
<td>Select a column and use the arrow buttons to reorder the columns in the primary key.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you set the Buffer Pool, Piece Size, Close, and Copy properties.</td>
</tr>
<tr>
<td>Storage</td>
<td>Lets you view the Storage Group and VCAT Catalog properties. Lets you set the Primary Space Allocation, Secondary Space Allocation, Erase, Free Page, Percent Free, and GBP Cache properties.</td>
</tr>
<tr>
<td>Partition</td>
<td>Lets you work with partitions for the index.</td>
</tr>
<tr>
<td>Space</td>
<td>Lets you view values in the following property groups:</td>
</tr>
<tr>
<td>Attributes</td>
<td>Make Unique, System Required, Total Keys, Page Fetch Pairs, and Distinct Keys</td>
</tr>
<tr>
<td>Statistics</td>
<td>Index Level, Cluster Ratio, Cluster Factor, Leaf Pages, Sequential Pages, and Density</td>
</tr>
<tr>
<td>Cards</td>
<td>First Key and Full Keys</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
User Datatypes Editor (IBM DB2 Z/OS)

The User Datatypes Editor lets you manage basic properties of a user datatype.

To edit a user datatype

1. Open an editor on the user datatype. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you work with properties in the following categories:</td>
</tr>
<tr>
<td>Base Datatype</td>
<td>Lets you set Type and Size settings.</td>
</tr>
<tr>
<td>Character Options</td>
<td>Lets you set the For Data and CCSID properties.</td>
</tr>
<tr>
<td><strong>Comment</strong></td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td><strong>Permissions</strong></td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td><strong>DDL View</strong></td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Users Editor (IBM DB2 Z/OS)

The Users Editor lets you manage permissions for a user and the objects owned by that user.

To edit a user

1. Open an editor on the user. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays the user <strong>Name</strong>.</td>
</tr>
<tr>
<td>Objects</td>
<td>Lets you manage database objects associated with the user. Objects are organized in a tree structure with folders containing the objects. Optionally, take one of the following actions:</td>
</tr>
<tr>
<td></td>
<td>Select an object and click <strong>Edit</strong> to open an object editor on the selected object.</td>
</tr>
<tr>
<td></td>
<td>Select an object and click <strong>Drop</strong> to initiate dropping the selected object.</td>
</tr>
<tr>
<td>Object Permissions and System Permissions</td>
<td>For details on using these tabs, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Views Editor (IBM DB2 Z/OS)

The Views Editor lets you view columns for a view and work with the dependencies and permissions for the view.

To edit a view

1. Open an editor on the view. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays all columns for the view. Details for each column include the Column Name, the Datatype (and if applicable, with the precision in parentheses), and whether or not Nulls are allowed for that column.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you view and modify the CREATE VIEW DDL that will implement any changes you make in this editor.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Microsoft SQL Server Object Editors

An Object Editor is provided for all supported Microsoft SQL Server objects. To see an Editor for a specific object, click the corresponding link below:

- Alerts Editor (SQL Server)
- Asymmetric Keys Editor (SQL Server)
- Backup Devices Editor (SQL Server)
- Certificates Editor (SQL Server)
- Check Constraints Editor (SQL Server)
- Databases Editor (SQL Server)
- Database Triggers Editor (SQL Server)
- Defaults Editor (SQL Server)
- Extended Procedures Editor (SQL Server)
- Foreign Keys Editor (SQL Server)
- Full-text Catalogs Editor (SQL Server)
- Full-text Indexes Editor (SQL Server)
- Functions Editor (SQL Server)
- Indexes Editor (SQL Server)
- Jobs Editor (SQL Server)
- Linked Servers Editor (SQL Server)
- Logins Editor (SQL Server)
- Operators Editor (SQL Server)
- Partition Functions Editor (SQL Server)
- Partition Schemes Editor (SQL Server)
- Primary Keys Editor (SQL Server)
- Procedures Editor (SQL Server)
- Remote Servers Editor (SQL Server)
- Roles Editor (SQL Server)
- Rules Editor (SQL Server)
- Schemas Editor (SQL Server)
Microsoft SQL Server Object Editors

- Sequences Editor (SQL Server)
- Server Roles Editor (SQL Server)
- Server Triggers Editor (SQL Server)
- Symmetric Key Editor (SQL Server)
- Synonyms Editor (SQL Server)
- Tables Editor (SQL Server)
- Triggers Editor (SQL Server)
- Unique Keys Editor (SQL Server)
- Users Editor (SQL Server)
- User Datatypes Editor (SQL Server)
- User Messages Editor (SQL Server)
- Views Editor (SQL Server)

For access to object editors for different supported DBMS platforms and an introduction to editor usage, see Modifying objects using editors.
Alerts Editor (SQL Server)

The Alerts Editor lets you modify the definition of a SQL Agent alert.

**To edit an alert**

1. Open an editor on the alert. For details, see [Opening an Object Editor](#).
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>This tab/panels lets you view the ID, Name, and Error Description settings. It lets you modify the Enabled, Type, Error #, Severity, Database, and Event Description settings. For details on these settings, see <a href="#">Alerts (SQL Server) - Properties</a>. The History and Occurrence groups display the following properties:</td>
</tr>
<tr>
<td>Last Occurrence Date</td>
<td>The date and time that this alert was last raised.</td>
</tr>
<tr>
<td>Last Response Date</td>
<td>The date and time that this alert was responded to by the SQLServerAgent service.</td>
</tr>
<tr>
<td>Occurrence Count</td>
<td>The number of times this alert occurred since last being reset.</td>
</tr>
<tr>
<td>Last Reset Date</td>
<td>The date and time that the Occurrence Date was last reset.</td>
</tr>
<tr>
<td>Reset Count</td>
<td>Use this button to set the Occurrence Date to zero.</td>
</tr>
<tr>
<td>Response</td>
<td>This tab lets you provide job execution details, set content of email, pager, and net send notifications, and select operators notified, for this alert. For details on the specific properties, see <a href="#">Alerts (SQL Server) - Response</a>.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see <a href="#">Viewing the SQL/DDL for an Object</a>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Asymmetric Keys Editor (SQL Server)

The Asymmetric Keys Editor lets you view and modify asymmetric key properties.

To edit an asymmetric key

1. Open an editor on the asymmetric key. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>This tab lets you view all properties assigned when the asymmetric key was created. For more information, see Asymmetric Keys (SQL Server) - Properties. In addition, this tab lets you modify the following properties: Authorization Owner - the AUTHORIZATION argument. Change Encryption Mechanism - activates the Encryption Type control, letting you change the encryption method used for this certificate. Encryption Type - lets you select among encryption using the MASTER KEY, a USER_PASSWORD, or NONE. Encryption Password and Decryption Password - available if you select an Encryption Type of USER_PASSWORD, they lets you provide the specific encryption/decryption passwords.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Backup Devices Editor (SQL Server)

The Backup Device editor lets you view key properties for a backup device.

To edit a backup device

1. Open an editor on the backup device. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Definition</strong></td>
<td>Displays the following property values: <strong>Name</strong> - the logical name. <strong>Device Type</strong> - DISK or TAPE. <strong>Physical Name</strong> - A file name (sqltable.dat for example) or full path (a:\sqltable.dat for example) identifying the device.</td>
</tr>
<tr>
<td><strong>DDL View</strong></td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Certificates Editor (SQL Server)

The Certificates Editor lets you view and modify check certificate properties.

To edit a certificate

1. Open an editor on the certificate. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>This tab lets you view all properties assigned when the certificate was created. For more information, see Certificates (SQL Server) - Properties. In addition, this tab lets you modify the following properties: Authorization Owner - the AUTHORIZATION_ARGUMENT argument. Active for Begin Dialog - the ON/OFF values for a ACTIVE FOR BEGIN_DIALOG = option. Change Encryption Mechanism - activates the Encryption Type control, letting you change the encryption method used for this certificate. Encryption Type - lets you select among encryption using the MASTER KEY, a USER_PASSWORD, or NONE. Encryption Password - available if you select an Encryption Type of USER_PASSWORD, it lets you provide the specific encryption password.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Check Constraints Editor (SQL Server)

The Check Constraints Editor lets you view and modify check constraints properties and edit the check constraint expression.

To edit a check constraint

1. Open an editor on the check constraint. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Definition</strong></td>
<td>Use the <strong>Enabled</strong> check box to enable or disable the check constraint. Use the <strong>Not For Replication</strong> check box to enable or disable the check constraint for replication. You can also edit the condition in the <strong>Check Condition</strong> box. The <strong>Table Column</strong> button opens a dialog that lets you select and paste column names into the check condition expression.</td>
</tr>
<tr>
<td><strong>DDL View</strong></td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Databases Editor (SQL Server)

The Databases Editor lets you manage basic properties, log and data files for a database.

To edit a database

1. Open an editor on the database. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Options</td>
<td>Lets you work with options in the following categories:</td>
</tr>
<tr>
<td>Creation Properties</td>
<td>Lets you choose values for the Compatible Level and Owner settings. NOTE: The Compatible level option sets certain database behaviors to be compatible with the specified earlier version of Microsoft® SQL Server. The compatibility level affects the behaviors in the specified database, not the entire server. To set database options for all future databases, set the database options on the model database. NOTE: When changing the database owner (dbo) select the check box to transfer the existing aliases of users who could act as the old dbo (including their permissions) to the new dbo.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you set the following properties: ANSI null default, ANSI nulls, ANSI padding, ANSI warnings, arithabert, auto create statistics, auto update statistics, auto close, auto shrink, concat null yields null, cursor close on commit, db chaining, dbo use only, default to local cursor, merge publish, numeric roundabout, offline, published, quoted identifier, read only, recursive triggers, select into/bulkcopy/pllsort, single user, subscribed, torn page detection, and trunc log on chkpt.</td>
</tr>
<tr>
<td>Placement</td>
<td>Displays the currently defined data files for the database. Optionally, you can:</td>
</tr>
<tr>
<td>Transaction Log</td>
<td>Displays the currently defined transaction logs for the database. Optionally, you can:</td>
</tr>
</tbody>
</table>
Click the New button, provide a Device File Name for the new transaction log, and use the other settings in the Log Device Properties group to provide additional details for the transaction log.

Select a transaction log from the list on the left and click Delete to remove the transaction log.

**Space**

Lets you view pie charts showing the data space usage and the transaction log (if available) space usage for the database.

**DDL View**

For details on using this tab, see Viewing the SQL DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Database Triggers Editor (SQL Server)

The Database Triggers Editor lets you enable or disable a database trigger and modify the body of the generated CREATE TRIGGER statement.

To edit a database trigger:

1. Open an editor on the database trigger. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Select the Enabled check box to enable the database trigger or deselect it to disable the trigger. In addition to the name and creation date details, this tab also lets you view the Trigger Timing and Encrypted property settings you chose when creating the trigger. For details on these properties, see Database Triggers (SQL Server) - Properties.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you modify the CREATE TRIGGER statement.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Trigger Events</td>
<td>Lets you view the DDL events you selected to fire this trigger.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Defaults Editor (SQL Server)

The Defaults Editor lets you change the owner and value of a default.

To edit a default

1. Open an editor on the default. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you modify the <strong>Value</strong> of the Default and the owning <strong>Schema</strong>.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Extended Procedures Editor (SQL Server)

The Procedures Editor lets you modify the library name for an extended procedure. It also lets you work with dependencies and permissions.

**Note:** Extended Procedures are only available on the master database.

**To edit an extended procedure**

1. Open an editor on the extended procedure. For details, see [Opening an Object Editor](#).

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you provide a dynamic-link library (DLL) <strong>Library Name</strong> for the extended procedure.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see <a href="#">Working with Object Dependencies</a>.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see <a href="#">Working with Privileges and Permissions</a>.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see <a href="#">Viewing the SQL/DDL for an Object</a>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Foreign Keys Editor (SQL Server)

The Foreign Keys Editor lets you manage the columns and basic properties of a foreign key.

To edit a foreign key

1. Open an editor on the foreign key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Mapping</td>
<td>The existing column mapping for the foreign key is represented by selected columns in the Main Table and Referenced Table lists. Additional candidates in the Referenced Table list are indicated by enabled column check boxes. If necessary, use the Table dropdown in the Referenced Table group to choose a new table for this foreign key. Select or deselect columns in the Main Table list and Referenced Table list to form the referential constraint between the two tables.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you specify Enabled, With NOCHECK, and Not For Replication properties. This tab also lets you select a Delete rule and an Update rule (NONE, SET NULL, SET DEFAULT, CASCADE).</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Full-text Catalogs Editor (SQL Server)

The Full-text Catalogs Editor lets you work with the basic definition and dependencies of a full-text catalog.

To edit a full-text catalog:

1. Open an editor on the full-text catalog. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the Parent Type, Parent Schema, Parent Name, Key Index, and Full-text Catalog Name properties for the partition scheme. It also lets you modify the Filegroup Name (SQL Server 2008 ^), Change Tracking, and Stoplist (SQL Server 2008 ^) properties. For more information on these properties, see Full-text Catalogs (SQL Server) - Properties.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Full-text Indexes Editor (SQL Server)

The Full-text Indexes Editor lets you work with the basic definition and dependencies of a full-text index.

To edit a full-text index:

1. Open an editor on the full-text index. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the <strong>Name</strong>, property and modify the <strong>Accent Sensitive</strong>, <strong>Default</strong>, and <strong>Authorization Owner</strong> properties. For more information on these properties, see Full-text Indexes (SQL Server) - Properties.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Functions Editor (SQL Server)

The Functions Editor lets you view and modify function definitions and dependencies.

To edit a function

1. Open an editor on the function. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you modify the owning Schema of the function.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you view and modify the dynamic-link library (DLL) or view the data definition language (DDL).</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, seePreviewing and Submitting Object Editor Changes.
Indexes Editor (SQL Server)

The Indexes Editor lets you manage columns and basic properties of an index and view index statistics.

**To edit an index**

1. Open an editor on the index. For details, see [Opening an Object Editor](#).
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Lets you manage columns that make up the index. On opening, this tab shows the existing columns. For each column, the datatype (and if applicable the precision in brackets) and whether the table definition permits nulls in the target table column. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Change the <strong>Sort</strong> order of a column.</td>
</tr>
<tr>
<td></td>
<td>Click the <strong>New</strong> button and select a column name from the dropdown, to add a column to the index.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click the <strong>Drop</strong> button to delete the column from the index.</td>
</tr>
<tr>
<td></td>
<td>Select a column and use the arrow buttons to reorder the columns in the index.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Creation</td>
<td>In addition to displaying identifying information, you can modify the <strong>Build Online</strong> and <strong>Max degree of parallelism</strong> properties. For details on these properties, see <a href="#">Indexes Wizard (SQL Server)</a>.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Lets you set <strong>Index Type</strong>, <strong>Clustered</strong>, <strong>Ignore Duplicate Key</strong> (for <strong>Index Type</strong> of UNIQUE), <strong>Statistics Recompute</strong>, <strong>Allow Row Locks</strong>, and <strong>Allow Page Locks</strong> properties. For details on these properties, see <a href="#">Indexes Wizard (SQL Server)</a>. <strong>NOTE:</strong> You cannot reorganize an index (primary key, or unique key) that has an <strong>Allow Page Locks</strong> property set to FALSE. For information on reorganizing indexes, see <a href="#">Reorganize (SQL Server indexes, primary keys, and unique keys)</a>.</td>
</tr>
<tr>
<td>Storage</td>
<td>Lets you set <strong>Partitioned</strong>, <strong>Partition Scheme</strong>, <strong>Parttiontion Column</strong>, <strong>Fill Factor</strong>, <strong>File Group</strong>, <strong>Pad Index</strong>, and <strong>Sort in Tempdb</strong> settings.</td>
</tr>
<tr>
<td>Statistics</td>
<td>Lets you view statistics in the following categories:</td>
</tr>
<tr>
<td>Page Statistics</td>
<td><strong>Data Pages</strong>, <strong>Reserved Pages</strong>, <strong>Used Pages</strong>, and <strong>Total Pages Modified</strong>.</td>
</tr>
<tr>
<td>Row Statistics</td>
<td><strong>Maximum Row Size</strong>, <strong>Minimum Row Size</strong>, <strong>Max Size of Non-Leaf Index Row</strong>, and <strong>Total Rows Modified</strong>.</td>
</tr>
</tbody>
</table>
Indexes Editor (SQL Server)

**DDL View** For details on using this tab, see [Viewing the SQL/DDL for an Object](#).

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Jobs Editor (SQL Server)

The Jobs Editor lets you modify the definition of a SQL Agent job.

To edit a job

1. Open an editor on the job. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>This tab/panels lets you specify an Enabled/disabled status and select a Category, as well as specify notify and delete levels for the job. For details on these settings, see Jobs (SQL Server) - Properties.</td>
</tr>
<tr>
<td>Steps</td>
<td>This tab/panels lets you work with the steps for a job, including subsystem specifics, success/failure/ retry details, and logging and file specifications. For details on these settings, see Jobs (SQL Server) - Steps.</td>
</tr>
<tr>
<td>Schedules</td>
<td>This tab/panels lets you create new schedules for this job, add schedules that were defined in other job definitions, delete schedules currently associated with the current job definition, and display all jobs using a selected schedule. For detailed instructions, see Jobs (SQL Server) - Schedules.</td>
</tr>
<tr>
<td>Alerts</td>
<td>On opening, this tab provides a list of all alerts that specify this job as the target job to be executed in response to those alerts. You can create new alert definitions and edit existing definitions from the list. When you execute the job that creates or edits this job, DDL to create all alerts on this tab is submitted. For detailed instructions, see Jobs (SQL Server) - Alerts.</td>
</tr>
<tr>
<td>Target</td>
<td>Lets you specify the server or servers where the job executes. For details, see Jobs (SQL Server) - Target.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Linked Servers Editor (SQL Server)

The Linked Servers Editor lets you manage basic properties and logins for a linked server.

To edit a linked server

1. Open an editor on the linked server. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td><strong>General</strong>  Is SQL Server  - Setting this check box indicates a linked server defined through Microsoft SQL Server. Any tables retrieved from the server are from the default database defined for the login on the linked server. Setting this check box disables the remaining OLE DB Provider settings. <strong>Product Name</strong>  - The product name of the OLE DB datasource to which you are linking. <strong>Datasource</strong>  - The name of the OLE DB provider managing access to the linked server. <strong>OLE DB Provider Name</strong>  - Select the name of the OLE DB provider managing access to the specified linked server. <strong>Provider Location</strong>  - The OLE DB location property corresponding to the linked server. <strong>Provider Connection String</strong>  - The OLE DB provider-specific connection string that identifies a unique datasource. <strong>Catalog</strong>  - The name of the catalog to be used when making a connection to the OLE DB provider.</td>
</tr>
<tr>
<td></td>
<td><strong>Server Options</strong>  <strong>Data Access Server</strong>  - Indicates whether the target linked server is enabled for distributed query access. <strong>RPC Out Server</strong>  - Lets you select the server with RPC encryption. <strong>RPC</strong>  - Enables RPC encryption from the server. <strong>Collation Compatible Server</strong>  - Indicates Change Distributed Query execution against linked servers. If you select this option, Microsoft SQL Server assumes that all characters in the linked server are compatible with the local server, with regard to character set and collation sequence (or sort order). This option is for Microsoft SQL Server 8.0 or later. <strong>Lazy Schema Validation</strong>  - This option lets you optimize performance by ensuring the query processor does not request metadata for any of the linked tables until data is actually needed from the remote member table. This option is for Microsoft SQL Server 8.0 or later. <strong>Use Remote Collation</strong> and <strong>Collation Name</strong>  - Let you indicate that the linked server should use remote collation and select the name of the collation. This option is for Microsoft SQL Server 8.0 or later. <strong>Query Timeout</strong>  - Type the query timeout value. This option is for Microsoft SQL Server 8.0 or later. <strong>Connection Timeout</strong>  - Type the connection timeout value. This option is for Microsoft SQL Server 8.0 or later.</td>
</tr>
</tbody>
</table>
Logins

Includes a table listing every user who has a login on the target linked server and their local login names. Optionally, you can:

Create a new login by clicking Add linked login button and providing the following information in the dialog that opens:

- **SQL Server Authentication**: Use SQL Server authenticated login credentials to login to linked server. If you choose this option, you must provide a Local Login Name. No Remote Login - Indicates that no remote login or password are required login to the linked server. All Users - All users will use the same login when connecting to the linked server. If you choose this option, you must provide a Linked Login Name and a Password. Local Login Name - Lets you select a local login name. Linked Login Name - Lets you type in a linked login name. Password - Lets you set a password.

Select a login, click the Modify button, and change the login names and password.

Select a login and click the Drop button to delete that login.

**DDL View**

For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
The Logins Editor lets you manage basic properties for a login, associated users and roles, and accounting.

To edit a login:

1. Open an editor on the login. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view or modify the following properties set when creating the login: Name, Default Database, Default Language, Password, Check Policy, Check Expiration, Must Change, Certificate, and Asymmetric Key. For detailed information on these settings, see Logins Wizard (SQL Server). In addition, when editing an existing login, you have access to the following settings:</td>
</tr>
<tr>
<td>Currently Logged In</td>
<td>Displays whether the user is currently logged in.</td>
</tr>
<tr>
<td>Enabled</td>
<td>Enabled, an ALTER LOGIN... ENABLE is submitted following the CREATE LOGIN statement issued by the editor. Disabled, an ALTER LOGIN... DISABLE is submitted</td>
</tr>
<tr>
<td>Server Roles</td>
<td>Lets you add the login as a member of one or more fixed server roles. For more information, see Logins (SQL Server) - Server Roles.</td>
</tr>
<tr>
<td>Users</td>
<td>Lets you add and remove user accounts for this login to specified databases. For more detailed information, see Logins (SQL Server) - Users.</td>
</tr>
<tr>
<td>DDL</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Operators Editor (SQL Server)

The Operators Editor lets you modify the definition of a SQL Agent operator.

To edit an operator

1. Open an editor on the operator. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>This tab/panel lets you change the operator's enabled/disabled status, modify contact information, and change the pager duty schedule. For details, see Jobs (SQL Server) - Properties.</td>
</tr>
<tr>
<td>Notifications</td>
<td>This tab lets you modify the set of SQL Agent alerts for which this operator will be notified. For details, see Operators (SQL Server) - Notifications.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>
3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Partition Functions Editor (SQL Server)

The Partition Functions Editor lets you view the basic definition and work with dependencies of a partition function.

To edit a partition function:

1. Open an editor on the partition function. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the Name, Input Parameter Type, Range, and Function Values properties for the partition function. For more information on these properties, see Partition Functions (SQL Server) - Properties.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Partition Schemes Editor (SQL Server)

The Partition Schemes Editor lets you view the basic definition and work with dependencies of a partition scheme.

To edit a partition scheme:

1. Open an editor on the partition scheme. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the Name, Partition Function, and Filegroup Name properties for the partition scheme. For more information on these properties, see Partition Schemes (SQL Server) - Properties.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Primary Keys Editor (SQL Server)

The Primary Keys Editor lets you manage the columns and basic properties for a primary key and lets you view page and row statistics.

To edit a primary key

1. Open an editor on the primary key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Lets you manage columns that make up the primary key. On opening, this tab shows the existing columns. For each column, the listing shows the datatype (and if applicable the precision in brackets) and whether the table definition permits nulls in the target table column. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Change the Sort order of a column.</td>
</tr>
<tr>
<td></td>
<td>Click the New button and select a column name from the dropdown, to add a column to the primary key.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click the Drop button to delete the column from the primary key.</td>
</tr>
<tr>
<td></td>
<td>Select a column and use the arrow buttons to reorder the columns in the primary key.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Creation</td>
<td>In addition to displaying identifying information, you can modify the Build Online and Max degree of parallelism properties. For details on these properties, see Primary Keys Wizard (SQL Server).</td>
</tr>
<tr>
<td>Attributes</td>
<td>Clustered - Indicates whether the target primary key is clustered. Ignore Duplicate Key - Indicates whether the target primary key ignores duplicate key values. If you select this option, the transaction that generated the duplicate key values can continue. Statistics Recompute - Indicates that index statistics are automatically recomputed as the index is updated. Microsoft does not recommend this.</td>
</tr>
<tr>
<td>Storage</td>
<td>File Group - Lets you select a file group. Fill Factor - Lets you specify the fill factor that specifies how full each index page can be. If no fill factor is specified, Microsoft SQL Server uses the database's default fill factor. Pad Index - If you specified a Fill factor of more than 0 percent, and you selected the option to create a unique index, you can specify to use the same percentage you specified in Fill Factor as the space to leave open on each interior node. By default, Microsoft SQL Server sets a 2 row index size.</td>
</tr>
</tbody>
</table>
Statistics  Lets you view statistics in the following categories:

<table>
<thead>
<tr>
<th>Page Statistics</th>
<th>Data Pages, Reserved Pages, Used Pages, and Total Pages Modified.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Row Statistics</td>
<td>Maximum Row Size, Minimum Row Size, Max Size of Non-Leaf Index Row, and Total Rows Modified.</td>
</tr>
</tbody>
</table>

DDL View  For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Procedures Editor (SQL Server)

The Procedures Editor lets you manage properties, the definition, dependencies, and permissions for a procedure.

To edit a procedure

1. Open an editor on the procedure. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you change the owning Schema.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you view the SQL code for the procedure.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Remote Servers Editor (SQL Server)

The Remote Server Editor lets you manage the connection and security properties for a remote server, and manage the associated logins.

To edit a remote server

1. Open an editor on the remote server. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with the following settings:</td>
</tr>
<tr>
<td>Server Type</td>
<td>Displays the server type, LOCAL or REMOTE. The local server routes all commands to the remote server. To communicate with a remote server, you log into a local server and submit your remote procedure calls for remote servers. The remote server receives remote procedure calls from the local server and processes them accordingly.</td>
</tr>
<tr>
<td>Publication Server</td>
<td>Specifies database publishing. When replication is installed, this option permits the tables of a database to be published for replication. When selected, this option enables publication. When not selected, this option disables publishing, drops all publications, and unmarks all transactions that were marked for replication in the transaction log.</td>
</tr>
<tr>
<td>Distribution Server</td>
<td>Enables the remote server to be a distribution server.</td>
</tr>
<tr>
<td>Subscription Server</td>
<td>Specifies database subscriptions. When selected, the database can be subscribed for publication. When not selected, the database cannot be subscribed for publication.</td>
</tr>
<tr>
<td>Publisher/Subscriber</td>
<td>Enables the remote server to be a publisher/subscriber server.</td>
</tr>
<tr>
<td>Collation Compatible Server</td>
<td>Indicates Change Distributed Query execution against remote servers. If you select this option, Microsoft SQL Server assumes that all characters in the remote server are compatible with the local server, with regard to character set and collation sequence (or sort order).</td>
</tr>
<tr>
<td>Data Access Server</td>
<td>Indicates whether the target remote server is enabled for distributed query access.</td>
</tr>
<tr>
<td>RPC Out Server</td>
<td>Enables the remote server to execute stored procedures on the local server using a remote procedure call (RPC).</td>
</tr>
</tbody>
</table>
Remote Servers Editor (SQL Server)

**Logins**  Includes a table listing the remote name, local name, and trusted status of logins for a remote server. Optionally you can:

Click **Add** to open a dialog that lets you add a new login. The dialog displays or lets you provide: **Remote Server Name** - Displays the remote server name. **Remote Login Name** - Lets you specify a remote login name. **All remote users** - Select this box if you want to use this name for all remote logins. **Local Login Name** - Lets you select a local user name. **Is Trusted** - Lets you specify this remote login as a trusted login.

Select a login, click **Modify**, and use the table above as a guide to modifying login options.

Select a login, and click **Drop** to delete the login.

**DDL View**  For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Roles Editor (SQL Server)

The Roles Editor lets you manage the users for a role.

To edit a role

1. Open an editor on the role. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays the Name, and either a Role Type of STANDARD and an Authorization Owner or a Role Type of APPLICATION and a Password.</td>
</tr>
<tr>
<td>Users</td>
<td>Let you manage users for the role. A user becomes associated with an application role after running the target application. Use the Join Rule and Leave Role buttons to move users between the Users In Role and Users Not In Role lists.</td>
</tr>
<tr>
<td>Object Privileges and System Privileges</td>
<td>For details on using these tabs, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
The Rules Editor lets you view or modify basic properties of a rule. 

To edit a rule

1. Open an editor on the rule. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you specify whether the rule is Enabled and view the Fire On Insert, Fire On Update, Fire On Delete, and Encrypted settings.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you view and modify the SQL code that will implement any changes you make using this editor.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Schemas Editor (SQL Server)

The Schemas Editor lets you change the owner of a group and manage the objects contained in the schema.

To edit a user

1. Open an editor on the user. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you modify the Owner of the schema.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>Objects</td>
<td>Displays the specific objects owned by the schema, grouped under object type folders. Optionally, you can: Select an object and click Edit to open an object editor on that object. Select an object and click Drop to initiate dropping the object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Sequences Editor (SQL Server)

This editor lets you view creation properties for a sequence as well as modify the scope, starting value and increment value.

To edit a sequence:

1. Open an editor on the sequence. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the Schema, Name, Create Date, Data Type Schema, Base Data Type, Data Type Name, and Data Type Precision properties for the synonym. Lets you modify the Start With, Increment By, Minimum Value, Maximum Value, Cycle, Cache, and Cache Size properties. For more information on these properties, see Sequences (SQL Server) - Properties. This tab also includes the following, display-only properties: Current Value - The value most recently returned by the NEXT VALUE FOR function or the last value resulting from an sp_sequence_get_range procedure execution. Is Exhausted - Indicates that the sequence object has reached the Maximum Value and Cycle is not set. The NEXT VALUE FOR function will return an error until the sequence is restarted using ALTER SEQUENCE.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Server Roles Editor (SQL Server)

The Server Roles Editor lets you generate a set of sp_addsrvrolemember calls. This lets you change the login members of SQL Server’s fixed server roles: bulkadmin, dbcreator, diskadmin, processadmin, securityadmin, serveradmin, setupadmin, and sysadmin.

To edit the login members of a server role:

1. Open an editor on the server role. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logins</td>
<td>Select all check boxes associated with logins that are to be members of this server role.</td>
</tr>
<tr>
<td>DDL</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
<tr>
<td>View</td>
<td></td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Server Triggers Editor (SQL Server)

The Server Triggers Editor lets you enable or disable a logon-based or other event-based server trigger and modify the body of the generated CREATE TRIGGER statement.

To edit a server trigger:

1. Open an editor on the server trigger. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Select the Enabled check box to enable the server trigger or deselect it to disable the trigger. In addition to the name and creation date details, this tab also lets you view the Trigger Timing, Fire On Logon, and Encrypted property settings you chose when creating the trigger. For details on these properties, see Server Triggers (SQL Server) - Properties.</td>
</tr>
<tr>
<td><strong>Definition</strong></td>
<td>Lets you modify the CREATE TRIGGER statement.</td>
</tr>
<tr>
<td><strong>Trigger Events</strong></td>
<td>Lets you view the DDL events you selected to fire this trigger.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Symmetric Key Editor (SQL Server)

The Symmetric Key Editor lets you view creation details for a key and modify its encryption mechanisms.

To edit a symmetric key:

1. Open an editor on the symmetric key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the Authorization Owner, Name, Create Date, Update Date, Provider Name, Key Algorithm, and Key Length properties. For more information, see Symmetric Keys (SQL Server) - Properties.</td>
</tr>
<tr>
<td>Encryption Mechanisms</td>
<td>Lets you manage the encryption mechanisms for this key. For detailed instructions, see Symmetric Keys (SQL Server) - Properties.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
The Synonyms Editor lets you view the basic definition and work with dependencies of a partition scheme.

**To edit a synonym:**

1. Open an editor on the synonym. For details, see [Opening an Object Editor](#).
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you view the <strong>Schema</strong>, <strong>Name</strong>, <strong>Server</strong>, <strong>Database</strong>, <strong>Referenced Object Type</strong>, <strong>Referenced Object Owner</strong>, and <strong>Referenced Object Name</strong> properties for the synonym. For more information on these properties, see <a href="#">Synonyms (SQL Server) - Properties</a>. This tab also includes a <strong>CreateDate</strong> property showing the data and time the synonym was created.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>For details on using this tab, see <a href="#">Working with Object Dependencies</a>.</td>
</tr>
<tr>
<td><strong>DDL View</strong></td>
<td>For details on using this tab, see <a href="#">Viewing the SQL/DDL for an Object</a>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Tables Editor (SQL Server)

The Tables Editor lets you manage columns, basic properties, indexes, and constraints for a table and view space usage details.

To edit a table

1. Open an editor on the table. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Displays the currently defined columns in the table. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Select a column, and in the Property/Value list modify property values for that column.</td>
</tr>
<tr>
<td></td>
<td>Click Add Column, provide a name for the new column, and set property values for the column.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click Delete to remove the column from the table.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Physical Storage</td>
<td>Lets you view the Partitioned, Text Image Filegroup, and FileStream On (.version 2008^) properties and modify the Filegroup property. For details on these properties, see Tables (SQL Server) - Properties.</td>
</tr>
<tr>
<td>Full-Text Index</td>
<td>Lets you view whether Full-Text Indexing is installed and active. The full-text index feature provides support for sophisticated word searches in character string data. A full-text index stores information about significant words and their location within a given column. This information is used to quickly complete full-text queries that search for rows with particular words or combinations of words. This feature is available for Microsoft SQL Server 8.0 or later.</td>
</tr>
<tr>
<td>Text In Row</td>
<td>Lets you enable Text In Row Data and specify a limit.</td>
</tr>
<tr>
<td>Filetable (Version 2012^)</td>
<td>Lets you view the As Filetable, Filetable Collate Filename, FiletablePK Constraint Name, Filetable StreamID Unique Constraint Name, and Filetable Fullpath Unique Constraint Name properties and lets you modify the Filetable Directory Name property. For details on these properties, see Tables (SQL Server) - Properties. This group also lets you modify an Enabled property. That control specifies whether system-defined constraints are enabled.</td>
</tr>
</tbody>
</table>
Tables Editor (SQL Server)

Indexes  Displays any indexes currently defined for the table. Optionally, you can:

Click **Add** to open an Index editor, letting you create a new index for this table. For more information, see Indexes Wizard (SQL Server).

Select an index and click **Edit** to open an wizard that lets you modify that index. For more information, see Indexes Editor (SQL Server).

Select an index and click **Drop** to open a dialog that lets you confirm that you want to drop the index. When dropping an index with the Clustered option enabled, the confirmation dialog includes an **Online** option that lets you specify an online drop (ONLINE-ON clause).

Constraints  Lets you manage constraints for the table. Constraints are grouped by type, under folders. Optionally take one of the following actions:

Select a constraint type folder and click **Add** to open a dialog that lets you add a constraint of that type.

Select a constraint and click **Edit** to open a dialog that lets you modify the constraint details.

Select a constraint and click **Drop** to open a dialog that lets you confirm that you want to drop the index. When dropping a clustered unique key or clustered primary key, the confirmation dialog includes an **Online** option that lets you specify an online drop (ONLINE-ON clause).

Space  Lets you view pie charts showing the space usage for the table. Optionally you can double-click a slice in the pie chart for detailed statistics.

Dependencies  For details on using this tab, see Working with Object Dependencies.

Permissions  For details on using this tab, see Working with Privileges and Permissions.

DDL View  For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Triggers Editor (SQL Server)

The Triggers Editor lets you enable and disable a trigger, view and modify the CREATE TRIGGER statement that will implement changes, and manage dependencies.

To edit a trigger

1. Open an editor on the trigger. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you set the Enabled property. It also lets you view the Trigger Timing (AFTER, INSTEAD OF), Fire On Insert, Fire On Update, Fire On Delete, and Encrypted properties.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you modify the CREATE TRIGGER body for a trigger. To modify a trigger, edit the text of the trigger body in the Trigger Text area. The existing trigger is automatically dropped and then recreated.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Unique Keys Editor (SQL Server)

The Unique Keys Editor lets you manage columns and properties for a unique key and view associated statistics.

To edit a unique key

1. Open an editor on the unique key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
</table>
| Columns   | Lets you manage columns that make up the unique key. On opening, this tab shows the existing columns. For each column, the listing displays the datatype (and if applicable the precision in brackets) and whether the table definition permits nulls in the target table column. Optionally you can:  
  - Change the Sort order of a column. 
  - Click the New button and select a column name from the dropdown, to add a column to the index. 
  - Select a column and click the Drop button to delete the column from the index. 
  - Select a column and use the arrow buttons to reorder the columns in the index. |
| Properties| Lets you work with settings in the following categories:                                                                                           |
| Creation  | In addition to displaying identifying information, you can modify the Build Online and Max degree of parallelism properties. For details on these properties, see Unique Keys Wizard (SQL Server). |
| Attributes| Clustered - Indicates whether the target index is clustered. Ignore Duplicate Key - Indicates whether the target primary key ignores duplicate key values. If you select his option, the transaction that generated the duplicate key values can continue. Statistics Recompute - Indicates that index statistics are automatically recomputed as the index is updated. Microsoft does not recommend this. |
Storage  File Group - Lets you specify the filegroup on which to place the index. This is for Microsoft SQL Server 7.0 or later. **Fill Factor** - Lets you specify a percentage that indicates how full Microsoft SQL Server should make the leaf level of each index page during index creation. When an index page fills up, Microsoft SQL Server must take time to split the index page to make room for new rows, which is quite expensive. For update-intensive tables, a properly chosen Fill factor value yields better update performance than an improper Fill factor value. **Pad Index** - If you specified a Fill factor of more than 0 percent, and you selected the option to create a unique index, you can specify to use the same percentage you specified in Fill Factor as the space to leave open on each interior node. By default, Microsoft SQL Server sets a 2 row index size.

Statistics  Displays statistics in the following categories:

- **Page Statistics**
  - Data Pages, Pages Reserved, Used Pages, and Total Pages Modified.

- **Row Statistics**
  - Maximum Row Size, Minimum Row Size, Max Size of Non-Leaf Index Row, and Total Rows Modified Since Last.

DDL View  For details on using this tab, see [Viewing the SQL/DDL for an Object](#).

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Users Editor (SQL Server)

The Users Editor lets you manage properties, assign roles, and manage object bindings for a user.

To edit a user

1. Open an editor on the user. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you view the Without Login, Login Name, Name, User Type, Certificate, Asymmetric Key, and Default Schema properties.</td>
</tr>
<tr>
<td><strong>Roles</strong></td>
<td>Lets you assign roles to a user by selecting the check boxes associated with the roles to be assigned.</td>
</tr>
<tr>
<td><strong>Objects</strong></td>
<td>Lets you manage database objects (Defaults, Indexes, Procedures, Rules, Tables, Triggers, User Datatypes, Views) associated with the user. Objects are organized in a tree structure with folders containing the objects. Optionally, take one of the following actions: Select an object and click Edit to open an object editor on the selected object. For information on each editor, use the links in Microsoft SQL Server Object Editors. Select an object and click Drop to initiate dropping the selected object.</td>
</tr>
<tr>
<td><strong>Object Permissions and System Permissions</strong></td>
<td>For details on using these tabs, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td><strong>DDL View</strong></td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>
3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
User Datatypes Editor (SQL Server)

The User Datatypes Editor lets you modify the base datatype, rule and default bindings, and referencing or referenced objects for a user datatype.

To edit a user datatype

1. Open an editor on the user datatype. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>In addition to letting you change the Schema, this tab lets you work with settings in the following categories:</td>
</tr>
<tr>
<td></td>
<td><strong>Base Datatype</strong> Lets you modify the Type and Allow Nulls properties. Depending on the Type selected, Precision, Scale, or Size properties are available as appropriate.</td>
</tr>
<tr>
<td></td>
<td><strong>Bindings</strong> Default Binding - Lets you select a default. For information on creating defaults, see Defaults Wizard (SQL Server). Rule Binding - Lets you select a rule. For information on creating rules, see Rules Wizard (SQL Server).</td>
</tr>
<tr>
<td></td>
<td><strong>Usage</strong> Lets you manage database objects referencing or referenced by a user datatype. Objects are grouped within object type folders. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Select an object and click <strong>Edit</strong> to open an object editor on the selected object.</td>
</tr>
<tr>
<td></td>
<td>Select an object and click <strong>Drop</strong> to initiate dropping the selected object.</td>
</tr>
<tr>
<td></td>
<td><strong>DDL View</strong> For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
User Messages Editor (SQL Server)

Note: User Messages are only on the master database.

The User Messages Editor lets you view or modify basic properties of a user message. It also lets you add, edit, or delete individual language versions of the message.

To edit a user message

1. Open an editor on the user message. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with the following properties:</td>
</tr>
<tr>
<td>Message Number</td>
<td>Displays the message number chosen when the user message was created.</td>
</tr>
<tr>
<td>Severity</td>
<td>Lets you modify the SQL Server error severity level (001-025).</td>
</tr>
<tr>
<td>Write to NT Event Log</td>
<td>Lets you specify that the message is always written to the Windows NT Event Log.</td>
</tr>
<tr>
<td>Information</td>
<td>Displays the currently-defined language versions for this message number. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Create a new language version for this message number. Click the Add new text for the user message button, and in the dialog box that opens, select a Language and provide the Message Text.</td>
</tr>
<tr>
<td></td>
<td>Select a language version of the message and click the Modify user message text button. This opens a dialog that lets you modify the Language or Message Text.</td>
</tr>
<tr>
<td></td>
<td>Select a language version of the message and click the Remove user message text button.</td>
</tr>
<tr>
<td></td>
<td>Note: You cannot create two versions of a message for the same language. NOTE: For a given message number there should always be a least one, us_english version of the message.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>
3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Views Editor (SQL Server)

The Views Editor lets you view columns and change the schema of a view.

To edit a view

1. Open an editor on the view. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays a list of the columns that make up the view. Details include the column Name, its Datatype, and whether the definition allows Nulls. This tab also lets you change the Schema owning the view.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you view the SQL for the View.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
MySQL editors

An Object Editor is offered for all supported MySQL objects. To see an Editor for a specific object, click the corresponding link below:

- Database editor (MySQL)
- Foreign Keys editor (MySQL)
- Functions editor (MySQL)
- Indexes, Primary Keys, and Unique Keys editors (MySQL)
- Tables editor (MySQL)
- Users editor (MySQL)

For access to object editors for different supported DBMS platforms and an introduction to editor usage, see Modifying objects using editors.
Database editor (MySQL)

The Databases Editor lets you manage basic properties and privileges for a database.

To edit a database:

1. Open an editor on the database. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you modify the Default Character Set and Collation properties. For details on these properties, see Databases - Properties.</td>
</tr>
<tr>
<td>Privileges</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Foreign Keys editor (MySQL)

The Foreign Keys Editor lets you manage column mapping, delete, and update actions for a foreign key.

To edit a foreign key:

1. Open an editor on the foreign key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Mapping</td>
<td>The existing column mapping for the foreign key is represented by selected columns in the Main Table and Referenced Table lists. Additional candidates in the Referenced Table list are indicated by enabled column check boxes. If necessary, use the Table dropdown in the Referenced Table group to choose a new table for this foreign key. Select or deselect columns in the Main Table list and Referenced Table list to form the referential constraint between the two tables.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you modify the On Delete and On Update (NO ACTION, RESTRICT, CASCADE, SET NULL) reference options.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Functions editor (MySQL)

The MySQL Functions editor lets you view properties of a basic function declaration.

To edit a function:

1. Open an editor on the function. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the Function Name, Return Type, and Shared Object Library properties. For details on these properties, see Functions - Properties. Under Specify Columns in Index, you can change the selection of columns that make up the index, primary key, or unique key.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Indexes, Primary Keys, and Unique Keys editors (MySQL)

These editors let you manage columns and view properties of an index, primary key, or unique key.

To edit an index:

1. Open an editor on the index. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the Table Name, Index Name, Constraint Type, and Index Type properties. For details on these properties, see Indexes, Primary Keys, or Unique Keys - Properties. Under Specify Columns in Index, you can change the selection of columns that make up the index, primary key, or unique key.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Tables editor (MySQL)

The MySQL Tables editor lets you modify basic properties and view usage statistics for a MySQL table.

To edit a table:

1. Open an editor on the index. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Columns</strong></td>
<td>Displays the currently defined columns in the table. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Select a column, and in the <strong>Property/Value</strong> list modify property values for that column.</td>
</tr>
<tr>
<td></td>
<td>Click <strong>Add Column</strong>, provide a name for the new column, and set property values for the column.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click <strong>Delete</strong> to remove the column from the table.</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you work with the following settings: <strong>Table Name</strong>, <strong>Storage Type</strong>, <strong>Row Format</strong>, <strong>Default Character Set</strong>, <strong>Default Collation</strong>, <strong>Auto Increment</strong>, <strong>Comment</strong>, <strong>Min Rows</strong>, <strong>Max Rows</strong>, <strong>Average Row Length</strong>, <strong>Pack Keys</strong>, <strong>Checksum</strong>, and <strong>Delay Key Write</strong>. For details on these properties, see Tables - Properties.</td>
</tr>
<tr>
<td><strong>Indexes</strong></td>
<td>Lets you add, delete, or modify table indexes. For details on available options, see Tables - Indexes.</td>
</tr>
<tr>
<td><strong>Foreign Keys</strong></td>
<td>For INNODB tables, this tab lets you add, delete, or modify table foreign keys. For details on available options, see Tables - Foreign Keys.</td>
</tr>
<tr>
<td><strong>MERGE tables</strong></td>
<td>For MRG_MyISAM tables, this tab lets you work with the collection of identical MyISAM tables that are to be used as a single table. For more information, see Tables - MERGE Tables.</td>
</tr>
<tr>
<td><strong>Privileges</strong></td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td><strong>Space</strong></td>
<td>Lets you view graphical and numerical table usage statistics. Values include <strong>Data Length</strong>, <strong>Index Length</strong>, <strong>Data Free</strong>, <strong>Max Data Length</strong>, <strong>Rows</strong>, and <strong>Average Row Length</strong>.</td>
</tr>
<tr>
<td><strong>DDL View</strong></td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Users editor (MySQL)

The MySQL Functions editor lets you work with basic properties, host details, and privileges for a user.

To edit a user:

1. Open an editor on the user. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Information</td>
<td>Lets you view the <strong>User Name</strong> property and lets you modify the <strong>Full Name</strong>, <strong>Description</strong>, <strong>Email</strong>, and <strong>Contact Information</strong> properties. For details on these properties, see Users wizard (MySQL).</td>
</tr>
<tr>
<td>User Hosts</td>
<td>Add a new host to the list by clicking the <strong>New</strong> button. Use the associated dropdown to select a valid host-name value (such as localhost or %), overwriting the text as necessary to provide a specific quoted identifier. Provide a password in the <strong>Password</strong> and <strong>Confirm</strong> fields and click <strong>Apply</strong>. Remove a selected host from the list by clicking the <strong>Delete</strong> button.</td>
</tr>
<tr>
<td><strong>Object Privileges</strong> and</td>
<td>For details on using these tabs, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td><strong>System Privileges</strong></td>
<td></td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Oracle Object Editors

An Object Editor is available for all supported Oracle objects. To see an Editor for a specific object, click the corresponding link below.

**Note:** If an objects has dependent objects, such as tables, triggers, procedures and views, you can view and access their dependent objects in the editor.

- Check Constraints Editor (Oracle)
- Clusters Editor (Oracle)
- Database Links Editor (Oracle)
- Directories Editor (Oracle)
- Disk Groups Editor (Oracle)
- Foreign Keys Editor (Oracle)
- Functions Editor (Oracle)
- Groups Editor (Oracle)
- Indexes Editor (Oracle)
- Job Queue Editor (Oracle)
- Jobs Editor (Oracle)
- Libraries Editor (Oracle)
- Materialized Views Editor (Oracle)
- Materialized View Logs Editor (Oracle)
- Outlines Editor (Oracle)
- Package Bodies Editor (Oracle)
- Packages Editor (Oracle)
- Primary Keys Editor (Oracle)
- Procedures Editor (Oracle)
- Programs Editor (Oracle)
- Profiles Editor (Oracle)
- Redo Log Groups Editor (Oracle)
- Roles Editor (Oracle)
- Rollback Segments Editor (Oracle)
Oracle Object Editors

- Schedules Editor (Oracle)
- Sequences Editor (Oracle)
- Synonyms Editor (Oracle)
- Tables Editor (Oracle)
- Tables Spaces Editor (Oracle)
- Triggers Editor (Oracle)
- Type Bodies Editor (Oracle)
- Types Editor (Oracle)
- Unique Keys Editor (Oracle)
- Users Editor (Oracle)
- Views Editor (Oracle)

For access to object editors for different supported DBMS platforms and an introduction to editor usage, see Modifying objects using editors.
Check Constraints Editor (Oracle)

The Check Constraints Editor lets you modify and enable/disable check constraints.

**To edit a check constraint**

1. Open an editor on the check constraint. For details, see [Opening an Object Editor](#).

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Definition</strong></td>
<td>Use the Enabled control to enable/disable the check constraint. You can also edit</td>
</tr>
<tr>
<td></td>
<td>the condition in the Check Condition box. The Table Columns button acts a time</td>
</tr>
<tr>
<td></td>
<td>saver in editing the condition. It opens a dialog that lets you select and paste</td>
</tr>
<tr>
<td></td>
<td>column names into the check condition expression.</td>
</tr>
<tr>
<td><strong>DDL View</strong></td>
<td>For details on using this tab, see <a href="#">Viewing the SQL/DDL for an Object</a>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Clusters Editor (Oracle)

The Clusters Editor lets you manage cluster column and table details, view and modify storage and space parameters, and manage performance settings for a cluster.

To edit a cluster

1. Open an editor on the cluster. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Columns</strong></td>
<td>Use the controls in the <strong>General Properties</strong> group to specify a hash or index <strong>Cluster Type</strong> and to specify a <strong>Key Size</strong> for the cluster. If you specify a hash cluster type, use the controls in the <strong>Hash Specifications</strong> group to specify the number of hash keys and to specify use of either the default hash function or a specified expression used as the hash function.</td>
</tr>
<tr>
<td><strong>Storage</strong></td>
<td>Lets you manage storage for a cluster:</td>
</tr>
<tr>
<td><strong>Data Block Storage</strong></td>
<td>Each transaction that updates a data block requires a transaction entry. <strong>Percent Free</strong> - minimum percentage of free space in a block <strong>Percent Used</strong> - minimum percentage of used space in a block. <strong>Initial transactions</strong> - The initial parameter ensures that a minimum number of concurrent transactions can update a data block, avoiding the overhead of allocating a transaction entry dynamically. <strong>Maximum transactions</strong> - The maximum parameter limits concurrency on a data block.</td>
</tr>
<tr>
<td><strong>Extents</strong></td>
<td>The unit of space allocated to an object whenever the object needs more space. <strong>Initial Extent</strong> - The initial space extent (in bytes) allocated to the object. <strong>Next Extent</strong> - The next extent (in bytes) that the object will attempt to allocate when more space for the object is required. <strong>Minimum Extents</strong> - The appropriate minimum extents value for the object. <strong>Maximum Extents</strong> - The appropriate maximum extents value for the object. <strong>Percent Increase</strong> - Magnifies how an object grows and, can materially affect available free space in a tablespace. Select a value in the corresponding box.</td>
</tr>
</tbody>
</table>

Optionally, you can modify the **Percent Free**, **Percent Used**, or **Max Transactions** values.

**Performance** Lets you modify the following performance settings:

| **Parallel Query Option** | Lets you specify **Degrees** and **Instances** settings for processing queries using many query server processes running against multiple CPUs, which provides substantial performance gains such as reduction of the query completion time. |
Clusters Editor (Oracle)

**Cache** group  The **Cache** setting keeps the blocks in memory by placing it at the most recently used end. This option is useful for small lookup tables.

**Space**  Lets you view the following usage and the space distribution details:

- **Space Utilization** group  Displays the percent of space reserved for future updates.

- **FreeLists** group  Displays the allocation of data blocks when concurrent processes are issued against the cluster. Identifying multiple freelists can reduce contention for freelists when concurrent inserts take place and potentially improve the performance of the cluster.

- **Extents** group  The unit of space allocated to an object whenever the object needs more space.

**Tables**  Lets you view details for each cluster column. Details for each column include the key column in the cluster, the clustered table name, and the key column in the table.

**DDL**  For details on using this tab, see [Viewing the SQL/DDL for an Object](#).

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Database Links Editor (Oracle)

The Database Links Editor lets you view connection string information for a database link.

To edit a database link

1. Open an editor on the database link. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Definition</strong></td>
<td>Displays connection string information for a database link. Details include the Public setting, the User name and Password associated with the database link, and a Connect String.</td>
</tr>
<tr>
<td><strong>DDL</strong></td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Directories Editor (Oracle)

The Directories Editor lets you change the path for a directory and modify associated privileges.

To edit a directory object

1. Open an editor on the directory. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Lets you view or modify the SQL code for the directory.</td>
</tr>
<tr>
<td>Privileges</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Disk Groups Editor (Oracle)

This editor lets you work with basic properties, individual disks, and attribute templates for an existing disk group. It also lets you work at the individual file and alias level as well as view current operations executing against the disk group.

**Note:** This functionality is available for Oracle 10 g.

**Note:** When opening the editor, if this is the first time you have initiated a disk group action since connecting, you are prompted to choose between a connection to the ASM instance or to continue using the default datasource connection. For details on the implications, see [Manage ASM Connection](#).

**Note:** If you do not have a connection to the ASM instance, you can view but cannot modify property values in the Disk Groups Editor.

**To edit a disk group:**

1. On a connected Oracle datasource, expand the **Instance** and **ASM** nodes.

2. In the right-hand pane, right-click a disk group and select **Edit** from the context menu.

3. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Later versions of Oracle offer different properties for this object type:</td>
</tr>
</tbody>
</table>

10G  
This tab lets you view the **Name**, **Redundancy Level**, and **Group State** values you chose on creating the disk group. For details on these properties, see [Disk Groups (Oracle) - Properties](#). A **Group Number** for the disk group is also displayed. The **General** group displays properties corresponding to disk group attributes or information available from V$ASM views: **Block Size**, **Total MB**, **Free MB**, **Required Mirror Free MB**, **Usable File MB**, **Offline Disks**, and **Is Unbalanced**. The **Attributes** group displays **Allocation Unit Size**, **Compatibility**, **Database Compatibility**, and **Sector Size** properties.

11GR1  
As of Oracle 11GR1, the **Compatibility** and **Database Compatibility** properties can be modified. For details on these properties, see [Disk Groups (Oracle) - Properties](#). A **Disk Repair Time** property can also be modified.

11GR2  
The **File Access Control Enabled** and **Access Control Unmask** properties let you add ACCESS_CONTROL.ENABLED (whether Oracle ASM File Access Control is enabled for the disk group) or ACCESS_CONTROL.UMASK (a three-digit number that masks out permissions) attributes. Consult Oracle documentation for details on these attributes.
Disks

The Path list on this tab lets you view the disks currently assigned to this disk group. With a Path list disk selected, the Property/Value list displays attributes for that disk. The Creation category shows disk creation and mount date details as well as the setting you chose when adding this disk. For details on these properties, see Disk Groups (Oracle) - Disks. The Property/Value list differs by version:

11GR1 The key differences for the 11gR1 release are the Mode Status, Online Wait, and Offline Timeout controls. Mode Status - Lets you bring a single disk ONLINE or OFFLINE. Online Wait - Enabled when bring a disk ONLINE, lets you select WAIT or NOWAIT. Offline Timeout - Enabled when taking a disk offline, lets you specify the amount of time after which the disk will be dropped after the status changes to OFFLINE.

11GR2 A Type property with REGULAR and QUORUM values is available.
Disk Groups Editor (Oracle)

Volumes (available as of Oracle 11GR2) lets you manage (add, edit, delete) volumes associated with the disk group.

Templates This tab lets you maintain the list of named attributes applied to disks in this disk group. Note that System Templates are automatically created for the disk group when the group is created. For details on template attributes and information on adding, editing, and deleting templates, see Disk Groups (Oracle) - Templates.

Files (disabled unless you have a direct connection to the ASM instance) The Directories list is a representation of the ASM virtual folder. On creation, the list is populated with the system directory hierarchy dictated by the ASM fully qualified file name convention. Use the associated buttons to create new directories, delete user-created directories, or modify the directory name or base directory of a user-created directory. The Files and Aliases list contains files generated automatically as part of database operations (including tablespace creation) and user-created aliases. Selecting a file or alias from the list displays its attributes in the Property/Value list on the right. Use the associated buttons to create an alias to a selected file, delete files or aliases, or modify the name or base directory of a user-created alias.

Operations (disabled unless you have a direct connection to the ASM instance) Displays any commands currently running on the ASM instance.

Users and Groups (available as of Oracle 11GR2) These tabs apply only to Oracle 11GR2 datasources installed on Linux/Unix computers. Permissions/ownership are also dependent on the File Access Control Enabled and Access Control Unmask values on the Properties tab. These tabs lets you manage the File Access Control users and user groups.

DDL View For details on using this tab, see Viewing the SQL/DDL for an Object.

4. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Foreign Keys Editor (Oracle)

The Foreign Keys Editor lets you enable a foreign key, manage its column mappings, and specify a delete rule.

**To edit a foreign key**

1. Open an editor on the foreign key. For details, see [Opening an Object Editor](#).
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Column Mapping</strong></td>
<td>The existing column mapping for the foreign key is represented by selected columns in the <strong>Main Table</strong> and <strong>Referenced Table</strong> lists. Additional candidates in the <strong>Referenced Table</strong> list are indicated by enabled column check boxes. If necessary, use the <strong>Table</strong> dropdown in the <strong>Referenced Table</strong> group to choose a new table for this foreign key. Select or deselect columns in the <strong>Main Table</strong> list and <strong>Referenced Table</strong> list to form the referential constraint between the two tables.</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you set the foreign key as <strong>Enabled</strong> and specify a <strong>Delete Rule</strong> of CASCADE or NO ACTION.</td>
</tr>
<tr>
<td><strong>DDL View</strong></td>
<td>For details on using this tab, see <a href="#">Viewing the SQL/DDL for an Object</a>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Functions Editor (Oracle)

The Functions Editor lets you modify basic properties and modify the CREATE/REPLACE DDL for a function.

To edit a function

1. Open an editor on the function. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view properties in the following categories:</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you view Status and Last Modified details for the function</td>
</tr>
<tr>
<td>Size Information</td>
<td>Lets you view Source Size, Parsed Size, Code Size, and Error Size for the function</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you modify the CREATE OR REPLACE FUNCTION DDL for the function.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Groups Editor (Oracle)

The Groups Editor lets you modify privileges for a group.

To edit a group

1. Open an editor on the group. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object Privileges and System Privileges</td>
<td>For details on using these tabs, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Indexes Editor (Oracle)

The Indexes Editor lets you manage columns, basic properties, storage, space, and partitioning for an index.

To edit an index

1. Open an editor on the index. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Displays a listing of the columns making up the index. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Use the Sort column check box to specify a sort option.</td>
</tr>
<tr>
<td></td>
<td>Click the New button to add a new column to the index.</td>
</tr>
<tr>
<td></td>
<td>Select an existing column and click the Delete button to delete that column from the index.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Attributes</td>
<td>Lets you view IsValid and Function-Based properties. Lets you set Index Type (UNIQUE, NONUNIQUE, BITMAP), No Sort, Logging, Reverse, and Invisible properties.</td>
</tr>
<tr>
<td>Parallel Query</td>
<td>Lets you set the No Parallel Execution property. Lets you set the Parallel Degree and Parallel Instances values.</td>
</tr>
<tr>
<td>Option</td>
<td></td>
</tr>
<tr>
<td>Storage</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Data Block Storage</td>
<td>Lets you choose the Tablespace, and specify Percent Free, Initial Transactions, and Max Transactions values.</td>
</tr>
<tr>
<td>Extents</td>
<td>Lets you specify Initial Extent, Next Extent, Minimum Extents, Maximum Extents, and Percent Increase values.</td>
</tr>
<tr>
<td>Freelists</td>
<td>Lets you specify Freelists and Freelist Groups values.</td>
</tr>
<tr>
<td>Buffer Pool</td>
<td>Lets you specify a buffer pool.</td>
</tr>
<tr>
<td>Space</td>
<td>Lets you view settings in the following categories:</td>
</tr>
<tr>
<td>Space Utilization</td>
<td>Lets you view the Size and number of Blocks settings.</td>
</tr>
<tr>
<td>Statistics</td>
<td>Lets you view Index Level, Distinct Keys, Cluster Factor, Leaf Blocks, Leaf Blks/Key and Data Blks/Key properties.</td>
</tr>
</tbody>
</table>
Partition: If the index is not currently partitioned, you can click the **Convert To Partitioned** button to partition the index. For more information, see [Partitioning Oracle indexes, primary keys, and unique keys](#). If the index is currently partitioned, this tab displays the following partition details:

Properties: Lets you view the **Locality** (Global/Local), **Alignment** (Prefixed/Non-Prefixed), **Partition Type** (RANGE or HASH), and **Subpartition type** properties.

Click the **Edit Partition** button to edit partition details. For more information, see [Partitioning Oracle indexes, primary keys, and unique keys](#).

Click the **Drop Partition** button to revert to an unpartitioned index.

Use the **Partition Commands** menu items to initiate object actions. For details, see the following topics: Allocate Extent, Analyze, Coalesce, Deallocate Unused Space, Mark Unusable - opens a dialog that lets you select one or more partitions/subpartitions to be marked as unusable. Rebuild - opens a dialog that lets you select one or more unusable subpartitions to be rebuilt. Split - opens a dialog that lets you divide a single partition into two partitions. You can split partitions if a single partition is causing maintenance problems because it is too large. **NOTES:** If you are preparing to drop or rebuild an index, mark local indexes as unusable. If you want to make unusable indexes valid or to recover space and improve performance, rebuild the unusable indexes. You cannot split a local index partition defined on a hash or composite table. Make sure that you specify an upper bound for the column that is lower than the upper bound for that column in the original partition.

Columns: Displays partitioning columns.

Partition Definitions: Displays the list of partition definitions. For each partition definition, listing shows the partition definition **Value**, the associated **Tablespace**, and whether the index is **Usable** or has been marked as Unusable by Oracle. Use the **Partition Commands** menu **Mark Unusable** or **Rebuild** commands to change the current **Usable** value.

DDL View: For details on using this tab, see [Viewing the SQL/DDL for an Object](#).

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Job Queue Editor (Oracle)

The Job Queue Editor lets you change the sql procedure specified for the job as well as manage the job’s schedule and status.

To edit a job queue

1. Open an editor on the job queue. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you modify the Submit as disabled, Next Date, Run Again, Every, Time Unit,</td>
</tr>
<tr>
<td></td>
<td>Use Custom Expression, and Custom Expression properties. For details on these</td>
</tr>
<tr>
<td></td>
<td>properties, see Job Queues (Oracle) - Properties. This tab also displays the</td>
</tr>
<tr>
<td></td>
<td>following properties: Job - the unique identifier assigned when the job was created.</td>
</tr>
<tr>
<td></td>
<td>User - the user who submitted the job. Schema User - the user schema for which to</td>
</tr>
<tr>
<td></td>
<td>parse the job. Priv User - the user whose privileges the job is to run under.</td>
</tr>
<tr>
<td>Definition</td>
<td>This tab lets you modify the DBMS_JOB.SUBMIT call’s WHAT parameter, specifying the</td>
</tr>
<tr>
<td></td>
<td>name of the PL/SQL procedure to run.</td>
</tr>
<tr>
<td>DDL</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
## Jobs Editor (Oracle)

The Jobs Editor lets you modify details of a job.

### To edit a job

1. Open an editor on the job. For details, see [Opening an Object Editor](#).

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>For details on using these settings, see <a href="#">Jobs (Oracle) - Properties</a>.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see <a href="#">Viewing the SQL/DDL for an Object</a>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Libraries Editor (Oracle)

The Libraries Editor lets you view and modify library definitions and manage dependencies and privileges for the library.

To edit a library

1. Open an editor on the library. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>The Definition tab of the Libraries Editor lets you modify the file name and path for a library and view the current status and whether the library is dynamic.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Privileges</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Materialized Views Editor (Oracle)

The Materialized Views Editor lets you view and modify materialized view information and partitions.

To edit a materialized view

1. Open an editor on the materialized view. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Information</td>
<td>Lets you work with properties in the following categories:</td>
</tr>
<tr>
<td>Master</td>
<td>Lets you work with the <strong>Table Name</strong> and <strong>Master View</strong> properties.</td>
</tr>
<tr>
<td>Last Refresh</td>
<td>Lets you work with the <strong>Last Date</strong> and <strong>Errors</strong> properties.</td>
</tr>
<tr>
<td>Refresh Configuration</td>
<td>Lets you work with the <strong>Type</strong>, <strong>Refresh Method</strong>, and <strong>Mode</strong> properties.</td>
</tr>
<tr>
<td>Rollback Usage</td>
<td>Lets you work with the <strong>Local</strong> and <strong>Master</strong> properties.</td>
</tr>
<tr>
<td>Options</td>
<td>Lets you work with the <strong>Updatable</strong> and <strong>Enable Query Rewrite</strong> properties.</td>
</tr>
<tr>
<td>Storage</td>
<td>Lets you work with properties in the following categories:</td>
</tr>
<tr>
<td>Placement</td>
<td>Lets you work with <strong>Tablespace</strong> and <strong>Cluster</strong> values.</td>
</tr>
<tr>
<td>Data Block Storage</td>
<td>Lets you work with <strong>Percent Free</strong>, <strong>Percent Used</strong>, <strong>Initial transactions</strong>, and <strong>Maximum transactions</strong> values.</td>
</tr>
<tr>
<td>Extents</td>
<td>Lets you work with <strong>Initial Extent, Next Extent, Minimum Extents, Maximum Extents</strong>, and <strong>Percent Increase</strong> values.</td>
</tr>
<tr>
<td>Performance</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Parallel Query Option</td>
<td>The Parallel server query option lets you process queries using many query server processes running against multiple CPUs. This option provides substantial performance gains such as reduction of the query completion time. <strong>Degrees</strong> - Lets you type a value indicating the number of query server processes that should be used in the operation. <strong>Instances</strong> - Lets you type a value indicating how you want the parallel query partitioned between the Parallel Servers.</td>
</tr>
<tr>
<td>Logging</td>
<td>Select <strong>Logging</strong> to create a log for all Materialized View updates.</td>
</tr>
</tbody>
</table>
Cache: Select Cache if you want Oracle to put data you access frequently at the most recently used end of the list in the buffer cache when a full table scan is performed. This option is useful for small lookup tables.

Query: Displays the associated query.

Partitions
- Partitioning Method: Displays the partitioning method, including Range-Hash Composite or Range-List Composite. Hash partitions partition the table according to a hash function. Composite partitions use both range and hash types, first partitioning the data by a range of values, and then further dividing the partitions into subpartitions by way of a hash function. List partitioning lets you control how rows map to partitions. You can specify a list of discrete values for the partitioning column in the description for each partition.

Row Movement: If its key is updated, migrates the row to a new partition.

Partitioning Columns: Displays partitioning columns.

Subpartitioning Columns: Displays subpartitioning columns.

Partitions: Click Add or Edit to open the Partition dialog. Click Drop to drop a partition.

Subpartition Template: If the partitioning type is Range-Hash Composite, displays a list of subpartitions in the subpartition template. Click Add, Insert, or Edit to open the Subpartition dialog. Click Drop to drop a subpartition.

Dependencies: For details on using this tab, see Working with Object Dependencies.

Privileges: For details on using this tab, see Working with Privileges and Permissions.

DDL View: For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Materialized View Logs Editor (Oracle)

The Materialized View Logs Editor lets you view replication log table details, and manage space, storage, and performance details for a materialized view log.

To edit a materialized view log

1. Open an editor on the materialized view log. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Information</td>
<td>Displays information on the log table used for replication.</td>
</tr>
<tr>
<td>Storage</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td></td>
<td><strong>Data Block Storage</strong> Lets you view the associated Tablespace and Initial Transactions value, and modify the Percent Free, Percent Used, and Max Transactions values.</td>
</tr>
<tr>
<td></td>
<td><strong>Extents</strong> Lets you view Initial Extent, Next Extent, Minimum Extents, Maximum Extents, and Percent Increase values.</td>
</tr>
<tr>
<td></td>
<td><strong>Column Filtering</strong> Lets you select the filter columns to be recorded in the materialized view log. You can specify only one primary key, one ROWID and one filter column list per materialized view log. The ROWID is a globally unique identifier for a row in a database. It is created at the time the row is inserted into a table, and destroyed when it is removed from a table.</td>
</tr>
<tr>
<td>Performance</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td></td>
<td><strong>Parallel Query Option</strong> The Parallel server query option lets you process queries using many query server processes running against multiple CPUs. This option provides substantial performance gains such as reduction of the query completion time. Degrees - Lets you type a value indicating the number of query server processes that should be used in the operation. Instances - Lets you type a value indicating how you want the parallel query partitioned between the Parallel Servers.</td>
</tr>
<tr>
<td></td>
<td><strong>Logging</strong> Select Logging to create a log for all Materialized View updates.</td>
</tr>
<tr>
<td></td>
<td><strong>Cache</strong> Select Cache if you want Oracle to put data you access frequently at the most recently used end of the list in the buffer cache when a full table scan is performed. This option is useful for small lookup tables.</td>
</tr>
</tbody>
</table>

Embarcadero Technologies 1071
Materialized View Logs Editor (Oracle)

**Dependencies** For details on using this tab, see [Working with Object Dependencies](#).

**DDL View** For details on using this tab, see [Viewing the SQL/DDL for an Object](#).

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Outlines Editor (Oracle)

The Outlines Editor lets you view information on an outline, and modify its category and associated SQL statement.

**Note:** The only SQL statements possible with stored outlines are SELECT, DELETE, UPDATE, INSERT...SELECT, and CREATE TABLE...AS SELECT.

**To edit an outline**

1. Open an editor on the outline. For details, see *Opening an Object Editor*.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>In addition to displaying basic creation and identification properties, this tab lets you select a new <strong>Category</strong> for the outline.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you view and modify the SQL Statement associated with the outline.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see <em>Viewing the SQL/DDL for an Object</em>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see *Previewing and Submitting Object Editor Changes*. 
Package Bodies Editor (Oracle)

While listed as separate objects in the Datasource Navigator/Explorer, package bodies are created and edited on the **Body** tab of the Packages Editor. For details, see [Packages Editor (Oracle)](#).
Packages Editor (Oracle)

The Packages Editor lets you view and modify header and body specifications of a package.

To edit package

1. Open an editor on the package. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
<td>Lets you modify the package header specifications.</td>
</tr>
<tr>
<td>Body</td>
<td>Lets you modify the package body specifications.</td>
</tr>
<tr>
<td>Information</td>
<td>Lets you work with status and size properties in the following categories:</td>
</tr>
<tr>
<td>Header</td>
<td>Lets you view Status, Created, and Last Modified, Size, and Source Size, Parsed Size, Code Size, and Error Size details for the header and body of the package.</td>
</tr>
</tbody>
</table>

Dependencies For details on using this tab, see Working with Object Dependencies.

Permissions For details on using this tab, see Working with Privileges and Permissions.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Primary Keys Editor (Oracle)

The Primary Keys Editor lets you manage columns, basic properties, storage and space, and partitions for a primary key.

To edit primary key

1. Open an editor on the primary key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Displays a listing of the columns making up the primary key. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Click the <strong>New</strong> button to add a new column to the index.</td>
</tr>
<tr>
<td></td>
<td>Select an existing column and click the <strong>Delete</strong> button to delete that column from the index.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Enforcing Index</td>
<td>Lets you view <strong>User Defined</strong>, <strong>Index Owner</strong>, and <strong>Index Name</strong> properties.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Lets you work with <strong>No Sort</strong> (only available if <strong>Enabled</strong> is set), <strong>Logging</strong> (YES, NO, or NONE), <strong>Reverse</strong> (disabled if <strong>No Sort</strong> is enabled), <strong>Validate</strong>, <strong>Deferrable</strong>, <strong>Deferred</strong> (IMMEDIATE or DEFERRED and only enabled if <strong>Deferrable</strong> is enabled), <strong>Enabled</strong>, <strong>Cascade</strong> (disabled if <strong>Enabled</strong> is set), <strong>Rely</strong> and <strong>Update Date</strong> properties.</td>
</tr>
<tr>
<td>Storage</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Data Block Storage</td>
<td>Lets you specify <strong>Tablespace</strong>, <strong>Percent Free</strong>, <strong>Initial Transactions</strong>, and <strong>Max Transactions</strong> values. NOTE: You should never place primary keys on the SYSTEM tablespace.</td>
</tr>
<tr>
<td>Extents</td>
<td>Displays <strong>Initial Extent</strong>, <strong>Next Extent</strong>, <strong>Percent Increase</strong>, <strong>Minimum Extents</strong> and <strong>Maximum Extents</strong> values.</td>
</tr>
<tr>
<td>Freelists</td>
<td>Lets you specify <strong>Freelists</strong> and <strong>Freelist Groups</strong> values.</td>
</tr>
<tr>
<td>Buffer Pool</td>
<td>Lets you specify a buffer pool.</td>
</tr>
<tr>
<td>Space</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Space Utilization</td>
<td>Lets you view <strong>Size</strong> and <strong>Blocks</strong> properties.</td>
</tr>
<tr>
<td>Statistics</td>
<td>Lets you view <strong>Index Level</strong>, <strong>Distinct Keys</strong>, <strong>Cluster Factor</strong>, <strong>Leaf Blocks</strong>, <strong>Leaf Blks/Key</strong>, and <strong>Data Blks/Key</strong> properties.</td>
</tr>
</tbody>
</table>
Primary Keys Editor (Oracle)

**Partition**  If the primary key is currently partitioned, this tab displays the following partition details:

**Properties**  Lets you view the **Locality** (Global/Local), **Alignment** (Prefixed/Non-Prefixed), **Partition Type** (RANGE or HASH), and **Subpartition type** properties.

Click the **Edit Partition** button to edit partition details. For more information, see *Partitioning Oracle indexes, primary keys, and unique keys*.

Click the **Drop Partition** button to revert to an unpartitioned primary key.

Use the **Partition Commands** menu items to initiate object actions. For details, see the following topics: Allocate Extent, Analyze, Coalesce, Deallocate Unused Space, Mark Unusable - opens a dialog that lets you select one or more partitions to be marked as unusable. Rebuild - opens a dialog that lets you select a partition to be rebuilt. Split - opens a dialog that lets you divide a single partition into two partitions. You can split partitions if a single partition is causing maintenance problems because it is too large.

**Columns**  Displays partitioning columns.

**Partition Definitions**  Displays details for each partition.

If the primary key is not currently partitioned, you can click the **Convert To Partitioned** button to partition the primary key. For more information, see *Partitioning Oracle indexes, primary keys, and unique keys*.

**DDL View**  For details on using this tab, see *Viewing the SQL/DDL for an Object*.

3. When finished, you can submit your changes. For details, see *Previewing and Submitting Object Editor Changes*. 
Procedures Editor (Oracle)

The Procedures Editor lets you view and modify the SQL code and properties of a procedure.

To edit a procedure

1. Open an editor on the procedure. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with properties in the following categories:</td>
</tr>
<tr>
<td></td>
<td>Properties  Lets you view Status, and Last Modified properties.</td>
</tr>
<tr>
<td></td>
<td>Size Information  Lets you view Source Size, Parsed Size, Code Size, and Error Size</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you modify the SQL code for a procedure.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Profiles Editor (Oracle)

The Profiles Editor lets you manage limits and manage user assignments for the profile.

To edit a profile

1. Open an editor on the profile. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resources</td>
<td>Let you work with settings in the following categories:</td>
</tr>
<tr>
<td>General Limits</td>
<td>Lets you specify <strong>Composite Limit</strong> and <strong>Private SGA</strong> settings.</td>
</tr>
<tr>
<td>Session Limits</td>
<td>Lets you specify the limit on the amount of private space a session can allocate in the shared pool of the SGA. Specific settings are <strong>Sessions Per User</strong>, <strong>CPU Per Session</strong>, <strong>Logical Reads</strong>.</td>
</tr>
<tr>
<td>Time Limits</td>
<td>Lets you specify the limit on total connection time per session. Specific settings are <strong>Connect Time</strong> and <strong>Idle Time</strong>.</td>
</tr>
<tr>
<td>Call Limits</td>
<td>Lets you specify the CPU time limit for a call (a parse, execute, or fetch), expressed in hundredths of seconds. Specific settings are <strong>CPU Per Call</strong> and <strong>Logical Reads</strong>.</td>
</tr>
<tr>
<td>Login Limits</td>
<td>Lets you specify the number of <strong>Failed Login Attempts</strong> on the user account before the account is locked and the <strong>Account Lock Time</strong>.</td>
</tr>
<tr>
<td>Password Limits</td>
<td>Lets you specify the <strong>Lifetime</strong>, <strong>ReuseTime</strong>, <strong>Reuse Max</strong>, <strong>Grace Period</strong> and a <strong>Verify Function</strong> for passwords.</td>
</tr>
<tr>
<td>Users</td>
<td>Use the <strong>Assign</strong> button to open a dialog that lets you assign a user to this profile or select a user from the list, and click the <strong>Unassign</strong> button to open a dialog prompting you to confirm that the user is to be unassigned.</td>
</tr>
<tr>
<td>DDL</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Programs Editor (Oracle)

The Programs Editor lets you modify details of a program.

To edit a program

1. Open an editor on the program. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>For details on using these settings, see Programs (Oracle) - Action.</td>
</tr>
<tr>
<td>Arguments</td>
<td>For details on using these settings, see Programs (Oracle) - Arguments.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
The Redo Log Groups Editor lets you manage the members in a redo log group.

To edit a redo log group

1. Open an editor on the redo log group. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Redo Log Members</td>
<td>Lets you add new members to the redo log group, edit existing members, and delete members from the redo log group.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Roles Editor (Oracle)

The Roles Editor lets you manage authentication and grant/revoke profiles for users and logins.

To edit a role

1. Open an editor on the role. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>Lets you manage role identity. When creating a role, you must establish certain rules governing its use. You can specify whether or not a role must be identified when used. If you require role identification, you can authenticate the user externally through the operating system, or with a specific password. If you specified that the role requires identification, provide a Password and specify whether the role is to be authenticated Globally or Externally.</td>
</tr>
<tr>
<td>User/Roles</td>
<td>Displays permissions for this role to logins or users. Click Grant to open a dialog that lets you grant this role to a login or another role. Select a role or login and click Revoke to revoke the role or login.</td>
</tr>
<tr>
<td>Object Privileges</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>and System Privileges</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.

For information on activating and deactivating roles for the current login in the current session, see Role Activation.
Rollback Segments Editor (Oracle)

The Rollback Segments Editor lets you view rollback segment status, manage rollback segment storage, and view activity levels.

To edit a rollback segment

1. Open an editor on the rollback segment. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Status</strong></td>
<td>Lets you enable and disable a rollback segment and displays status details for the rollback segment. The tab displays whether the rollback segment is online or offline and provides the associated <strong>Tablespace</strong>, <strong>Size</strong>, and <strong>No. of Extents</strong>.</td>
</tr>
<tr>
<td><strong>Storage</strong></td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td><strong>Extents</strong></td>
<td>The unit of space allocated to an object whenever the object needs more space.</td>
</tr>
<tr>
<td><strong>Initial Extent</strong></td>
<td>The initial space extent (in bytes) allocated to the object.</td>
</tr>
<tr>
<td><strong>Next Extent</strong></td>
<td>The next extent (in bytes) that the object will attempt to allocate when more space for the object is required.</td>
</tr>
<tr>
<td><strong>Optimal Size</strong></td>
<td>Optimal extent size</td>
</tr>
<tr>
<td><strong>Minimum Extents</strong></td>
<td>The appropriate minimum extents value for the object.</td>
</tr>
<tr>
<td><strong>Maximum Extents</strong></td>
<td>The appropriate maximum extents value for the object.</td>
</tr>
<tr>
<td><strong>Extent Detail</strong></td>
<td>Displays extent details.</td>
</tr>
<tr>
<td><strong>Activity</strong></td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td><strong>Activity Levels</strong></td>
<td>Displays <strong>Active Transactions</strong>, <strong>Writes</strong>, <strong>Gets</strong> and <strong>Waits</strong> values.</td>
</tr>
<tr>
<td><strong>Dynamic Sizing</strong></td>
<td>Displays <strong>High Watermark</strong>, <strong>Extends</strong>, ** Shrinks**, and <strong>Wraps</strong> values.</td>
</tr>
<tr>
<td><strong>DDL</strong></td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Schedules Editor (Oracle)

The Schedules Editor lets you modify details of a schedule.

To edit a schedule

1. Open an editor on the schedule. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>For details on using these settings, see Schedules (Oracle) - Properties.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Sequences Editor (Oracle)

The Sequences Editor lets you manage parameters for a sequence, manage database objects dependent on the sequence, and manage privileges for the sequence.

To edit a sequence

1. Open an editor on the sequence. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Parameters</td>
<td>Lets you specify increment, minimum value and maximum value settings.</td>
</tr>
<tr>
<td>Current/Next Sequence Numbers</td>
<td>Lets you work with sequence cycle numbers.</td>
</tr>
<tr>
<td>Options</td>
<td>Lets you specify Cache Size, Cycle When Reach Max/Min, and Generate Numbers in Order (useful when you are using the sequence number as a timestamp) values.</td>
</tr>
</tbody>
</table>

Dependencies For details on using this tab, see Working with Object Dependencies.

Privileges For details on using this tab, see Working with Privileges and Permissions.

DDL For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Synonyms Editor (Oracle)

The Synonyms Editor lets you view base object information and manage database objects dependent on a synonym.

To edit a synonym

1. Open an editor on the synonym. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays the type, owner, name, and other details of the object referenced by the synonym.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
The Tables Editor lets you manage columns, constraints, storage and space, and partitions for a table.

**To edit a table**

1. Open an editor on the table. For details, see [Opening an Object Editor](#).
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Columns</strong></td>
<td>Displays the currently defined columns in the table. For any selected column, the Property/Value list provides additional detail on that column. Available properties depend on the datatype you choose as well as on the property values you select: Virtual - indicates whether this column is defined as an Oracle virtual column. If selected, the value is provided by the calculation in the Default Value box. Datatype properties- Lets you select a type and depending on your selection, additional properties such as Scale, Width, and Unused may be available. Allow Nulls - Select this check box to allow nulls in this column. Encryption properties include Password, Salted, and EncryptionAlgorithm. Default Value - If Virtual is selected, this box lets you specify a valid Oracle column expression. Otherwise, it can contain a pseudocolumn (CURRENT_TIMESTAMP, USER, SYSDATE, or UID) or an expression. lets you choose among CURRENT_TIMESTAMP, USER, SYSDATE, and UID. Comment lets you add a comment to the column. LOB Storage settings are available for bfile, blob, clob, and nclob types. They include Segment Name. Configuration properties (Tablespace, Chunk, Percent Version, Enable Storage In Row, Cache, and Logging), and Storage properties (Initial Extent, Next Extent, Percent Increase, Minimum Extents, Maximum Extents, Free Lists, and Free List Groups). Optionally, you can:</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td><strong>Table</strong></td>
<td>Lets you work with the following properties, corresponding to CREATE TABLE clauses: Cache, Row Movement, Parallel Degree, and Parallel Instances.</td>
</tr>
<tr>
<td><strong>Physical</strong></td>
<td>Lets you view the Row Organization property. Lets you set the Logging and Table Compression properties.</td>
</tr>
</tbody>
</table>
Tables Editor (Oracle)

Indexes  
Lets you manage indexes for a table. On opening, the list of current indexes for the table is displayed. Optionally, take one of the following actions:

- Click **Add** to open a dialog that lets you add a new index to the table.
- Select an index and click **Edit** to open a dialog that lets you edit index properties.
- Select an index and click **Drop** to open a dialog that lets you remove the index from the table.

Constraints  
Lets you manage constraints for the table. Constraints are grouped by type, under folders. Optionally take one of the following actions:

- Select a constraint type folder and click **Add** to open a dialog that lets you add a constraint of that type.
- Select a constraint and click **Edit** to open a dialog that lets you modify the constraint details.
- Select a constraint and click **Drop** to remove the constraint.

Storage  
Lets you work with settings in the following categories:

- **Data Block Storage**  
  Lets you choose the **Tablespace Name**, and specify **Percent Free, Initial Transactions**, and **Max Transactions** values.

- **Extents**  
  Lets you view **Initial Extent, Next Extent, Minimum Extents, Maximum Extents, and Percent Increase** values.

- **Freelists**  
  Lets you specify **Freelists** and **Freelist Groups** values.

- **Bufferpool**  
  Lets you specify a **Buffer Pool**.

IOT Properties  
Lets you work with settings in the following categories:

- **Ungrouped**  
  Lets you specify an overflow segment.

- **Percent Threshold**  
  Lets you specify the percentage of space reserved for an index-organized table.

- **Key Compression**  
  Lets you enable or disable compression and provide a compression value.

Space  
Lets you work with settings in the following categories:

- **Space Utilization**  
  Lets you view **Size** and number of **Blocks**.

- **Row Information**  
  Lets you view the **Number of Rows, Average Row Length**, and **Chain Rows** properties.
Tables Editor (Oracle)

</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
# Tablespace Editor (Oracle)

The Tablespace Editor lets you manage datafiles, space, storage, quotas, and objects for a tablespace.

**To edit a tablespace**

1. Open an editor on the tablespace. For details, see *Opening an Object Editor*.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Datafiles</td>
<td>The tab lists details for each datafile on the tablespace. Optionally you can add or delete files or edit file attributes. For detailed information on using this tab, see <em>Tablespaces (Oracle) - Datafiles</em>.</td>
</tr>
<tr>
<td>Properties</td>
<td>This tab lets you view the Name, Big File, Type, Encrypted, Locally Managed, Minimum Extent Size, Uniform Allocation, Use Default Block Size, Block Size, Automatic Segment Space Management, Initial Extent, Next Extent, Minimum Extents, Maximum Extents, and Percent Increase properties. This tab lets you modify the Status, Logging, Force Logging, and Compression Type properties. For more information on these properties, see <em>Tablespaces (Oracle) - Properties</em>.</td>
</tr>
<tr>
<td>Extent Details</td>
<td>Provides details (Name, Type, File ID, Extent ID, Block ID, Blocks, and Bytes) for each extent in the tablespace.</td>
</tr>
<tr>
<td>Space</td>
<td>Displays free blocks versus used blocks statistics for the tablespace, including a pie chart representation.</td>
</tr>
<tr>
<td>Map</td>
<td>This tab presents a graphical, segment map of the tablespace. The map is color-coded to show usage of each segment (FREE, SELECTED, OTHER, TEMPORARY, ROLLBACK, CACHE, TABLE, INDEX, TABLE PARTITION, NESTED TABLE, INDX PARTITION, INDX SUBPARTITION, TEXT, CLUSTER, LOB, LOBSEGMENT, LOBINDEX, or LOB PARTITION). Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Click <strong>Legend</strong> to view the color legend of the map.</td>
</tr>
<tr>
<td></td>
<td>Hover the mouse over a segment to display its Segment ID, Block ID, Size (kb), Size (in blocks), Tablespace File ID, and Segment Type details.</td>
</tr>
<tr>
<td></td>
<td>Click <strong>Display</strong> to open a window that aids in navigating the graphical segment map. The Overview window displays a smaller version of the segment map. The selected area can be dragged up and down the window, displaying the selected area in the larger, main map. The selected area can also be resized, to display a larger or smaller area in the main map.</td>
</tr>
<tr>
<td></td>
<td>Select an INDEX or TABLE segment on the map and click <strong>Reorganize</strong> to initiate a Rebuild Indexes or Reorganize (respectively) action. For details, see <em>Rebuild Index</em> and Reorganize /Reorg.</td>
</tr>
<tr>
<td></td>
<td>The <strong>Object Demographics</strong> area provides a tabular representation of the tablespace map. It provides details on a segment-by-segment basis.</td>
</tr>
</tbody>
</table>
For background information, see About Oracle Tablespace Storage.

**Objects**  Displays the objects currently stored on the tablespace, grouped under object type folders. Optionally you can:

Specify a logging option using the Log Changes When Scheme/Data is Modified? radio set.

Select an object under one of the object folders and click Edit to open an object editor on that object.

**Quotas**  Oracle limits the amount of space that can be allocated for storage of a user's objects within the specified tablespace to the amount of the quota. Users with privileges to create certain types of objects can create those objects in the specified tablespace. The Quotas tab of the Tablespace editor lets you manage user space quotas for tablespaces on the current datasource. Optionally, you can:

Click Add or select a user and click Edit to assign a user unlimited or a specific space usage quota on the tablespace. For details, see Adding or Editing User Tablespace Quotas.

Select an existing user and click Drop to delete the quota for that user.

**DDL View**  For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.

**Adding or Editing User Tablespace Quotas**

When you assign a quota:

- Users with privileges to create certain types of objects can create those objects in the specified tablespace.

- Oracle limits the amount of space that can be allocated for storage of a user's objects within the specified tablespace to the amount of the quota.

**Note:** This functionality is available for Oracle only.

User tablespace quotas are added and modified from the Tablespaces editor.

The table below describes the options and functionality on the Add User Quota... or Edit User Quota... dialogs:
About Oracle Tablespace Storage

The Storage tab of the Tablespace Editor lets you view storage details for tablespaces on the current datasource.

Tip: Always create tablespaces for user data and never place user tables and indexes in the SYSTEM tablespace. Placing user objects in the SYSTEM tablespace can degrade performance and introduce space-related headaches to the database.

Oracle or later supports locally managed tablespaces, which can all but eliminate the problem of tablespace fragmentation. It totally does away with the storage parameters of MINEXTENTS, MAXEXENTS, PCTINCREASE, and NEXT. With locally managed tablespaces you either specify the initial extent size and let Oracle automatically size all other extents, or specify a uniform extent size for everything.

Tip: One of the best ways to avoid fragmentation in a tablespace is to pre-allocate the space that your objects will use. If possible, plan for one to two years' growth for each object and allocate your space accordingly. Having initial empty objects will not affect table scan times as Oracle only scans up to the high-water mark (the last used block) in a table.

Of all your tablespaces, you want to avoid fragmentation problems in your SYSTEM tablespace the most as this is the major hotbed tablespace for Oracle activities. The easiest way to avoid this is to not allow any user (even the default DBA ID's SYS and SYSTEM) to have access to it. There are three ways to do this:

- Ensure no user has a DEFAULT or TEMPORARY tablespace assignment of SYSTEM.
- Ensure no user has a quota set for SYSTEM.

Ensure no user has been granted the UNLIMITED TABLESPACE privilege.
Triggers Editor (Oracle)

The Triggers Editor lets you modify actions, events, and other details for a trigger.

To edit a trigger

1. Open an editor on the trigger. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>In addition to displaying basic identification and creation properties, this tab lets you work with settings in the following categories:</td>
</tr>
<tr>
<td>Attributes</td>
<td>Lets you specify whether the trigger is Enabled, select the Trigger Timing (BEFORE, AFTER, COMPOUND), and the Trigger Type (ROW, STATEMENT).</td>
</tr>
<tr>
<td>Correlation Names</td>
<td>Lets you provide an Old Table Alias and a New Table Alias as well as construct a When Clause.</td>
</tr>
<tr>
<td>Status</td>
<td>Lets you view Object Status, Create Date, Last Modified, and Base Object Type properties.</td>
</tr>
<tr>
<td>Size Information</td>
<td>Lets you view Source Size, Parsed Size, Code Size, and Error Size properties. For detailed information on these properties, see Triggers (Oracle) - Properties.</td>
</tr>
<tr>
<td>Events</td>
<td>Lets you select the DDL, DML, or Database manipulation events that fire this trigger. For detailed information, see Triggers (Oracle) - Events.</td>
</tr>
<tr>
<td>Column Selection</td>
<td>For triggers firing on UPDATE events, lets you work with the associated columns. For detailed information, see Triggers (Oracle) - Column Selection.</td>
</tr>
<tr>
<td>Action</td>
<td>Lets you modify the trigger action PL/SQL block for any trigger on the datasource. You modify the body of the trigger in the Trigger Action (PL/SQL Block) area. For detailed information, see Triggers (Oracle) - Action.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Type Bodies Editor (Oracle)

The Type Bodies Editor contains the code for the methods that implement an object type. To create or replace a type body in one of your schema, you must have the CREATE TYPE or CREATE ANY TYPE system privilege. To replace a type in another user’s schema, you must have the DROP ANY TYPE system privilege.

While listed as separate objects in the Datasource Navigator/Explorer, type bodies are created and edited on the Body tab of the Types Editor. For details, see Types Editor (Oracle).
Types Editor (Oracle)

The Types Editor lets you manage header text and body text for a type.

To edit a type

1. Open an editor on the type. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
<td>Lets you manage the type header text.</td>
</tr>
<tr>
<td>Body</td>
<td>Lets you create and modify type body text for the type.</td>
</tr>
<tr>
<td></td>
<td>For information on creating type bodies, see Object Types Wizard (Oracle).</td>
</tr>
<tr>
<td>Information</td>
<td>Displays the header and body information for a type.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Privileges</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Unique Keys Editor (Oracle)

The Unique Keys Editor lets you manage columns, basic properties, storage and space, and partitions for a unique key.

To edit a unique key:

1. Open an editor on the unique key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Displays a listing of the columns making up the index. Details include the Column name, the Datatype, and whether the definition allows Nulls. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Click the New button to add a new column to the index.</td>
</tr>
<tr>
<td></td>
<td>Select an existing column and click the Delete button to delete that column from the index.</td>
</tr>
<tr>
<td>Properties</td>
<td>In addition to displaying basic identification information, this tablets you work with settings in the following categories:</td>
</tr>
<tr>
<td></td>
<td>Enforcing Index Lets you view User-Defined, Index Owner, and Index Name settings.</td>
</tr>
<tr>
<td></td>
<td>Attributes Lets you set No Sort, Logging, Reverse, Validate, Deferrable, Deferred, Enabled, Cascade, Rely, and Update Date properties.</td>
</tr>
<tr>
<td>Storage</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td></td>
<td>Data Block Storage Lets you choose the Tablespace Name, and specify Percent Free, Initial Transactions, and Max Transactions values.</td>
</tr>
<tr>
<td></td>
<td>Extents Lets you specify Initial Extent, Next Extent, Minimum Extents, Maximum Extents, and Percent Increase values.</td>
</tr>
<tr>
<td></td>
<td>Freelists Free lists let you manage the allocation of data blocks when concurrent processes are issued against the cluster. Identifying multiple free lists can reduce contention for free lists when concurrent inserts take place and potentially improve the performance of the cluster. This tab lets you specify Freelists and Freelist Groups values.</td>
</tr>
<tr>
<td></td>
<td>Buffer Pool Lets you select a Buffer Pool.</td>
</tr>
<tr>
<td>Space</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td></td>
<td>Space Utilization Displays the Size and number of Blocks properties.</td>
</tr>
<tr>
<td></td>
<td>Statistics Lets you view Index Level, Distinct Keys, Cluster Factor, Leaf Blocks, Leaf Blks/Key and Data Blks/Key settings.</td>
</tr>
</tbody>
</table>
**Extents**
The unit of space allocated to an object whenever the object needs more space. This tab lets you view **Number of Extents** and **Maximum Extents** properties.

**Partition**
If the unique key is currently partitioned, this tab displays the following partition details:

**Properties**
Lets you view the **Locality** (Global/Local), **Alignment** (Prefixed/Non-Prefixed), **Partition Type** (RANGE or HASH), and **Subpartition type** properties.

Click the **Edit Partition** button to edit partition details. For more information, see [Partitioning Oracle indexes, primary keys, and unique keys](#).

Click the **Drop Partition** button to revert to an unpartitioned unique key.

Use the **Partition Commands** menu items to initiate object actions. For details, see the following topics: Allocate, Extent, Analyze, Coalesce, Deallocate, Unused Space, Dealocate, Rebuild, and Split.

**Columns**
Displays partitioning columns.

**Partition Definitions**
Displays details for each partition.

If the unique key is not currently partitioned, you can click the **Convert To Partitioned** button to partition the unique key. For more information, see [Partitioning Oracle indexes, primary keys, and unique keys](#).

**DDL View**
For details on using this tab, see [Viewing the SQL/DDL for an Object](#).

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Users Editor (Oracle)

The Users Editor lets you manage basic properties, roles, tablespace quotas, and associated objects for a user.

To edit a user

1. Open an editor on the user. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td></td>
<td><strong>Defaults</strong> Lets you select a Default Tablespace and Temporary Tablespace as well as select the Profile used by this user. For more on creating profiles, see Profiles Wizard (Oracle).</td>
</tr>
<tr>
<td></td>
<td><strong>Account Identified By</strong> - Lets you select among REQUIRED YES, REQUIRED EXTERNAL, and REQUIRED_GLOBAL. <strong>Password</strong> - (available with Identified By value of REQUIRED_YES only) lets you specify a password. <strong>External Name</strong> - (available with Identified By value of REQUIRED_GLOBAL only) lets you specify the name of the user in the enterprise directory service. <strong>Account Locked</strong> - lets you lock this user account. <strong>Password Expired</strong> - (available with Identified By value of REQUIRED_YES only) lets you mark the password as expired, forcing the user to change their password before being allowed to connect.</td>
</tr>
<tr>
<td>Role</td>
<td>Lets you select the roles that are to be assigned to this user.</td>
</tr>
<tr>
<td>Quota</td>
<td>Lets you set tablespace quotas for the user. Set an unlimited quota by selecting a tablespace and selecting the Unlimited radio button. Set a specific quota by selecting a tablespace, selecting the Other radio button, and providing a Quota value in kilobytes or megabytes.</td>
</tr>
<tr>
<td>Objects</td>
<td>Lets you manage database objects associated with a user. Objects are grouped within object type folders. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Select an object and click <strong>Edit</strong> to open an object editor on the selected object.</td>
</tr>
<tr>
<td></td>
<td>Select an object and click <strong>Drop</strong> to initiate dropping the selected object.</td>
</tr>
</tbody>
</table>
Object Privileges and System Privileges

DDL View

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Views Editor (Oracle)

The Views Editor lets you work with view columns and manage the dependencies and permissions for the view.

To edit a view

1. Open an editor on the view. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:
   
<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays a listing of the columns making up the view.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you view and modify the DDL that will implement any changes made with the editor.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Partitioning Oracle indexes, primary keys, and unique keys

The Add Partition wizard lets you partition an Oracle index, primary key, or unique key.

To partition an index, primary key, or unique key

1. Open an editor on the index, primary key, or unique key. For details, see Opening an Object Editor.

2. On the Partition tab, click Convert to Partitioned.

Note: If the object is already partitioned, the Convert to Partitioned button is not present.

3. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>In addition to displaying basic identification and ownership properties, this pane lets you work with the following settings: Locality - GLOBAL or LOCAL. Alignment - displays whether this partitioned object is prefixed or non-prefixed. Partition Type - RANGE or HASH. Subpartition Type - displays the subpartition type.</td>
</tr>
<tr>
<td>Columns</td>
<td>For each column to be added, click New to add a column, select a Column name, and specify a Sort order.</td>
</tr>
<tr>
<td>Range Definitions (only available for a Partition Type of RANGE)</td>
<td>Lets you create an ordered list of partitions. For each partition, click New to open the Add Partition Definition wizard. On the Partition Definition pane, provide a Name, select a Tablespace, and enable or disable Logging. On the Storage pane, provide Data Block Storage, Extents, and Freelists property values. Click Add. The Range Definitions pane also lets you edit and remove partitions.</td>
</tr>
<tr>
<td>Hash Definitions (only available for a Partition Type of HASH)</td>
<td>Lets you specify a Partition method: NoneNumber of Partitions - Specify a Number of Partitions, and then for each partition, click the New button and select a tablespace. By Partition Name - For each partition, click New, specify a Name and select a Tablespace.</td>
</tr>
</tbody>
</table>

4. When ready, click Finish.
PostgreSQL Object Editors

You modify PostgreSQL objects using the following wizards:

- Check Constraints Editor (PostgreSQL)
- Domains Editor (PostgreSQL)
- Exclusion Constraints, Primary Keys, or Unique Keys Editors (PostgreSQL)
- Foreign Keys Editor (PostgreSQL)
- Functions Editor (PostgreSQL)
- Indexes Editor (PostgreSQL)
- Roles Editor (PostgreSQL)
- Rules Editor (PostgreSQL)
- Schemas Editor (PostgreSQL)
- Tables Editor (PostgreSQL)
- Tablespaces Editor (PostgreSQL)
- Triggers Editor (PostgreSQL)
- Types Editor (PostgreSQL)
- Views Editor (PostgreSQL)
Check Constraints Editor (PostgreSQL)

The Check Constraints Editor lets you view or modify check constraints properties.

To edit a check constraint

1. Open an editor on the check constraint. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view or modify properties defined when creating the object. For details on these properties, see Check Constraints Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>
3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Commits Editor (PostgreSQL)

The Domains Editor lets you view or modify domain properties.

To edit a domain

1. Open an editor on the domain. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view or modify properties defined when creating the object. For details on these properties, see Domains Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Constraints</td>
<td>Lets you add, drop, or edit constraints on this object. For details on these properties, see Domains Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Exclusion Constraints, Primary Keys, or Unique Keys Editors (PostgreSQL)

The Exclusion Constraints Editor, Primary Keys Editor, and Unique Keys Editor offer the same steps in modifying these PostgreSQL objects.

To edit an exclusion constraint, primary key, or unique key

1. Open an editor on the target object. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view or modify properties defined when creating the object. For details on these properties, see Exclusion Constraints, Primary Keys, and Unique Keys Wizards (PostgreSQL).</td>
</tr>
<tr>
<td>Columns</td>
<td>Lets you work with the columns designated for this object. For details, see Exclusion Constraints, Primary Keys, and Unique Keys Wizards (PostgreSQL).</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Statistics</td>
<td>Displays the following pg_stat_all_indexes or pg_statio_all_table view statistics: Scans, Keys Read, Rows Fetched, Blocks Read, Buffer Hits, and Index Size.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Foreign Keys Editor (PostgreSQL)

The Foreign Keys Editor lets you view or modify column mapping and properties for a foreign key.

To edit a foreign key

1. Open an editor on the foreign key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Mapping</td>
<td>Lets you work with the columns of the main table and mapped referenced table columns for this foreign key. For details, see Foreign Keys Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you view or modify properties defined when creating the object. For details on these properties, see Foreign Keys Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Functions Editor (PostgreSQL)

The Functions Editor lets you view or modify the function body, parameters, and properties for a function.

To edit a function

1. Open an editor on the function. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you modify the settings defined when the function was created or last edited. For details on these properties, see Functions Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Parameters</td>
<td>Lets you modify the function inputs and outputs defined when the function was created or last edited. For details on these settings on this tab, see Functions Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Body</td>
<td>Lets you modify the function definition specified when the function was created or last edited. For details on working with this tab, see Functions Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Indexes Editor (PostgreSQL)

The Indexes Editor lets you view or modify the columns and properties for an index.

To edit an index

1. Open an editor on the index. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view or modify properties defined when creating the object. For details on these properties, see Indexes Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Columns</td>
<td>Lets you modify the columns that make up the index. For details, see Indexes Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Roles Editor (PostgreSQL)

The Roles Editor lets you manage properties and users for a role.

To edit a role

1. Open an editor on the role. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you modify the properties set for the role when it was created or last edited. For details on these properties, see Roles Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Membership</td>
<td>Lets you modify the set of users GRANTED to the role. For details, see Roles Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Rules Editor (PostgreSQL)

The Rules Editor lets you view or modify rules properties.

To edit a rule

1. Open an editor on the rules. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view or modify properties defined when creating the object. For details on these properties, see Rules Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Schemas Editor (PostgreSQL)

The Schemas Editor lets you change the owner of a schema, manage its permissions, and view referencing and referenced dependencies.

To edit a schema

1. Open an editor on the schema. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you modify the Owner of the schema.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Tables Editor (PostgreSQL)

The Tables Editor lets you manage settings for an existing table.

To edit a table

1. Open an editor on the table. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>In addition to displaying the identification properties for this table, this tab lets you view the Persistence setting. You can modify the Tablespace, With OIDS, Fill Factor, Table Autovacuum, and Toast Table Autovacuum settings. For details on these properties, see Tables Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Ancestors</td>
<td>This tab/panel lets you modify a table’s INHERITS clause. For each table to be added to the list, use the New button to enable a dropdown that lets you select a table. Use the Delete button to remove a selected table from the list.</td>
</tr>
<tr>
<td>Columns</td>
<td>Displays the currently defined columns in the table. For any selected column, the Property/Value list provides additional detail on that column. Available properties depend on the datatype you choose as well as on the property values you select. For details on working with this tab, see Tables Wizard (PostgreSQL). You can add a column by clicking Add Column, providing a name for the new column, and set its property values. Similarly, select a column and click Delete to remove the column from the table. Lastly, change a column’s position by selecting the column and using the arrow buttons.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Constraints</td>
<td>Lets you manage constraints for the table. Constraints are grouped by type, under folders. Optionally take one of the following actions: To add a constraint, select a constraint type folder and click Add to open a dialog that lets you add a constraint of that type. To edit a constraint, select a constraint and click Edit to open a dialog that lets you modify the constraint details. To delete a constraint, select a constraint and click Drop to remove the constraint.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Tablespaces Editor (PostgreSQL)

The Tablespaces Editor lets you manage properties and permissions as well as view dependencies for a tablespace.

To edit a tablespace

1. Open an editor on the tablespace. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view or modify settings specified when the tablespace was created or most recently edited. For details on these properties, see Tablespaces Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Triggers Editor (PostgreSQL)

The Triggers Editor lets you manage properties and targeted columns for a trigger.

To edit a trigger

1. Open an editor on the trigger. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view or modify settings specified when the trigger was created or most recently edited. For details on these properties, see Triggers Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Column Selection</td>
<td>Lets you view or modify columns targeted when the trigger was created or most recently edited. For details on these settings on this tab, see Triggers Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Types Editor (PostgreSQL)

The Types Editor lets you view or modify type properties.

To edit a type

1. Open an editor on the type. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view or modify properties defined when creating the object. For details on these properties, see Types Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Range Kind</td>
<td>Lets you view or modify the Range Kind defined when creating the object. For details on these properties, see Types Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Base Kind</td>
<td>Lets you view or modify the Base Kind defined when creating the object. For details on these properties, see Types Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Views Editor (PostgreSQL)

The Views Editor lets you manage settings for an existing view.

To edit a view

1. Open an editor on the view. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you modify the settings defined when the function was created or last edited. For details on these properties, see Views Wizard (PostgreSQL).</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you modify the DDL originally generated to create the view.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Comment</td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Sybase ASE Object Editors

An Object Editor is offered for all supported Sybase ASE objects. To see an Editor for a specific object, click the corresponding link below:

Note: If an object has dependent objects, such as tables, triggers, procedures and views, you can view and access their dependent objects in the editor.

- Aliases Editor (Sybase ASE)
- Check Constraints Editor (Sybase ASE)
- Database Devices Editor (Sybase ASE)
- Databases Editor (Sybase ASE)
- Data Cache Editor (Sybase ASE)
- Defaults Editor (Sybase ASE)
- Dump Devices Editor (Sybase ASE)
- Extended Procedures Editor (Sybase ASE)
- Foreign Keys Editor (Sybase ASE)
- Functions Editor (Sybase ASE)
- Groups Editor (Sybase ASE)
- Indexes Editor (Sybase ASE)
- Logins Editor (Sybase ASE)
- Primary Keys Editor (Sybase ASE)
- Procedures Editor (Sybase ASE)
- Remote Servers Editor (Sybase ASE)
- Roles Editor (Sybase ASE)
- Rules Editor (Sybase ASE)
- Segments Editor (Sybase ASE)
- Tables Editor (Sybase ASE)
- Triggers Editor (Sybase ASE)
- Unique Keys Editor (Sybase ASE)
- User Datatypes Editor (Sybase ASE)
- User Messages Editor (Sybase ASE)
Sybase ASE Object Editors

- Users Editor (Sybase ASE)
- Views Editor (Sybase ASE)

For access to object editors for different supported DBMS platforms and an introduction to editor usage, see Modifying objects using editors.
Aliases Editor (Sybase ASE)

The Aliases Editor lets you view and modify an alias definition.

To edit an alias

1. Open an editor on the alias. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you change the user referenced by the alias.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Check Constraints Editor (Sybase ASE)

The Check Constraints Editor lets you manage a check constraint definition and modify the condition expression.

To edit a check constraint

1. Open an editor on the check constraint. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Lets you edit the condition in the Check Condition box. The Table Columns button acts a time saver in editing the condition. It opens a dialog that lets you select and paste column names into the check condition expression. NOTE: If the Check Condition box shows a Source text for this compiled object is hidden message, source text for this compiled object has been hidden. For more information, see Hide Text.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Database Devices Editor (Sybase ASE)

The Database Devices Editor lets you view or modify basic properties of a database device and view space usage details.

To edit a database device

1. Open an editor on the database device. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td></td>
<td>Attributes and Autogrowth For information on working</td>
</tr>
<tr>
<td></td>
<td>with properties in these categories, see Database Devices (Sybase ASE) - Properties.</td>
</tr>
<tr>
<td></td>
<td>Page range The First Virtual Page and Last Virtual Page numbers for the target database device.</td>
</tr>
<tr>
<td></td>
<td>Mirror These controls are only enabled if mirroring is enabled on the server. Mirrored - enables/disables mirroring for this device. Mirror Enabled - enables/disables the existing mirror. Mirror Name - name of the existing mirror.</td>
</tr>
<tr>
<td></td>
<td>Space Details include the Device Size, SpaceUsed, FreeSpace, and the size and usage for all Database fragments.</td>
</tr>
<tr>
<td></td>
<td>DDL View For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Databases Editor (Sybase ASE)

The Databases Editor lets you manage properties, placement, and binds for a database as well as view associated space statistics.

To edit a database

1. Open an editor on the database. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>For information on working with these settings, see Databases (Sybase ASE) - Properties.</td>
</tr>
<tr>
<td>Placement</td>
<td>Displays device fragments. Optionally you can: Select a fragment to view the <strong>Device Name</strong>, <strong>Size</strong>, and <strong>Device Type</strong> (DATA AND LOG or DATA ONLY) for the fragment. Click the New button to open a dialog that lets you provide the data device and log device details for a new database fragment. NOTE: We strongly recommend that you place the transaction log on a separate device from all other database fragments.</td>
</tr>
<tr>
<td>Space</td>
<td>Lets you view pie charts showing the data space usage and the transaction log (if available) space usage for the database.</td>
</tr>
<tr>
<td>Bindings</td>
<td>This tab is only available for databases created with a Type of TEMP. It displays all applications or logins bound to the database. Optionally, you can: Bind another application or login to the database by selecting the APPLICATION or LOGIN folder as appropriate, clicking Add, and in the dialog that opens select a login or provide an application name. Remove bindings by selecting the specific application or login and clicking Drop.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Data Cache Editor (Sybase ASE)

This editor lets you modify a data cache’s basic properties, object binding, and pool configuration.

**Note:** Consult Microsoft SQL Server documentation for detailed information on cache creation and configuration. Before creating or editing a data cache, be familiar with caching strategies, pool configuration, object binding, and server restart requirements. For assistance, see [Accessing Third Party Documentation](#).

**To edit a data cache:**

1. Open an editor on the data cache. For details, see [Opening an Object Editor](#).
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you view the Name, Status, Partitions, and Run Size properties and modify the Configured Size property. For caches with a Type of MIXED or LOGONLY, you can also modify the Type, and Policy properties. For more information on these properties, see <a href="#">Data Caches (Sybase ASE) - Properties</a>.</td>
</tr>
<tr>
<td><strong>Objects</strong></td>
<td>Lets you bind and unbind databases, tables and indexes for this data cache as well as modify the caching strategy for bound objects. For details on these tasks, see <a href="#">Data Caches (Sybase ASE) - Objects</a>.</td>
</tr>
<tr>
<td><strong>Pools</strong></td>
<td>Generates the sp_poolconfig calls required to add or modify buffer pools for this cache. It lets you add or delete pools, change the configured size of a pool, or modify the wash size or asynchronous prefetch percentage for a pool. The list on the left displays the pools currently configured for the cache. The Memory Pool Attributes list on the right displays the following attributes for a selected pool: Configured Size - total size of the memory pool Wash Size - the cache location at which dirty pages are written. Run Size - (display only) Async Prefetch - the percentage of buffers in the pool that can be used to hold buffers that have been read into cache using asynchronous prefetch, but that have not yet been used. Affected Pool - the size of I/O performed in the memory pool where the memory is to be deallocated. Optionally, you can:</td>
</tr>
<tr>
<td>Modify pool attributes</td>
<td>Select a pool from the list and modify values in the Memory Pool Attributes list</td>
</tr>
<tr>
<td>Add a new pool</td>
<td>Click Add Pool and select an I/O Size (in kilobytes). Modify pool attributes as required.</td>
</tr>
<tr>
<td>Delete a pool</td>
<td>Select a pool from the list and click Delete Pool.</td>
</tr>
<tr>
<td><strong>DDL View</strong></td>
<td>For details on using this tab, see <a href="#">Viewing the SQL/DDL for an Object</a>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Defaults Editor (Sybase ASE)

The Defaults Editor lets you modify the value and manage bindings for a default.

To edit a default

1. Open an editor on the default. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you change the Value of the default. NOTE: If the Value box shows a Source text for this compiled object is hidden message, source text for this compiled object has been hidden. For more information, see Hide Text.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Dump Devices Editor (Sybase ASE)

The Dump Devices Editor lets you view basic properties of a dump device.

To edit a dump device

1. Open an editor on the dump device. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Displays the Name, Physical Name, and Device Type for the dump device. For more information, see Dump Devices (Sybase ASE) - Properties. If the Device Type is TAPE, this tab also shows a Tape capacity setting.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Extended Procedures Editor (Sybase ASE)

The Procedures Editor lets you view and modify an extended procedure definition.

To edit an extended procedure

1. Open an editor on the extended procedure. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you specify the <strong>Library Name</strong> for the extended procedure. NOTE: If the <strong>Library Name</strong> box shows a <strong>Source text for this compiled object is hidden</strong> message, source text for this compiled object has been hidden. For more information, see Hide Text.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Foreign Keys Editor (Sybase ASE)

The Foreign Keys Editor lets you modify the column mapping and specify properties of a foreign key.

To edit a foreign key

1. Open an editor on the foreign key. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Mappings</td>
<td>The existing column mapping for the foreign key is represented by selected columns in the Main Table and Referenced Table lists. Additional candidates in the Referenced Table list are indicated by enabled column check boxes. If necessary, use the Table dropdown in the Referenced Table group to choose a new table for this foreign key. Select or deselect columns in the Main Table list and Referenced Table list to form the referential constraint between the two tables.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you specify a Match Full value of TRUE or FALSE.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Functions Editor (Sybase ASE)

The Functions Editor lets you view and modify the body of a function, as well as work with permissions and dependencies.

To edit a function:

1. Open an editor on the function. For details, see "Opening an Object Editor".
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Lets you view and modify the CREATE FUNCTION statement, including the function body, for the function. NOTE: If the Definition tab for the function shows a Source text for this compiled object is hidden message, source text for this compiled object has been hidden. For more information, see &quot;Hide Text&quot;.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see &quot;Working with Object Dependencies&quot;.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see &quot;Working with Privileges and Permissions&quot;.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see "Previewing and Submitting Object Editor Changes".
Groups Editor (Sybase ASE)

The Groups Editor lets you manage users in a group and the group’s associated privileges.

Tip: The refresh button lets you refresh or clear the editor’s contents, and log SQL.

To edit a group

1. Open an editor on the group. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>Lets you add users to, or remove users from the group. To move a user from one of the Users Not In Group or Users In Group lists to the other list, select the user in the list and click the Join Group or Leave Group button.</td>
</tr>
<tr>
<td>Object Privileges</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>System Privileges</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>DDL</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Indexes Editor (Sybase ASE)

The Indexes Editor lets you manage columns, properties, and partitions, and view statistics for an index.

To edit an index

1. Open an editor on the index. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Lets you manage columns that make up the index. On opening, this tab shows the existing columns. For each column, the datatype (and if applicable the precision in brackets) and whether the table definition permits nulls in the target table column. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Change the <strong>Sort</strong> order of a column.</td>
</tr>
<tr>
<td></td>
<td>Click the <strong>New</strong> button and select a column name from the dropdown, to add a column to the index.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click the <strong>Drop</strong> button to delete the column from the index.</td>
</tr>
<tr>
<td></td>
<td>Select a column and use the arrow buttons to reorder the columns in the index.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td></td>
<td><strong>Attributes</strong> Has the <strong>Index Type</strong> (UNIQUE or NONUNIQUE), <strong>Clustered</strong>, <strong>Ignore Duplicate Key</strong> (available with <strong>Index Type</strong> of UNIQUE), <strong>Ignore Duplicate Rows</strong> (available with <strong>Clustered</strong> enabled), <strong>Allow Duplicate Rows</strong> (available with <strong>Clustered</strong> enabled), and <strong>Maximum Rows Per Page</strong> properties.</td>
</tr>
<tr>
<td>Partition</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Lets you view the <strong>Locality</strong> (Global/Local), <strong>Alignment</strong> (Prefixed/Non-Prefixed), <strong>Partition Type</strong> (including Range-Hash Composite or Range-List Composite), and <strong>Subpartition type</strong> properties.</td>
</tr>
<tr>
<td></td>
<td><strong>Columns</strong> Displays partitioning columns.</td>
</tr>
<tr>
<td></td>
<td><strong>Partition Definitions</strong> Displays details for each partition.</td>
</tr>
</tbody>
</table>
Indexes Editor (Sybase ASE)

Statistics  Lets you view statistics in the following categories:

| Page Statistics | Data Pages, Reserved Pages, Used Pages, OAM Page Ratio, and Index Page Ratio. |
| Row Statistics   | Maximum Row Size, Minimum Row Size, Max Size of Non-Leaf Index Row, and Maximum Rows Per Page. |

DDL View  For details on using this tab, see Viewing the SQL/DDL for an Object.

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Logins Editor (Sybase ASE)

The Logins Editor lets you manage basic properties for a login, associated users and roles, and accounting.

To edit a login:

1. Open an editor on the login. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with the following properties set when creating the login: <strong>Name</strong>,</td>
</tr>
<tr>
<td></td>
<td><strong>FullName</strong>, <strong>Default database</strong>, <strong>Default language</strong>, <strong>Locked</strong> (or <strong>Account Locked</strong>),</td>
</tr>
<tr>
<td></td>
<td><strong>Password</strong>, <strong>Password expiration</strong>, <strong>Minimum password length</strong>, <strong>Maximum Login attempts</strong>,</td>
</tr>
<tr>
<td></td>
<td>and <strong>Authentication Mechanism</strong>. Against Sybase 15.7 and higher, servers, <strong>Profile</strong> (with an additional <strong>default</strong> option available) and <strong>Exempt Inactive Lock</strong> parameters are available. For detailed information on these settings, see Logins Wizard (Sybase ASE). In addition, when editing an existing login, you have access to the following settings:</td>
</tr>
<tr>
<td></td>
<td><strong>Is currently logged in</strong> Displays whether the user is currently logged in.</td>
</tr>
<tr>
<td></td>
<td><strong>Login trigger</strong> Displays the login trigger currently configured for this login. This is the stored procedure automatically executed when the user logs on. For information on configuring login triggers for a login, see Add/Modify Login Trigger and Drop Login Trigger.</td>
</tr>
<tr>
<td>Users</td>
<td>Lets you maintain database user accounts for a login. For more detailed information, see Logins (Sybase ASE) - Users.</td>
</tr>
<tr>
<td>Roles</td>
<td>Lets you maintain the roles granted to this login. For more detailed information, see Logins (Sybase ASE) - Users. For information on activating and deactivating roles for the current login in the current session, see Role Activation.</td>
</tr>
<tr>
<td>Accounting</td>
<td>The <strong>Accounting</strong> tab of the Logins Editor lets you manage chargeback accounting statistics for every login on the current server. Chargeback accounting statistics are CPU and I/O usage statistics that Sybase ASE accumulates for every login. To start a new accounting period, the system administrator must clear all previous login statistics. Optionally, you can click the <strong>Clear Statistics</strong> button to start a new accounting interval. The <strong>Clear Statistics</strong> dialog lets you clear statistics immediately or use scheduling options.</td>
</tr>
<tr>
<td>DDL</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Primary Keys Editor (Sybase ASE)

The Primary Keys Editor lets you manage the columns that make up the primary key and its basic properties, as well as view statistics for the primary key.

To edit a primary key

1. Open an editor on the primary key. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Lets you manage columns that make up the primary key. On opening, this tab shows the existing columns. For each column, the datatype (and if applicable the precision in brackets) and whether the table definition permits nulls in the target table column. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Change the Sort order of a column.</td>
</tr>
<tr>
<td></td>
<td>Click the New button and select a column name from the dropdown, to add a column to the primary key.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click the Drop button to delete the column from the primary key.</td>
</tr>
<tr>
<td></td>
<td>Select a column and use the arrow buttons to reorder the columns in the primary key.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you work with settings in the following categories:</td>
</tr>
<tr>
<td></td>
<td>Attributes Lets you set the Clustered and Maximum Rows Per Page properties.</td>
</tr>
<tr>
<td></td>
<td>Storage Lets you set Reserve Page Gap, Segment (DEFAULT, LOGSEGMENT or SYSTEM), and Fill Factor properties.</td>
</tr>
<tr>
<td>Statistics</td>
<td>Lets you view statistics in the following categories:</td>
</tr>
<tr>
<td></td>
<td>Page Statistics Data Pages, Reserved Pages, Used Pages, OAM Page Ratio, and Index Page Ratio.</td>
</tr>
<tr>
<td></td>
<td>Row Statistics Maximum Row Size, Minimum Row Size, Max Size of Non-Leaf Index Row, and Maximum Rows Per Page.</td>
</tr>
<tr>
<td></td>
<td>DDL View For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Procedures Editor (Sybase ASE)

The Procedures Editor lets you view and modify procedure definitions and modify associated privileges and dependencies.

To edit a procedure

1. Open an editor on the procedure. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Lets you modify the SQL code for a procedure. NOTE: If the Definition tab for the procedure shows a Source text for this compiled object is hidden message, source text for this compiled object has been hidden. For more information, see Hide Text.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, seePreviewing and Submitting Object Editor Changes.
Remote Servers Editor (Sybase ASE)

The Remote Server Editor lets you manage the connection and security properties for a remote server, and manage the associated logins.

**Note:** Before using this editor, consult Sybase documentation for information on configuring remote server logins. For more information, see [Accessing Third Party Documentation](#).

### To edit a remote server

1. Open an editor on the remote server. For details, see [Opening an Object Editor](#).
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with the Network Name, Server Type, Timeout Inactive Connections, Network Password Encryption, Security Model, Security Mechanism, Message Integrity, Message Confidentiality, and Mutual Authentication settings. For details on these settings, see <a href="#">Remote Servers (Sybase ASE) - Properties</a>.</td>
</tr>
<tr>
<td>Logins</td>
<td>Lets you build pairs of <code>sp_addremotelogin</code> and <code>sp_remoteoption</code> system procedure calls that authorize a new remote server user and configures remote login options for that user:</td>
</tr>
<tr>
<td></td>
<td>Click the Add Remote Login button to open a dialog that displays or lets you provide: Remote Server Name - Displays the remote server name. Remote Login Name - Lets you specify a remote login name. Select the All remote users box if you want to use this name for all remote logins. Local Login Name - Lets you select a local user name. Trusted Remote Login - Lets you specify this remote login as a trusted login.</td>
</tr>
<tr>
<td></td>
<td>Select a login, click <strong>Modify</strong>, and use the table above as a guide to modifying login options.</td>
</tr>
<tr>
<td></td>
<td>Select a login, and click <strong>Drop</strong> to delete the login.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see <a href="#">Viewing the SQL/DDL for an Object</a>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Roles Editor (Sybase ASE)

The Roles Editor lets you manage authentication, logins, and privileges for a role.

**Note:** User-defined roles are available in Sybase ASE 11.5 or later.

**To edit a role**

1. Open an editor on the role. For details, see *Opening an Object Editor*.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays the role <strong>Name</strong>, and lets you work with the <strong>Password</strong>, <strong>Password Expiration</strong>, <strong>Minimum Password Length</strong>, and <strong>Maximum Failed Logins</strong> settings. For detailed information on these settings, see <em>Roles (Sybase ASE) - Properties</em>. This tab also lets you work with the following settings:</td>
</tr>
<tr>
<td></td>
<td><strong>Apply Server Wide</strong> Displays whether the <strong>maximum failed logins</strong> server configuration parameter has been set. If <strong>Apply Server Wide</strong> is unselected, the <strong>Maximum Failed Logins</strong> setting applies only to the current role. For information on setting the <strong>maximum failed logins</strong> configuration parameter, see <em>Session Recording</em>.</td>
</tr>
<tr>
<td></td>
<td><strong>Role Locked</strong> Lets you manually lock the role.</td>
</tr>
<tr>
<td>Logins/Roles</td>
<td>Displays the logins or roles that have been granted to this role in the <strong>Objects that have this Role granted</strong> list. Other roles and logins available to be granted to this role are shown in the <strong>Objects that don’t have this Role granted</strong> list. Optionally, you can:</td>
</tr>
<tr>
<td></td>
<td>Use the <strong>Logins/Roles</strong> radio boxes to toggle the two lists between logins and roles display.</td>
</tr>
<tr>
<td></td>
<td>Grant a login or another role to this role by selecting the login/role from the <strong>Objects that don’t have this Role granted</strong> list and clicking <strong>Grant</strong>.</td>
</tr>
<tr>
<td></td>
<td>Revoke a login or role from this role by selecting the login/role from the <strong>Objects that have this Role granted</strong> list and clicking <strong>Revoke</strong>.</td>
</tr>
<tr>
<td>Object Privileges</td>
<td>For details on using these tabs, see <em>Working with Privileges and Permissions</em>. For details on using these tabs, see <em>System Privileges</em>.</td>
</tr>
<tr>
<td>DDL</td>
<td>For details on using this tab, see <em>Viewing the SQL/DDL for an Object</em>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see *Previewing and Submitting Object Editor Changes*. 
For information on activating and deactivating roles for the current login in the current session, see Role Activation.
Rules Editor (Sybase ASE)

The Rules Editor lets you modify basic properties of a rule.

To edit a rule

1. Open an editor on the rule. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you specify a JavaScript: popup.TextPopup(Poptext1, Popfont, 9, 9, -1, -1)</td>
</tr>
<tr>
<td></td>
<td>Restriction and select a Type (STANDARD_RULE, AND_ACCESS_RULE, OR_ACCESS_RULE).</td>
</tr>
<tr>
<td></td>
<td>NOTE: If the Restriction box shows a Source text for this compiled object is hidden message, source text for this compiled object has been hidden. For more information, see Hide Text.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Segments Editor (Sybase ASE)

The Segments Editor lets you manage segment location, associated objects, segment space, and segment thresholds.

To edit a segment

1. Open an editor on the segment. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>This tab lets you view the Name and Max Size settings you specified when creating the segment. It also lets you change the Grow By and Threshold Free Space settings. For information on these settings, see Segments (Sybase ASE) - Properties. This tab also displays a Hysteresis value, the global variable @@thresh_hysteresis, that controls threshold sensitivity to variations in free space.</td>
</tr>
<tr>
<td>Location</td>
<td>Lets you <strong>Drop</strong> or <strong>Extend</strong> selected segments.</td>
</tr>
<tr>
<td>Objects</td>
<td>Lets you manage database objects associated with the segment. Objects are organized in a tree structure. You can open an object editor on a table, index, or constraint by double-clicking that object. For information on specific editors, see Sybase ASE Object Editors.</td>
</tr>
<tr>
<td>Space</td>
<td>Displays a summary of segment space distribution, broken down into data, indexes, unused, and other. Also provides reserved, data, indexes, and unused space values for each object on the segment.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Displays a list of the free pages thresholds for the segment. For a selected threshold, the <strong>Property/Value</strong> list displays the associated procedure name. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Click the <strong>Add</strong> button to specify the number of free pages and procedure name for a new segment threshold.</td>
</tr>
<tr>
<td></td>
<td>Select an existing threshold and modify the threshold’s procedure name value.</td>
</tr>
<tr>
<td></td>
<td>Select an existing threshold and click the <strong>Delete</strong> button to delete that threshold</td>
</tr>
<tr>
<td>DDL</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Tables Editor (Sybase ASE)

The Tables Editor lets you manage columns, basic properties, constraints, storage and space, and partitions of a table.

To edit a table

1. Open an editor on the table. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
</table>
| Columns      | Displays the currently defined columns in the table. For any selected column, the Property/Value list provides additional detail on that column. Available properties depend on the datatype you choose as well as on the property values you select: **Computed** and **Computed Expression** - Let you define a column as a computed column and provide the computed column expression. **Type** - Lets you select a datatype (depending on the type, additional properties such as **Size, Width, and Scale** may be available). **Identity Column** - Select this check box to define the column as an identity column. **Allow Nulls** - Select this check box to allow nulls in this column. **Default Collation** - available for text/character datatypes, lets you specify a default collation. **Default Value** - Lets you type a constant value or select a function returning a constant value to serve as the default for the column **Default Binding** and **Rule Binding** - Let you bind a rule or default to a column. Optionally, you can:

- Select a column, and in the Property/Value list modify property values for that column.
- Click Add Column, provide a name for the new column, and set property values for the column.
- Select a column and click Delete to remove the column from the table.

<table>
<thead>
<tr>
<th>Properties</th>
<th>Lets you work with properties in the following categories:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical Storage</td>
<td>Lets you set the <strong>Segment Name</strong> (DEFAULT, SYSTEM), <strong>Maximum Rows Per Page</strong>, <strong>Reserve Page Gap</strong>, and <strong>Identity Gap</strong> properties.</td>
</tr>
<tr>
<td>Cache Strategy</td>
<td>Lets you set <strong>MRU Replacement Strategy</strong> and <strong>Prefetch Strategy</strong> properties.</td>
</tr>
<tr>
<td>Row Locking Strategy</td>
<td>Lets you view the <strong>Expected Row Size</strong> property and set the <strong>Lock Scheme</strong> (ALLPAGES, DATAPAGES, ROWPAGES) property.</td>
</tr>
</tbody>
</table>
Indexes

Let you manage indexes for a table. On opening, the list of current indexes for the table is displayed. Optionally, take one of the following actions:

Click **Add** to open a dialog that lets you add a new index to the table.

Select an index and click **Edit** to open a dialog that lets you edit index properties.

Select an index and click **Drop** to open a dialog that lets you remove the index from the table.

Constraints

Let you manage constraints for the table. Constraints are grouped by type, under folders. Optionally take one of the following actions:

Select a constraint type folder and click **Add** to open a dialog that lets you add a constraint of that type.

Select a constraint and click **Edit** to open a dialog that lets you modify the constraint details.

Select a constraint and click **Drop** to remove the constraint.

Space

Let you view the table usage and the distribution of table space for a table. Optionally, double-click a slice in the pie chart for detailed statistics.

Partitions

Displays partition details for the table including the **Partition Type** (ROUNDROBIN, HASH, LIST, RANGE), partitioning **Columns** (name and datatype) and **Partition Definitions** (Name, values, segments). You can also add or modify partition definitions. For more information, see **Partitioning Sybase ASE Tables**.

Dependencies

For details on using this tab, see **Working with Object Dependencies**.

Permissions

For details on using this tab, see **Working with Privileges and Permissions**.

DDL View

For details on using this tab, see **Viewing the SQL/DDL for an Object**.

3. When finished, you can submit your changes. For details, see **Previewing and Submitting Object Editor Changes**.

**Partitioning Sybase ASE Tables**

The **Create Partition** and **Edit Partition** wizards let you work with table partitions.

To create or edit table partitions

1. Open an editor on a table. For details, see **Opening an Object Editor**.

2. On the **Partition** tab, click the **Create Partition** or **Edit Partition** button.

3. Use the following table as a guide to understanding and modifying the settings on the tabs of this wizard:
### Tables Editor (Sybase ASE)

#### Tab | Settings and tasks
---|---
**Properties**<br>In addition to displaying basic identification and ownership properties, this pane lets you select a **Partition Type** (ROUNDROBIN, HASH, LIST, RANGE).<br>**Columns** (not available for a **Partition Type** of ROUNDROBIN)<br>For each column to be added, click **New** to add a column and select a **Column** name.<br>**Range Definitions** (only available for a **Partition Type** of RANGE)<br>Let's you create an ordered list of partitions. For each partition, click **New** to open the **Add Partition Definition** wizard. Provide a **Name**, select a **Segment**, (DEFAULT, SYSTEM, LOGSEGMENT) and click **Add**. The **Range Definitions** pane also lets you edit and remove partitions.<br>**Partitions Definitions** (only available for a **Partition Type** of HASH)<br>Let’s you specify a Partition method: **None** **Number of Partitions** - Specify a **Number of Partitions**, and then for each partition, click the **New** button and select a segment. **By Partition Name** - For each partition, click **New**, specify a **Name** and select a **Segment**.<br>**List Definitions** (only available for a **Partition Type** of LIST)<br>Let’s you create a list of partition definitions. For each partition, click **New** to open the **Add Partition Definition** wizard. Provide a **Name**, select a **Segment**, (DEFAULT, SYSTEM, LOGSEGMENT) and click **Add**. The **List Definitions** pane also lets you edit and remove partitions.<br>4. When ready, click **Finish**.
Triggers Editor (Sybase ASE)

The Triggers Editor lets you modify the trigger body of a trigger and change its enabled/disabled status.

To edit a trigger:

1. Open an editor on the trigger. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you view the basic identifying properties of the trigger and its parent view or table: Parent Type, Parent Owner, Parent Name, Owner, Name, Create Date, Fire On Insert, Fire On Update, and Fire On Delete. For details on these properties, see Triggers (Sybase ASE) - Properties. This panel also lets you specify whether the trigger is Enabled.</td>
</tr>
<tr>
<td>Definition</td>
<td>Lets you modify the CREATE TRIGGER body for a trigger. To modify a trigger, the trigger must be dropped then recreated. NOTE: If the Definition tab for the trigger shows a Source text for this compiled object is hidden message, source text for this compiled object has been hidden. For more information, see Hide Text.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes
Unique Keys Editor (Sybase ASE)

The Unique Keys Editor lets you manage the columns and basic properties for a unique key as well as view page and row statistics.

To edit a unique key

1. Open an editor on the unique key. For details, see Opening an Object Editor.

2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Columns</td>
<td>Lets you manage columns that make up the unique key. On opening, this tab shows the existing columns. For each column, the datatype (and if applicable the precision in brackets) and whether the table definition permits nulls in the target table column. Optionally you can:</td>
</tr>
<tr>
<td></td>
<td>Change the Sort order of a column.</td>
</tr>
<tr>
<td></td>
<td>Click the New button and select a column name from the dropdown, to add a column to the index.</td>
</tr>
<tr>
<td></td>
<td>Select a column and click the Drop button to delete the column from the index.</td>
</tr>
<tr>
<td></td>
<td>Select a column and use the arrow buttons to reorder the columns in the index.</td>
</tr>
<tr>
<td>Properties</td>
<td>Lets you work with properties in the following categories:</td>
</tr>
<tr>
<td>Attributes</td>
<td>Lets you set Clustered and Maximum Rows Per Page properties.</td>
</tr>
<tr>
<td>Storage</td>
<td>Lets you set the Reserve Page Gap, and Segment (DEFAULT, LOGSEGMENT, SYSTEM) properties.</td>
</tr>
<tr>
<td>Statistics</td>
<td>Lets you view statistics in the following categories:</td>
</tr>
<tr>
<td>Page Statistics</td>
<td>Data Pages, Reserved Pages, Used Pages, OAM Page Ratio, and Index Page Ratio.</td>
</tr>
<tr>
<td>Row Statistics</td>
<td>Maximum Row Size, Minimum Row Size, Max Size of Non-Leaf Index Row, and Maximum Rows Per Page.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
User Datatypes Editor (Sybase ASE)

The User Datatypes Editor lets you view and modify user datatype definitions and view objects associated with a user datatype.

To edit a user datatype

1. Open an editor on the user datatype. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Lets you work with properties in the following categories:</td>
</tr>
<tr>
<td></td>
<td>Base datatype  Lets you set Type, Size, Allow Nulls, and Identity settings.</td>
</tr>
<tr>
<td></td>
<td>Bindings      Lets you set Default Binding and Rule Binding properties.</td>
</tr>
<tr>
<td>Usage</td>
<td>Displays all objects referring to or referenced by a user datatype.</td>
</tr>
<tr>
<td>DDL View</td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
User Messages Editor (Sybase ASE)

The User Messages Editor lets you manage user messages and their respective object bindings.

**Note:** On Sybase ASE, user messages are only available under the **Master** database.

**To edit a user message**

1. Open an editor on the user message. For details, see [Opening an Object Editor](#).
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Information</strong></td>
<td>Displays the message text for each language version of the message and offers the options to add a new language version, drop a language version, or modify a language version. For detailed instructions, see <a href="#">User Messages (Sybase ASE) - Information</a>.</td>
</tr>
<tr>
<td><strong>Bindings</strong></td>
<td>Displays any constraints to which the user message is bound. This tab also lets you create new bindings and delete current bindings. For details, see <a href="#">User Messages (Sybase ASE) - Bindings</a>.</td>
</tr>
<tr>
<td><strong>DDL View</strong></td>
<td>For details on using this tab, see <a href="#">Viewing the SQL/DDL for an Object</a>.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see [Previewing and Submitting Object Editor Changes](#).
Users Editor (Sybase ASE)

The Users Editor lets you view and modify user definitions and manage associated logins and objects.

To edit a user

1. Open an editor on the user. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Lets you view the user <strong>Name</strong> and <strong>Login Name</strong> for the user. Lets you specify a <strong>Group Name</strong> for the user.</td>
</tr>
<tr>
<td><strong>Logins</strong></td>
<td>Lets you assign logins to a user by selecting associated check boxes.</td>
</tr>
<tr>
<td><strong>Objects</strong></td>
<td>Lets you manage database objects associated with the user. Objects are organized in a tree structure with folders containing the objects. Optionally, take one of the following actions:</td>
</tr>
<tr>
<td></td>
<td>Select an object and click <strong>Edit</strong> to open an object editor on the selected object.</td>
</tr>
<tr>
<td></td>
<td>Select an object and click <strong>Drop</strong> to initiate dropping the selected object.</td>
</tr>
<tr>
<td><strong>Object Permissions</strong></td>
<td>For details on using these tab, see Working with Privileges and Permissions.</td>
</tr>
<tr>
<td>and <strong>System Permissions</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Comment</strong></td>
<td>For details on using this tab, see Adding a Comment to an object.</td>
</tr>
<tr>
<td><strong>DDL View</strong></td>
<td>For details on using this tab, see Viewing the SQL/DDL for an Object.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Views Editor (Sybase ASE)

The Views Editor lets you view the columns for the view and work directly with the SQL to create the view.

To edit a view

1. Open an editor on the view. For details, see Opening an Object Editor.
2. Use the following table as a guide to understanding and modifying the settings on the tabs of this editor:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Displays all columns for the view. Details for each column include the Column Name, the Datatype (and if applicable, with the precision in parentheses), and whether or not Nulls are allowed for that column.</td>
</tr>
<tr>
<td>Definition</td>
<td>Displays the SQL (CREATE VIEW) for the view. NOTE: If the Definition tab for the view shows a Source text for this compiled object is hidden message, source text for this compiled object has been hidden. For more information, see Hide Text.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>For details on using this tab, see Working with Object Dependencies.</td>
</tr>
<tr>
<td>Permissions</td>
<td>For details on using this tab, see Working with Privileges and Permissions.</td>
</tr>
</tbody>
</table>

3. When finished, you can submit your changes. For details, see Previewing and Submitting Object Editor Changes.
Object actions

In addition to letting you create and perform basic editing on various object types, there are a number of actions that can be applied to objects. While object action support differs by DBMS platform, they are most commonly implementations of:

- ALTER OBJECT TYPE clauses/options not typically available from object editors, such as REBUILD INDEX and RENAME
- Other SQL commands such as TRUNCATE, REORG, and LOCK
- System procedures and other available utilities

Most object actions are implemented as multi-panel wizards that guide you through the action. For an introduction to invoking object actions and working through the panels, see Overview of object actions/operations execution.

For a listing of available actions and access to detailed instructions, see Available object actions by DBMS.
Overview of object actions/operations execution

Most commonly, initiating an object operation opens a wizard with panels that guide you through initiating the action. For details, see the following topics

- Initiating an object operation
- Using object operation wizards
Initiating an object operation

Object operations are most commonly available as right-click context menu selections on the Database Navigator/Explorer, available with one or more objects selected.

**Note:** To verify availability of an object action for a specific object type and DBMS platform, see the topic covering that object type in Supported Objects.

To Initiate an Object Operation in DBArtisan

1. Connect to the datasource that contains the object you want to perform the operation against. For more information, see Connecting to Datasources.
2. On the Datasource Navigator/Explorer, expand nodes until the target object type is visible. If working in the Datasource Navigator, expand the object type node or if working on the Datasource Explorer, click the target object type. See the following topics for more information:
   - Datasource Navigator and Datasource Explorer, for general information on working with the Navigator and Explorer.
   - Supported Objects, specific object type topic - for information on navigating Datasource Navigator/Explorer nodes to the target object type.
3. Take one of the following actions:
   - To initiate an operation against a single object, right-click the object, and select the operation from the context menu. Alternatively, select the object and then, from the Datasource Navigator/Explorer Toolbar’s Command menu, select the action.
   - To initiate an operation against a multiple objects, first use CTRL-clicking to select multiple objects. Then, either right-click one of the selected objects and select the operation from the context menu, or select an operation from the Datasource Navigator/Explorer toolbar’s Command menu.

For information on using the wizard panels to provide required information and execute an operation, see Using object operation wizards.
Using object operation wizards

A typical object operation wizard is a multi-panel window that walks you through the steps necessary to execute the operation. The wizard typically opens on a first panel named either Action Options or using a name specific to that object action. For example, the first panels for the Rename and Drop operations:

The wizard’s Next and Back buttons let you navigate through the wizard panels. While the remaining panels of the wizard differ by action type, the following are the most common:

- Dependencies
- Preview

After providing information and inspecting settings on the panels, there are two execution options:

- Use the Execute (or Finish) button to execute the operation immediately
- Use the Schedule button to schedule the operation to execute the operation at a later time or to be executed on a regular basis. For more information, see Scheduling.

Dependencies

For those object action wizards that include a Dependencies panel, it lists the objects potentially impacted by this object action. Within the main categories of Referencing Objects and Referenced Objects, objects are grouped within object type folders.

Caution: A Dependencies panel, if present, is provided for information only. No attempt is made to resolve the current action in referenced or referring objects.
Using object operation wizards

## Preview

The Preview panel lets you inspect the SQL generated by wizards or editors when you create, edit, or perform other actions against a database object. Depending on the action being taken, this panel may contain the following controls:

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Save" /></td>
<td>Lets you save the SQL.</td>
</tr>
<tr>
<td><img src="image" alt="Print" /></td>
<td>Lets you print the SQL.</td>
</tr>
<tr>
<td><img src="image" alt="Email" /></td>
<td>Lets you send the SQL via e-mail.</td>
</tr>
<tr>
<td><img src="image" alt="Editor" /></td>
<td>Opens an SQL Editor on the SQL contained in the Preview dialog. For more information, see <strong>Using the SQL Editor</strong>.</td>
</tr>
<tr>
<td><img src="image" alt="Schedule" /></td>
<td>Opens a dialog that lets you select job scheduling options. Once you have selected your options, a third-party job scheduler opens. For more information, see <strong>Scheduling</strong>.</td>
</tr>
<tr>
<td><img src="image" alt="Execute" /></td>
<td>Executes the SQL.</td>
</tr>
<tr>
<td><img src="image" alt="Cancel" /></td>
<td>Closes the Preview dialog without executing the SQL and returns you to the wizard, editor, or dialog box from which you invoked the Preview dialog. Since you cannot edit the SQL in the Preview dialog, this lets you make changes before once again previewing and then executing the SQL.</td>
</tr>
</tbody>
</table>

Add or Modify Check Constraint

This action opens a Check Constraints Editor or Check Constraints Wizard.

Platform Availability
- DB2 LUW, DB2 z/OS, MySQL, ORCL, SQL SVR, SYB ASE

To Open the Check Constraint Editor or Check Constraint Wizard
1. On the Navigator/Explorer, right-click the Check Constraints node and select Create.
2. Use the following table as a guide to creating or editing the constraint. Note that settings available varies by DBMS type.

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Table Owner or Table Schema</td>
</tr>
<tr>
<td></td>
<td>Select the owner of the table for which the check constraint is to be created.</td>
</tr>
<tr>
<td>Table or Table Name</td>
<td>Lets you select where you want to place the check constraint.</td>
</tr>
<tr>
<td>Name</td>
<td>Lets you type the name of the constraint, which can be up to 30 characters long and must be unique across the entire database.</td>
</tr>
<tr>
<td>Enabled or Enforced</td>
<td>Enables or disables the check constraint.</td>
</tr>
<tr>
<td>Not for Replication</td>
<td>Enabling this feature ensures that the constraint is not enforced if the table is replicated for another database.</td>
</tr>
<tr>
<td>Check Condition</td>
<td>Type the check constraint condition. As a convenience, use the Table Columns button to paste in column names as part of the condition.</td>
</tr>
<tr>
<td>Comment</td>
<td>Lets you type a comment.</td>
</tr>
<tr>
<td>DDL View</td>
<td>Preview the DDL generated by your choices. Finally, use the Execute button to create the check constraint.</td>
</tr>
</tbody>
</table>
Add/Modify Login Trigger

This action lets you build and submit an `sp_modifylogin` or ALTER LOGIN call that specifies a login script option. The target login trigger can be any stored procedure located on the user’s default database, and the procedure will run each time the user successfully logs in. The action can be used to:

- Add a login trigger to a login that currently has no login trigger configured
- Change the specified stored procedure for a login that already has a login trigger configured

Platform Availability

- SYB ASE

To Specify the Stored Procedure Used as a Login Trigger for a Login:

1. If using DBArtisan, on the Datasource Navigator/Explorer, expand the data source nodes until the Logins node is visible and then select the Logins node. DBArtisan displays the logins.

2. Right-click a login and select Login Trigger Actions > Add/Modify Login Trigger from the context menu. The Add/Modify Login Trigger dialog opens.

3. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>From the Login Procedure dropdown, choose the default database stored procedure that is to be configured as the login trigger for this login.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation and when ready, click Execute.</td>
</tr>
</tbody>
</table>

After executing this action, the specified stored procedure name is available in the Login editor. For details, see Logins Editor (Sybase ASE).

Related Information

- Drop Login Trigger
Add Private Key

The Add Private Key object action builds and submits an ALTER CERTIFICATE... WITH PRIVATE KEY statement, optionally including a DECRYPTION BY PASSWORD argument. This lets you change the private key for a certificate, add a private key to a certificate that currently does not have one, and optionally, specify a decryption password.

Note: This functionality is available for Microsoft SQL Server only.

To change a certificate’s private key

1. Initiate an Add Private Key action against a certificate. For more information see Initiating an object operation.

The Add Private Key dialog box opens.

2. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Lets you work with the following settings:</td>
</tr>
<tr>
<td>Private Key File</td>
<td>The full path and filename (local or UNC) of the file to which the private key is to be written.</td>
</tr>
<tr>
<td>Decryption Password</td>
<td>The password required to decrypt the key.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

3. Finally, use the Execute button to create the object.

Topics

- Backup Certificate.
Allocate Extent

The Allocate Extent dialog lets you explicitly allocate extents for clusters, tables, and indexes in Oracle. Though Oracle dynamically allocates extents when additional space is required, explicit allocation of additional extents can be useful if you know that an object grows.

Explicit allocation of additional extents can be particularly helpful when using Oracle Parallel Server. When using Oracle Parallel Server and allocating additional extents, you can allocate an extent explicitly to a specific instance in order to minimize contention for free space among multiple instances.

Platform Availability

- ORCL

Important Notes

For composite-partitioned tables, you can allocate extents to subpartitions as well as partitions.

To Allocate an Extent for a Cluster, Table, or Index

1. Initiate an Allocate Extent action against a table, cluster, index, primary key, or unique key. For more information see Initiating an object operation.

2. Use the following table as a guide to setting the options on this dialog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extent Size</td>
<td>Specify an extent size in KBs or MBs.</td>
</tr>
<tr>
<td>Datafile</td>
<td>Lets you select the new datafile. You can choose a specific datafile from which to take space for the added extent. If you choose (Default), Oracle takes the space from any accessible datafile in the tablespace containing the table, index, or cluster.</td>
</tr>
<tr>
<td>Instance</td>
<td>Lets you specify a freelist from which to draw the extent. If you are using Oracle Parallel Server, you can assign the new extent to a free list group associated with a specific instance. The number you enter in the instance text box should be the number of the freelist group that you wish to use, rather than the number of the specific instance. If you are using Oracle Parallel Server and you omit this parameter, Oracle allocates the extent, but the extent is drawn from the master freelist by default. Only use this parameter for Oracle Parallel Server. NOTE: The number you enter in the Instance field should be the number of the free list group that you wish to use, rather than the number of the specific instance.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Analyze

This action lets you work with statistics for tables, indexes (primary keys and unique keys), and clusters.

Platform Availability

- ORCL

This action lets you build and submit the following ANALYZE statement variations or DBMS_STATS package procedure calls:

<table>
<thead>
<tr>
<th>Options</th>
<th>ANALYZE statement variation or DBMS_STATS call generated</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compute Statistics</td>
<td>ANALYZE INDEX/CLUSTER/TABLE... COMPUTE STATISTICS</td>
</tr>
<tr>
<td>Gather Statistics</td>
<td>DBMS_STATS.GATHER_INDEX_STATS DBMS_STATS.GATHER_TABLE_STATS,</td>
</tr>
<tr>
<td>Delete Statistics</td>
<td>ANALYZE INDEX/CLUSTER/TABLE... DELETE STATISTICS DBMS_STATS.DELETE_INDEX_STATS DBMS_STATS.DELETE_TABLE_STATS</td>
</tr>
<tr>
<td>Estimate Statistics</td>
<td>ANALYZE INDEX/TABLE/CLUSTER... ESTIMATE STATISTICS</td>
</tr>
<tr>
<td>Validate Structure</td>
<td>ANALYZE INDEX/TABLE/CLUSTER... VALIDATE STRUCTURE</td>
</tr>
<tr>
<td>Import Statistics</td>
<td>DBMS_STATS.IMPORT_INDEX_STATS DBMS_STATS.IMPORT_TABLE_STATS</td>
</tr>
</tbody>
</table>

Note: Before using this object action, consult Oracle documentation for information on the ANALYZE statement and relevant DBMS_STATS package procedures. Be familiar with restrictions, required permissions, partition options, parameter values, and requirements. For more information, see Accessing Third Party Documentation.

To obtain or modify statistics for a database object:

1. Initiate an Analyze action against one or more clusters, indexes, primary keys, unique keys, or tables. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Analyze wizard:
Analyze

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td>Take the following steps:</td>
</tr>
<tr>
<td></td>
<td>If you are not working against a cluster, either select the <strong>Use dbms_stats_package</strong> check box to generate one of the DBMS_STATS procedure calls or deselect the <strong>Use dbms_stats_package</strong> check box to generate an ANALYZE statement variation.</td>
</tr>
<tr>
<td></td>
<td>From the <strong>Type</strong> dropdown, select one of the options from the table above.</td>
</tr>
<tr>
<td></td>
<td>Additional options are offered depending on the <strong>Type</strong> value you choose. They correspond to ANALYZE statement clauses or DBMS_STATS procedure parameters. See Oracle documentation for details.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Displays the DDL that will execute the object action. For details, see <strong>Preview</strong>.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see **Scheduling**.
Analyze Tables

This action lets you build and submit an ANALYZE TABLE statement, analyzing and storing the key distribution for a table.

Platform Availability

- MySQL

To analyze a table:

1. Initiate an Analyze Tables action against one or more tables. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Lets you review the tables you selected.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Attach Database

The Attach Database object action lets you specify a set of previously detached data and transaction files to be used to attach a database to a Microsoft SQL Server instance. This makes the database available in exactly the same state it was in when it was detached.

Platform Availability

- SQL SVR

To Attach a Database

1. Initiate an Attach Database action against a database. For more information see Initiating an object operation.

The Attach Database File(s) dialog opens.

2. In the Database Name to be Attached box, type the database name.
3. In the grid, do one of the following:
   - Select the target database file(s).
   - To add database file(s), click Add and then enter the name of the MDF (master data file) of the database to attach.

The appropriate *.ldf file is automatically added.

4. To drop database file(s), click Drop and then select the target file(s).
5. Click Execute. For information on the scheduling option, see Scheduling.

Topics

- Detach Database
Backup

Right-clicking a SQL Server or Sybase ASE database and selecting **Backup** opens a tool that lets you backup that database. For details, see **Database Backup**.
Backup Certificate

The **Backup Certificate** object action builds and submits a BACKUP CERTIFICATE... TO FILE statement with optionally, a WITH PRIVATE KEY clause. This lets you back up a certificate to file.

**Platform Availability**
- **SQL SVR**

**To write a certificate to disk**

1. Initiate a **Backup Certificate** action against a certificate. For more information see [Initiating an object operation](#).

The **Attach Database File(s)** dialog box opens.

2. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Lets you work with the following settings:</td>
</tr>
<tr>
<td>File</td>
<td>The full path and filename (local or UNC) of the file to which the certificate is to be written.</td>
</tr>
<tr>
<td>Private Key File</td>
<td>The full path and filename (local or UNC) of the file to which the private key is to be written.</td>
</tr>
<tr>
<td>Encryption Password</td>
<td>The password used to encrypt the private key before writing the key to the backup file.</td>
</tr>
<tr>
<td>Decryption Password</td>
<td>The password used to decrypt the private key before backing up the key.</td>
</tr>
</tbody>
</table>

**Dependencies** Lets you review the objects potentially impacted by this action. For more information, see [Dependencies](#).

**Preview** Preview the DDL generated for the operation and when ready, use the **Schedule** or **Execute** button to perform this action.

3. Finally, use the **Execute** button to create the object.

**Topics**
- **Add Private Key**
The Bind Package Wizard lets you set package parameters, add environments, and set package properties.

**Platform Availability**
- DB2 z/OS

To Package Parameters, Add Environments, and Set Package Properties

1. Expand an owning schema, right-click **Packages**, and select **Bind** from the context menu.

The **Bind Package** wizard opens.

2. Use the following table as a guide to understanding and setting options on this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Location Lets you select the name of the location to connect to.</td>
</tr>
<tr>
<td></td>
<td>Collection Lets you select the location of the DBMS where the package binds and where the description of the package resides.</td>
</tr>
<tr>
<td></td>
<td><strong>Would you like to Copy an Existing Package from Another Collection</strong></td>
</tr>
<tr>
<td></td>
<td><strong>New Package</strong> (available if you select No for the Would you like... control) Lets you select a Package Name and PDS Name.</td>
</tr>
<tr>
<td></td>
<td><strong>Copy Package</strong> (available if you select Yes for the Would you like... control) Lets you qualify with the following: <strong>Collection</strong> - the collection to copy from. <strong>Options</strong> - COMMAND or COMPOSITE. <strong>Package</strong> - Lets you select a package. <strong>Version</strong> - Lets you select a version of the package.</td>
</tr>
</tbody>
</table>
Bind Package

2  Lets you select a package **Owner**, a **Qualifier** (the package creator), an **Action** of ADD or REPLACE, and the **Version** of the package.

3  **Isolation** Determines how far to isolate an application from the effects of other running applications.

**Keep Dynamic** Specifies that DB2 keeps dynamic SQL statements after commit points. The application does not need to prepare an SQL statement after every commit point. DB2 keeps the dynamic SQL statement until the application process ends, a rollback operation occurs or the application executes an explicit PREPARE statement with the same statement identifier. If the prepared statement cache is active, DB2 keeps a copy of the prepared statement in the cache. If the prepared statement cache is not active, DB2 keeps only the SQL statement string past a commit point. DB2 then implicitly prepares the SQL statement if the application executes an OPEN, EXECUTE, or DESCRIBE operation for that statement.

**Current Data** Determines whether to require data currency for read-only and ambiguous cursors when the isolation level of cursor stability is in effect. It also determines whether block fetching can be used for distributed, ambiguous cursors.

**Degree** Determines whether to attempt to run a query using parallel processing to maximize performance. Lets you select an option.

**DB Protocol** Specifies which protocol to use when connecting to a remote site that is identified by a three-part name statement.

**Dynamic Rules** Determines what values apply at run time for the following dynamic SQL attributes: The authorization ID that is used to check authorization
The qualifier that is used for unqualified objects
The source for application programming options that DB2 uses to parse and semantically verify dynamic SQL statements Whether dynamic SQL statements can include GRANT, REVOKE, ALTER, CREATE, DROP, and RENAME statements

**Release**  **Commit** - Releases resources at each commit point.  **Deallocate** - Releases resources only when the program terminates.

**Validate** Determines whether to recheck, at run time, errors found during bind. The option has no effect if all objects and needed privileges exist. **Bind** - If not all objects or needed privileges exist at bind time, the wizard displays an error messages, and does not bind the package. **Run** - If not all objects or privileges exist at bind time, the process issues warning messages, but the bind succeeds. DB2 checks existence and authorization again at run time for SQL statements that failed those checks during bind. The checks use the authorization ID of the package owner.
4. **Explain**

Obtains information about how SQL statements in the package are to execute, and then inserts that information into the table owner.PLAN_TABLE, where owner is the authorization ID of the owner of the plan or package. This option does not obtain information for statements that access remote objects.

- **Optimization Hint**

Query optimization hints are used for static SQL.

- **Reoptvars**

Re-determines the access path at run time.

- **Encoding**

Lets you select type of language for the package.

- **Defer Prepare**

Optionally, prepares dynamic SQL statements that refer to remote objects. Lets you choose from DEFER(PREPARE) and NODEFER(PREPARE).

- **Degree**

1 or ANY.

- **Page Writes**

NO, PH1, or YES.

- **Flag**

Lets you select flag for messages to display: all (default), completion, error or warning, and informational.

5. Use the arrow buttons to move system connections between the **Disabled Environments** and **Enabled Environments** lists.

3. When ready, click **Finish**.
Bind To Temporary Database

This action builds and submits a `sp_tempdb bind` system procedure call. It lets you bind a login to a temporary database.

Platform Availability
- SYBASE

To Bind a Login to a Temporary Database

1. Initiate a **Bind To Temporary Database** action against one or more logins. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the **Bind To Temporary Database** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action</strong> Options</td>
<td>Select the target temporary database from the <strong>Bind To Temporary Database</strong> dropdown.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see <a href="#">Dependencies</a>.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Build

This action lets you build a procedure, specifying a Build utility function (ALTER_REBUILD, REBUILD, REBIND, or DESTROY), a Build owner, Precompile options, Compile options, Prelink options, Link options, and Bind options.

Platform Availability

- DB2 z/OS

To Build a Procedure

1. Initiate a Build action against a procedure. For more information see Initiating an object operation.
2. Type or select the build options in the Procedure Build Options dialog:
3. Click Build.
Build Query

Right-clicking a table and selecting **Build Query** opens a tool that lets you create, structure, and manipulate queries. For details, see *Query Builder*.
Cancel Thread

This action issues a -CANCEL THREAD command against an active or inactive thread, cancelling processing for those threads.

Platform Availability
- DB2 z/OS

To Cancel Processing for a Thread

1. In the Navigator/Explorer, expand the Performance node and then select the Active Threads or Inactive Threads node.
2. Right click an active thread or inactive thread and select Cancel Thread from the context menu.
3. When prompted to verify, click Yes.
Change Access Status

This action builds and submits a basic ALTER TABLE... READ ONLY/READ WRITE statement. This lets you toggle the table between READ ONLY and READ/WRITE modes.

**Note:** In DBArtisan, the Datasource Explorer listing for an Oracle table has a Read-Only field that displays the current mode for a table.

**Platform Availability**

- ORCL 11g

**To Change Between READ ONLY and READ WRITE Modes for a Table**

1. Initiate a Change Access Status action against one or more tables. For more information, see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td>Select the Read-only check box to generate a ALTER TABLE... READ ONLY statement, putting the table into read-only mode. Deselect the Read-only check box to generate a ALTER TABLE... READ WRITE statement, putting the table into read-write mode.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Lets you review the objects potentially impacted by this action. For more information, see <a href="#">Dependencies</a>.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Preview the DDL generated for the operation. For more information, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Change Category

You can change the category of a target Stored Outline.

Platform Availability

- ORCL

To Change the Category of a Stored Outline

1. Initiate a Change Category action against a stored outline. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Change Category wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>From the Category dropdown, choose a new, target category.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For more information, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.

Topics

- Drop By Category
- Reassign By Category
Change Job's Owner

This action builds and submits an `sp_update_job` call with an `@owner_login_name` argument. It lets you change the owner of a SQL Agent job.

Platform Availability

- SQL SVR

To Change the Owner of a Job

1. Initiate a Change job’s owner action against a job. For more information see Initiating an object operation.

DBArtisan opens the Change job’s owner dialog.

2. Use the following table as a guide to understanding and modifying settings in the Change job’s owner wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>From the New Owner dropdown, select the new owner for the job.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Change Owner

This action lets you generate and submit an ALTER objecttype objectname OWNER TO newobjectname statement, for one or more selected objects of the following types:

- Domains
- Functions
- Schema
- Tables
- Tablespaces
- Types
- Views

This lets you specify a new owner for the object.

Platform Availability

- PSTGRS *

To change the owner of an object

1. Initiate a Change Owner action against one or more objects of an object type shown in the table above. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Change Category wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>From the New Owner dropdown, choose a new owner for the object.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.

Topics

- Change Schema
Change Password

The Change Password dialog lets you change user or login passwords, which you should do on a regular basis to guard against security leaks.

Platform Availability

- MySQL, ORCL, SQL SVR, SYB ASE

To Change the Password for a User or Login

1. Take one of the following actions:
   - In DBArtisan, for Sybase ASE or SQL Server, select the Logins node.
   - In DBArtisan, for MySQL and Oracle, select the Users node.

2. Right-click the user or login, and then select Change Password from the context menu.

   The Change Password dialog opens.

3. For Oracle and SQL Server datasources, in the Old Password box, type the old password. Providing the old password is optional on SQL Server datasources.

4. In the New Password box, type the new password.

5. In the Confirm Password box, type the new password.

6. Click Execute. For information on the scheduling option, see Scheduling.
Change Schema

This action lets you generate and submit an **ALTER** objecttype objectname **SET SCHEMA** newobjectname statement, for one or more selected objects of the following types:

- Domains
- Functions
- Tables
- Types
- Views

This lets you specify a new schema for the object.

**Platform Availability**

- **PSTGRS** *

**To change the schema for an object**

1. Initiate a **Change Schema** action against one or more objects of an object type shown in the table above. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the **Change Category** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td>From the <strong>New Owner</strong> dropdown, choose a new owner for the object.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Displays the DDL that will execute the object action. For details, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).

**Topics**

- [Change Owner](#)
Change Status

You can change the status of a number of relevant object types. For details, see the following topics:

- **Change Status (Oracle, SQL Server, and Sybase ASE triggers)**
- **Change Status (SQL Server DDL triggers)**
- **Change Status (Full-text Indexes)**
- **Change Status (check constraints)**
- **Change Status (tablespaces)**

**Change Status (Oracle, SQL Server, and Sybase ASE triggers)**

The **Change Status** object action lets you build an issue an ALTER TABLE statement that specifies a DISABLE (DISABLE TRIGGER) or ENABLE (ENABLE TRIGGER) option. This lets you enable or disable any triggers.

Loading a database from a previous dump causes any triggers defined in the database to fire. To speed the time required to load a database you should disable triggers.

**Note:** Disabling triggers can lead to problems with maintaining referential integrity and business rules

**To enable or disable a trigger:**

1. Initiate a **Change Status** action against one or more triggers. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the **Change Status** wizard:

<table>
<thead>
<tr>
<th><strong>Step</strong></th>
<th><strong>Settings and tasks</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td>Select the <strong>Enabled</strong> check box to enable the trigger. Deselect it to disable the trigger.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see <a href="#">Dependencies</a>.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Displays the DDL that will execute the object action. For details, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Change Status (SQL Server DDL triggers)

In DBArtisan, the Change Status object action lets you build and issue a DISABLE TRIGGER... ON DATABASE/ON ALL SERVER or ENABLE TRIGGER... ON DATABASE/ON ALL SERVER statement. This lets you enable or disable one or more database triggers or server triggers.

**Note:** The DBArtisan Datasource Explorer listing for a server trigger or database trigger indicates its current status.

**To enable or disable a trigger:**

1. Initiate a Change Status action against one or more triggers. For more information see [Initiating an object operation](#).
2. Use the following table as a guide to understanding and modifying settings in the Change Status wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td>Select the Enabled check box to enable the trigger. Deselect it to disable the trigger.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see [Scheduling](#).

Change Status (Full-text Indexes)

The action builds and submits an ALTER FULLTEXT INDEX statement with an ENABLE or DISABLE argument, letting you enable or disable the full-text index. Full-text searching is unavailable on tables or views with a disabled full-text index.

**Platform Availability**

- SQL SVR

**To Enable or Disable a Full-text Index**

1. Initiate a Change Status action against one or more full-text indexes. For more information, see [Initiating an object operation](#).
2. Use the following table as a guide to understanding and modifying settings in the dialog:
Change Status

Step | Settings and tasks
--- | ---
Action Options | Select the Enabled check box to enable the full-text index. Deselect the Enabled check box to disable the full-text index. Note that on opening the dialog, the Enabled check box state reflects whether the index is currently enabled or disabled.

Preview | Preview the DDL generated for the operation. For more information, see Preview.

3. Click Execute. For information on the scheduling option, see Scheduling.

Change Status (check constraints)

You can change the enabled/disabled status of check constraints, foreign key constraints, primary key constraints, and unique key constraints.

For detailed instructions, see:

- Setting constraint status for Microsoft SQL Server objects
- Setting Constraint Status for Oracle Objects

Setting constraint status for Microsoft SQL Server objects

The Set Constraint Status dialog lets you specify the ability of a group of constraints to be replicated, and (for Microsoft SQL Server version 7 or later) enable or disable check constraints, foreign key constraints, primary key constraints, and unique key constraints.

Completing the Set Constraint(s) Status Dialog Box

To complete this dialog, do the following:

1. Initiate a Change Status action against one or more check constraints. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying the settings on the Change Status wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Enabled</td>
</tr>
<tr>
<td>Not for Replication</td>
<td>When you duplicate the table schema and data of a source database containing constraints marked &quot;Not for Replication&quot;, these objects are not carried over to the duplicate of the schema.</td>
</tr>
</tbody>
</table>
3. Use the **Execute** or **Schedule** button to complete the operation.

### Setting Constraint Status for Oracle Objects

The **Set Constraint(s) Status** dialog lets you change the status of check constraints, foreign key constraints, primary key constraints, and unique key constraints. You can enable or disable selected constraints and, in the case of primary key and unique key constraints, lets you enable with or without validation and disable with or without the changes cascading.

When enabled, the rule defined by the constraint is enforced on the data values in the columns on which the constraint is placed. When disabled, the constraint rule is not enforced but the constraint continues to be stored in the data dictionary.

Temporarily disabling constraints can improve performance when you are loading large amounts of data or when you are making massive changes to a table. Disabling constraints also can be useful if you are importing or exporting one table at a time.

**Note:** Primary keys for index-organized tables cannot be disabled.

**Note:** You cannot drop a unique or primary key constraint that is part of a referential integrity constraint without also dropping the foreign key. To drop the referenced key and the foreign key together, select the **Cascade** check box in the **Set Constraint(s) Status** dialog.

The table below describes the options and functionality on the **Set Constraint(s) Status** dialog.

**Note:** The options differ by object.
Change Status

Option | Description
--- | ---
Enable | Enabling the constraint and not selecting the Validate check box automatically uses Oracle ENABLE NOVALIDATE clause which enables a constraint so that it does not validate the existing data. A table using constraints in enable novalidate mode can contain invalid data but you cannot add new invalid data to that table. The enable novalidate mode is useful as an intermediate state or when you do not want the constraint to check for possible exceptions (e.g., after a data warehouse load).

Validate | Enabling the constraint and selecting the Validate check box causes Oracle to validate all existing data in the key columns of the table with the constraint. If an exception exists, Oracle returns an error and the constraint remains disabled.

Cascade | Selecting the Cascade check box when disabling a primary key or foreign key constraint instructs Oracle to simultaneously disable any constraints that depend on the primary or unique key. Selecting the Delete Cascade check box instructs Oracle to delete data in the child table (on which the foreign key is defined) if the referenced data is the parent table is deleted.

Completing the Set Constraint(s) Status Dialog Box

To complete this dialog box, do the following:

1. Initiate a Change Status action against one or more check constraints. For more information see Initiating an object operation.

2. Use the table above to select dialog box options.

3. Use the Execute or Schedule button to complete the operation.

Change Status (tablespaces)

You can change the online, offline, or read only status of a tablespace to control access to its segments. In addition, when setting a tablespace offline, you can choose between NORMAL, TEMPORARY, or IMMEDIATE modes of taking the tablespace offline.

Platform Availability

- ORCL

To Change the Status of a Tablespace

1. Initiate a Change Status action against one or more tablespaces. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Change Status wizard:
### Change Status

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td>From the <strong>Change Status</strong> dropdown, select ONLINE, OFFLINE, or READ ONLY. If you select OFFLINE, from the <strong>OfflineMode</strong> dropdown, select NORMAL, TEMPORARY, or IMMEDIATE.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For more information, see <a href="#">Dependencies</a>.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Preview the DDL generated for the operation. For more information, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>
Check Data

The Check Data Wizard checks tablespaces for violations of referential and check constraints. The wizard also checks for consistency between a base tablespace and a LOB tablespace.

Upon completion, the wizard reports information about violations that are detected and the status of tablespaces that violate any constraints is set to CHECK-PENDING. Also, the CHECK-PENDING status of all tablespaces that do not violate any constraints is reset. Optionally, the utility deletes rows that violate constraints.

Platform Availability

- DB2 z/OS

Important Notes

- Run the Check Data Wizard after a conditional restart or a point-in-time recovery on all tablespaces where parent and dependent tables might not be synchronized or where base tables and auxiliary tables might not be synchronized.
- Run the Check Data Wizard against a base tablespace only, not a LOB table space.

To Check Tablespace Data

1. Initiate a Check Data action against a tablespace. For more information see Initiating an object operation.
2. Use the following table as a guide to understanding and modifying settings in the Check Data Utility wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select tablespaces: If the Wizard is opened from the Tablespaces Editor, the target tablespaces are initially displayed. To check additional tablespaces, click the Add button.</td>
</tr>
<tr>
<td></td>
<td>Add Opens the Object Selector Dialog Box.</td>
</tr>
<tr>
<td></td>
<td>Delete Deletes selected tablespace.</td>
</tr>
</tbody>
</table>
Check Data

2 Do you want the utility to be restartable?

- Lets you specify to execute Wizard in restartable mode. You can restart it from the Datasource Navigator/Explorer.

Would you like to specify the scope?

- Lets you specify scope options: Pending (default) - DBArtisan keeps track of the data rows that must be checked to ensure referential integrity. Auxonly - Select if you only want to check tables with LOB columns. All - Select whenever the scope information is in doubt. The scope information is recorded in the DB2 catalog. The scope information can become in doubt whenever you start the target table space with ACCESS(FORCE), or the catalog is recovered to a point in time. RefOnly - Select if you want to check all dependent tables in the specified tablespaces except tables with LOB columns.

Would you like to specify the auxiliary error?

- Lets you specify the auxiliary error options: Report (default) - DBArtisan sets the base tablespace to the auxiliary CHECK-pending (ACHKP) status. If CHECK DATA encounters only invalid LOB columns and no other LOB column errors, the base table space is set to the auxiliary warning status. Invalidate - DBArtisan sets the base table LOB column to an invalid status, and sets the base table space to the auxiliary warning (AUXW) status. You can use SQL to update a LOB column in the AUXW status, however, any other attempt to access the column will result in a -904 SQL return code.

Exceptions

- Lets you specify the number of exceptions, from 0 to 2147483647.

Error ddn

- Lets you specify the name of an error data definition (DD) statement that corresponds to a data control block that contains the same name. Lets you select a previously saved dataset template or click Edit to open the Dataset Template Editor.

Work ddn

- Lets you specify the name of a work data definition (DD) statement that corresponds to a data control block that contains the same name. Lets you select a previously saved dataset template or click Edit to open the Dataset Template Editor.

3 Exceptions

- Displays the Source and Destination tables for each exception. You can select one or more rows from the grid.

Add

- Opens the Exceptions dialog. For details, see Exceptions Dialog Box.

Delete

- Deletes the selected exception.
Check Data

4. Do you want to specify the device type for temporary data sets by DFSORT?
   - Lets you specify the device type for temporary data sets to be dynamically allocated by DFSORT.

   Do you want to specify the sort number?
   - Lets you type the number of datasets to be dynamically allocated by the sort program. The range of the text field is 0 to 2147483647.

3. When ready, click Finish.

Exceptions Dialog Box

The table below describes the options and functionality on the Exceptions dialog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base Table Owner</td>
<td>Lets you select the base table owner.</td>
</tr>
<tr>
<td>Base Table</td>
<td>Lets you select the base table.</td>
</tr>
<tr>
<td>Exception Table Owner</td>
<td>Lets you select the exception table owner.</td>
</tr>
<tr>
<td>Exception Table</td>
<td>Lets you select the exception table.</td>
</tr>
</tbody>
</table>
**Check Disk Group**

This action builds and submits an ALTER DISKGROUP CHECK... statement with FILE/DISK/ FAILGROUP/ALL and REPAIR options, letting you verify the internal consistency of disk group metadata.

**Note:** Before this object action is available you must have a direct connection to the ASM instance. For details, see Manage ASM Connection.

**Platform Availability**

- **ORCL 10g**

**To Verify Internal Consistency of Metadata for a Mounted Disk Group**

1. On a connected Oracle datasource, expand the Instance and ASM nodes.
2. Right-click the Disk Groups node and select Create from the context menu.
3. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td><strong>Repair</strong> - Select this check box to include a REPAIR clause, instructing Oracle to attempt to repair any errors found during the check. Deselect this check box to include a NOREPAIR clause.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

4. Click **Execute**. For information on the scheduling option, see Scheduling.
Check Index

The Check Index Wizard lets you test whether indexes are consistent with the data they index. The Wizard issues warning messages when an inconsistency is found.

Run the **Check Index** action after a conditional restart or a point-in-time recovery on all tablespaces where you suspect that the indexes may not be consistent with the data. Also run the wizard before executing the **Check Data** action to ensure that the indexes used by the Check Data Wizard are valid (see **Check Data**). This is especially important before using the Check Data with DELETE YES.

When checking an auxiliary table index, the **Check Index** Wizard verifies that each LOB is represented by an index entry, and that an index entry exists for every LOB.

**Platform Availability**
- **DB2 z/OS**

**To Check Index/Data Consistency**

1. Initiate a **Check Index** action against a tablespace or index. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the **Check Index Utility** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 <strong>Select Index</strong></td>
<td>If you initiated the Check Index operation against one or more indexes, the target indexes are initially displayed. To check additional indexes, click the <strong>Add</strong> button.</td>
</tr>
<tr>
<td></td>
<td><strong>Add</strong> Opens the Indexes <strong>Selector</strong> dialog.</td>
</tr>
<tr>
<td></td>
<td><strong>Delete</strong> Deletes selected index.</td>
</tr>
<tr>
<td>2 <strong>Select tablespaces</strong></td>
<td>If you initiated the Check Index operation against one or more tablespaces, the target tablespaces are initially displayed. To check additional tablespaces, click the <strong>Add</strong> button.</td>
</tr>
<tr>
<td></td>
<td><strong>Add</strong> Opens the <strong>Object Selector Dialog Box</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Delete</strong> Deletes selected tablespace.</td>
</tr>
<tr>
<td>3 <strong>Do you want the utility to be restartable?</strong></td>
<td>Lets you specify to execute Wizard in restartable mode. You can restart it from the Datasource Navigator/Explorer.</td>
</tr>
<tr>
<td></td>
<td><strong>Work DDN</strong> Lets you specify the name of a work data definition (DD) statement that corresponds to a data control block that contains the same name. Lets you select a previously saved dataset template or click <strong>Edit</strong> to open the Dataset Template Editor.</td>
</tr>
</tbody>
</table>
Do you want to specify the device type for temporary data sets by DFSORT?

Let's you specify the device type for temporary data sets to be dynamically allocated by DFSORT.

Do you want to specify the sort number?

Let's you type the number of datasets to be dynamically allocated by the sort program. The range of the text field is 0 to 2147483647.

3. When ready, click Finish.
Check Tables

This action lets you issue a CHECK TABLE statement, checking one or more tables for errors. This operation returns a standard CHECK TABLE result set. Each returned message consists of Table (name), Op (with a value of CHECK), Msg_type (STATUS, ERROR, INFO, WARNING), and Msg_text components.

Platform Availability

- MySQL

To Check a Table for Errors

1. Initiate a Check Tables action against one or more tables. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Action Options</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changed</td>
<td>Only check tables that have changed since the last check.</td>
</tr>
<tr>
<td>Extended</td>
<td>Perform a full key lookup for all keys in each row.</td>
</tr>
<tr>
<td>Fast</td>
<td>Check only tables that have not been properly closed.</td>
</tr>
<tr>
<td>Medium</td>
<td>Scan rows to verify that deleted links are valid. Calculate a key checksum for the rows and verify using a calculated checksum for keys.</td>
</tr>
<tr>
<td>Quick</td>
<td>Perform a full key lookup for all keys in each row.</td>
</tr>
</tbody>
</table>

Preview

Displays the DDL that will execute the object action. For more information, see Preview.

3. Click Execute. For information on the scheduling option, see Scheduling.

The results set opens on the Results tab of an ISQL editor window. For more information, see Using the Results Editor.
Checkpoint

Running a Checkpoint lets you force all dirty pages for the current database to be written to disk. A dirty page is any data or log page which, after being read into the buffer cache, is modified but not yet written to disk. The Checkpoint statement saves time in a subsequent recovery by creating a point at which all modifications to data and log pages are guaranteed to have been written to disk. If the current database is in log-truncate mode, CHECKPOINT also truncates the inactive portion of the log.

Platform Availability
- SQL SVR, SYBASE

Important Notes
The default permission for executing a checkpoint is the db_owner fixed database role.

To Run a Checkpoint Against One or More Databases
1. Initiate a Checkpoint action against one or more databases. For more information see Initiating an object operation.
2. Use the following table as a guide to working through the panels of the Checkpoint dialog

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Displays the names of the database(s) you chose.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL generated to execute the Checkpoint operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>
3. Use one of the Schedule or Execute buttons to execute the Checkpoint.
Checksum Tables

This action lets you issue a CHECKSUM TABLE statement, returning a live checksum.

Platform Availability

- MySQL

To Check a Table for Errors:

1. Initiate a Checksum Tables action against one or more tables. For more information see Initiating an object operation.
2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td><strong>Extended</strong> Specifies that the whole table is to be read, row by row.</td>
</tr>
<tr>
<td></td>
<td><strong>Quick</strong> Specifies that the live checksum is to be reported. For information on enabling a live checksum for a table, see Tables wizard (MySQL).</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.

The results set opens on the Results tab of an ISQL editor window. For more information, see Using the Results Editor.
Coalesce

You can maximize the size of free space chunks in tablespaces to avoid the situation in which an object cannot acquire enough contiguous free space to accommodate its next extent size. Towards this goal, look for opportunities to coalesce adjacent blocks of free space into a single, larger block.

Oracle automatically coalesces adjacent free space chunks with a background process. However, it still supports the commands for coalescing free space manually. Depending on the size of the tablespace, coalescing its free space can take a long time. So determine when to perform this operation. If you coalesce immediately, the tablespace is locked.

Platform Availability

- ORCL

Important Notes

- You cannot coalesce on an UNDO tablespace.

To Coalesce a Tablespace

1. Initiate a Coalesce action against one or more tablespaces. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Coalesce wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Verify display of the tablespaces to be coalesced.</td>
</tr>
<tr>
<td>options</td>
<td></td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For more information, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>
Compile

You can recompile specific objects by issuing the proper ALTER statement. The explicit recompilation of invalid objects eliminates the need for implicit run-time recompilation which, in turn, can cause run-time compilation errors and performance overhead. Recompile objects after you make changes to that object or dependent objects.

The following table lists the object types by DBMS for which the Compile operation is available:

<table>
<thead>
<tr>
<th>DB2 LUW</th>
<th>Procedures</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle</td>
<td>Functions Java Sources Materialized Views Packages Package Bodies Procedures Schema Types Views Type Bodies</td>
</tr>
</tbody>
</table>

Note: The objects you can compile and the steps in compiling them differ according to the type of data source you are working against. Before proceeding, make sure you are familiar with the material in Compiling Oracle Objects.

To Compile an Object

1. Initiate a Compile action against one or more supported objects (see the table above). For more information see Initiating an object operation.

The Compile wizard opens. Options offered on the Action Options tab differ by object type. For example, no options are provided when compiling Java Sources, while a full range of dependent object-based and debug options are provided when compiling procedures.

2. Use the following table as a guide to working through the panels of the dialog box
Compile

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td><strong>Compile dependents</strong> If enabled, this option compiles statements for all objects referenced by the object being compiled. For example, if you compile a function that references a specific procedure and you select to compile the dependent objects, an ALTER COMPILE statement is created for that referenced procedure. If disabled, only the current object is compiled and the object’s dependencies are ignored. This is the default setting.</td>
<td>DB2 LUW Procedures Oracle Functions, Packages, Procedures, Types, and Views</td>
</tr>
<tr>
<td><strong>Compile only invalid dependents</strong></td>
<td>If you enabled the <strong>Compile dependents</strong> option, enabling this option compiles only invalid dependent objects - Creates ALTER COMPILE statements for only those objects that are currently invalid.</td>
<td>DB2 LUW Procedures Oracle Functions, Packages, Procedures, Types, and Views</td>
</tr>
<tr>
<td><strong>Compile system dependents</strong></td>
<td>If you enabled the <strong>Compile dependents</strong> option, enabling this option compiles dependent system objects - Compiles all of the referenced objects with the debug option.</td>
<td>DB2 LUW Procedures Oracle Functions, Packages, Procedures, Types, and Views</td>
</tr>
<tr>
<td><strong>Compile with debug</strong></td>
<td>Enabling this option instructs the Oracle PL/SQL compiler to generate and store the code for use in debugging sessions.</td>
<td>DB2 LUW Procedures Oracle Functions, Packages, Package Bodies, Procedures, Types, Type Bodies, and Views</td>
</tr>
<tr>
<td><strong>Keep specific name</strong></td>
<td>When enabled, compilation will keep the current name.</td>
<td>DB2 LUW Procedures Oracle Functions, Packages, Procedures, Types, and Views</td>
</tr>
</tbody>
</table>

**Dependencies** Lets you review any dependencies before you proceed. For more information, see Dependencies.

**Preview** Displays the DDL generated to execute the Checkpoint operation. For more information, see Preview.

3. Click **Execute**. For information on the scheduling option, see Scheduling.

**Compiling Oracle Objects**

To recompile an object it must belong to your schema or you need ALTER ANY privileges on that object. You must also have appropriate privileges for any associated objects. Prior to compiling objects of a particular type, see the relevant topic below:
Notes on Compiling Oracle Functions

You can recompile a function. Oracle first recompiles any invalid objects on which the function depends. In addition, it marks any objects that depend on the function as invalid.

To recompile a function that is part of a package, compile the package itself. An ALTER FUNCTION statement to compile a stand-alone function. However, you should not use the ALTER FUNCTION statement to individually recompile a function that is part of a package.

Notes on Compiling Oracle Java Sources

Oracle lets you compile a Java source. Oracle resolves references to other Java sources.

Notes on Compiling Oracle Materialized Views

You can compile materialized views. If a materialized view fails to revalidate after you recompile, that materialized view cannot be fast refreshed ON DEMAND or used for query rewrite.

Notes on Compiling Oracle Packages and Package Bodies

You can recompile a package and recompile all package objects together.

Recompiling a package compiles both the package specification and the package body by issuing two consecutive ALTER statements. However, only the ALTER statement is shown for the specification in the Preview: Confirm Compile dialog. You can recompile only the package body by explicitly compiling the package body itself.

When recompiling the entire package, Oracle recompiles the package even if it is invalid. However, if there are compilation errors, the package remains invalid and Oracle invalidates all dependent objects.
Recompiling only a package body does not invalidate objects that depend upon the package specification regardless of whether or not the package body has compilation errors.

**Notes on Compiling Oracle Procedures**

You can compile a procedure that is part of a package, by compiling the package itself. The `ALTER PROCEDURE` statement is used to compile a stand-alone procedure. However, you should not use the `ALTER PROCEDURE` statement to individually recompile a procedure that is part of a package.

**Notes on Compiling Oracle Types and Type Bodies**

You can recompile a type. Both the type specification and the type body are recompiled.

**Notes on Compiling Oracle Views**

You can recompile a view when you have altered an object referenced by that view. When you recompile a view, Oracle invalidates all dependent objects.
Convert Tables

This action lets you build and submit an ALTER TABLE statement, specifying an ENGINE= option, specifying any available storage engine.

Note: For information on how to quickly convert a table to use the INNODB storage engine, see Rebuild Table.

Platform Availability

- MySQL

To Change the Storage Engine for a Table

1. Initiate a Convert Tables action against one or more tables. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Use the Convert To dropdown to select an available storage engine.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Copy Object Names

The Copy Object Names functionality lets you copy and then paste object name(s) into other applications.

Platform Availability

- ORCL, SQL SVR

To Copy an Object Name to be Pasted into Another Application

1. On the DBArtisan Datasource Navigator/Explorer, expand nodes until the target object type is visible and then click the target object type.

2. Right-click on the specific database object or objects and select Copy object name(s).
Copy Schema

This action lets you quickly make copies of a database schema and its corresponding objects.

Platform Availability

- DB2 LUW

To Copy a Schema

1. In the data sources pane, right-click a data source and select Copy Schema from the context menu.

2. Use the following table as a guide to understanding and choosing options the options in the Copying Schema dialog:

<table>
<thead>
<tr>
<th>Pane</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Lets you specify <strong>Copying Schema</strong>, <strong>Target Schema</strong>, specify a <strong>Copy Mode</strong> of COPY, COPYNO, or DDL, specify a <strong>Log filename</strong> (COPY and COPYNO modes only), select an <strong>Object Owner</strong>, and <strong>Error table schema</strong>, provide an <strong>Error table name</strong>, and specify a <strong>Drop error table after action execution</strong> options.</td>
</tr>
<tr>
<td>Tablespace mapping</td>
<td>Lets you specify source and target tablespace options.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL generated to execute the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Execute or Schedule the action.
Copy to Copy

Platform Availability

- **DB2 z/OS**

The *Copy to Copy* dialog lets you make image copies. Starting with either the local primary or recovery site primary copy, the *Copy to Copy* dialog can make up to three copies of the following types:

- Local primary
- Local backup
- Recovery site primary
- Recovery site backup

The copies are used by the RECOVER utility when recovering a table space or index space to the most recent time or to a previous time. These copies can also be used by MERGECOPY, UNLOAD, and possibly a subsequent Copy to Copy execution.

To Perform a Copy To Copy Operation

1. Initiate a *Copy To Copy* action against a tablespace or index. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the *Copy To Copy Utility* wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>Do you want the utility to be restartable?</strong> Lets you specify to execute Wizard in restartable mode. You can restart it from the Datasource Navigator/Explorer.</td>
</tr>
<tr>
<td></td>
<td><strong>Tape Stacking</strong> Stacks similar output data sets as successive files on one logical tape volume, where a logical tape volume can consist of a multi-volume aggregate, if any of the resulting data sets on the tapes span volumes. Within one utility execution, output data sets are stacked on a logical tape volume of the same usage type. For example, local primary image copies are stacked separately from local backup image copies. Also lets you specify the Copy and Recovery dataset information once as variable names appended with generated values.</td>
</tr>
<tr>
<td>2-4</td>
<td><strong>Object Grid</strong> Displays the target tablespaces, indexespaces, or indexes. Your can select multiple items in the list. The Partition column is editable. You can add the partition numbers in this column, separated by commas.</td>
</tr>
<tr>
<td></td>
<td><strong>Add</strong> For details, see <a href="#">Object Selector Dialog Box</a>.</td>
</tr>
<tr>
<td></td>
<td><strong>Delete</strong> Deletes the selected objects.</td>
</tr>
<tr>
<td></td>
<td><strong>Set Properties</strong> For details, see <a href="#">Object Properties Dialog Box</a>.</td>
</tr>
</tbody>
</table>
3. When ready, click **Finish**.

**Object Properties Dialog Box**

The **Object Properties** dialog opens when you click the **Set Properties** button against a selected object when performing a Copy To Copy operation.

The table below describes the options and functionality on this dialog box:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>From</strong></td>
<td><strong>Copy</strong> - The particular image copy data set (dsn) as the input to COPYTOCOPY job. Specify the name in the <strong>Dataset Name</strong> field. <strong>Last Copy</strong> - The most recent image copy that was taken for the tablespace or index space to be the input to COPYTOCOPY job. This could be a full or incremental copy. <strong>Last Full Copy</strong> - The most recent full image copy that was taken for the object to be the input to COPYTOCOPY job. <strong>Last In CR Copy</strong> - The most recent incremental image copy that was taken for the object to be the input to COPYTOCOPY job.</td>
</tr>
<tr>
<td><strong>Dataset Name</strong></td>
<td>Only available if you selected a <strong>From</strong> Value of <strong>Copy</strong>. This field lets you specify a dataset name.</td>
</tr>
<tr>
<td><strong>Would you like to specify the volume information</strong></td>
<td>Only available if you selected a <strong>From</strong> Value of <strong>Copy</strong>. If you select Yes, you can specify a <strong>Volume</strong> and view the <strong>Sequence Number</strong>.</td>
</tr>
<tr>
<td><strong>Local Site Primary Copy</strong></td>
<td>Lets you specify a dataset name for the local site primary image copy. This relates to the copydsn1 parameter in the stored procedure.</td>
</tr>
<tr>
<td><strong>Local Site Backup Copy</strong></td>
<td>Lets you specify the device for the image copy. This relates to the copydev1 parameter in the stored procedure.</td>
</tr>
<tr>
<td><strong>Recovery Site Primary Copy</strong></td>
<td>Lets you specify the primary space allocation amount for the image copy. This relates to the copyospace1 parameter in the stored procedure.</td>
</tr>
<tr>
<td><strong>Recovery Site Backup Copy</strong></td>
<td>Lets you specify a dataset name for the local site backup image copy. This relates to the copydsn2 parameter in the stored procedure.</td>
</tr>
</tbody>
</table>

**Object Selector Dialog Box**

The table below describes the options and functionality on the panel of the **Object Selector** dialog
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database Like</td>
<td>Lets you type the pattern for querying the tablespaces. You can type multiple words, separated by spaces.</td>
</tr>
<tr>
<td>Tablespace Like</td>
<td>Lets you type the pattern for querying the tablespaces. You can type multiple words, separated by spaces.</td>
</tr>
<tr>
<td>Creator Like</td>
<td>Lets you type the pattern for querying the creator. You can type multiple words, separated by spaces.</td>
</tr>
<tr>
<td>Index Like</td>
<td>Lets you type the pattern for querying the index. You can type multiple words, separated by spaces.</td>
</tr>
<tr>
<td>Match Case</td>
<td>Lets you specify match case.</td>
</tr>
<tr>
<td>Object Grid</td>
<td>Lets you select one or more rows in this list.</td>
</tr>
<tr>
<td>Query</td>
<td>Repopulates grid based on the object query.</td>
</tr>
<tr>
<td>Select All</td>
<td>Selects all rows in Object Grid.</td>
</tr>
<tr>
<td>Unselect All</td>
<td>Unselects all rows in Object Grid.</td>
</tr>
</tbody>
</table>
Create Alias

The Create Alias object action lets you create an alias to a selected object. The following table shows the object types for which this action is available:

<table>
<thead>
<tr>
<th>Materialized Query Tables</th>
<th>Sequences</th>
<th>Tables</th>
<th>Views</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2 LUW</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>DB2 z/OS</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
</tbody>
</table>

To create an alias to one of the supported object types:

1. Initiate a Create Alias action against a supported object (see the table above). For more information see Initiating an object operation.

The Alias Wizard opens. For information on using the Alias editor, see the topic corresponding to the DBMS you are working against:

- Aliases Wizard (DB2 LUW)
- Aliases Wizard (DB2 Z/OS)
Create Clone

This action provides support for ADD CLONE option functionality, letting you create a clone on an existing base table. This creates a table with a cloned definition but with no data.

**Note:** The base table must reside on a universal tablespace. For more information, see [Tablespaces Wizard (DB2 Z/OS)](Tablespaces Wizard (DB2 Z/OS)).

**Platform Availability**

- [DB2 z/OS](DB2 z/OS) version 9 ^

**To Create a Clone for One or More Tables:**

1. Initiate a **Create Clone** action against one or more tables. For more information see [Initiating an object operation](Initiating an object operation).

2. Use the following table as a guide to understanding and modifying settings in the **Create Clone** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td>Lets you provide a <strong>Clone Name</strong>.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see <a href="Dependencies">Dependencies</a>.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Displays the DDL that will execute the object action. For more information, see <a href="Preview">Preview</a>.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](Scheduling).

The clone for a table is not displayed in the Datasource Navigator/Explorer listing of tables for a data source. To determine whether a table has a clone, see the **Dependencies** tab/panel on a Table editor or on the wizard for object actions such as Drop or Rename.

After creating a clone for a table, you can exchange data between the base table and the clone.

**Related Information**

- [Exchange Data With Clone](Exchange Data With Clone)
- [Drop Clone](Drop Clone)
Create Insert Statements

The Create Insert Statements dialog box lets you automatically create a set of Insert Statements for selected columns and records and based on the data in a table.

```sql
-- TABLE INSERT STATEMENTS

--

INSERT INTO DB2ADMIN.AUTHOR ( AU_FNAME, PHONE )
VALUES ( 'Johnson', '4084967223' ) ;

INSERT INTO DB2ADMIN.AUTHOR ( AU_FNAME, PHONE )
VALUES ( 'Marjorie', '4159867020' ) ;
```

Platform Availability

- DB2 LUW
- DB2 z/OS
- MySQL
- ORCL
- SQL SVR
- SYB ASE

To Create Insert Statements Based on Existing Table Data

1. In the left pane of the application, select the Tables node.
2. In the right pane of the application, right-click a table, and then select Create Insert Statements.

The Create Insert Statements dialog opens.

3. In Columns, select columns to be included in the INSERT statement.
4. Optionally, in the Where box, type a WHERE clause.
5. Enable or disable Include owner information in insert statements.
6. Enable or disable Set row count, which lets you specify a row count, the number of rows in a table that were affected by the Insert statement executed against the table, or a view based on the table.
7. Click OK.

An ISQL window opens with a set of Insert statements corresponding to the criteria you provided and the table data. For more information, see Using the SQL Editor.
Create Like

The Create Like Editor lets you create a new object based on an existing object. The following table shows availability of the Create Like function for particular object types by DBMS:

<table>
<thead>
<tr>
<th>DB2 LUW</th>
<th>DB2 Z/OS</th>
<th>ITB/FBD</th>
<th>MySQL</th>
<th>SQL Server</th>
<th>Oracle</th>
<th>Sybase ASE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Materialized Query Tables</td>
<td>Tables</td>
<td>Tables</td>
<td>Tables</td>
<td>Logins Tables</td>
<td>Tables</td>
<td>Logins Tables</td>
</tr>
</tbody>
</table>

To Create an Object Based on Another Object

1. Initiate a Create Like action against a table. For more information see Initiating an object operation.

A Create Like wizard opens.

2. Provide a name for the new object.

3. Modify settings on each panel of the wizard as required.

For particular object types, tasks and settings on the panels of the Create Like wizard are similar to those for the object editors for that object type. For information, see:

- Materialized Query Tables Editor (IBM DB2 LUW)
- Tables Editor (IBM DB2 LUW)
- Tables Editor (IBM DB2 Z/OS)
- Tables editor (MySQL)
- Logins Editor (SQL Server)
- Tables Editor (SQL Server)
- Users Editor (SQL Server)
- Tables Editor (Oracle)
- Logins Editor (Sybase ASE)
- Tables Editor (Sybase ASE)
- Users Editor (Sybase ASE)

4. Click Execute to create the new object.
Create or Edit Java Source

The Java Editor lets you enter Java code. The table below describes the Java Editor toolbar options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock/Unlock Connection</td>
<td>Click to lock or unlock connection.</td>
</tr>
<tr>
<td>Create</td>
<td>Click to open the Create Options dialog, which lets you select the options for creating the java source.</td>
</tr>
<tr>
<td>Errors</td>
<td>Click to split the workspace in half, displaying the error messages in the lower half of the workspace.</td>
</tr>
</tbody>
</table>

When you add a script in a new file, you not only choose a name for the file, but choose among create options. Finally, when you complete your script, you can Preview, Schedule or immediately Execute it.

Platform Availability

- ORCL
Create Synonym

You can perform an ad hoc Create Synonym operation against a specific object displayed in the Datasource Navigator/Explorer. For background information, see Synonyms.

Platform Availability
- ORCL

You can perform this operation against the following object types:
- Functions
- Materialized Views
- Packages
- Package Bodies
- Procedures
- Sequences
- Tables
- Views

To Create a Synonym for an Object

1. Expand the node corresponding to one of the object types supported for this operation, listed in the table above.

   The right-hand pane is populated with all objects of that type.

2. Right-click the target object and select Create Synonym from the context menu.

3. A Create Synonym wizard opens.

   For information on using the wizard, see Synonyms Wizard (Oracle).
Create View

Right-clicking one or more tables in the Navigator/Explorer and selecting **Create View** opens a wizard that lets you create a new view. For more information, see the following topics:

- Views Wizard (DB2 LUW)
- Views Wizard (DB2 Z/OS)
- Views Wizard (SQL Server)
- Views Wizard (Oracle)
- Views Wizard (Sybase ASE)
DBCC

The DBCC (Database Consistency Check) function box lets you:

- Specify single or multiple tables or indexes for validation.
- Perform database-wide validations.
- Perform object-level validations of databases.

Platform Availability

- SQL SVR, SYB ASE

To Perform a Database Consistency Check

1. Initiate a DBCC action against a database, table, or index, as follows:

   - If you are checking consistency of a Sybase ASE or SQL Server database or a SQL Server table, right-click the object and select DBCC from the context menu, as appropriate.

   - If you are checking consistency of a Sybase ASE table, right-click the table and select either DBCC > Check Allocation, DBCC > Check Table, DBCC > Check Text, or DBCC > Rebuild Index from the context menu, as appropriate.

   - If you are checking consistency of a Sybase ASE index, right-click the index and select either DBCC > Check Allocation, or DBCC > Check Index from the context menu, as appropriate.

   - If you are checking consistency of a SQL Server index, right-click the table and select either DBCC > Check Fragmentation, DBCC > Update Usage, DBCC > Check Index, or DBCC > Show Statistics from the context menu, as appropriate.

For more information see Initiating an object operation.

A dialog that that lets you specify DBCC options opens.

2. See the following topics as a guide to understanding and setting options on the dialog:

   - DBCC for Microsoft SQL Server Databases
   - DBCC for Microsoft SQL Server Tables
   - DBCC for Microsoft SQL Server Indexes
   - DBCC for Sybase ASE Databases
   - DBCC for Sybase ASE Tables
   - DBCC for Sybase ASE Indexes
3. Click **Execute**. For information on the scheduling option, see **Scheduling**.

**DBCC for Microsoft SQL Server**

The **DBCC (Database Consistency Check)** dialog lets you specify single or multiple tables or indexes for validation in Microsoft SQL Server. Use this dialog box to perform table-level or index-level validations of databases which are too large to undergo database-level DBCC operations in a time-efficient manner.

The **DBCC** dialog includes the following elements:

- A window displaying the target database objects
- A drop-down list of DBCC Operations
- Buttons for previewing the operation’s SQL code, scheduling the operation, and executing the operation

**DBCC for Microsoft SQL Server Databases**

The **DBCC** dialog for databases lets you perform database-wide validations. You should validate your databases as part of regular database maintenance to guard against corruption and failure. Microsoft SQL Server offers a set of DBCC commands to validate the integrity of your databases. Generally, you should perform these DBCC commands prior to dumping your databases to ensure that you are capturing clean backups of your databases.

The fundamental difference between the **DBCC** dialog for databases, tables and indexes is the content of the DBCC Operation drop-down list.

The table below describes the options and functionality on the **DBCC** dialog.
DBCC for Microsoft SQL Server Tables

The **DBCC** dialog for tables lets you perform table-level validations of databases. The fundamental difference between the **DBCC** dialog for tables and indexes is the content of the **DBCC Operation** drop-down list.

The table below describes the options and functionality on the **DBCC** dialog.

<table>
<thead>
<tr>
<th><strong>DBCC Operation</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Check Allocation</td>
<td>Executes a DBCC CHECKALLOC command. Makes sure that all data and index panels are correctly allocated and used. It reports on the amount of space allocated and used in the database. When checking allocation, you have the option to skip non-clustered indexes by selecting the Skip non-clustered indexes check box.</td>
</tr>
<tr>
<td>Check Catalog</td>
<td>Executes a DBCC CHECKCATALOG command. Checks for consistency in and between system tables.</td>
</tr>
<tr>
<td>Check Database</td>
<td>Executes a DBCC CHECKDB command. Verifies that all tables and indexes are properly linked, that indexes are in proper sorted order, that all pointers are consistent, that the data on each panel is reasonable, and that panel offsets are reasonable. When checking a database, you have the option to skip non-clustered indexes by selecting the Skip non-clustered indexes check box.</td>
</tr>
<tr>
<td>Check FileGroup</td>
<td>Executes a DBCC CHECKFILEGROUP command. Verifies that all tables and indexes for the specified filegroup are properly linked, that indexes are in proper sorted order, that all pointers are consistent, that the data on each panel is reasonable, and that panel offsets are reasonable. When checking filegroups, you have the option to skip non-clustered indexes by selecting the Skip non-clustered indexes check box.</td>
</tr>
<tr>
<td>Show Oldest Transaction</td>
<td>Executes a DBCC OPENTRAN command. Displays information on the oldest active transaction and the oldest distributed and non-distributed replicated transactions, if any, within the specified database.</td>
</tr>
<tr>
<td>Update Usage</td>
<td>Executes a DBCC UPDATEUSAGE command. Reports and corrects the rows, used, reserved, and dpanels columns of the sysindexes table for any clustered indexes on objects of the type U (user-defined table) or S (system table).</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Check Current Identity Value</td>
<td>Checks the current identity value for the target objects, correcting values if needed depending on parameter specifications. Identity columns created with a NOT FOR REPLICATION clause in either the CREATE TABLE or ALTER TABLE statement are not corrected by this operation.</td>
</tr>
<tr>
<td>Check Fragmentation</td>
<td>Displays the target table's data and index fragmentation information, determining whether the table is heavily fragmented. When a table is heavily fragmented, you can reduce fragmentation and improve read performance by dropping and recreating a clustered index (without using the SORTED_DATA option). Doing so reorganizes the data, resulting in full data pages. To adjust the level of fullness, use the Rebuild Index operation's FILLFACTOR option. When INSERT, UPDATE, and DELETE statements fragment tables, they usually do so with unequal distribution across the entire database so that each page varies in fullness over time, forcing additional page reads for queries that scan part or all of a table.</td>
</tr>
<tr>
<td>Check Table</td>
<td>Checks the linkages and sizes of text, ntext and image pages for selected tables. For the data, index, text, ntext, and image pages of the target tables, this operation also checks that index and data pages are correctly linked, indexes are in their proper sorted order, pointers are consistent, the data on each page is reasonable, and the page offsets are reasonable. DBCC CHECKTABLE requires a shared lock on all tables and indexes in the database for the duration of the operation. However, DBCC CHECKTABLE does not check the allocations of pages in the specified table (for this, use DBCC CHECKALLOC). To perform DBCC CHECKTABLE on every table in the database, use DBCC CHECKDB.</td>
</tr>
<tr>
<td>Check Text/Image Allocation</td>
<td>Checks the allocation of text, ntext, or image columns for a table. In later versions of Microsoft SQL, use DBCC CHECKTABLE to check the integrity of the data, index, text, ntext, and image pages for the target table.</td>
</tr>
<tr>
<td>Pin Table</td>
<td>Pins target tables in memory so that they are not flushed when Microsoft SQL Server needs space to read in new pages. DBCC PINTABLE is best used for keeping small, frequently referenced tables in memory. Pinning a large table can consume a large portion of the buffer cache, leaving inadequate memory to service other tables in the system. A pinned table that is larger than the buffer cache itself can fill the entire cache, necessitating a shut down of the system by a sysadmin user, who must then restart Microsoft SQL Server and unpin the table. Pinning too many small tables can result in a similar problem.</td>
</tr>
<tr>
<td>Rebuild Index</td>
<td>Dynamically rebuilds one, multiple, or all indexes for a table in the target database, allowing indexes which enforce either primary key or unique constraints to be rebuilt without need for dropping and recreating. This operation is not supported for use on system tables.</td>
</tr>
<tr>
<td>Unpin Table</td>
<td>Marks target tables as unpinned, rendering their pages flushable from the buffer cache if space is needed to read in a new page from disk.</td>
</tr>
</tbody>
</table>
DBCC

Update Usage  Reports and corrects inaccuracies in the sysindexes table (which can result in incorrect space usage reports by the sp_spaceused system stored procedure) and corrects the rows, used, reserved, and dpages columns of the sysindexes table for tables and clustered indexes. If there are no inaccuracies in sysindexes, DBCC UPDATEUSAGE returns no data. Use this operation to synchronize space-usage counters. Executing this operation on large tables or databases can require some time, so it should typically be used only when you suspect incorrect values returned by sp_spaceused.

DBCC for Microsoft SQL Server Indexes

The following Database Console Commands are supported, letting you perform index-level validations of databases.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check Fragmentation</td>
<td>Lets you build and submit a DBCC SHOWCONTIG command, to display fragmentation information for the selected index, letting you determine whether the table is heavily fragmented. When a table is heavily fragmented, you can reduce fragmentation and improve read performance by dropping and recreating a clustered index. For details, see <a href="https://learn.microsoft.com/en-us/sql/relational-databases/indexes/rebuild-index">Rebuild Index (SQL Server)</a>.</td>
</tr>
<tr>
<td>Update Usage</td>
<td>Lets you build and submit a DBCC UPDATEUSAGE command, reporting on and correcting pages and row count inaccuracies that can result in incorrect space usage reports. The Count Rows control lets you add a WITH COUNT_ROWS argument, dictating that the row count column be corrected as necessary. The No Informational Messages control lets you add a WITH NO_INFOMSGS argument, suppressing all informational messages.</td>
</tr>
<tr>
<td>Check Index</td>
<td>Lets you build and submit a DBCC CHECKTABLE command, verifying the integrity of pages and structures of the table or indexed view. Disabling the Show Informational Messages control adds a WITH NO_INFOMSGS argument, suppressing informational messages.</td>
</tr>
<tr>
<td>Show Statistics</td>
<td>Lets you build and submit a DBCC SHOW_STATISTICS command, displaying current query optimization statistics for the owning table or indexed view.</td>
</tr>
</tbody>
</table>

DBCC for Sybase ASE

The DBCC (Database Consistency Check) dialog lets you specify single or multiple databases, tables or indexes for validation in Sybase ASE. Use this dialog box to perform table-level or index-level validations of databases which are too large to undergo database-level DBCC operations in a time-efficient manner.

The DBCC dialog includes the following elements:

- A window displaying the target database objects
- A drop-down list of DBCC Operations
- Buttons for previewing the operation’s SQL code, scheduling the operation, and executing the operation
DBCC for Sybase ASE Databases

The DBCC dialog for databases lets you perform database-wide validations. The fundamental difference between the DBCC dialog for databases, tables and indexes is the content of the DBCC Operation drop-down list.

The table below describes the options and functionality on the DBCC dialog.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check Allocation</td>
<td>Checks the allocation and use of all pages in the target database.</td>
</tr>
<tr>
<td>Check Catalog</td>
<td>Checks for consistency in and between system tables in the target database.</td>
</tr>
<tr>
<td>Check Database</td>
<td>Checks the allocation and structural integrity of all the objects in the target database.</td>
</tr>
<tr>
<td>Check Storage</td>
<td>Checks the target database for allocation, OAM page entries, page consistency, text valued columns, allocation of text valued columns, and text column chains. The results of this operation are stored in the dbccdb database.</td>
</tr>
<tr>
<td>Database Repair</td>
<td>Drops a damaged database.</td>
</tr>
</tbody>
</table>

DBCC for Sybase ASE Tables

The DBCC dialog for tables lets you perform table-level validations of databases. The fundamental difference between the DBCC dialog for tables and indexes is the content of the DBCC Operation drop-down list.

The table below describes the options and functionality on the DBCC dialog.
### DBCC

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Check Allocation</strong></td>
<td>Checks the database to see that every page is correctly allocated, and that no allocated page is unused. Use TABLEALLOC frequently (daily) to check page linkages in the Adaptive Server before performing a database dump to ensure the integrity of the dumped data.</td>
</tr>
<tr>
<td><strong>Check Table</strong></td>
<td>Checks the linkages and sizes of text, ntext and image pages for selected tables. For the data, index, text, ntext, and image pages of the target tables, this operation also checks that index and data pages are correctly linked, indexes are in their proper sorted order, pointers are consistent, the data on each page is reasonable, and the page offsets are reasonable. DBCC CHECKTABLE requires a shared lock on all tables and indexes in the database for the duration of the operation. However, DBCC CHECKTABLE does not check the allocations of pages in the specified table (for this, use DBCC CHECKALLOC). To perform DBCC CHECKTABLE on every table in the database, use DBCC CHECKDB.</td>
</tr>
<tr>
<td><strong>Check Text</strong></td>
<td>Upgrades text values after you have changed an Adaptive Server's character set to a multibyte character set.</td>
</tr>
<tr>
<td><strong>Rebuild Index</strong></td>
<td>Dynamically rebuilds one, multiple, or all indexes for a table in the target database, allowing indexes which enforce either primary key or unique constraints to be rebuilt without need for dropping and recreating. This operation is not supported for use on system tables.</td>
</tr>
</tbody>
</table>

#### DBCC Operation Options

Additional options are offered for selected operations which you can specify to further customize a database consistency check. The table below describes each option:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Error Option</strong></td>
<td>Click <strong>Fix Error</strong> to have any allocation errors fixed. You must put your database in single-user mode to fix errors, so specify this option during times of low usage.</td>
</tr>
<tr>
<td><strong>Job Scope</strong></td>
<td>Select <strong>Optimize</strong> to produce a report based on the allocation pages listed in the object allocation map (OAM) pages for the table. It does not report and cannot fix unreferenced extents on allocation pages that are not listed in the OAM pages. The optimized option is the default. Select <strong>Full</strong> to perform the equivalent of a table-level CHECKALLOC, reporting all types of allocation errors. Select <strong>Fast</strong> to produce an exception report of pages that are referenced but not allocated in the extent. Fast does not produce an allocation report.</td>
</tr>
<tr>
<td><strong>Update Index Option</strong></td>
<td>Click this check box to skip non-clustered indexes when updating index options.</td>
</tr>
</tbody>
</table>

#### DBCC for Sybase ASE Indexes

The **DBCC** dialog for indexes lets you perform index-level validations of databases. Unlike the **DBCC** dialog for tables, this **DBCC** dialog offers only one option on the **DBCC Operation** drop-down list: **Check Allocation**. This option checks the specified
database to see that all pages are correctly allocated and that no allocated page is unused.

The table below describes the options and functionality on the DBCC dialog.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBCC Option</td>
<td>Checks the specified database to see that all pages are correctly allocated and that no page that is allocated is not used.</td>
</tr>
<tr>
<td>Error Option</td>
<td>Any allocation errors detected are fixed. You must put your database in single-user mode to fix errors, so specify this option during times of low usage.</td>
</tr>
<tr>
<td>Job Scope</td>
<td>Produces a report based on the allocation pages listed in the object allocation map (OAM) pages for the table. It does not report and cannot fix unreferenced extents on allocation pages that are not listed in the OAM pages. The optimized option is the default. A full job is the equivalent to a table-level CHECKALLOC, reporting all types of allocation errors. A fast job does not produce an allocation report, but produces an exception report of pages that are referenced but not allocated in the extent.</td>
</tr>
</tbody>
</table>
Deallocate Unused Space

The **Deallocate Unused Space** dialog lets you deallocate space from clusters, indexes, and tables. You can also deallocate unused space from table partitions and subpartitions. When you find that allocated space is not being used, you can free that space for use by other objects by explicitly deallocating space. Oracle releases the freed space to the user quota for the tablespace in which the deallocation occurs.

Oracle deallocates unused space from the end of the object toward the high water mark. In other words, Oracle frees space starting with the space that would have been used last. If an extent is completely contained in the space to be deallocated, then the whole extent is freed. If an extent is only partially contained in the space to be deallocated, then Oracle shrinks that extent to the size of the used space up to the high water mark, and frees the unused space in the extent.

If you are deallocating unused space from an index and the index is range-partitioned or hash-partitioned, Oracle deallocates unused space from each partition in the index. If an index is a local index on a composite-partitioned table, Oracle deallocates unused space from each of the subpartitions in the index.

**Tip:** You can verify that the deallocated space is freed by going to the **Space** tab in the appropriate editor.

**Platform Availability**

- **ORCL**

**To Deallocate Unused Space from an Index or Table**

1. Initiate a **Deallocate Unused Space** action against one or more Clusters, Indexes, Primary Keys, Tables, or Unique Keys. For more information see [Initiating an object operation](#).

The **Deallocate Unused Space** dialog opens.

2. Use the following table as a guide to understanding and specifying options on this dialog:
Deallocate Unused Space

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify the number of bytes above the high-water mark that the objects will have after deallocation. If no value is specified, all unused space will be freed.</td>
<td>If you do not specify an amount of unused space and the high water mark is above the size of INITIAL and MINEXTENTS, then all of the unused space is freed. If the high water mark is less than the size of INITIAL or MINEXTENTS, then all unused space above MINEXTENTS is freed. If you specify an amount of unused space and the remaining number of extents is smaller than MINEXTENTS, then the MINEXTENTS value changes to reflect the new number. If the initial extent becomes smaller as a result of the deallocation, the INITIAL value changes to reflect the new size of the initial extent.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Delete Statistics

Lets you create and issue a DELETE STATISTICS statement, allowing you to delete statistics for a table or for specified columns of a table.

Platform Availability

- SYB ASE

To Delete Statistics for a Table

1. Initiate a Delete Statistics action against one or more tables. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Delete Statistics wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Displays the names of the tables you selected and if appropriate, lets you select a specific Partition Name.</td>
</tr>
<tr>
<td>Columns (Sybase ASE 15 only)</td>
<td>All columns - lets you delete statistics for all columns in the table. Specific columns - select this option and then select check boxes associated with each specific column for which statistics are to be deleted.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For more information, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Describe

Right-clicking a table, view, procedure or function in the Navigator/Explorer and selecting Describe opens a window that lets you view columnar information (for tables and views) or input parameter information (for procedures and functions).
**Detach Database**

The **Detach Database** object action removes the database from the server but leaves the database intact within the data and transaction log files that compose the database. These data and transaction log files can then be used to attach the database to any instance of Microsoft SQL Server, including the server from which the database was detached. This makes the database available in exactly the same state it was in when it was detached.

**Platform Availability**

- **SQL SVR**

**To Detach Data and Transaction Files for a Database**

1. Initiate a **Detach Database** action against a database. For more information see [Initiating an object operation](#).

   The **Detach Database(s)** dialog opens.

2. To skip the UPDATE STATISTICS operation when detaching the database, select the **Skip Checks** check box for the target database(s).

**Tip:** This option is useful for databases that are to be moved to read-only media.

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).

**Related Information**

- **Attach Database**
Disable Index

The Disable Index(es) action lets you mark an index as disabled or inactive and unavailable for use.

Platform Availability

- SQL SVR

Note: On SQL Server this action can also be applied to primary keys and unique keys.

To Disable an Index

1. Initiate a Disable Index(es) action against one or more indexes. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Displays the name of the index, primary key, or unique key being disabled.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For more information, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Disable Job

You can enable or disable any job queue. Job Queues are built-in mechanisms that let you schedule a variety of SQL-based or command-line driven tasks.

Platform Availability

- ORCL

To Disable a Job Queue

1. Initiate a Disable Job action against a job queue. For more information see Initiating an object operation.

The Disable dialog opens.

2. Click Execute. For information on the scheduling option, see Scheduling.

Topics

- Enable Job (Job Queue)
- Run Job (job queues).
# Disable Keys

This action lets you build and submit an ALTER TABLE statement that specifies the DISABLE KEYS option. This action tells MySQL stop updating nonunique indexes.

**Platform Availability**
- MySQL

**To Stop Updates to Nonunique Indexes**

1. Initiate a **Disable Keys** action against one or more tables. For more information see [Initiating an object operation](#).

The **Disable Keys** dialog opens.

2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Lets you review the tables you selected.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).

**Note:** You can subsequently recreate missing indexes. For details, see [Enable Keys](#).
Disable/Enable Triggers

These actions let you build and submit ALTER TABLE statements that specify ENABLE TRIGGER or DISABLE TRIGGER options.

Platform Availability
- SQL SVR, SYB ASE

To Enable or Disable Triggers for a Table
1. On the Database Navigator/Explorer, select the Tables node.
2. On the Database Navigator/Explorer, right-click one or more selected tables and select Enable Triggers or Disable Triggers.

The Enable Triggers or Disable Triggers dialog opens, as appropriate.
3. Click Execute.
Disconnect ASM Connection

This action disconnects a direct connection to an ASM instance and reverts to the default datasource login.

**Note:** For information on connecting directly to an ASM instance, see Manage ASM Connection.

**Platform Availability**
- ORCL 10g

**To Disconnect from an ASM Instance**
1. On a connected Oracle datasource, expand the **Instance** node.
2. Right-click the **ASM** node and select **Disconnect ASM Connection** from the context menu.
Drop

The Confirm Drop dialog lets you drop one or more database objects and remove their definition from the system catalog.

Platform Availability
- DB2 LUW, DB2 z/OS, MySQL, ORCL, SQL SVR, SYB ASE, SYB IQ

To Drop an Object

1. Initiate a Drop action against one or more objects. For more information see Initiating an object operation.

The Confirm Drop dialog opens on the Action Options panel.

2. On the Action Options panel, select any options specific to the object type or configuration of the object you are dropping.

3. Navigate to the Dependencies pane to view database objects that are dependent on the object you are dropping.

Note: For Microsoft SQL Server, when dropping Logins, you also have the option to delete corresponding user objects.

Note: For Microsoft SQL Server, when dropping Databases, you also have the option to delete the backup and restore history for the database.

4. Navigate to the Preview pane to verify that the correct DDL was created, and if necessary navigate backward and modify your choices.

5. Click Execute to drop the object.
Drop Automatic Storage Path(s)

This action lets you remove tablespace storage paths on a datasource and subsequently rebalance any affected tablespaces. It builds and submits:

- An ALTER DATABASE DROP STORAGE ON... statement specifying the storage paths to be removed
- Optionally, one ALTER TABLESPACE... REBALANCE statement for each tablespace impacted by the ALTER DATABASE DROP STORAGE ON... statement

Platform Availability

- DB2 LUW 9.7

Prerequisites or Setup Tasks

This object action is only available for datasources configured for autostorage and that have at least two autostorage paths configured.

To drop storage paths on a datasource

1. Initiate a Drop Automatic Storage Path(s) action against a datasource. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path(s) Selection</td>
<td><strong>Path:</strong> Select the check box associated with each storage path that is to be dropped. This object action will not allow you to select all storage paths on a datasource. At least one path must be left active. <strong>Rebalance the affected tablespaces:</strong> Selecting this check box generates an ALTER TABLESPACE... REBALANCE statement for each tablespace affected by the storage paths you selected to drop.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.

For related information, see Rebalance.
Drop By Category

This action lets you build and submit one or more calls to the `outln_pkg.drop_by_cat` subprogram, letting you drop outlines belonging to specified categories.

**Platform Availability**

- ORCL

**To Drop One or More Stored Outlines of a Particular Category**

1. Initiate a Drop By Category action against one or more stored outlines. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in this Drop By Category wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Select the categories to drop.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see [Scheduling](#).

**Related Information**

- [Change Category](#)
- [Reassign By Category](#)
Drop Clone

If you have created a clone from a base table, you can drop that clone. To determine whether a table has a clone, see the Dependencies tab/panel on a Table editor or on the wizard for object actions such as Drop or Rename.

Platform Availability

- DB2 z/OS version 9

To Drop the Clones of One or More Tables

1. Initiate a Drop Clone action against one or more tables. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Confirm Drop Clone wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Lets you review the action you initiated.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.

Related Information

- Create Clone
- Exchange Data With Clone
Drop Java

This action lets you make use of the dropjava tool, deleting schema objects corresponding to Java files.

Platform Availability

- ORCL

To Drop Schema Objects Associated with a Java File

1. Initiate a Drop Java action against one or more Java Classes. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings on the Drop Java Objects dialog:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Who Owns the Java Object</td>
<td>Select the owner of objects to be dropped.</td>
</tr>
<tr>
<td>File to be dropped</td>
<td>Use these controls to build a list of Java files for which associated objects are to be dropped.</td>
</tr>
<tr>
<td>Drop Synonym</td>
<td>Drops any synonyms defined for objects being dropped.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.

Topics

- Load Java
Drop Login Trigger

The **Drop Login Trigger** action lets you build and submit an `sp_modifylogin` or `ALTER LOGIN` call that specifies a NULL login script option. This removes the configured login trigger for the login, the default database stored procedure that executes each time the user successfully logs in.

**Note:** If a login has a login trigger configured, the specified stored procedure name is visible in the Login editor. For details, see [Logins Editor (Sybase ASE)](#).

### Platform Availability

- **SYB ASE**

### To Remove the Currently Configured Login Trigger for a Login

1. On the DBArtisan Datasource Navigator/Explorer, expand the data source nodes until the **Logins** node is visible and then select the **Logins** node.

2. Right-click a login and select **Login Trigger Actions > Drop Login Trigger** from the context menu. The **Drop Login Trigger** dialog opens.

3. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Displays the login you selected to run the action against.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For details, see <a href="#">Dependencies</a>.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>

### Topics

- [Add/Modify Login Trigger](#)
Drop Materialized Query Table

The **Drop Materialized Query** action lets you convert a materialized query table to a regular table.

**Platform Availability**

- **DB2 LUW**

**To Convert a Materialized Query Table to a Regular Table**

1. Initiate a **Drop Materialized Query Table** action against one or more materialized query tables. For more information see [Initiating an object operation](#).

2. The **Confirm MQT Conversion to Regular** dialog opens.

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Drop Unused

This action lets you build and submit one or more calls to the `outln_pkg.drop_unused` subprogram, letting you drop outlines that have not been used since being created.

**Platform Availability**

- ORCL

**To Drop One or More Unused Stored Outlines**

1. Initiate a [Drop Unused](#) action against one or more stored outlines. For more information see Initiating an object operation.

   The **Drop Unused** dialog opens.

2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see **Scheduling**.

   This action lets you build and submit an `ALTER TABLE... DROP UNUSED COLUMNS` statement, letting you remove columns currently marked as unused.

**Platform Availability**

- ORCL

**To Drop the Clones of one or more Tables**

1. Initiate a [Drop Unused Columns](#) action against one or more tables. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the **Drop Unused Columns** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Displays the tables you selected</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see **Scheduling**.
Edit Data

Right-clicking a table and selecting Edit Data lets you edit table data. For details, see Data Editor.
Enable/Disable (Oracle Jobs)

This action builds and submits a DBMS_SCHEDULER.DISABLE or DBMS_SCHEDULER.ENABLE call, letting you enable or disable a job or program.

Platform Availability

- ORCL 10g ^

To enable or disable a job or program

1. In DBArtisan, on a connected Oracle datasource, expand the Instance and Scheduler nodes and select the Jobs or Programs node.
2. Right-click a job or program and select Enable/Disable from the context menu.
3. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Select the Enabled check box to enable the job or program. Leave the Enabled check box deselected to disable the job or program.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

4. Click Execute. For information on the scheduling option, see Scheduling.
Enable/Disable Filetable(s)

This action lets you build and submit an ALTER TABLE statement, specifying either an ENABLE FILETABLE_NAMESPACE or DISABLE FILETABLE_NAMESPACE argument. This enables or disables system-defined constraints on a FileTable.

Platform Availability

- SQL SVR

To enable or disable system-defined constraints on a FileTable

1. Initiate an Enable/Disable Filetables action against one or more tables. For more information see Initiating an object operation.

The Enable/Disable Filetable(s) dialog box opens.

2. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Enabled If selected, an ALTER TABLE with an ENABLE FILETABLE_NAMESPACE argument is generated. If unselected, an ALTER TABLE with a DISABLE FILETABLE_NAMESPACE argument is generated.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lets you review the objects potentially impacted by this action. For more information, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation and when ready, use the Schedule or Execute button to perform this action.</td>
</tr>
</tbody>
</table>

3. Finally, use the Execute button to create the object.

For information on setup of filegroups, FileTable, and Filestream, see the following topics:

- Databases Wizard (SQL Server)
- Tables Wizard (SQL Server)
Enable/Disable Job (SQL Agent Job)

This action builds and submits an `sp_update_job` call with an `@enabled` argument. It lets you change the enabled/disabled status of a SQL Agent job.

**Platform Availability**

- SQL SVR

**To Change the Enabled/Disabled Status of a Job**

1. Initiate an [Enable/Disable Job](#) action against one or more jobs. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the [Enable/Disable jobs](#) wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td>Select the <strong>Enable</strong> check box to enable the selected jobs. Deselect the <strong>Enable</strong> check box to disable the selected jobs.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Displays the DDL that will execute the object action. For details, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Enable/Disable Stored Outline Auto-creation/Auto-use

There are two object actions that can be performed against one or more stored outlines, that dictate whether execution plans are automatically generated or used:

Enable/disable stored outline auto-creation

Lets you specify whether Oracle to create a stored outline for every query submitted to the server.

Enable/disable stored outline auto-use

Lets you specify whether Oracle uses stored outlines to generate execution plans.

Platform Availability

- ORCL

To Specify Whether Stored Outlines are Automatically Created and Used

1. Initiate an Enable/disable stored outline auto-use or Enable/disable stored outline auto-creation action against one or more stored outlines. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Automatically create stored outlines or Automatically use stored outlines</td>
</tr>
<tr>
<td>Category</td>
<td>Lets you select an outline category. This option is only available if you enabled the feature.</td>
</tr>
<tr>
<td>No Override</td>
<td>If selected, outlines will not override. This option is only available if you enabled the feature.</td>
</tr>
</tbody>
</table>

Dependencies

Review the referring and referred objects that will be automatically resolved when you execute this operation.

Preview

Preview the DDL generated for the operation. For more information, see Preview.

3. When ready, click Execute.
Enable Job (Job Queue)

This action lets you enable or disable any job queue. Job Queues are built-in mechanisms that let you schedule a variety of SQL-based or command-line driven tasks.

**Platform Availability**
- ORCL

**To Enable a Job Queue**

1. Initiate an **Enable Job** action against a job queue. For more information see [Initiating an object operation](#).

The **Enable** dialog opens.

2. Click **Execute**. For information on the scheduling option, see [Scheduling](#).

**Topics**
- [Disable Job](#)
- [Run Job (job queues)](#)
Enable Keys

You can issue an ALTER TABLE statement that specifies the ENABLE KEYS option. This action tells MySQL to recreate missing indexes.

Platform Availability

- MySQL

To Recreate Missing Indexes

1. Initiate an Enable Keys action against one or more tables. For more information see Initiating an object operation.

The Enable Keys dialog opens.

2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Lets you review the tables you selected.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.

Note: You can also instruct MySQL to stop updating nonunique indexes. For details, see Disable Keys.
Enable Recycle Bin

This action builds and submits an ALTER SYSTEM SET "_recyclebin"=TRUE or ALTER SYSTEM SET "_recyclebin"=FALSE statement, letting you enable or disable the Oracle Recycle Bin.

This action lets you enable or disable the Oracle Recycle Bin, building and submitting one of the following version-specific statement variations:

- **Oracle 10g R1** - ALTER SYSTEM SET "_recyclebin" TRUE / FALSE
- **Oracle 10g R2** - ALTER SYSTEM SET RECYCLEBIN ON / OFF SCOPE=BOTH
- **Oracle 11g** - ALTER SYSTEM SET RECYCLEBIN ON / OFF DEFERRED SCOPE=BOTH (note that in this case, the change takes effect after reconnecting to the datasource)

When the Recycle Bin is enabled, dropped objects are stored in the Recycle Bin until explicitly purged.

**To Enable or Disable the Recycle Bin**

1. In DBArtisan, right-click an Oracle datasource node, and select **Command > Enable Recycle Bin** from the context menu.

2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Panel</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Select the <strong>Enable</strong> check box to enable Recycle Bin functionality. Deselect the</td>
</tr>
<tr>
<td>Options</td>
<td><strong>Enable</strong> check box to disable the feature.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see <strong>Preview</strong>.</td>
</tr>
</tbody>
</table>

**Note:** In general, you can determine the current enabled/disabled state of the Recycle Bin by opening the **Enable Recycle Bin** dialog. If the **Enable** check box is selected, the Recycle Bin is currently **Enable** Note however, that the **Enable Recycle Bin** action reads the current state of the Recycle Bin by querying the v$parameter object. On some Oracle 10g R1 servers, the "_recyclebin" parameter does not appear listed in v$parameter – it is hidden. As a result, for this specific case, the value of the check box when opening the **Enable Recycle Bin** dialog will always be **TRUE**, regardless of the actual value.

3. Click **Execute**. For information on the scheduling option, see **Scheduling**.

**Topics**

- **Recycle Bin**
- **Flashback Recycle Bin Entry**
- **Purge Recycle Bin Entry**
Enable Recycle Bin

- Purge Recycle Bin
Error

The Error message displays a warning. After reading the warning, click Close to continue.
Estimate Size

The **Estimate Size** dialog for tables and indexes lets you estimate how large a table or index will become given a row growth projection. The results let you proactively plan your space-related object needs.

**Platform Availability**
- ORCL, SYBASE

**To Estimate Size for a Table or Index**

1. Initiate an **Estimate Size** action against one or more tables or indexes. For more information see [Initiating an object operation](#).

The **Estimate Size** dialog opens.

2. Use the following topics as a guide to estimating size and using the other options offered on this dialog:
   - [Estimating Oracle index or table sizes](#)
   - [Estimating Sybase ASE index or table sizes](#)

### Estimating Oracle index or table sizes

The **Estimate Size** dialog remains open until you manually close it. This lets you run several estimations, varying the method and various metrics. Each estimation run is a three-step process:

1. Select a size estimation method:
   - **Use current row data from current statistics** - The table or index must have been previously analyzed for statistics to be obtained. Note that the **Analyze Index(es)** and **Analyze Table(s)** buttons can be used to initiate this action. For more details, see [Analyze](#).
   - **Use table/index definition source** - The maximum row length for the index or table will be calculated. Note that this usually produces much higher space estimates.
   - **Manually enter estimation metrics** - Manually enter in data for space estimates if the objects have no data or if the index definition source method is not desired.

2. Depending on the method you chose, provide additional metrics:
   - **Percent Free**
   - **Row Size**
   - **Number of rows**
3. Click the **Estimate Size** button and view the estimate in the **Estimated Index Size** box.

Other options include:

- Use the **Report** button to generate an HTML report of results
- Use the **Save As** button to save a result grid file
- Use the **Owner** and **Name** controls to select another table or index for size estimates.
- Use the **Add Index** or **Add Table** button to add another table or index to your size estimates. Similarly, use the **Remove Index** or **Remove Table** button to remove a table or index from the dialog.

### Estimating Sybase ASE index or table sizes

The **Estimate Size** dialog remains open until you manually close it. This lets you run several estimations, varying the available metrics. Each estimation run is a two-step process:

1. Provide the metrics for your estimate:
   - **Fill Factor** (indexes only) - Specify a percentage of how full each index page can become.
   - **Number of rows** - Specify the number of rows for your size estimate.

   **Note:** Optionally you can use the **Update Statistics** button to open a dialog that lets you generate new statistics for the index or table. For details, see [Update Statistics](#).

2. Click the **Estimate Size** button and view the estimate in the **Estimated Index Size** box.

Other options include:

- Use the **Report** button to generate an HTML report of results
- Use the **Save As** button to save a result grid file
- Use the **Database, Owner, Table Name, and Index Name** controls to select another table or index for size estimates.
- Use the **Add Index** or **Add Table** button to add another table or index to your size estimates. Similarly, use the **Remove Index** or **Remove Table** button to remove a table or index from the dialog.
Exchange Data With Clone

This action lets you issue an EXCHANGE statement with the DATA BETWEEN TABLE table1 AND table2 syntax, letting you swap data between a base table and its clone. To determine whether a table has a clone, see the Dependencies tab/panel on a Table editor or on the wizard for object actions such as Drop or Rename.

Platform Availability

- DB2 z/OS version 9

To Exchange Data Between One or More Tables and their Clones

1. Initiate a Clone Actions > Exchange Data With Clone action against one or more tables. For more information see Initiating an object operation.

The Exchange Data With Clone dialog opens.

2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Lets you review the action you initiated.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.

Topics

- Create Clone
- Drop Clone
Execute

The **Execution** dialog lets you execute extended procedures, functions, and procedures.

Platform and object type availability

DB2 LUW DB2 z/OS ITB/FBD MySQL Oracle SQL Server Sybase ASE

<table>
<thead>
<tr>
<th>Extended procedures</th>
<th>✓</th>
</tr>
</thead>
<tbody>
<tr>
<td>Functions</td>
<td>✓</td>
</tr>
<tr>
<td>Procedures</td>
<td>✓ ✓ ✓ ✓ ✓ ✓ ✓</td>
</tr>
</tbody>
</table>

To Compile an Extended Procedure, Function, or Procedure

1. In the DBArtisan Datasource Navigator/Explorer, select a valid object node. Objects of that type are shown in the right pane.

2. Right click the target object and select **Execute** from the context menu.

**Note:** If the extended procedure, function, or procedure takes input parameters, you are prompted to provide values.

The Results editor opens, showing either results of a successfully executed extended procedure, function, or procedure, or showing error messages if execution was not successful. For details, see [Using the Results Editor](#).

Working With Execution Parameters

If you initiate an **Execute** action against an extended procedure, function, or procedure that takes input parameters, a dialog prompts you to provide parameter values and otherwise manage parameters.

The **Procedure Execution** dialog lets you:

- Save input parameters as *.prm files to preserve specific input parameter configurations.
- Open *.prm files to save the effort of reentering specific input parameters.
- Reset parameters to their default setting.

The table below describes the options and functionality of the **Procedure Execution** dialog:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
<td>Specify the required input parameters in this window. If input parameters are not required for the execution of the target procedure, a message displays in this window, stating that the procedure “has no input parameters. Press execute to run it.”</td>
</tr>
<tr>
<td><strong>Open</strong></td>
<td>Click to open an Open dialog, from which you can open an existing *.prm file. The saved parameters immediately populate the dialog box upon opening.</td>
</tr>
<tr>
<td><strong>Save</strong></td>
<td>Click to save the values of your input parameters as a *.prm file. You can reopen a saved *.prm file from this dialog box at any time.</td>
</tr>
<tr>
<td><strong>Reset</strong></td>
<td>Click to reset the parameters in the Parameter window to their default values.</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Select to gather default information from the data dictionary. ORACLE ONLY: You can not specify non-default parameters after specifying a default parameter.</td>
</tr>
<tr>
<td><strong>Continue</strong></td>
<td>Click to execute the procedure once you have entered values for all required parameters in the Parameter window.</td>
</tr>
</tbody>
</table>
Extract

You can extract the statements required to create existing objects into an Interactive SQL window.

Note: For information on setting preferences for this action, see DDL Extract Options.

Platform Availability

DB2 LUW, DB2 z/OS, MySQL, ORCL, SQL SVR, SYB ASE, SYB IQ

To Extract the DDL for an Object

1. Initiate an Extract action against one or more objects. For more information see Initiating an object operation.

The DDL Editor opens with the DDL to create the selected objects. For more information, see Using the DDL Editor.
Extract Data as XML

This function allows you to take SQL data, extract it, and make it available as XML data. The XML Editor Filter allows you to pick and choose among columns and designate rows and then creates the For XML statement that enables the operation. The resulting XML document is created and presented in an active XML Editor. At this point the document can be saved in XML format.

Caution: To use the Extract Data as XML feature in Sybase ASE, you must first purchase and install an XML Services license from Sybase.

Platform Availability

- ORCL 9i, SQL SVR, SYB ASE 12.5.1

To Open the XML Editor Filter

1. Initiate an Extract Data as XML action against a table. For more information see Initiating an object operation.

An XML Editor Filter dialog opens.

2. In the Columns area, select the check boxes corresponding to the columns with data you want to extract.

3. Optionally, in the Where box, type a WHERE clause to qualify the records that will be extracted.

Note: As you select options, inspect the Select box to verify the query you are creating.

4. Use the table below as a guide to understanding and specifying the optional DBMS-specific settings in this dialog:

<table>
<thead>
<tr>
<th>DBMS</th>
<th>Setting or group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sybase ASE</td>
<td>Refer to Sybase online documentation for details on XML mapping information. For assistance, see Accessing Third Party Documentation.</td>
<td></td>
</tr>
<tr>
<td>Oracle</td>
<td><strong>Row Set Tag</strong></td>
<td>Identify the XML element name you want to use to replace the Row Set tag.</td>
</tr>
<tr>
<td></td>
<td><strong>Row Tag</strong></td>
<td>Identify the XML element names you want to use to replace the Row tag.</td>
</tr>
<tr>
<td></td>
<td><strong>Max Rows.</strong></td>
<td>The maximum number of rows to fetch</td>
</tr>
</tbody>
</table>
SQL Server XML Mode

**AUTO** mode returns query results as nested XML elements. For any table in the From clause with a column in the Select clause, it is represented as an XML element. When you select **RAW** mode, each row in the query result set is transformed into an XML element with the generic row identifier. The XML attribute name will be the same as the column name for non-null columns.

XML Options

**XML DATA** specifies that an XML data schema will be returned. **ELEMENTS** specifies that columns will be returned as subelements—otherwise they are mapped to XML attributes. This is an option only if **AUTO** is selected. When **BINARY BASE64** is selected, any binary data is encoded in base-64 format. You must specify this option in **RAW** mode. It is the default for **AUTO**.

5. When ready, click **OK**. An XML representation of the extracted data opens in an XML editor.
Flashback Recycle Bin Entry

This action lets you build and submit a FLASHBACK TABLE... TO BEFORE DROP statement against a table in the Recycle Bin. This recovers the table and restores it to its state immediately before the drop.

**Note:** The Datasource Navigator/Explorer entry for a Recycle Bin entry has a Can Undrop field that indicates whether a Flashback Recycle Bin Entry action can be performed against the item.

**Platform Availability**
- ORCL 10g^1

**To Recover a Table Currently in the Recycle Bin**

1. In the DBArtisan Datasource Navigator/Explorer, under an Oracle Schema node, select the Recycle Bin node. Contents of the Recycle Bin are displayed.

2. Right-click one or more selected tables in the Recycle Bin and select Flashback Recycle Bin Entry from the context menu. The Flashback Recycle Bin Entry dialog opens.

3. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Displays the table entries you selected to restore.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

4. Click Execute. For information on the scheduling option, see Scheduling.

**Topics**

- Recycle Bin (for a support summary including topics such as displaying Recycle Bin contents)
- Enable Recycle Bin
- Purge Recycle Bin Entry
- Purge Recycle Bin
Flashback Table

This action builds and submits a FLASHBACK TABLE statement, letting you restore a table to a state at some specified time in the past.

*Note:* Before using this object action, consult Oracle documentation for information on restrictions, required permissions, and details on System Change Numbers and Restore Points. For more information, see [Accessing Third Party Documentation](#).

**Platform Availability**

- **ORCL 10g ^**

*Note:* Available options differ by the version of Oracle that you are working against.

**To Restore a Table to Some Previous State**

1. Initiate a Flashback Table action against a table. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings on the dialog:

<table>
<thead>
<tr>
<th>Panel</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td><strong>Type</strong></td>
</tr>
<tr>
<td></td>
<td>Lets you select a specific FLASHBACK TABLE clause: <strong>BEFORE DROP</strong> - If the table is currently in the Recycle Bin, the table will be restored to its state immediately before being dropped. <strong>SCN</strong> - restores the table to a time corresponding to a specified System Change Number. <strong>TIMESTAMP</strong> - restores the table to a time corresponding to a specified timestamp value. <strong>RESTORE POINT</strong> - (10g R2 ^) restores the table to a time corresponding to a specified name associated with an SCN.</td>
</tr>
</tbody>
</table>

| SCN | If you selected a **Type** value of SCN, type a System Change Number. |
| Timestamp | If you selected a **Type** value of TIMESTAMP, use this control to provide a timestamp. |
| **Restore Point (10g R2 ^)** | If you selected a **Type** value of RESTORE POINT, select a restore point. |
| **Enable Trigger** | If you selected a **Type** value of SCN, TIMESTAMP, or RESTORE POINT, selecting this check box overrides the default behavior, ensuring that triggers remain enabled during the flashback process. |
| **Rename To** | If you selected a **Type** value of BEFORE DROP, specify a new name for the table being retrieved from the Recycle Bin. |
Flashback Table

**Dependencies** For details on using this tab, see Dependencies.

**Preview** Displays the DDL that will execute the object action. For details, see Preview.

3. Click **Execute**. For information on the scheduling option, see Scheduling.

**Topics**

- Flashback Recycle Bin Entry
Flush Cache

This action lets you clear all dynamic SQL in the cache for a package and forces IBM DB2 for Linux, Unix, and Windows to recompile the SQL the next time it is called.

Platform Availability
- DB2 LUW

To Flush the Cache for a Package

1. Initiate a **Flush Cache** action against a package. For more information see [Initiating an object operation](#).

The **Flush Package Cache** dialog opens.

2. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Flush Tables

This action lets you build and submit a FLUSH statement, specifying a TABLE or TABLES option. This flushes the specified tables and removes all query results from the query cache.

Platform Availability

- MySQL

To Flush One or More Tables

1. Initiate a Flush Tables action against one or more stored tables. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Displays the tables selected for this flush operation.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Free (Packages)

You can delete one or more packages.

Platform Availability

- DB2 z/OS

To Delete Packages

1. Initiate a Free Packages action against one or more packages. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Confirm Free wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Displays the names of the packages you chose to free. This panel also lets you select a Order Drop By Selection setting, which dictates whether drop statements are generated in the order objects are selected.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Free Plan

In DBArtisan, this action lets you drop plans associated with packages or DBRMs.

To Drop a Plan

- In DBArtisan, click the **Free** button on the **Plans** tab of the DBRMs editor. For more information, see [DBRMs Editor (IBM DB2 Z/OS)](https://www.ibm.com/).  
- In DBArtisan, click the **Free** button on the **Plans/Packlists** tab of the Packages editor. For more information, see [Packages Editor (IBM DB2 Z/OS)](https://www.ibm.com/).

For more information on dropping database objects, see [Drop](https://www.ibm.com/).
**Hide Text**

This action lets you build and submit `sp_hidetext` calls against one or more objects. This allows you to hide the source text for particular object types:

**Caution:** The **Hide Text** action is irreversible. Once hidden, source text cannot be made viewable or otherwise retrievable again.

**Note:** For details on the specific elements hidden, consult Sybase documentation. See [Accessing Third Party Documentation](#).

When viewing an object after hiding text, hidden elements occupying entire tabs or individual property boxes, are annotated with a **Source text for this compiled object is hidden** message.

![Source text for this compiled object is hidden](image)

**Hide Text** can be applied both to individual objects and to objects containing or owning other objects. Supported object types for which **Hide Text** can be applied to individual objects, and the resulting application-specific hidden elements in object editors are as follows:

- **Check constraints**  
  - Check Condition box, **Definition** tab.

- **Defaults**  
  - Value box, **Properties** tab.

- **Extended procedures**  
  - Library name box, **Properties** tab.

- **Functions**  
  - **Definition** tab.

- **Procedures**  
  - **Definition** tab.

- **Rules**  
  - Restriction box, **Properties** tab.

- **Triggers**  
  - **Definition** tab.

- **Views**  
  - **Definition** tab.

Object-containing or object-referencing object types to which **Hide Text** can be applied are as follows:
Hide Text

**Databases**  Hides the source text of all compiled objects in the selected database.

**Tables**  Hides the source text of all check constraints, defaults, and triggers defined on the selected table.

**Users**  Hides the source text of all compiled objects owned by the selected user.

**Caution:** Because of the potentially broad scope of hiding text for users and databases, you should exercise extreme care when applying Hide Text to those object types.

**Platform Availability**

- **SYBASE**

**To Permanently Hide the Source Text for One or More Objects**

1. For DBArtisan, in the Datasource Navigator/Explorer, expand nodes until the node corresponding to one of the target object types is visible, and select that node. Objects of that type are shown in the right pane.

2. Right-click one or more selected objects, and then select Hide Text from the context menu. The Confirm Hide Text dialog opens.

3. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td>Displays the name of the objects you selected.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For more information, see Dependencies.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

4. Click Execute. For information on the scheduling option, see Scheduling.

DBArtisan Datasource Explorer views for supported objects show a Hidden property that indicates whether Hide Text has been applied to the object. Y indicates that source text for this compiled object has been irreversibly hidden.
Import Data From File

Right-clicking a table in the Navigator/Explorer and selecting *Import Data From File* opens a dialog that lets you import table data from a file. For details, see [Import Data](#).
**Kill**

This action issues a DBMS-specific command (KILL or ALTER SYSTEM KILL SESSION, for example) required to terminate a blocking lock, lock, or process. The following table shows the DBMS platform and object types for which the **Kill** action is available:

<table>
<thead>
<tr>
<th>DB2 LUW</th>
<th>DB2 z/OS</th>
<th>MySQL</th>
<th>ORCL</th>
<th>SQL SVR</th>
<th>SYB ASE</th>
</tr>
</thead>
<tbody>
<tr>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>

**To kill a blocking lock, lock, or process**

1. In the Navigator/Explorer, expand the **Performance** node and then select the **Blocking Locks**, **Locks**, or **Processes** node.

2. In the Navigator/Explorer, right click a blocking lock, lock, or process and select **Kill** from the context menu.

3. When prompted to verify, click **Yes**.
Load Java

Before you can call Java stored procedures, you must load them into the Oracle database and publish them to SQL.

**Note:** This functionality is available for Oracle only.

**Note:** For related information, see [Drop Java](#).

The Java Load Wizard lets you:

- Select the owner of the Java object and the files to load.
- Select options for the loading of the files.
- Select Resolver options.

### Java Load Wizard - Panel 1

The table below describes the options of the first panel of the Java Load Wizard.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Who owns the Java Object?</strong></td>
<td>Lets you select the owner of the Java object.</td>
</tr>
<tr>
<td><strong>Select files to be loaded</strong></td>
<td>Select a file, and then click <strong>Add</strong>.</td>
</tr>
</tbody>
</table>

### Java Load Wizard - Panel 2

The table below describes the options of the second panel of the Java Load Wizard.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>When do you want the Java files to be resolved?</strong></td>
<td>Lets you specify when the source file is loaded as a source schema object, the source file is compiled, class schema objects are created for each class defined in the compiled .java file, and the compiled code is stored in the class schema objects.</td>
</tr>
<tr>
<td><strong>Select the Encoding Options</strong></td>
<td>Lets you specify the encoding of the .java file.</td>
</tr>
<tr>
<td><strong>Grant Access to the following users</strong></td>
<td>Lets you select one or more users.</td>
</tr>
</tbody>
</table>

### Java Load Wizard - Panel 3

The table below describes the options of the third panel of the Java Load Wizard.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Other Load Options</td>
<td>OPTIONAL: Lets you select options.</td>
</tr>
<tr>
<td>Add Resolver Options</td>
<td>Lets you specify the objects to search within the schemas defined.  <strong>Add</strong> - Click to open the <strong>Select a Resolver Option</strong> dialog to add a new resolver option in the list.  <strong>Edit</strong> - Click to open the <strong>Resolver Edit</strong> dialog to modify a resolver option.  <strong>Remove</strong> - Select one or more resolver option and click to delete.</td>
</tr>
</tbody>
</table>
Lock

The Lock Table dialog lets you lock tables to prevent other users from reading or updating the table data. Locking a table saves the time of locking each row of the table that needs to be updated. Lock mode options preventing other users from viewing or modifying table data, or allowing other users to view but not modify table data. Locks are released at the end of a transaction.

Platform Availability

- DB2 LUW

To Lock a Table

1. Initiate a Lock action against one or more tables. For more information see Initiating an object operation.

The Lock Table dialog opens.

2. Select a Lock Mode option:
   - Share - Lets other users view but not modify the table data.
   - Exclusive - Prevents other users from viewing or modifying the table data.

3. Click Execute. For information on the scheduling option, see Scheduling.
Lower High Water Mark

Against automatically-managed tablespaces, this action lets you build and submit an ALTER TABLESPACE... REDUCE statement, specifying that existing containers be reduced by a specified size.

Against database-managed tablespaces, you build and submit an ALTER TABLESPACE... LOWER HIGH WATER MARK statement followed by an ALTER TABLESPACE... REDUCE statement, explicitly lowering the high water mark before reducing the size of the tablespace.

Note: Before using this object action, consult DB2 LUW documentation for information on automatic and non-automatic storage, storage reclaimability, as well as database versus system-managed tablespaces. For more information, see Accessing Third Party Documentation.

Platform Availability

- DB2 LUW 9.7

To Lower the High Water Mark for a Tablespace

1. Initiate a Lower High Water Mark action against a tablespace. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and choosing options in the Lower High Water Mark dialog:
Against automatically-managed tablespaces, this pane lets you provide the REDUCE option value for the generated ALTER TABLESPACE statement. Two options are provided. Selecting MAX specifies that the high water mark be lowered by moving the maximum number of extents to the beginning of the tablespace. Specifying a Size and Unit specifies the numeric value by which the tablespace is to be reduced through extent movement. Against database-managed tablespaces, this pane only allows you to specify that All Containers are to be decreased by a specified Size (in Pages, KB, MB, or GB Units). If you want to specify individual containers, use the Containers panel.

This tab is only available for database-managed tablespaces. As well, the functionality provided depends on whether you selected the All Containers option on the Action Options pane. With All Containers selected, this panel lets you specify an ON DBPRATITI O NNUM clause on the ALTER TABLESPACE... REDUCE statement generated, specifying partitions for the container operations. Click the Partitions button, select one or more partitions on the Select Partitions dialog, and click OK. With All Containers deselected, this panel lets you specify an ON DBPRATITI O NNUM clause and also lets you specify a database container clause on the ALTER TABLESPACE... REDUCE statement generated. For each container to be included in the database container clause, click the Add Container button, select a container from the dropdown, and select a Size and Unit (Pages, KB, MB, or GB) for the container.

Displays the DDL generated to execute the operation. For more information, see Preview.

3. Execute or Schedule the action.
Manage ASM Connection

For working against ASM disk groups, DBArtisan lets you toggle the login between the general datasource and a specific connection to the associated ASM instance.

Note: When registering an Oracle datasource that has an ASM instance, you can use the Connect as control to specify the SYSASM privilege. This give you full administrative privilege for the ASM instance. For details, see Registering Datasources.

You can create or edit disk groups using the basic datasource connection. For information on object actions that require you to connect directly to the ASM instance, see the following topics:

- Check Disk Group
- Mount Disk Group
- Rebalance Disk Group
- Undrop Disk

The Manage ASM Connection action lets you toggle between the two connection types.

Platform Availability

- ORCL 10g

To Toggle the Login Between the Datasource and the Specific ASM Instance

1. On a connected Oracle datasource, expand the Instance and ASM node.

2. Right-click the Disk Groups or ASM node and select Manage ASM Connection from the context menu. A Manage ASM Instance Connection dialog opens, prompting you to choose a connection type. Take one of the following actions:

   - To connect directly to the ASM instance, deselect the Use existing connection to DB instance check box, provide the connection details and logon credentials.
   - To use the default connection to the associated datasource, select the Use existing connection to DB instance check box.

3. Click OK.

Note: The Manage ASM Instance Connection dialog also opens automatically on the first object action against a disk group after connecting to an Oracle datasource.

When connected to the ASM instance you can revert to the default datasource connection with a single step. For details, see Disconnect ASM Connection.
Merge Copy

The Merge Copy function makes a merged copy of the data sets within a table space. You can merge incremental copies of a tablespace to make one incremental copy, or you can merge incremental copies with a full image copy to make a new full image copy.

Platform Availability

- **DB2 z/OS**

To Create a Merge Copy

1. On the Datasource Navigator/Explorer, expand the Tablespaces node. DBArtisan displays the Tablespaces.

2. Right-click the target tablespace and select MergeCopy from the context menu. DBArtisan opens the **MERGECOPY Utility** wizard.

3. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Do you want the utility to be restartable? Yes or No</td>
</tr>
<tr>
<td></td>
<td>Tape Stacking Properties Yes or no. When you select Yes, you can then set the dataset Properties.</td>
</tr>
<tr>
<td></td>
<td>Do you want to merge all incremental copies with the full image copy to make a new full image copy? Self-evident</td>
</tr>
<tr>
<td></td>
<td>WorkDDN Here you are setting the dataset information for the working data definition name.</td>
</tr>
<tr>
<td>2</td>
<td>Select tablespaces Lets you work with the list of tablespaces.</td>
</tr>
</tbody>
</table>

4. When ready, click **Finish**.
Migrate

Right-clicking one or more objects and selecting Migrate from the context menu opens the Migration Wizard, letting you migrate an object definition to another supported DBMS. For information on using the wizard, see Using the Schema Migration Wizard.
Mirror

The **Mirror** object action lets you build and submit a DISK MIRROR command, creating a mirror that immediately takes over when the primary device fails.

**Platform Availability**

- **SYB ASE**

**To Create a Database Device Mirror**

1. Initiate a **Mirror** action against a database device. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the **Mirror** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td>Displays the database device you selected and lets you work with the following settings:</td>
</tr>
<tr>
<td><strong>Mirror Name</strong></td>
<td>Lets you specify the full path name of the database mirror device that is to be the secondary device.</td>
</tr>
<tr>
<td><strong>Serial Writes</strong></td>
<td>Lets you specify whether serial writes to the devices are enforced</td>
</tr>
<tr>
<td><strong>Contiguous</strong> (VM S only)</td>
<td>If the mirror is a file rather than a device, this option forces the file to be created contiguously.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Displays the DDL that will execute the object action. For details, see Preview/.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Modify Recovery

The Modify Recovery Wizard lets you delete records from SYSIBM.SYSCOPY, related log records from SYSIBM.SYSLGRNX, and entries from the DBD. You can delete records based on a specific age or based on the date the record was written.

You should run the wizard regularly to clear outdated information from SYSIBM.SYSCOPY and SYSIBM.SYSLGRNX. These tables, and particularly SYSIBM.SYSLGRNX, can become very large and take up considerable amounts of space. By deleting outdated information from these tables, performance for processes that access data from these tables can be improved.

Platform Availability

- DB2 z/OS

To Run the Modify Recovery Utility

1. Initiate a Modify Recovery action against a tablespace. For more information see Initiating an object operation.
2. Use the following table as a guide to understanding and modifying settings in the Modify Recovery Utility wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>Select tablespaces</strong>&lt;br&gt;<strong>Add</strong>&lt;br&gt;<strong>Delete</strong>&lt;br&gt;Displays the available tablespaces.&lt;br&gt;Opens the Object Selector Dialog Box.&lt;br&gt;Deletes the selected items.</td>
</tr>
<tr>
<td>2</td>
<td><strong>Delete history record(s) by Age</strong>&lt;br&gt;<strong>Days</strong> between 1 and 32767.&lt;br&gt;<strong>Date</strong> lets you delete all records written before a specified Date in eight digit format yyyyymmdd (e.g. 20000218).</td>
</tr>
</tbody>
</table>

3. When ready, click Finish.
Modify Statistics

The Modify Statistics Wizard lets you delete unwanted statistics history records from the statistics catalog tables. You can delete statistics history records that were written before a specific date, or records of a specific age. You can delete the records for an entire tablespace, index space, or index.

You should run the wizard regularly to clear outdated information from the statistics history catalog tables. Deleting outdated information from the statistics history catalog tables, improves the performance of processes that access data from those tables.

Platform Availability

- DB2 z/OS

To Run the Modify Statistics Utility

1. Initiate a Modify Statistics action against a tablespace. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Modify Statistics wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select tablespaces</td>
</tr>
<tr>
<td>Add</td>
<td>Displays the available tablespaces.</td>
</tr>
<tr>
<td>Delete</td>
<td>Opens the Object Selector Dialog Box.</td>
</tr>
<tr>
<td>Delete</td>
<td>Deletes the selected items.</td>
</tr>
<tr>
<td>2</td>
<td>Select indexes</td>
</tr>
<tr>
<td>Add</td>
<td>Displays the available indexes.</td>
</tr>
<tr>
<td>Delete</td>
<td>Opens the Index Selector Dialog Box.</td>
</tr>
<tr>
<td>Delete</td>
<td>Deletes the selected items.</td>
</tr>
<tr>
<td>3</td>
<td>Select indexspaces</td>
</tr>
<tr>
<td>Add</td>
<td>Displays the available indexspaces.</td>
</tr>
<tr>
<td>Delete</td>
<td>Opens the Indexspaces Selector dialog.</td>
</tr>
<tr>
<td>Delete</td>
<td>Deletes the selected items.</td>
</tr>
<tr>
<td>4</td>
<td>Delete history record(s) by Age</td>
</tr>
<tr>
<td>Delete options</td>
<td>Lets you choose among Delete All statistics rows, Delete Access path statistics rows, and Delete Space tuning statistics rows options</td>
</tr>
<tr>
<td>Date</td>
<td>specifies a Number of Days between 1 and 32767.</td>
</tr>
<tr>
<td>Date</td>
<td>Lets you delete all records written before a specified Date in eight digit format yyyymmdd (e.g. 20000218).</td>
</tr>
</tbody>
</table>

3. When ready, click Finish.
**Mount Disk Group**

This action builds and submits an ALTER DISKGROUP... MOUNT or ALTER DISKGROUP... DISMOUNT FORCE/NO FORCE statement. This lets you manually make disk groups available or unavailable to all database instances running on the same node.

**Note:** Before this object action is available you must have a direct connection to the ASM instance. For details, see Manage ASM Connection.

**Platform Availability**
- ORCL 10g

**To Mount or Dismount a Disk Group**

1. On a connected Oracle datasource, expand the Instance and ASM nodes.
2. Right-click the Disk Groups node and select Mount Disk Group from the context menu.
3. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>All - Selected, an ALTER DISKGROUP ALL... statement is generated, letting you the mount or dismount operation to occur in all disk groups. Dismount - select this check box to make the disk group unavailable. Deselect this check box to have the disk group mounted. Force - only available with Dismount selected. If Force is selected, ASM will dismount the disks even if some files in the disk group are open. If deselected, a NOFORCE option is used. Restricted (available as of Oracle 11GR1) - When selected, a RESTRICTED clause is included in the generated ALTER DISKGROUP statement, mounting the disk in single-instance exclusive mode, making the disk group unusable by any ASM client. When unselected, a NORMAL clause is included in the generated ALTER DISKGROUP statement, mounting the disk group in shared mode, and other ASM instances and clients can access the disk group.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

4. Click **Execute**. For information on the scheduling option, see Scheduling.
Move Log

You can move a transaction log from one device to another.

Platform Availability

- SYB ASE

To Move a Database Transaction Log to Another Device

1. Initiate a Move Log action against one or more databases. For more information see Initiating an object operation.

The Move Log dialog opens.

2. From the New Device dropdown, select the defined device to which you want to move the transaction log.

3. Click Execute. For information on the scheduling option, see Scheduling.
Move Table

The **Move Table** action lets you move data in an active table into a new, identically-named table, leaving the data online and available for use. This action lets you build and submit one or more SYSPROC.ADMIN_MOVE_TABLE calls. A single call, corresponding to the MOVE command, lets you execute all move operations in a single step. Multiple calls correspond to use of the INIT, COPY, REPLAY, VERIFY, SWAP, CLEANUP or CANCEL commands, and let you execute the move operations in individual steps.

**Note:** Before using this object action, consult DB2 LUW documentation for information on the ADMIN_MOVE_TABLE procedure, specifically the options and parameters used by the procedure. For more information, see [Accessing Third Party Documentation](#).

**Platform Availability**

- DB2 LUW 9.7

To move table data

1. Initiate a **Move Table** action against a table. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and choosing options the options in the dialog:

<table>
<thead>
<tr>
<th>Pane</th>
<th>Categories and Option Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action</strong></td>
<td>Method</td>
</tr>
<tr>
<td>Options</td>
<td>The <strong>Use Target Table</strong> option lets you select from the two methods available with use of the ADMIN_MOVE_TABLE procedure. Select the <strong>Use Target Table</strong> check box if you have already created the target table, and are using this action to move the data to that table. Leave the <strong>Use Target Table</strong> check box unselected to specify tablespaces used by the new table and have this action create the table before moving data to the new table.</td>
</tr>
<tr>
<td></td>
<td><strong>Tablespace</strong></td>
</tr>
<tr>
<td></td>
<td>These options are only available with the <strong>Use Target Table</strong> check box deselected. They let you optionally specify new data, index, and LOB tablespaces for the target table.</td>
</tr>
<tr>
<td></td>
<td><strong>Target Table</strong></td>
</tr>
<tr>
<td></td>
<td>This option is only available with the <strong>Use Target Table</strong> check box selected. It lets you specify an existing table to be used as the target table during the move.</td>
</tr>
<tr>
<td></td>
<td><strong>Operations</strong></td>
</tr>
<tr>
<td></td>
<td>The <strong>Generate...</strong> options correspond to the ADMIN_MOVE_TABLE Operation input parameters. These can be used in one of two mutually exclusive ways. You can generate a single ADMIN_MOVE_TABLE call specifying MOVE to have all operations performed at one time. Alternatively, you can generate one or more ADMIN_MOVE_TABLE calls corresponding to each of the selected INIT, COPY, REPLAY, VERIFY, SWAP, CLEANUP, or CANCEL options, to have the table moved one step at a time.</td>
</tr>
</tbody>
</table>
Move Table

MOVE, INIT, COPY, REPLAY, VERIFY, SWAP, CLEANUP, and CANCEL Options

A set of options is displayed for each selected Generate... option. Depending on the Generate... selection, KEEP, COPY_USE_LOAD, COPY_WITH_INDEXES, FORCE, NO_STATS, COPY_STATS, NO_AUTO_REVAL, REORG, NO_TARGET_LOCKSIZE, CLUSTER, NON_CLUSTER, and LOAD_MSGPATH options may be available. Keep in mind that CLUSTER and NON_CLUSTER options are mutually exclusive and that LOAD_MSGPATH is only available when COPY_USE_LOAD is selected.

Preview Displays the DDL generated to execute the operation. For more information, see Preview.

3. Click the Execute or Schedule button.
Next Used Filegroup

This action builds and submits an ALTER PARTITION SCHEME... NEXT USED statement, letting you alter the designated NEXT USED filegroup for a partition scheme.

Platform Availability

- SQL SVR

To Change a Partition Scheme’s Next Used Filegroup

1. Initiate a Next Used Filegroup action against a partition scheme. For more information, see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Next Used</td>
<td>Select the new filegroup from the Filegroup Name dropdown.</td>
</tr>
<tr>
<td>Filegroup</td>
<td></td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Object Properties

This action submits a `sp_iqhelp` procedure call against a selected object of one of the following types:

- Domains
- Events
- Functions
- Procedures
- System Tables
- Tables
- Views

Standard `sp_iqhelp` output, providing information about the object, is opened in a Results Editor.

Platform Availability

- SYB IQ

To display `sp_iqhelp` information for an object

1. Initiate an Object Properties action against an object of one of the types in the table above. For more information see Initiating an object operation.

The output opens in a Results Editor.
Open (Logs and Error logs)

This action displays the contents of error logs or SQL Server Agent-specific log files.

Platform Availability

- SQL SVR

To display the contents of a log file

1. In the Navigator/Explorer, expand the Server node and if opening a SQL Server Agent log, expand the SQL Server Agent node.

2. In the Navigator/Explorer, select the Logs or Error Logs node.

3. In the Navigator/Explorer, right click an ierror log or log and select Open from the context menu.

The contents of the file are displayed in the right-hand pane.
## Open Control Files

The control file contains information about the associated database that is required for the database to be accessed by an instance, both at startup and during normal operation.

**Note:** Only the Oracle database server can modify a control file's information; no user can edit a database's control file directly.

The **Control File Information** dialog lets you view statistics (**Type**, **Record Size**, **Records Total**, **Records Used**, **First Index**, **Last Index**, and **Last Recid**) on the following control file entries:

<table>
<thead>
<tr>
<th>ACM OPERATION</th>
<th>ARCHIVED LOG</th>
<th>BACKUP CORRUPTION</th>
<th>BACKUP DATAFILE</th>
<th>BACKUP PIECE</th>
</tr>
</thead>
<tbody>
<tr>
<td>BACKUP SET</td>
<td>BACKUP REDO LOG</td>
<td>BACKUP SPFILE</td>
<td>CKPT PROGRESS</td>
<td>COPY CORRUPTION</td>
</tr>
<tr>
<td>DATABASE</td>
<td>DATABASE BLOCK CORRUPTION</td>
<td>DATABASE INCARNATION</td>
<td>DATAFILE</td>
<td>DATAFILE COPY</td>
</tr>
<tr>
<td>DATAFILE HISTORY</td>
<td>DELETED OBJECT</td>
<td>FILENAME</td>
<td>FLASHBACK LOG</td>
<td>FOREIGN ARCHIVED LOG</td>
</tr>
<tr>
<td>GUARANTEED RESTORE POINT</td>
<td>INSTANCE SPACE RESERVATION</td>
<td>LOG HISTORY</td>
<td>MTTR</td>
<td>OFFLINE RANGE</td>
</tr>
<tr>
<td>PROXY COPY</td>
<td>RECOVERY DESTINATION</td>
<td>REDO LOG</td>
<td>REDO THREAD</td>
<td>REMOVABLE RECOVERY FILES</td>
</tr>
<tr>
<td>RESTORE POINT</td>
<td>RMAN CONFIGURATION</td>
<td>RMAN STATUS</td>
<td>STANDBY DATABASE MATRIX</td>
<td>TABLESPACE</td>
</tr>
<tr>
<td>TEMPORARY FILENAME</td>
<td>THREAD INSTANCE NAME MAPPING</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Platform Availability
- ORCL

### To View the Control File for a Database

1. On the Navigator/Explorer, under **Storage** expand the Control Files node.

DBArtisan displays the Control Files.

2. In the right pane of the application, right-click a control file, and then select **Open**.

DBArtisan opens the **Control File Information** dialog.
Optimize Tables

You can issue an OPTIMIZE TABLE statement, reclaiming unused space and defragmenting the data file.

Platform Availability

- MySQL

To Optimize Table Storage

1. Initiate an Optimize Tables action against one or more tables. For more information see Initiating an object operation.

The Optimize Tables dialog opens.

2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Lets you review the tables you selected.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Place

The Placement dialog lets you place tables and indexes on different segments. From a performance standpoint it is not recommended to have a table and its supporting indexes on the same device or disk segment. It is also good to have more frequently accessed indexes and tables grouped together on higher speed devices, if possible.

Platform Availability

- SYB ASE

To Place an Index or Table on a Segment

1. Initiate a Place action against one or more tables or indexes. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Place wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Use the Segment dropdown to specify the segment on which you can place objects, the default, logsegment or system.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For more information, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Population status

This action builds and submits an ALTER FULLTEXT INDEX statement with a START {FULL|INCREMENTAL|UPDATE} POPULATION or STOP | PAUSE | RESUME POPULATION argument, letting you start, stop, pause or resume population of the full-text index.

**Note:** Before using this action, consult Microsoft SQL Server documentation for detailed information on topics such as timestamp column restrictions on the INCREMENTAL option and the interaction of these options with the background update index and auto change tracking features. For more information, see [Accessing Third Party Documentation](#).

Platform Availability

- SQL SVR

**To Control Population of a Full-text Index**

1. Initiate a Population Status action against one or more full-text indexes. For more information, see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td>Select an option from the Action dropdown: START FULL - every row of the table is retrieved for full-text indexing, even rows that have already been indexed. START INCREMENTAL - only the rows modified since the last population are retrieved. This option only works properly against tables with a timestamp column. START UPDATE - only insertions, updates, or deletions processed since the last change-tracking index update. Change-tracking population must be enabled on the table, but the background update index or the auto change tracking should be disabled. STOP - stops a paused population or population in progress. PAUSE - pauses a FULL population in progress RESUME - resumes a paused FULL population.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Preview the DDL generated for the operation. For more information, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see [Scheduling](#).
Purge Recycle Bin

This action builds and submits a PURGE RECYCLEBIN, PURGE DBA_RECYCLEBIN, PURGE TABLESPACE tablespacename, or PURGE TABLESPACE tablespacename USER username statement. This lets you select one of the following purge Recycle Bin options:

- Purge all objects belonging to the current user
- Purge all objects belonging to all users
- Purge all objects residing on a specified tablespace
- Purge all objects residing on a specified tablespace and belonging to a specified user

Platform Availability

- ORCL 10g ^

To Purge Objects in the Recycle Bin Tables and Associated Objects

1. In DBArtisan, expand the Schema node, right-click the Recycle Bin node and select Purge Recycle Bin from the context menu.

2. Use the following table as a guide to understanding and modifying settings on the Confirm Purge Recycle Bin wizard:

<table>
<thead>
<tr>
<th>Panel</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Purge Options</td>
</tr>
<tr>
<td></td>
<td>Select a PURGE option type: RECYCLEBIN purges all objects belonging to the current user. DBA_RECYCLEBIN purges objects system wide. TABLESPACE purges objects residing on a specific tablespace.</td>
</tr>
<tr>
<td></td>
<td>Tablespace</td>
</tr>
<tr>
<td></td>
<td>If you selected a Purge value of TABLESPACE, select the tablespace for which all residing objects will be purged. Optionally, use the User control to further qualify the objects that will be purged.</td>
</tr>
<tr>
<td></td>
<td>User</td>
</tr>
<tr>
<td></td>
<td>If you selected a Purge value of TABLESPACE, you can use this control to restrict purging to only those tablespace-residing objects belonging to a particular user.</td>
</tr>
<tr>
<td></td>
<td>Preview</td>
</tr>
<tr>
<td></td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.

Topics

- Recycle Bin (for a support summary including topics such as displaying Recycle Bin contents)
- Enable Recycle Bin
- Flashback Recycle Bin Entry
Purge Recycle Bin

- Purge Recycle Bin Entry
Purge Recycle Bin Entry

This action builds and submits a PURGE INDEX or PURGE TABLE statement, letting you permanently delete tables or indexes from the Oracle Recycle Bin. Once purged, the tables or indexes and any associated objects that were contained in the Recycle Bin are no longer retrievable.

Note: The Datasource Navigator/Explorer entry for a Recycle Bin entry has a Can Purge field that indicates whether a Purge Recycle Bin Entry action can be performed against the item.

Platform Availability

- ORCL 10g

To Permanently Purge Selected Tables or Indexes Currently in the Recycle Bin

1. In the DBArtisan Datasource Navigator/Explorer, under an Oracle Schema node, select the Recycle Bin node. Contents of the Recycle Bin are displayed.

2. Right-click one or more selected tables or indexes in the Recycle Bin and select Purge Recycle Bin Entry from the context menu. The Confirm Purge Recycle Bin Entry dialog opens.

3. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Displays the table and index entries you selected to purge.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

4. Click Execute. For information on the scheduling option, see Scheduling.

Note: When dropping tables on a datasource with the Recycle Bin feature enabled, the Drop action has an option that lets you immediately purge the table.

Topics

- Recycle Bin
- Enable Recycle Bin
- Flashback Recycle Bin Entry
- Purge Recycle Bin
Quiesce

You can quiesce at the instance or database level. For details, see the following topics:

- Quiesce (Database)
- Quiesce (Instance)

Quiesce (Database)

This action lets you restrict user access to a database.

Platform Availability

- DB2 LUW

Note: Quiesce Database is not supported for a DB2 8 server from an IBM DB2 for Linux, Unix, and Windows client or for an IBM DB2 for Linux, Unix, and Windows 7 server from an IBM DB2 for Linux, Unix, and Windows client.

To Quiesce a Database

1. On the Navigator/Explorer, right-click a datasource node and select Command > Quiesce from the context menu. Provide login credentials if prompted.

2. Use the following table as a guide to understanding and modifying settings on the Quiesce Database dialog:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connections</td>
<td>Lets you select an Immediate quiesce or Defer.</td>
</tr>
</tbody>
</table>

3. Click Execute.

Quiesce (Instance)

This action lets you restrict user access to an instance.

Platform Availability

- DB2 LUW

To Quiesce an Instance

1. On the Navigator/Explorer, right-click the Instance node.

2. Select Command > Quiesce from the context menu. Provide login credentials if prompted.
3. Use the following table as a guide to understanding and modifying settings on the **Quiesce Instance** dialog:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>For user</strong></td>
<td>Select this radio button to restrict a user and then type the user name in the associated box.</td>
</tr>
<tr>
<td><strong>For group</strong></td>
<td>Select this radio button to restrict a group and then type the group name in the associated box.</td>
</tr>
</tbody>
</table>

**Connections** Lets you select an **Immediate** quiesce or **Defer**.

4. Click **Execute**.

**Topics**

- **Unquiesce**
Quiesce Tablespaces

The Quiesce Tablespaces action lets you build and submit a call to the online QUIESCE utility with a TABLESPACES option, establishing a quiesce point on a table space.

Platform Availability

- DB2 z/OS

To Quiesce a Tablespace

1. On the Datasource Explorer, select the Tablespaces node or in the Datasource Navigator expand the node.

DBArtisan displays the Tablespaces.

2. Right-click one or more selected table spaces, and then select Quiesce Tablespaces from the context menu.

DBArtisan opens the Quiesce Utility Wizard dialog.

3. Optionally, deselect Write To Disk so that changed pages are not written to disk.

4. Click Finish.

Topics

- Recover
Reassign By Category

This action lets you reassign the category of stored outlines in Oracle.

Outlines are a set of results for the execution plan generation of a particular SQL statement. When you create an outline, plan stability examines the optimization results using the same data used to generate the execution plan. That is, Oracle uses the input to the execution plan to generate an outline, and not the execution plan itself.

Platform Availability

- **ORCL**

To Reassign a Stored Outline to a Different Category

1. Initiate a **Reassign By Category** action against one or more stored outlines. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the **Reassign By Category** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Displays the outlines you selected. Select a new category for the outline or outlines from the <strong>Category</strong> dropdown.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).

Topics

- [Change Category](#)
- [Drop By Category](#)
Rebalance

This action lets you build and submit one or more ALTER TABLESPACE... REBALANCE statements. This creates containers on recently added storage paths and drops containers from storage paths that are in DROP PENDING state.

Platform Availability

- DB2 LUW 9.7

Prerequisites or Setup Tasks

This object action is only available for tablespaces that meet the following criteria:

- The tablespace must use automatic storage. That is, in the Tablespace Editor, the Use Automatic Storage property is selected. For more information see Tablespaces Editor (IBM DB2 LUW).
- In the Tablespace Editor, the Type property specifies LARGE or REGULAR.

To rebalance a tablespace

1. Initiate a Rebalance action against one or more tablespaces.
2. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Displays the tablespaces selected for this operation.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.

Topics

- Drop Automatic Storage Path(s)
Rebalance Disk Group

This action builds and submits an ALTER DISKGROUP... REBALANCE statement with an optional POWER option. This lets you manually rebalance the disk group, distributing datafiles evenly across drives.

**Note:** Before this object action is available you must have a direct connection to the ASM instance. For details, see [Manage ASM Connection](#).

**Platform Availability**
- **ORCL** 10g

**To Manually Rebalance a Disk Group**
1. On a connected Oracle datasource, expand the **Instance** and **ASM** nodes.
2. Right-click the **Disk Groups** node and select **Rebalance Disk Group** from the context menu.
3. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td><strong>Power</strong> - If deselected, ASM executes rebalance operations at the power rate set by the ASM_POWER_LIMIT initialization parameter. If selected, you can specify the power rate using the <strong>Power value</strong> control. <strong>Power value</strong> - If <strong>Power</strong> is selected, specify a value between 0 and 11. A 0 value stops the rebalance operation and at the other extreme, 11 lets ASM execute the rebalance as quickly as possible. <strong>Wait</strong> (available as of Oracle 11GR1) - Lets you specify a WAIT/NOWAIT clause, letting you specify when during the rebalance that control is returned to the user.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see <a href="#">Dependencies</a>.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>

4. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Rebind Packages

The Rebind Package dialog lets you update the best access path for SQL statements when the contents of a package changes.

Tip: If the physical storage of a package is changed or dropped, rebinding updates the path of the SQL statements.

Platform Availability

- DB2 LUW, DB2 z/OS

To Rebind One or More Packages

1. Initiate a Rebind Packages action against one or more packages. For more information see Initiating an object operation.

The Rebinding Package dialog opens.

2. Click Execute. For information on the scheduling option, see Scheduling.
Rebind Plans

This action lets you update the best access path for SQL statements when the contents of a plan change.

Tip: If the physical storage of a plan is changed or dropped, rebinding updates the path of the SQL statements.

Platform Availability

- **DB2 z/OS**

To Rebind a Plan

- In DBArtisan, click the **Rebind** button on the **Plans** tab of the DBRM's editor. For more information, see [DBRM's Editor (IBM DB2 z/OS)](#).

- In DBArtisan, click the **Rebind** button on the **Plans/Packlists** tab of the Packages editor. For more information, see [Packages Editor (IBM DB2 z/OS)](#).
Rebuild (Full-text Catalogs)

This action builds and submits a basic ALTER FULLTEXT CATALOG catalogname REBUILD statement, with no additional options or arguments. This lets you rebuild the entire catalog by deleting the existing catalog and building a new one.

Platform Availability
- SQL SVR

To Rebuild a Full-text Catalog

1. Initiate a Rebuild action against one or more full-text catalogs. For more information, see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Displays the catalogs you selected.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lets you review the objects potentially impacted by this action. For more information, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Rebuild Index

See the following topics for DBMS-specific instructions on rebuilding indexes:

- Rebuild Index (DB2 z/OS)
- Rebuild Index (Oracle)
- Rebuild Index (SQL Server)

Rebuild Index (DB2 z/OS)

The Rebuild Index Wizard reconstructs indexes from the table that they reference.

To Rebuild One or More Indexes

1. On the Datasource Explorer, select the **Indexes** node or in the Datasource Navigator expand the node.

2. Right-click the target index select **Rebuild Index** from the context menu.

The **Rebuild Index Utility** wizard opens.

3. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Panel</th>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select Indexes</td>
<td>Lets you select an index to rebuild.</td>
</tr>
<tr>
<td></td>
<td>Add</td>
<td>For more information, see <strong>Index Selector Dialog Box</strong>.</td>
</tr>
<tr>
<td></td>
<td>Delete</td>
<td>Deletes the selected index(es).</td>
</tr>
<tr>
<td>2</td>
<td>Select tablespaces</td>
<td>Lets you select the target tablespace.</td>
</tr>
<tr>
<td></td>
<td>Add</td>
<td>For more information, see <strong>Table Selector Dialog Box</strong>.</td>
</tr>
<tr>
<td></td>
<td>Delete</td>
<td>Deletes the selected items.</td>
</tr>
<tr>
<td>3</td>
<td>Do you want the utility to be restartable?</td>
<td>Select to make the utility restartable.</td>
</tr>
<tr>
<td></td>
<td>Do you want to reuse the db2 managed dataset?</td>
<td>Default is No.</td>
</tr>
<tr>
<td></td>
<td>WorkDDN</td>
<td>Lets you select a work ddn template from the list or click Edit to specify the dataset information.</td>
</tr>
</tbody>
</table>
Rebuild Index

Do you want to specify to sort device type?  Default is No.

Do you want to specify the sort number?  Default is No.

Do you want to specify the sort keys?  Default is No.

Do you want to specify the stats online?  Lets you specify the stats online.

Do you want to output message to SYSPrint?  The default is no.

Do you want to specify the correlation stats option?  Lets you specify correlation stats on the next panel of the wizard.

Do you want to force aggregation or rollup processing to be done even though some parts do not contain data?  The default is Default.

KeyCard  Collects all of the distinct values in all of the 1 to n key column combinations for the specified indexes. n is the number of columns in the index.

Frequent Item  Lets you add items to the grid.

Add  For more information, see Add Frequent Item Dialog Box.

Update Statistics  Lets you specify update statistics.

History Statistics  Lets you specify history statistics.

Rebuild Index (Oracle)

The Rebuild Indexes dialog lets you rebuild an index that has become fragmented. Rebuilding an index is a good alternative to coalescing an index because you can move the index to a different tablespace and change both tablespace and storage parameters while eliminating fragmentation. However, rebuilding an index has a higher cost than coalescing an index. These same qualities also make rebuilding an index a viable alternative to dropping an index then re-creating it.

As a rule of thumb, check indexes for rebuilds when their level (or tree depth) reaches four or greater, or many deleted leaf rows are found. The Rebuild Indexes dialog can also be used to easily move an index from one tablespace to another.

Important Notes
  - If you are rebuilding a function-based index, the index is enabled when the rebuild is finished.
You cannot rebuild a partitioned index. You must rebuild each partition or subpartition individually.

The table below describes the options and functionality on the Rebuild dialog.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Tablespace</td>
<td>Defaults to the tablespace which currently includes the index. To change the tablespace containing the index, choose a new tablespace from the list.</td>
</tr>
<tr>
<td>Logging</td>
<td>Recoverable - The creation of the index logs in the redo log file. Non-Recoverable - The creation of the index is not logged in the redo log file.</td>
</tr>
<tr>
<td>Use Parallel Processes</td>
<td>Performs processes for the sequential execution of a SQL statement in parallel using multiple parallel processes. One process, known as the parallel execution coordinator, dispatches the execution of a statement to several parallel execution servers and coordinates the results from all of the server processes to send the results back to the user. NOTE: Only available for Oracle with the Parallel Server option. NO PARALLEL execution - Select this if you are concerned that the cost of synchronizing parallel processes will impede the throughput of data.</td>
</tr>
<tr>
<td>Order</td>
<td>Reverse - Instructs Oracle to store the bytes of the index block in reverse order and to exclude the ROWID when rebuilding the index. No Reverse - Instructs Oracle to store the bytes of the index block in normal order when rebuilding the index.</td>
</tr>
</tbody>
</table>

To Rebuild an Oracle Index

1. Initiate a Rebuild action against one or more indexes. For more information see Initiating an object operation.

The Rebuild Indexes dialog opens.

2. To move the index to a new tablespace, click the New Tablespace list and then click the new tablespace.

3. In the Logging box, click:
   - The Recoverable option button to make the operation log in the redo file.
   - The Non-Recoverable option button if you do not want the operation logged in the redo file.

4. If you are using Parallel Server, select the Parallel Server check box and:
   - Type a value indicating the number of query server processes that should be used in the operation in the Degree box.
   - Type a value indicating how you want the parallel query partitioned between the Parallel Servers in the Instances box.

5. In the Order box:
Rebuild Index

- Click the **Reverse** option button to rebuild the index to store the bytes of the index block in reverse order.
- Click the **No Reverse** option button to rebuild the index to store the bytes of the index block in order.

6. Click **Execute**. For information on the scheduling option, see **Scheduling**.

Rebuild Index (SQL Server)

The **Rebuild Indexes** dialog lets you rebuild an entire index, primary key, or unique key or a single partition of those objects. Depending on your choice, a number of REBUILD WITH clause options are available.

To Rebuild an Index

1. Initiate a **Rebuild Index** action against one or more indexes, primary keys, or unique keys. For more information see **Initiating an object operation**.

2. Use the following table as a guide to understanding and modifying settings in the **Rebuild Index** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td>To rebuild a single partition, specify a <strong>Partition number</strong> and optionally, provide <strong>Sort in tempdb</strong> and <strong>MaxDOP</strong> property values used to create the REBUILD WITH clause. To rebuild the entire index, primary key, or unique key, DO NOT provide a <strong>Partition Number</strong>, and optionally, provide <strong>Pad Index</strong>, <strong>Sort in tempdb</strong>, <strong>Ignore Duplicate Key</strong>, <strong>Statistics no recompute</strong>, <strong>Online</strong>, <strong>Allow Row Locks</strong>, <strong>Allow Page Locks</strong>, <strong>MaxDOP</strong>, and <strong>Fill Factor</strong> property values used to create the REBUILD WITH clause. For more information on these properties, see <a href="IndexesWizard">Indexes Wizard (SQL Server)</a>.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Dependencies</th>
<th>Lets you review the objects potentially impacted by this action.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see **Scheduling**.
Rebuild Outlines

You can rebuild one or more stored outlines in a single operation.

Platform Availability

- ORCL

To Rebuild a Stored Outline

1. Initiate a Rebuild Outlines action against one or more stored outlines. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Rebuild Outlines dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Displays the stored outlines you selected.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lets you review the objects potentially impacted by this action.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Rebuild Table

This action builds and submits an ALTER TABLE statement with an ENGINE=InnoDB option.

Platform Availability

- MySQL

To Rebuild a Table

1. Initiate a Rebuild Table action against one or more tables. For more information, see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Rebuild Table dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td>Displays the tables you selected.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Lets you review the objects potentially impacted by this action. For more information, see Dependencies.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Recompile

You can recompile one or more tables. Recompilation causes each procedure and trigger that uses the target table to be recompiled the next time it runs.

The queries used by procedures and triggers are optimized only once, when they are compiled. As you add indexes or make other changes to your database that affect its statistics, your compiled procedures and triggers may lose efficiency. By recompiling the procedures and triggers that act on a table, you can optimize the queries for maximum efficiency.

**Platform Availability**

- SQL SVR, SYBASE

**To Recompile One or More Tables**

1. Initiate a **Recompile** action against one or more tables. For more information see [Initiating an object operation](#).

   The **Recompile Tables** dialog opens.

2. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
**Recover**

This action lets you build and submit a call to the RECOVER utility, recovers data to the current state or to a previous point.

**Platform Availability**

- **DB2 z/OS**

**To Recover Data to the Current State or to Some Previous State**

1. On the Datasource Explorer, select the Tablespaces or Indexes node or in the Datasource Navigator expand one of those nodes.

2. Right-click a tablespace or index and then select **Recover** from the context menu.

The **RECOVER Utility Wizard** dialog opens.

3. Complete the panels of the wizard and when complete click **Finish**.
Recover Abort

This action issues a RECOVER INDOUBT... ACTION ABORT command against an indoubt thread, cancelling the thread.

Platform Availability

- DB2 z/OS

To cancel an indoubt thread

1. In the Navigator/Explorer, expand the Performance node.
2. If using the Datasource Explorer select the Indoubt Threads node or if using the Datasource navigator expand that node.
3. Right click an indoubt thread and select Recover Abort from the context menu.
4. When prompted to verify, click Yes.

Topics

- Recover Commit
Recover Commit

This action issues a RECOVER INDOUBT... ACTION COMMIT command against an indoubt thread, committing the thread.

Platform Availability
- DB2 z/OS

To commit an indoubt thread
1. In the Datasource Navigator/Explorer, expand the Performance node.
2. If using the Datasoure Explorer select the Indoubt Threads node or if using the Datasource Navigator expand that node.
3. Right click an indoubt thread and select Recover Commit from the context menu.
4. When prompted to verify, click Yes.

Topics
- Recover Abort
Redistribute

DBArtisan lets you redistribute the data in a nodegroup. The Redistribute action implements the REDISTRIBUTE NODEGROUP and lets you specify UNIFORM, USING DISTFILE, USING TARGETMAP, -CONTINUE, or ROLLBACK parameters.

Platform Availability

- DB2 LUW

To Redistribute the Data in a Nodegroup

1. If using the Datasource Explorer select the Nodegroups node or if using the Datasource Navigator expand that node.

DBArtisan displays the nodegroups.

2. Select one or more nodegroups, right-click the selected objects, and then select Redistribute from the context menu.

DBArtisan opens the Redistribute Nodegroup dialog.

3. Select one of the following methods:
   - Uniform
   - Using Dist File (provide the distinct file name in the corresponding box)
   - Using Target Map (provide the target file name in the corresponding box)

4. Click Execute. For information on the scheduling option, see Scheduling.
Refit

Refit lets you refit a database device. If you are restoring a damaged master database, or have added devices since the last database or transaction log dump, then refit a device after reinitializing. Refitting a device ensures that the information in sysusages and sysdatabases is consistent with the information in sysdevices.

Platform Availability

- SYBASE

To Refit a Database Device

1. Initiate a Refit action against one or more database devices. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Refit wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Displays the database devices you selected for refitting.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Refresh Table

The Refresh Table dialog lets you reload materialized query tables that have been defined with refresh options.

Platform Availability

- DB2 LUW

To Reload a Materialized Query Table

1. Initiate a Refresh Table action against one or more materialized query tables. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings on the Refresh Materialized Query Table dialog:

<table>
<thead>
<tr>
<th>Pane</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Select an Online Option of ALLOW NO ACCESS, ALLOW READ ACCESS or ALLOW WRITE ACCESS. Enable or disable Query Optimization. Select an INCREMENTAL or NOT INCREMENTAL Refresh Option.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated by the options you chose. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.

For procedures on restoring a damaged master database, consult the Commands Reference Manual.
Refresh Materialized View

This action lets you build and submit a REFRESH MATERIALIZED VIEW statement, to replace the contents of a materialized view.

Platform Availability

PSTGRS

Note: This action is only available against views created with the Is Materialized control selected. For more information, see Views Wizard (PostgreSQL).

To replace the contents of a materialized view

1. Initiate an Refresh Materialized View action against a view. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action options</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If With No Data is selected, a WITH NO DATA clause is included in the generated DDL. No new data is generated and the materialized view will be in an unscannable state.</td>
<td></td>
</tr>
</tbody>
</table>

Dependencies Review the referring and referred objects that will be automatically resolved when you execute this operation. For details, see Dependencies.

Preview Displays the DDL that will execute the object action. For details, see Preview.

3. Finally, use the Execute button to create the object.

Topics

- Backup Certificate
Reinitialize

The reinitialize function allows you to keep a database device on the Sybase ASE server open while resetting the device to its state immediately after it was opened.

Platform Availability

- SYB ASE

To Reinitialize a Database Device

1. Initiate a Reinitialize action against a database device. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings on the Reinitialize dialog:

<table>
<thead>
<tr>
<th>Pane</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Displays the database device you selected to reinitialize.</td>
</tr>
<tr>
<td>Options</td>
<td></td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For more information, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated by the options you chose. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Rename

This action lets you rename an object. In general, all referenced or referring objects are updated to reflect the new name.

The following table outlines object type support for the operation for all supported DBMS:

- DB2 LUW
- DB2 z/OS
- ITB/FBD
- MySQL
- Oracle
- SQL Server
- Sybase ASE
The following table notes the exceptions and provides prerequisite tasks to be performed before renaming an object.
## Notes and restrictions on renaming

<table>
<thead>
<tr>
<th>DBMS</th>
<th>Microsoft SQL Server</th>
<th>IBM DB2 for OS/390 and z/OS</th>
<th>Sybase ASE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Microsoft SQL Server lets you rename a database if you own it.</td>
<td>You can rename a primary key if the underlying table has only one owner.</td>
<td>Before renaming a database, set it to single-user mode.</td>
</tr>
<tr>
<td></td>
<td>Before renaming a database, set it to single-user mode.</td>
<td>System indexes can not be renamed.</td>
<td>System indexes can not be renamed.</td>
</tr>
<tr>
<td></td>
<td>Microsoft SQL Server will not rename a table if it is referenced within the body of other objects that call it, such as tables, triggers or views. As a result, renaming a table can result in broken dependencies with other objects. Also, Microsoft SQL Server does not let you rename System Tables.</td>
<td>The rename operation does not rename the table if it is referenced within the body of other objects, such as tables, triggers or views, that call it. As a result, renaming a table can result in broken dependencies with other objects.</td>
<td>The rename operation does not rename the table if it is referenced within the body of other objects, such as tables, triggers or views, that call it. As a result, renaming a table can result in broken dependencies with other objects. The rename operation does not rename the view if it is referenced within the body of other objects, such as stored procedures, triggers or other views, that call it. As a result, renaming a view can result in broken dependencies with other objects. Databases with a Type of ARCHIVE or with the In-memory property selected cannot be renamed. For more information, see Databases (Sybase ASE) - Properties.</td>
</tr>
</tbody>
</table>

### To Rename an Object

1. Initiate a **Rename** action against a supported object (see the table above). For more information see [Initiating an object operation](#).  

2. Use the following table as a guide to understanding and modifying settings in the **Rename** dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rename</td>
<td>Name</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Review the referring and referred objects for which naming will be automatically resolved when you execute the renaming operation. For more information, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Reorganize /Reorg

Reorganize or Reorg options are offered against the following DBMS platform/object types:

- Reorganizing IBM DB2 for Linux, Unix, and Windows Objects
- Reorganizing Oracle Objects
- Reorganize (SQL Server indexes, primary keys, and unique keys)
- Reorganize (SQL Server Full-text Catalogs)
- Reorganize (Sybase ASE Indexes and Tables)
- Reorg Index (DB2 z/OS)
- Reorg (DB2 z/OS Tablespaces)

Reorganizing IBM DB2 for Linux, Unix, and Windows Objects

Reorganize Dialog Box (One Table)

The table below describes the options and functionality on the Reorganize dialog.
Reorganize /Reorg

Step | Description
--- | ---
**Action Options**  
- Choose a **Reorg Type** of table or all indexes of the table.
- Optionally, choose an **Index Schema** and specify an **Index name**.
- Enable or disable **Inplace Reorg** and if you enable, choose an **Inplace reorgmode** of Start, Stop, Pause, or Resume.
- Select an **Access mode** to control read and write access.
- Select an **Index reorgmode** to clean up empty pages, delete after cleaning up empty pages, or convert to a type 2 index.
- If you did not enable **Inplace Reorg**, select a **Tablespace**.
- Select a **Long Tablespace**.
- Enable or disable the following options: **Index scan**, **Reorglong field and LOB data**, **Reset Dictionary**, **No truncate table**, and **Reorganize all partitions**.

**Partitions**  
If you did not enable **Reorganize all partitions**, select the partitions to reorganize.

**Preview**  
Preview the DDL code generated from your choices. For more information, see [Preview](#).

Reorganize Dialog Box (Multiple Tables)

The table below describes the options and functionality on the **Reorganize** dialog.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Temporary Tablespace</strong></td>
<td>Associates a temporary tablespace with the table's tablespace. You can select another tablespace from the list.</td>
</tr>
</tbody>
</table>

Reorganize (SQL Server indexes, primary keys, and unique keys)

The **Reorganize Indexes** dialog lets you reorganize an entire index, primary key, or unique key or a single partition of that object. It also lets you specify a **LOB_COMPACTION** option.

**Note:** You cannot reorganize an index (primary key, or unique key) that has an **Allow Page Locks** property set to FALSE. For information on setting index properties, see [Indexes Editor (SQL Server)](#).

To reorganize an index

1. Initiate a **Reorganize** action against an index, primary key, or unique key. For more information see [Initiating an object operation](#).
The **Reorganize Index** wizard opens.

2. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td>To reorganize a single partition, specify a <strong>Partition number</strong> and optionally, specify <strong>Lob Compaction</strong> used to create the <code>REORGANIZE WITH</code> clause. To reorganize the entire index, primary key, or unique key, DO NOT provide a <strong>Partition Number</strong>, and optionally, specify <strong>Lob Compaction</strong> used to create the <code>REORGANIZE WITH</code> clause.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For more information, see <a href="#">Dependencies</a>.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Preview the DDL generated for the operation. For more information, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).

## Reorganizing Oracle Objects

The **Reorganize** dialog lets you reduce query processing time against tables.

### To Reorganize an Oracle Table

1. Initiate a **Reorganize** action against a table. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the **Reorganize** dialog:

<table>
<thead>
<tr>
<th>Panel</th>
<th>Group</th>
<th>Setting and description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td><strong>Reorganize method</strong></td>
<td><strong>Online</strong> - If selected, reorganization is carried out online, using <code>DBMS_REDEFINITION</code> procedures. <code>DBMS_REDEFINITION</code> is Oracle’s online table reorganization package and is available for Oracle 9i. During an online reorganization, the table can still be accessed using DML statements like <code>SELECT</code> and <code>UPDATE</code>. If this check box is unselected, reorganization is carried out using a series of simple <code>ALTER TABLE</code> statements. This method is intended for offline usage.</td>
</tr>
<tr>
<td></td>
<td><strong>Tablespace</strong></td>
<td>If you want to move the table(s) to a new tablespace, select the new tablespace from this list.</td>
</tr>
<tr>
<td></td>
<td><strong>Data Block Storage</strong></td>
<td>Type <code>ALTER TABLE</code> property values for the <strong>Percent Free</strong> (<code>PCTFREE</code> property), <strong>Percent Used</strong> (<code>PCTUSED</code> property), <strong>Initial Transactions</strong> (<code>INITTRANS</code> property), and <strong>Max Transactions</strong> (<code>MAXTRANS</code> property).</td>
</tr>
</tbody>
</table>
Reorganize /Reorg

**Extents**
Type an ALTER TABLE MOVE STORAGE property value for the Initial Extent (INITIAL) property. Type ALTER TABLE STORAGE property values for the Next Extent (NEXT property), Percent Increase (PCTINCREASE property), Minimum Extents (NEXT property), and Maximum Extents (MAXEXTENTS property).

**Freelists**
Use the Free Lists and BufferPool (DEFAULT, KEEP, RECYCLE) settings to provide values for the FREELISTS and BUFFER_POOL components of a STORAGE clause. Use the Free List Groups setting to provide a value for the FREELIST GROUPS component of a STORAGE clause.

**Parallel Query**
Use the Parallel Degree setting to provide a value for the DEGREE component of a PARALLEL clause. This specifies the number of servers used in processing operations.

**Physical**
Logging - When disabled, a NOLOGGING clause is added to the ALTER TABLE statement.

**Dependencies**
For details on using this tab, see Dependencies.

**Preview**
For details on using this tab, see Preview.

3. Click Execute. For information on the scheduling option, see Scheduling.

### Reorganize (SQL Server Full-text Catalogs)

This action builds and submits a basic ALTER FULLTEXT CATALOG catalogname REORGANIZE statement, with no additional options or arguments. This lets you merge smaller indexes into a larger, master index.

**To reorganize a full-text catalog:**

1. Initiate a Reorganize action against one or more full-text catalogs. For more information, see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Displays the catalogs you selected.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lets you review the objects potentially impacted by this action. For more information, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Reorganize (Sybase ASE Indexes and Tables)

The Reorganize dialog lets you reduce query processing time against tables. This functionality is available for both tables and indexes.

For more information, see
- Reorganizing Sybase ASE Tables
- Reorganize Sybase ASE Indexes

Reorganizing Sybase ASE Tables

This action lets you build and submit one of four REORG subcommands: FORWARDED_ROWS, RECLAIM_SPACE, COMPACT, or REBUILD. REORG optimizes the use of table space and improves performance.

The Reorganize Table dialog lets you reduce the query processing time against a table by reorganizing the table to ensure that space is properly allocated to it. For lengthy reorganization processes, this dialog box also lets you execute a process in increments, lets you resume an incomplete process, and lets you specify the duration of each increment. For more information, see Incremental Reorganizations.

**Tip:** Frequent update activity on a table can cause data rows to migrate and to chain over multiple data pages. Chained or forwarded rows can degrade performance because more physical reads are required to access a row of data. Consequently, you should monitor chained rows regularly to spot performance bottlenecks before they become severe. In addition, altering physical storage parameters can lead to fragmentation of space on your data pages, which also results in reduced performance levels.

You should consider reorganizing a table if you are experiencing slow performance due to:
- A large number of chained or forwarded rows on your data pages
- A large amount of fragmentation in your data pages

**Note:** You can reorganize tables in Sybase ASE versions 12 and 12.5.

The table below describes the options and functionality on the Reorganize Table dialog:
Reorganize /Reorg

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Compact</strong></td>
<td>Lets you reclaim space and undo row forwarding. Minimizes interference with other activities by using multiple small transactions of brief duration. Each transaction is limited to eight pages of reorg processing. These three commands also provide resume and time options that allow you to set a time limit on how long a reorg runs and to resume a reorg from the point at which the previous reorg stopped, making it possible to use a series of partial reorganizations at off-peak times to reorganize a large table. For information on result options, see Incremental Reorganizations.</td>
</tr>
<tr>
<td><strong>Reclaim Space</strong></td>
<td>Lets you reclaim unused space resulting from deletions and row-shortening updates on a page. Minimizes interference with other activities by using multiple small transactions of brief duration. Each transaction is limited to eight pages of reorg processing. These three commands also provide resume and time options that allow you to set a time limit on how long a reorg runs and to resume a reorg from the point at which the previous reorg stopped, making it possible to use a series of partial reorganizations at off-peak times to reorganize a large table. For information on result options, see Incremental Reorganizations.</td>
</tr>
<tr>
<td><strong>Rebuild</strong></td>
<td>Lets you undo row forwarding and reclaim unused page space. It also rewrites all rows to comply with the target table’s clustered index, writes rows to data pages to comply with space management setting changes (via sp_chgattribute), and drops and re-creates all the target table’s (or tables’) indexes. Reorg rebuild holds an exclusive table lock for its entire duration. On a large table this can be a significant amount of time. However, reorg rebuild accomplishes everything that dropping and re-creating a clustered index does and takes less time. In addition, reorg rebuild rebuilds the table using all of the table’s current space management settings. Dropping and re-creating an index does not use the space management setting for reservepagegap. In most cases, reorg rebuild requires additional disk space equal to the size of the table it is rebuilding and its indexes.</td>
</tr>
<tr>
<td><strong>Undo Row Forwarding</strong></td>
<td>Lets you undo row forwarding, a process that occurs when an update increases a row’s length in a data-only-locked table such that the row is too large to fit on its original page.</td>
</tr>
<tr>
<td><strong>Options</strong></td>
<td>Start at the point where a previous reorg left off - Select to resume a previously initiated but incomplete partial reorganization. Then specify the duration for which you want the resumed reorganization to continue before stopping again. This box is disabled for the rebuild command.</td>
</tr>
</tbody>
</table>

**Incremental Reorganizations**

If target tables are too long to reorganize in one session, you can reorganize them in increments over multiple sessions by specifying a maximum duration for each session. After tables are reorganized for the specified duration, the operation stops until you resume it again from the Options box of the Reorganize Table dialog. The Options box lets you specify to resume a previously initiated but incomplete partial reorganization. It also lets you specify the duration for which you want a resumed reorganization to continue before stopping again. The Option box is disabled for the rebuild command.

**Note:** The duration you specify refers to elapsed time, not CPU time.
In the option box, if you select the check box without specifying a duration, the reorg executes at the point where the previous reorg stopped and continues to the end of the target tables. If you clear the check box and specify a duration, the reorg starts at the beginning of the target tables and continues for the specified number of minutes. If you select the check box and specify a duration, the reorg runs from the point where it last left off, and continues for the specified number of minutes.

**Note:** If you reorganize a table using one command (Compact, Reclaim Space, or Undo Forwarding) for a specified duration, you cannot resume the process from its resume point using a different command. For example, you cannot compact a table for an hour, and then reclaim space on the remainder of the table. A resumed reorganization process must utilize the same command from start to finish. Selecting a different command begins a new reorganization process.

**Caution:** While this option lets you reorganize a large table in multiple manageable pieces, any updates to the table between reorganization runs can cause pages to be skipped or processed more than once.

### Reorganize Sybase ASE Indexes

The **Reorganize Index** dialog lets you reduce the query processing time against a table by running a reorg rebuild command on the target index.

This operation:
- Undoes row forwarding and reclaim unused page space
- Rewrites all rows in the table to comply with the table's clustered index
- Writes rows to data pages to comply with space management setting changes (via `sp_chgattribute`)
- Drops and re-creates the table's indexes

Reorg rebuild holds an exclusive table lock for its entire duration. On a large table this can be a significant amount of time. However, reorg rebuild accomplishes everything that dropping and re-creating a clustered index does and takes less time. In addition, reorg rebuild rebuilds the table using all of the table's current space management settings. Dropping and re-creating an index does not use the space management setting for `reservepagegap`. In most cases, reorg rebuild requires additional disk space equal to the size of the table it is rebuilding and its indexes.

### Reorg Index (DB2 z/OS)

This action lets you build and submit a `REORG INDEX` utility call.

**Note:** Before using this action consult IBM documentation for details on REORG INDEX utility options. For online access to DB2 documentation, see [Accessing Third Party Documentation](#).

To **Reorganize an Index**
1. Initiate a **Set Default** action against a tablespace. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in this wizard. Note that some settings are only available based on other selections.
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Indexes</td>
<td>On opening, the list displays the index you chose to reorganize. Optionally, you can add more indexes to the list that are to be reorganized by clicking <strong>Add</strong>. Adding indexes using the <strong>Index Selector</strong> dialog is a two-step process. Use the <strong>Database Like</strong>, <strong>Index Creator</strong>, <strong>Index Like</strong>, and <strong>Match Case</strong> controls to provide a search criteria pattern and then click <strong>Query</strong> to display qualified indexes in the <strong>Index Selector</strong> list. Then select one or more indexes from the list, click <strong>Add</strong>, and close the dialog. To remove a selected index from the list to be reorganized, select the index in the list and click <strong>Delete</strong>.</td>
</tr>
<tr>
<td>Do you want the utility to be reusable</td>
<td>Select this check box to make the utility restartable.</td>
</tr>
<tr>
<td>Share Level</td>
<td>Lets you select share level that allows users to view but not modify the table data: <strong>REFERENCE</strong>, <strong>CHANGE</strong>, or <strong>None</strong>.</td>
</tr>
<tr>
<td>Deadline</td>
<td>Lets you specify a deadline for the switch phase of reorganization to start. If it is estimated that the switch phase will not start by the deadline, the reorganization terminates. <strong>None</strong> - Specifies that there is no deadline for the read-only iteration of log processing. <strong>Timestamp</strong> - Specifies the deadline for the switch phase to start processing. labeled-duration-expression - Click the ... button to open a dialog that lets you build a custom CURRENT_TIMESTAMP or CURRENT_DATE value.</td>
</tr>
<tr>
<td>Drain Specification</td>
<td>Lets you specify that DB2 drains the write claim class after the delay. The number of log records, and thus the estimated time, for a future iteration of log processing will be 0.</td>
</tr>
<tr>
<td>Fast Switch</td>
<td>Keeps the data set name unchanged and updates the catalog to reference the newly reorganized data set.</td>
</tr>
<tr>
<td>Maxro (only available with a <strong>Share Level</strong> of <strong>CHANGE</strong>)</td>
<td>Lets you DEFER or specify the maximum amount of time for the last iteration (read-only access iteration) of log processing.</td>
</tr>
<tr>
<td>Drain (only available with a <strong>Share Level</strong> of <strong>CHANGE</strong>)</td>
<td>Lets you specify drain behavior (WRITERS or ALL) at the end of the log phase after the MAXRO threshold is passed and when the last log iteration is to be applied:</td>
</tr>
<tr>
<td>Long Log (only available with a <strong>Share Level</strong> of <strong>CHANGE</strong>)</td>
<td>Lets you provide a LONGLOG value of CONTINUE, DRAIN, or TERM</td>
</tr>
<tr>
<td>Delay (only available with a <strong>Share Level</strong> of <strong>CHANGE</strong>)</td>
<td>Lets you specify the minimum interval between the time REORG sends the LONGLOG message to the console and the time REORG performs the action specified by the <strong>Long Log</strong> setting.</td>
</tr>
<tr>
<td>Timeout (only available with a <strong>Share Level</strong> of <strong>CHANGE</strong>)</td>
<td>Lets you specify a timeout option of ABEND or TERM.</td>
</tr>
</tbody>
</table>
**Leaf dist limit**

Lets you specify the value that is to be compared to the LEAFDIST value for the specified partitions of the index in SYSIBM.SYSINDEXPART. If any LEAFDIST value exceeds the specified **Leaf dist limit**, REORG is performed or, if you specify REPORTONLY, recommended.

**Report**

If selected, REORG is only recommended.

**Unload**

Specify a continue or terminate value of CONTINUE, ONLY, or PAUSE.

**Do you want to specify the stats option**

Specifies that statistics are to be collected and either reported or stored in the DB2 catalog.

**Do you want to output message to SYSPRINT**

Specifies that a set of messages is to be generated to report the collected statistics and output to SYSPRINT.

**Do you want to specify the correlation stats option**

Lets you specify a correlation-stats-spec for statistics reporting.

**Do you want to force aggregation or rollup processing to be done even though some parts do not contain data**

Specifies whether statistics are to be aggregated or rolled up when RUNSTATS is executed.

**Work DDN**

Lets you specify a DD name or a TEMPLATE name from a previous TEMPLATE control statement.

**Would you like to preformat**

Lets you specify that remaining pages are to be preformatted up to the high-allocated RBA in the index space.

3. When ready, click **Finish**.

**Reorg (DB2 z/OS Tablespaces)**

The Reorganize Tablespace Wizard reorganizes a tablespace to improve access performance and reclaim fragmented space. The wizard can also reorganize a single partition or range of partitions of a partitioned table space. You can specify the degree of access to the data during reorganization, and optionally collect inline statistics.

**Completing the Reorganize Tablespace Wizard**

To complete the Reorganize Tablespace Wizard, do the following:

1. Initiate a **Reorg** action against a tablespace. For more information see Initiating an object operation.

The **Reorganize Tablespace** Wizard opens.

2. Complete the wizard panels, and then click **Finish**.

The **Preview** dialog opens.
Reorganize Tablespace Wizard - Panel 1

The table below describes the options and functionality on this panel of the Reorganize Tablespace Wizard:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>

Reorganize Tablespace Wizard - Panel 7

The table below describes the options and functionality on this panel of the Reorganize Tablespace Wizard:
Reorganize Tablespace Wizard - Panel 6

The table below describes the options and functionality on this panel of the Reorganize Tablespace Wizard:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off Pos Limit</td>
<td>The specified value is compared to the result of the calculation ((\text{NEAROFFPOS} + \text{FAROFFPOS}) \times 100 / \text{CARDF}) for the specified partitions in SYSIBM.SYSINDEXPART for the explicit clustering indexes for every table in the specified table space. Alternatively, the values in SYSINDEXPART are checked for a single non-partitioned table space, or for each partition if you specified an entire partitioned table space as the target object. If at least one calculated value exceeds the OFFPOSLIMIT value, REORG is performed or recommended. NOTE: This option is valid for non-LOB table spaces only.</td>
</tr>
<tr>
<td>Ind Ref Limit</td>
<td>The specified value is compared to the result of the calculation ((\text{NEARINDREF} + \text{FARINDREF}) \times 100 / \text{CARDF}) for the specified partitions in SYSIBM.SYSTABLEPART for the specified table space. Alternatively, the values in SYSTABLEPART are checked for a single non-partitioned table space, or for each partition if you specified an entire partitioned table space as the target object. If at least one calculated value exceeds the INDREFLIMIT value, REORG is performed or recommended. NOTE: This option is valid for non-LOB table spaces only.</td>
</tr>
<tr>
<td>Report Only</td>
<td>The reorganization is only recommended, not performed.</td>
</tr>
<tr>
<td>Unload</td>
<td>Specifies whether the utility job is to continue processing or end after the data is unloaded. Continue - Specifies that, after the data has been unloaded, the utility continues processing. Pause - Specifies that after the data has been unloaded, processing ends. Only - Specifies that after the data has been unloaded, the utility job ends and the status in SYSIBM.SYSUTIL corresponding to this utility ID is removed. External - Specifies that after the data has been unloaded, the utility job is to end and the status in SYSIBM.SYSUTIL corresponding to this utility ID is removed.</td>
</tr>

Embarcadero Technologies
Reorganize Tablespace Wizard - Statistics Tables

The table below describes the options and functionality on this panel of the Reorganize Tablespace Wizard:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Tables</td>
<td>Lets you select tables (and columns) to collect statistics for. The sample column is editable and you can type an integer value into this column.</td>
</tr>
<tr>
<td>Add</td>
<td>Opens the <a href="#">Table Selector Dialog Box</a>.</td>
</tr>
<tr>
<td>Set Properties</td>
<td>Lets you customize the selection of columns in the selected tables.</td>
</tr>
</tbody>
</table>

Reorganize Tablespace Wizard - Statistics Indexes

The table below describes the options and functionality on this panel of the Reorganize Tablespace Wizard:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do you want to keep the dictionary?</td>
<td>A collection of language-related linguistic information used during text analysis, indexing, retrieval, and highlighting of documents in a particular language. NOTE: Available only if Continue or Pause option was specified for Unload on the previous panel.</td>
</tr>
<tr>
<td>Do you want to specify statistics?</td>
<td>Lets you include statistics for the tablespace in the SQL statement. Enabled only if Continue or Pause option was specified for Unload on the previous panel.</td>
</tr>
<tr>
<td>Do you want to output message to SYSPRINT?</td>
<td>Lets you specify to output message to SYSPRINT.</td>
</tr>
<tr>
<td>Do you want to force aggregation or rollup processing to be done even though some parts do not contain data?</td>
<td>Lets you specify to process with forced aggregation, gathered into a mass, or rollup.</td>
</tr>
</tbody>
</table>
Reorganize /Reorg

Option | Description
--- | ---
Select Index | Lets you specify the indexes and the correlation values for collecting the statistics. The sample column is editable and you can type an integer value into this column.
Add | Opens the Index Selector Dialog Box.
Set Properties | Lets you specify the correlation information for each index.

Reorganize Tablespace Wizard - Panel 7

The table below describes the options and functionality on this panel of the Reorganize Tablespace Wizard:

Option | Description
--- | ---
Punch DDN | Lets you select punch DDN from the list. Contains generated LOAD statements that let you reload the discarded data. Required if Unload External option is chosen on Panel 5.
Discard DDN | Lets you select discard DDN from the list.
Unload DDN | Lets you select DD name of the unload data set. Required unless NOSYSREC on Panel 2 or Share level CHANGE Panel 3 is selected.
Work DDN | Lets you select the DD statement for a temporary data set used for intermediate output.

Reorganize Tablespace Wizard - Panel 8

The table below describes the options and functionality on this panel of the Reorganize Tablespace Wizard:

Option | Description
--- | ---
Discard | Lets you select discard DDN from the list.
No Pad | No a character is added to fill empty space.
Add | Opens the Table Selector Dialog Box.
Set Condition | Lets you customize the selection of columns in the selected tables.

Reorganize Tablespace Wizard - Panel 8

The table below describes the options and functionality on this panel of the Reorganize Tablespace Wizard
Reorganize /Reorg

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Would you like to specify the device type?</td>
<td>Lets you specify the device type.</td>
</tr>
<tr>
<td>Do you want to specify the sort number?</td>
<td>Lets you type the number of datasets to be dynamically allocated by the sort program. The range of the text field is 0 to 2147483647.</td>
</tr>
<tr>
<td>Preformat</td>
<td>Lets you specify that the remaining pages are preformatted up to the high allocated RBA in the table space and index spaces associated with the table specified in table-name. The preformatting occurs after the data has been loaded and the indexes are built.</td>
</tr>
</tbody>
</table>

Reorganize Tablespace Wizard - Panel 9

The table below describes the options and functionality on this panel of the Reorganize Tablespace Wizard:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Punch DDN</td>
<td>Lets you select punch DDN from the list. Contains generated LOAD statements that let you reload the discarded data. Required if Unload External option is chosen on Panel 5.</td>

<tr>
<td>Discard DDN</td>
<td>Lets you select discard DDN from the list.</td>
</tr>
<tr>
<td>Unload DDN</td>
<td>Lets you select DD name of the unload data set. Required unless NOSYSREC on Panel 2 or Share level CHANGE Panel 3 is selected.</td>
</tr>
<tr>
<td>Work DDN</td>
<td>Lets you select the DD statement for a temporary data set used for intermediate output.</td>
</tr>
</tbody>
</table>

Condition Dialog Box

The **Condition** dialog lets you type free form condition text.

**Note:** The correctness of the condition text is not tested.
Repair Tables

This action builds and submits a REPAIR TABLE statement, letting you repair a corrupted table. This operation returns a standard REPAIR TABLE result set. Each returned message consists of **Table** (name), **Op** (with a value of REPAIR), **Msg_type** (STATUS, ERROR, INFO, WARNING), and **Msg_text** components.

**Platform Availability**

- **MySQL**

**To Repair a Possibly Corrupted Table**

1. On the Datasource Navigator/Explorer, expand nodes until the **Tables** node is visible.
2. In DBArtisan, if using the Datasource Explorer select the **Tables** node or if using the Datasource Navigator expand that node.
3. Right-click one or more selected tables and select **Repair Tables** from the context menu.

The **Repair Tables** dialog opens.

4. Use the following table as a guide to understanding and modifying settings in this wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td><strong>Quick</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Extended</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Use FRM file</strong></td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Displays the DDL that will execute the object action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

5. Click **Execute**. For information on the scheduling option, see Scheduling.

The results set opens on the **Results** tab of an ISQL editor window. For more information, see Using the Results Editor.
Report

DBArtisan offers two basic object reporting options:

- You can generate a simple summary of all objects of a given type for a single database. For each object, the report contains similar information to that shown in the Datasource Explorer for that object type. The report opens in a built-in HTML browser. You can find data in the report, save it, or print the report.

- You can generate a detailed report of one or more objects of a given type for a single database. For each object, the report contains information similar to that available in the object editor for that object type. In addition to opening in the built-in HTML browser, the report file is written to an .htm file.

Platform Availability

- DB2 LUW, DB2 z/OS, MySQL, ORCL, SQL SVR, SYBASE

To Generate a Summary Report on all Objects of a Selected Type in DBArtisan

1. On the Datasource Explorer, select a node corresponding to the object type you want to report on or on the Datasource Navigator expand that node.

2. Right-click an object, and then select Report from the context menu.

3. Select the Summary Report option and click OK.

The Generate Report dialog opens.

To Generate a Detail Report on One or More Objects

1. In DBArtisan, on the Datasource Navigator/Explorer, select the target object node.

2. Right-click one or more selected objects, and then select Report from the context menu.

3. If using DBArtisan, select the Detail Report option and click OK.

The Report dialog opens.

4. In Report Home Page File Name, type the report name or click Browse to locate the report.

5. Use the Append date and time stamp to report file name and Save report in date specific folders controls to ensure that the disk files are not overwritten each time you generate reports against the specified file name.

6. In Report Title, type the title that is to appear in the report.

7. If you selected multiple objects, use the Report Options controls to specify a Single HTML File for All Objects or Separate HTML Files for Each Object.

8. Click Execute.
The report opens in the built-in browser and writes a copy to disk.
Resize

The Resize dialog lets you dynamically increase the size of database devices without having to add and configure additional database devices.

Platform Availability

- SYBASE 12.5.01

**To Resize a Database Device by a Specified Number of Pages**

1. Initiate a Resize action against one or more database devices. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Resize wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Measurement Unit and Size</th>
<th>Dependencies</th>
<th>Preview</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Lets you specify the amount, in pages, kilobytes, megabytes, gigabytes, or terabytes, by which to increase the device size.</td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For more information, see Dependencies.</td>
<td>Preview the DDL generated for the operation and when ready, use the Schedule or Execute button to perform this action. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Restart (Object Action)

The Restart Sequence dialog lets you restart a sequence, starting at the value specified in the sequence definition or starting at a specified value.

Platform Availability

- DB2 LUW

To Rebuild a Stored Outline

1. Initiate a Restart action against a sequence object. For more information see Initiating an object operation.

The Restart Sequence dialog opens.

2. Select one of the following Restart Sequence options:
   - Originating Value use the value specified in the object definition
   - This value lets you specify a custom start value

3. Click Execute. For information on the scheduling option, see Scheduling.
Restart Sequence(s)

This action builds and submits an ALTER SEQUENCE... RESTART/RESTART WITH statement. This lets you reset the current value to either the initial value specified when the sequence was created, or reset it to a specified value.

Platform Availability
- SQL SVR

To reset the value of a sequence

1. Initiate a Restart Sequence(s) action against one or more sequences. For more information, see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td><strong>Start</strong> An integer that will be returned as the next value of the sequence object. The integer must be within the range specified for the sequence. If no value is provided, sequence numbering restarts with the initial value specified when the sequence was created.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lets you review the objects potentially impacted by this action. For more information, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Resynchronize

This action executes an ALTER DATABASE... FOR PROXY_UPDATE statement, forcing resynchronization of proxy tables within the proxy database.

**Note:** This functionality is available for Sybase ASE 12.5.

**To manually resynchronize proxy tables**

1. Initiate a Resynchronize action against one or more databases. For more information, see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td>Lists the database or databases you selected to resynchronize.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Lets you preview the DDL generated for the operation.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Role Activation

You can activate or deactivate roles for the current session. The Role Activation action builds and submits one or more SET ROLE commands.

Platform Availability

- ORCL, SYBASE

To Enable or Disable One or More Roles in the Current Session

1. Right-click on a connected Sybase ASE or Oracle datasource node and select Role Activation from the context menu. The Role Activation dialog opens.

2. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Panel</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Role Activation</td>
<td>The list contains entries for each role that has been granted to the current login. For information on granting/assigning roles to a login or user, see Users Editor (Oracle) and Logins Editor (Sybase ASE). To activate a role, select the Active check box associated with the role. If the role is configured to require a password, provide it in the Password box. To deactivate a role, deselect the Active check box associated with the role.</td>
</tr>
</tbody>
</table>

Preview

Preview the DDL generated for the operation and when ready, click Execute.

3. Click Execute.

Topics

- Role Wizard (Sybase ASE)
**Rotate Log**

This action signals the log-file manager to immediately switch to use of a new output file.

**Platform Availability**

PSTGRS

**To Drop an Object**

1. Initiate a **Rotate Log** action against the Logs node of a PostgreSQL datasource node. For more information see [Initiating an object operation](#).

2. When prompted to verify, click **Yes**.
Run Job (Oracle Jobs)

This action builds and submits a DBMS_SCHEDULER.RUN_JOB call, letting you run a job immediately.

Platform Availability

- ORCL 10g

To run a job immediately

1. In DBArtisan, on a connected Oracle datasource, expand the Instance and Scheduler nodes and select the Jobs node.

2. Right-click a job and select Run Job from the context menu.

3. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Select the Use current session check box to provide a USE_CURRENT_SESSION attribute value of TRUE. Deselect the Use current session check box to provide a use_current_session attribute value of FALSE.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

4. Click Execute. For information on the scheduling option, see Scheduling.
Run Job (job queues)

You can immediately run any defined job queue, regardless of its current schedule. Job Queues are built-in mechanisms that let you schedule a variety of SQL-based or command-line driven tasks.

Platform Availability

- ORCL

To Run a Job

1. Initiate a Run Job action against a job queue. For more information see Initiating an object operation.

The Run dialog opens.

2. Click Execute. For information on the scheduling option, see Scheduling.

Topics

- Enable Job (Job Queue)
- Disable Job.
Runstats Index

The Runstats Index Wizard gathers statistics on indexes. If no statistics are available, DB2 makes fixed default assumptions which may result in inefficiencies.

To ensure the effectiveness of the paths selected, you can run the wizard:

- After a table is loaded.
- After an index is physically created.
- After running **Rebuild Index** or **Reorg Index** without collecting statistics.

For more information, see **Rebuild Index (DB2 z/OS)** and **Reorg Index (DB2 z/OS)**.

- Before running **Reorg Index** with the OFFPOSLIMIT, IN DREFLIMIT, or LEAFDISTLIMIT options. For more information, see **Reorg Index (DB2 z/OS)**.

Platform Availability

- **DB2 z/OS**

To Gather Statistics on an Index

1. On the Datasource Navigator/Explorer, expand the **Tablespaces** or **Indexes** node.

DBArtisan displays objects of the selected type.

2. Right-click the target tablespace and select **RunStats Index** from the context menu.

DBArtisan opens the **RunStats Index Utility** wizard.

3. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>Select Index</strong></td>
</tr>
<tr>
<td></td>
<td>If you initiated the RunStats Index operation against one or more indexes, the target indexes are initially displayed. To check additional Indexes, click the Add button.</td>
</tr>
<tr>
<td></td>
<td><strong>Add</strong></td>
</tr>
<tr>
<td></td>
<td>Opens the <strong>Indexes Selector</strong> dialog.</td>
</tr>
<tr>
<td></td>
<td><strong>Delete</strong></td>
</tr>
<tr>
<td></td>
<td>Deletes selected index.</td>
</tr>
<tr>
<td></td>
<td><strong>Set Properties</strong></td>
</tr>
<tr>
<td></td>
<td>Opens the <strong>Set Correlation Option Dialog Box</strong> for the selected row.</td>
</tr>
</tbody>
</table>
Runstats Index

2 Select tablespaces
   If you initiated the RunStats Index operation against one or more tablespaces, the target tablespaces are initially displayed. To check additional tablespaces, click the Add button.

Add
   Opens the Object Selector Dialog Box.

Delete
   Deletes selected tablespace.

Set Properties
   Opens the Set Correlation Option Dialog Box for the selected row.

3 Access level while RUNSTATS is running
   Lets you select an access level, either Readonly or Change.

Do you want to output message to SYSPRINT?
   Lets you specify to output message to SYSPRINT.

Do you want to force aggregation or rollup processing to be done even though some parts do not contain data?
   Lets you specify to process with forced aggregation, gathered into a mass, or rollup.

4 Update Statistics
   Lets you update the catalog statistics.

History Statistics
   Lets you update the history statistics.

4. When ready, click Finish.

Set Correlation Option Dialog Box

The table below describes the options and functionality on the Set Correlation Option dialog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KeyCard</td>
<td>Collects all of the distinct values in all of the 1 to n key column combinations for the specified indexes. n is the number of columns in the index.</td>
</tr>
<tr>
<td>Frequent Item</td>
<td>Lets you add items to the grid.</td>
</tr>
</tbody>
</table>

Add
   Opens the Add Frequent Item Dialog Box

Add Frequent Item Dialog Box

The table below describes the options and functionality on the Add Frequent Item dialog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>Opens the Add Frequent Item Dialog Box</td>
</tr>
</tbody>
</table>
### Runstats Index

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Number of Columns</strong></td>
<td>Lets you type the number of columns. Default is 1.</td>
</tr>
<tr>
<td><strong>Count</strong></td>
<td>Lets you type the count. Default is 10.</td>
</tr>
</tbody>
</table>
Runstats Tablespace

The Runstats Tablespace Wizard gathers statistics on tablespaces, indexes, and columns. This information is recorded in the DB2 catalog and uses it to select access paths to data during the bind process. The wizard lets you evaluate database design and helps you decide to reorganize tablespaces or indexes.

Platform Availability

- **DB2 z/OS**

To Perform a RunStats Operation Against a Tablespace

1. On the Datasource Explorer, expand the **Tablespaces** node or in the Datasource Navigator expand that node.

   Objects of the selected type are displayed.

2. Right-click the target tablespace and select **RunStats Tablespace** from the context menu.

   The **RunStats Tablespace Utility** wizard opens.

3. Use the following table as a guide to understanding and modifying settings in the wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preliminary options</td>
<td>Database Name</td>
</tr>
<tr>
<td></td>
<td>Tablespace Name</td>
</tr>
<tr>
<td></td>
<td>Partition Number</td>
</tr>
<tr>
<td></td>
<td>Do you want to runstats on all tables in this tablespace?</td>
</tr>
<tr>
<td></td>
<td>Do you want to runstats on all indexes in this tablespace?</td>
</tr>
<tr>
<td>Table sample and key card details (Panel is displayed only if you selected Yes to either of the all indexes... or all tables... options on the first panel)</td>
<td>Table Sample</td>
</tr>
<tr>
<td></td>
<td>KeyCard</td>
</tr>
<tr>
<td></td>
<td>Add</td>
</tr>
<tr>
<td></td>
<td>Delete</td>
</tr>
</tbody>
</table>
Runstats Tablespace

Table selection (Panel is displays only if you selected No to the all tables... options on the first panel)

| **Select Tables** | Lets you select the tables in the table that runstats will be run on. The Sample column is blank initially for each row. It is editable with values between 1 - 100. The Indicator column is blank initially for each new row that is added. However if you set the custom columns for a row (via set properties button), this column shows an asterisk (*). |
| | **Add** | Opens the [Table Selector Dialog Box](#). |
| | **Delete** | Deletes the selected table(s). |
| | **Set Properties** | Lets you customize the selection of columns in the selected table(s). |

Index selection (Panel is displays only if you selected No to the all indexes... options on the first panel)

| **Select Indexes** | Lets you select index(es) for the runstats operation. |
| | **Add** | Opens the [Select Column for Table Dialog Box](#). |
| | **Delete** | Deletes selected index(es). |
| | **Set Properties** | Opens the [Set Correlation Option Dialog Box](#). |

Runstats options

| **Access level while RUNSTATS is running** | Lets you select an access level, either Readonly or Change. |
| **Do you want to output message to SYSPRINT?** | Lets you specify to output message to SYSPRINT. |
| **Do you want to force aggregation or rollup processing to be done even though some parts do not contain data?** | Lets you specify to process with forced aggregation, gathered into a mass, or rollup. |

Statistics

| **Update Statistics** | Lets you update the catalog statistics. |
| **History Statistics** | Lets you update the history statistics. |

4. When ready, click **Finish**.

Select Column for Table Dialog Box

The table below describes the options and functionality on the **Select Column for Table** dialog:
Table Selector Dialog Box

The table below describes the options and functionality on the panel of the **Table Selector** dialog.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tablespace Like</td>
<td>Displays the tablespace.</td>
</tr>
<tr>
<td>Table Creator</td>
<td>Displays the table(s) creator of the tablespace that was selected on Panel 2.</td>
</tr>
<tr>
<td>Table Name</td>
<td>Displays the table(s) of the tablespace that was selected on Panel 2.</td>
</tr>
<tr>
<td>All Columns</td>
<td>Selects all columns.</td>
</tr>
<tr>
<td>Table Selector</td>
<td>Lets you select one or more rows per table, up to 10.</td>
</tr>
<tr>
<td>Query</td>
<td>Repopulates Table Selector based on the tablespace query.</td>
</tr>
<tr>
<td>Select All</td>
<td>Selects all rows in Table Selector.</td>
</tr>
<tr>
<td>Unselect All</td>
<td>Unselects all rows in Table Selector.</td>
</tr>
<tr>
<td>Add</td>
<td>Click to add the table to the wizard.</td>
</tr>
</tbody>
</table>

Index Selector Dialog Box

The table below describes the options and functionality on the panel of the **Index Selector** dialog.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Index Creator</td>
<td>Displays the index(es) creator of the tablespace that was selected on Panel 2.</td>
</tr>
<tr>
<td>Index</td>
<td>Displays the index(es) of the tablespace that was selected on Panel 2.</td>
</tr>
<tr>
<td>Index Selector</td>
<td>Lets you select one or more rows in this list.</td>
</tr>
<tr>
<td>Query</td>
<td>Repopulates Index Selector based on the tablespace query.</td>
</tr>
<tr>
<td>Select All</td>
<td>Selects all rows in Index Selector.</td>
</tr>
<tr>
<td>Unselect All</td>
<td>Unselects all rows in Index Selector.</td>
</tr>
<tr>
<td>Add</td>
<td>Click to add the index to the wizard.</td>
</tr>
</tbody>
</table>
Schema (Object Action)

The **Schema** dialog lets you view key properties of the columns in a table or view.

**Platform Availability**
- DB2 LUW, DB2 z/OS, MySQL, ORCL, SQL SVR, SYB ASE

**To View a Column Summary for a Table or View**

1. Initiate a **Schema** action against a table or view. For more information see [Initiating an object operation](#).
Select * From

This action lets you retrieve all data contained in tables or views. Results are displayed in a row and column grid.

Platform Availability

- DB2 LUW, DB2 z/OS, MySQL, ORCL, SQL SVR, SYB ASE

To Select All Data in One or More Tables or Views

1. Initiate a Select * From action against one or more tables or views. For more information see Initiating an object operation.

For each selected table or view, a two-tabbed window opens:

- The Results tab displays the data selected from the table, in a grid similar to a spreadsheet. Right-click and toolbar options offer many of the functions provided in the Results editor. For more information, see Using the Results Editor.

- The Query tab displays the full query generated for the operation. Right-click and toolbar options offer many of the functions provided in the ISQL editor. For more information, see Using the SQL Editor.
Set Default

This function lets you set a tablespace as the default tablespace. Users created without a specified default tablespace will be assigned this default tablespace. If no default tablespace is set, users created without a specified tablespace will have their default tablespace set to SYSTEM.

Platform Availability
  - ORCL 10g ^

To Set a Tablespace as the Default

1. Initiate a Set Default action against a tablespace. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Set Default wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td>Verify that the panel displays the tablespace to be set as default.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Review the referring and referred objects that will be automatically resolved when you execute this operation. For more information, see Dependencies.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Preview the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>
Set Integrity

DB2 SET INTEGRITY statement support lets you perform tasks such as taking tables into and out of set integrity pending state, placing tables into full access state, and pruning the contents of one or more staging tables.

**Note:** This operation should not be performed without an in-depth understanding of the SET INTEGRITY statement. For online access to DB2 documentation, see [Accessing Third Party Documentation](#).

**Platform Availability**
- DB2 LUW

**To Open the Set Integrity Wizard**

1. On the Navigator/Explorer, expand a DB2 database, and click or expand the Table node.

2. Select the appropriate table(s), right-click, and choose Set Integrity from the menu. You can select more than one table by clicking CTRL + the tables you want.

**OR**

Select the appropriate table, click **Command** on the toolbar, and then choose **Set Integrity** from the drop-down menu.

The table below lists all fields you can see in the Set Integrity Wizard. Depending on the options you choose, you may not see them all.
Set Integrity

### Required Field

<table>
<thead>
<tr>
<th>Tables</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>Tables</td>
<td>The list of one or more tables you selected appear.</td>
</tr>
</tbody>
</table>

### Integrity Option

<table>
<thead>
<tr>
<th>Integrity Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>When selected, tables have their foreign key and check constraints, and column generation disabled and so are put in a pending state. This also means materialized query or staging tables are not immediately refreshed and are put in a pending state. <strong>TO DATALINK RECONCILE PENDING</strong>--When selected, DATALINK integrity is disabled and tables are put in a check pending no access state. Dependent and descendant tables are not affected. <strong>IMMEDIATE CHECKED</strong>--This turns on a table’s integrity checking turned on. Any checking that was deferred is carried out. <strong>FULL ACCESS</strong>--Tables become fully accessible as soon as the SET INTEGRITY statement executes. <strong>PRUNE</strong>--This is appropriate only for staging tables. The content of the staging table is pruned and set to an inconsistent state. If any table in the table-name list is not a staging table, an error is returned. <strong>UNCHECKED</strong>--Allows you turn on some or all integrity checking but the table will not be checked for integrity violations. This can affect data integrity.</td>
</tr>
</tbody>
</table>

### Table Readability/Cascade/Descendent Types

<table>
<thead>
<tr>
<th>Specifies the readability of the table while it is in check pending state:</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO ACCESS</td>
<td>The table(s) are put in a check pending no access state so read/write access to the table is prohibited. <strong>READ ACCESS</strong>--The table(s) are put in a check pending read state. This allows read access to the non-appended portions of any tables.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Specifies whether to be immediately cascaded to all descendents</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CASCADE IMMEDIATE</td>
<td>The check pending state for foreign key constraints is immediately extended to descendant foreign key constraints or to materialized query or staging tables. <strong>CASCADE DEFERRED</strong>--Only the selected tables are put in the check pending state. Descendant foreign key, materialized query, or staging tables remain unchanged.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Descendent Types</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Materialized Query Tables</td>
<td>When selected, the check pending state is immediately cascaded to only descendant materialized query tables. <strong>Foreign Key Tables</strong>--When selected, the check pending state is cascaded immediately only to descendant foreign key tables. <strong>Staging Tables</strong>--When selected, the check pending state is cascaded immediately only to descendant staging tables.</td>
</tr>
</tbody>
</table>

Check Appended Portion?
Set Integrity

Do you want to check on the appended portion (if any) of the table?

Default/Yes/No/Force Generated--If you do not specify this generated column current values will be compared to the computed value of the expression as if an equality check constraint existed. If this is specified, generated columns are computed only for the appended portion. Prune--Possible only for staging tables. When you check this, the contents of the staging table are pruned and the staging table is set to an inconsistent state.

Full Access--When selected, tables will become accessible after the SET INTEGRITY statement executes.

Specify Exception Tables

List of Base Tables Any row that is in violation of a foreign key or check constraint is copied to the exception table you select.

Integrity Options: IMMEDIATE UNCHECKED

IMMEDIATE UNCHECKED options

Foreign Key--These constraints are turned on when the table is removed from check pending status. Check--Check constraints are turned on when the table is removed from check pending status. Datalink Reconcile Pending--DATALINK integrity constraints are turned on when the table is removed from check pending status. Materialized Query--Immediate refreshing is turned on for a materialized query table when it is removed from a check pending state. Generated Column--When the table is removed from check pending status, generated columns are turned on. Staging--Immediate propagation is turned on for a staging table.

Do you want tables to become fully accessible after the SET INTEGRITY statement executes?

Yes/No

3. When ready, click the Finish button to preview and submit the generated DDL. For more information, see Preview.
Set Online/Offline

The Set Database(s) Online/Offline dialog lets you disable your databases to prevent access, and enable your databases to grant access through the Datasource menu.

Platform Availability
- SQL SVR, SYB ASE

Important Notes
For Sybase ASE, you can only set databases online.

To Set One or More Databases Online or Offline
1. Initiate a Set Online/Offline action against one or more databases. For more information see Initiating an object operation.
2. Use the following table as a guide to working through the panels of the Set Online/Offline dialog

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Set offline (SQL Server only)</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Set UNDO Tablespace dialog lets you dynamically set an UNDO tablespace if the tablespace is running in AUTO UNDO mode.

Platform Availability
- ORCL 9i

To Dynamically Set an UNDO Tablespace

1. Initiate a Set Undo action against a tablespace. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying the settings on the Set Undo Tablespace wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Displays the tablespace you selected to be set as an Undo tablespace.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated from your choices. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Shrink

For details on using Shrink operations to save or reclaim space, see the following topics:

- Shrink SQL Server databases
- Shrink Oracle rollback segments
- Shrink Oracle tables or indexes

Shrinking SQL Server databases

You can reclaim space from a database that is too large.

To Shrink a SQL Server Database

1. Initiate a Shrink action against one or more databases. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying the settings on the Shrink wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Displays the databases you selected and lets you work with the following settings:</td>
</tr>
<tr>
<td>Move data pages to beginning of file before shrink</td>
<td>Select to move data pages to the beginning of the file before the shrink.</td>
</tr>
<tr>
<td>Release All Unused Space</td>
<td>Deselect to set the target free space to retain, and then in the Target Free Space to Retain (percent) box, type the new value of free space to retain. The new size for the database must be at least as large as the Minimum Allowable Size displayed in the Current File Size box.</td>
</tr>
<tr>
<td>Target free space percent after shrink</td>
<td>Lets you specify the target free space percent after the shrink.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated from your choices. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the other options, see Preview and Scheduling.

Shrinking Oracle rollback segments

You can shrink the size of rollback segments. The proper sizing of rollback segments is critical to their overall performance. Performance degrades whenever a rollback segment must extend, wrap or shrink in response to transaction loads. Ideally, you want to make the extents of rollback segments as small as possible while still ensuring that each transaction can fit into a single extent.
Shrink

After an abnormally large transaction load, you might consider shrinking a rollback segment to eliminate unnecessary space. Oracle lets you shrink a rollback segment manually by a specific amount or back to its Optimal Size.

**Important Notes**

For Oracle 9 or later, Shrink is not available if auto-UNDO management is enabled.

**To Shrink the Size of One or More Rollback Segments**

1. Initiate a **Shrink** action against one or more rollback segments. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying the settings on the **Shrink** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td>Displays the rollback segments you selected and lets you work with the following settings:</td>
</tr>
<tr>
<td>Specify the size...</td>
<td>If you do not provide a specific number the Rollback Segment uses the OPTIMAL value specified in the Storage clause. If an OPTIMAL value is not specified, the size defaults to the MINEXTENTS value of the Storage clause.</td>
</tr>
</tbody>
</table>

   **Preview** Preview the DDL generated from your choices. For more information, see [Preview](#).

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).

**Shrinking Oracle tables or indexes**

You can shrink the size of tables or indexes.

**Important Notes**

Shrink is only available for tables in which the **Row Movement** property is enabled. For information on setting the **Row Movement** when creating or editing a table, see [Tables Wizard (Oracle)](#) and [Tables Editor (Oracle)](#).

**To Shrink the Size of One or More Indexes or Tables**

1. Initiate a **Shrink** action against one or more indexes or tables. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying the settings on the **Shrink** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td>Displays the objects you selected and lets you work with the following settings:</td>
</tr>
<tr>
<td><strong>Compact</strong></td>
<td>Enable <strong>Compact</strong> to restrict shrinking to defragmenting the segment space and compact rows.</td>
</tr>
</tbody>
</table>
Shrink

**Cascade** Enable **Cascade** to simultaneously shrink all dependent objects.

**Dependencies** Lists referring and referenced objects potentially impacted by the change. For details, see [Dependencies](#).

**Preview** Preview the DDL generated from your choices. For more information, see [Preview](#).

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Start Database

The Start Database dialog lets you start a database:

- When the database that has been stopped with a Stop Database dialog. For more information, see Stop Database.
- After a tablespace, partition, or index has been placed in group buffer pool RECOVER pending status (GRECP) or if pages have been put on the logical page list (LPL) for that object.

Depending on the specified options, the database can be made available for read-only processing, read-write processing, or utility-only processing. In a data sharing environment, the command can be issued from any DB2 on the group that has access to the database.

Platform Availability

- DB2 z/OS

To Start a Database

1. In DBArtisan, Datasource Explorer, select the Databases or Tablespaces node or in the Datasource Navigator expand one of those nodes.

2. Right-click the target object and select Start Database from the context menu.

The Start Database dialog opens.

3. Use the following table as a guide to understanding and settings options on this dialog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database Grid</td>
<td>The Partition column is editable and can include one or more unique numeric values separated by commas. Initially the Partition column is blank. No validation is made for the correctness of partition numbers so make sure that the partitions exist.</td>
</tr>
<tr>
<td>Access</td>
<td>Lets you select access options of Read/Write, Read only, Utility only or Force.</td>
</tr>
</tbody>
</table>

4. Click Execute. For information on the scheduling option, see Scheduling.
Stop Database

The Stop Database dialog lets you stop a database, optionally letting you allow running applications access until their next COMMIT.

Platform Availability

- DB2 z/OS

To Stop a Database

1. On the DBArtisan Datasource Explorer, select the Databases or Tablespaces node or in the Datasource Navigator expand one of those nodes.

2. Right-click the target object and select Stop Database from the context menu.

The Stop Database dialog opens.

3. Use the following table as a guide to understanding and settings options on this dialog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database Grid</td>
<td>The Partition column is editable and can include one or more unique numeric</td>
</tr>
<tr>
<td></td>
<td>values separated by commas. Initially the Partition column is blank. No</td>
</tr>
<tr>
<td></td>
<td>validation is made for the correctness of partition numbers so make sure that</td>
</tr>
<tr>
<td></td>
<td>the partitions exist.</td>
</tr>
<tr>
<td>Stop at</td>
<td>Enabling this option sends the STOP DATABASE statement with an AT(COMMIT)</td>
</tr>
<tr>
<td>COMMIT</td>
<td>clause, allowing running applications to continue access until their next</td>
</tr>
<tr>
<td></td>
<td>commit.</td>
</tr>
</tbody>
</table>

4. Click Execute. For information on the scheduling option, see Scheduling.
Start/Stop Job (SQL Agent Job)

This action builds and submits an `sp_start_job` or `sp_stop_job` call for one or more SQL Agent jobs. It lets you immediately start or halt execution of a job.

Platform Availability

- SQL SVR

To Immediately Start or Halt Execution of One or More Jobs

1. Initiate a Start/Stop action against one or more jobs. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the Start/Stop jobs wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Select the Start check box to start the selected jobs. Deselect the Start check box to stop the selected jobs.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see [Scheduling](#).
Stop Job

This action builds and submits a DBMS_SCHEDULER.STOP_JOB call, letting you stop a job immediately.

Platform Availability

- ORCL 10g

To stop a job

1. In DBArtisan, on a connected Oracle datasource, expand the Instance and Scheduler nodes and select the Jobs node.

2. Right-click a job and select Stop Job from the context menu.

3. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>Select the Force Stop check box to provide a FORCE attribute value of TRUE forcing the job to terminate immediately. Deselect the Use current session check box to provide a FORCE attribute value of FALSE.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

4. Click Execute. For information on the scheduling option, see Scheduling.
Switch Logfile

The Switch Logfile action issues an ALTER SYSTEM SWITCH LOGFILE statement. This forces a log switch to make the currently active group inactive and available for maintenance activities.

Platform Availability

- ORCL

To Force a Log Switch

1. Select or expand the Storage node and select the Redo Log Groups node
2. Right-click one or more selected objects and select Switch Logfile from the context menu.

The Preview: Switch Logfile dialog opens.
3. Click Execute.

Topics

- Take Checkpoint
Switch Online

The Switch Online dialog lets you access a tablespace by switching it online after the parent container(s) have been recovered or restored.

Platform Availability

- DB2 LUW

To Switch a Tablespace Online:

1. Initiate a Switch Online action against one or more tablespaces. For more information see Initiating an object operation.

The Switch Online dialog opens.

2. Click Execute. For information on the scheduling option, see Scheduling.
Take Checkpoint

The Take Checkpoint action issues an ALTER SYSTEM CHECKPOINT statement. This forces a fast database checkpoint.

Platform Availability

- **ORCL**

To Force a Fast Database Checkpoint

1. Select or expand the **Storage** node and select the **Redo Log Groups** node
2. Right-click one or more selected redo log groups and select Take Checkpoint from the context menu.

The **Preview: Take Checkpoint** dialog opens.
3. Click **Execute**.

Topics

- **Switch Logfile**
Transfer Ownership

An object owner or a user with SECADM authority can transfer ownership of an object to another user. The new user is automatically granted the same privileges as the former owner. Ownership can be transferred on an object-by-object basis or you can transfer all objects currently owned by an individual user.

Platform Availability and object type support

- **DB2 LUW 9.1**

The following table lists the object types that support ownership transfer:

<table>
<thead>
<tr>
<th>Aliases</th>
<th>Check Constraints</th>
<th>Event Monitors</th>
<th>Foreign Keys</th>
</tr>
</thead>
<tbody>
<tr>
<td>Functions</td>
<td>Indexes</td>
<td>Primary Keys</td>
<td>Procedures</td>
</tr>
<tr>
<td>Materialized Query Tables</td>
<td>Schema</td>
<td>Sequences</td>
<td>Structured Types</td>
</tr>
<tr>
<td>Tables</td>
<td>Tablespaces</td>
<td>Triggers</td>
<td>Unique Keys</td>
</tr>
<tr>
<td>User Datatypes</td>
<td>Views</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To Transfer Ownership of an Object

1. Initiate a **Transfer Ownership** action against one or more supported objects (see table above). For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying settings in the **Transfer Ownership** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action options</td>
<td>If you initiated the ownership transfer against a user, select the specific objects belonging to that user that are to be assigned to a new user. Use the <strong>New Owner</strong> dropdown to select a defined user as the new owner of the selected object or objects.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated for the operation. For more information, see <strong>Preview</strong>.</td>
</tr>
</tbody>
</table>
Truncate

This action lets you quickly delete the rows of one or more tables or clusters. Truncating a table is a faster alternative to deleting all of its rows.

Caution: If you truncate a table, all the rows are deleted. These rows are not logged as individual drops and cannot be recovered from a transaction log or other type of log.

Platform Availability

- DB2 LUW, DB2 z/OS, MySQL, ORCL, SQL SVR, SYBASE

To Truncate a Table or Cluster

1. Initiate a **Truncate** or **Truncate Table** action against one or more tables or clusters. For more information see [Initiating an object operation](#).

The **Truncate** wizard/dialog box opens.

2. For help with DBMS-specific settings and additional information, see the following topics:
   - [Notes on truncating Oracle objects](#)
   - [Notes on truncating Sybase ASE objects](#)
   - [Notes on truncating IBM DB2 z/OS objects](#)

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).

Notes on truncating Oracle objects

You can truncate any table or cluster in their schema or, if you have the DROP ANY TABLE system privilege, you can truncate any table in any schema.

Observe the following when truncating tables or clusters:

- Before truncating a cluster or table containing a parent key, disable all referencing foreign keys existing in different tables.
- Truncating a cluster or table does not generate any rollback information and commits immediately.
- Oracle alters the storage parameter NEXT to the size of the last extent deleted from the segment.
- Oracle automatically deletes all data in the table's indexes and any materialized view direct-load INSERT information associated with a truncated table.
- If the table is not empty, all associated nonpartitioned indexes and all partitions of associated global partitioned indexes are marked unusable.
- You cannot truncate a hash cluster nor can you truncate individual tables in a hash cluster or an index cluster.
When you truncate a table or cluster, you can specify whether space currently allocated for the table is returned to the containing tablespace or if it is returned to the system. The table below describes the Truncate dialog options available when truncating an Oracle table or cluster:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drop Storage</td>
<td>Select if you want the freed extents returned to the system where they can be used by other objects.</td>
</tr>
<tr>
<td>Reuse Storage</td>
<td>Select if you want the space to remain allocated to the table or cluster you have just truncated.</td>
</tr>
</tbody>
</table>

**Notes on truncating Sybase ASE objects**

Truncate against a Sybase ASE table can be applied to the entire table or to a single partition.

*Note:* You cannot truncate a table referenced by a foreign key constraint. Instead, use a DELETE statement without a WHERE clause.

*Tip:* When you truncate a table, Sybase ASE removes all rows from the target table, but retains the table structure (its indexes, columns, constraints, etc.). The counter used by an identity for new rows is reset to the seed for the column. To retain the identity counter, use a DELETE statement instead of TRUNCATE. To remove the target table definition and its data, use a DROP TABLE statement.

The following table shows the settings on the Truncate Table dialog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Partition Name</td>
<td>Selecting a partition name from the dropdown restricts the truncate operation to a single partition.</td>
</tr>
</tbody>
</table>

**Notes on truncating IBM DB2 z/OS objects**

When truncating an IBM DB2 z/OS table, the **Action Options** tab offers the following settings:
## Truncate

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Reuse Storage</strong></td>
<td>Corresponds to the DROP STORAGE/REUSE STORAGE clause of a TRUNCATE TABLE statement. This setting specifies whether storage currently allocated to the table is reused or dropped.</td>
</tr>
<tr>
<td><strong>Restrict When Delete Triggers</strong></td>
<td>Corresponds to the RESTRICT WHEN DELETE TRIGGERS/IGNORE DELETE TRIGGERS clause of a TRUNCATE TABLE statement. When enabled, an error is returned if triggers are defined for the table. When disabled, triggers defined for the table are not activated by the Truncate operation.</td>
</tr>
<tr>
<td><strong>Immediate</strong></td>
<td>Corresponds to the IMMEDIATE clause of a TRUNCATE TABLE statement. If enabled, the truncate operation is executed immediately and cannot be undone. If disabled, a Rollback can undo the Truncate operation.</td>
</tr>
</tbody>
</table>
Unbind From Temporary Database

This action builds and submits a `sp_tempdb unbind` system procedure call. It lets you unbind a login from a temporary database.

Platform Availability

- SYBASE

To Unbind a Login from a Temporary Database

1. Initiate a Unbind From Temporary Database action against one or more logins. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying settings in the Unbind From Temporary Database wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Displays the logins you selected for unbinding.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

3. Click Execute. For information on the scheduling option, see Scheduling.
Undrop Disk

This action builds and submits an ALTER DISKGROUP... UNDROP statement. This lets you cancel pending drops of disks in one or all disk groups.

**Note:** Before this object action is available you must have a direct connection to the ASM instance. For details, see [Manage ASM Connection](#).

### Platform Availability
- **ORCL 10g**

### To Cancel Pending Disk Drops
1. On a connected Oracle datasource, expand the Instance and ASM nodes.
2. Right-click the Disk Groups node and select Undrop Disk from the context menu.
3. Use the following table as a guide to understanding and modifying settings in the dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action options</strong></td>
<td>Undrop all - If unselected, this action applies only to the disk group you initiated the action against. If selected, the action is applied to disks in all disk groups on this ASM instance.</td>
</tr>
<tr>
<td><strong>Dependencies</strong></td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td><strong>Preview</strong></td>
<td>Displays the DDL that will execute the object action. For details, see Preview.</td>
</tr>
</tbody>
</table>

4. Click Execute. For information on the scheduling option, see [Scheduling](#).
Unmirror

The Unmirror operation lets you execute a DISK UNMIRROR command against a database device, suspending disk mirroring. Options include specifying the primary or secondary device, and whether unmirroring is permanent or temporary.

Platform Availability

- SYBASE

To Suspend Mirroring for a Database Device

1. Initiate an **Unmirror** action against a database device. For more information see [Initiating an object operation](#).

2. Use the following table as a guide to understanding and modifying the settings on the **Unmirror** wizard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Options</td>
<td>Displays the database device you selected and lets you work with the following settings:</td>
</tr>
<tr>
<td>Side</td>
<td>Specifies whether to disable the PRIMARY device or the SECONDARY, or mirror, device.</td>
</tr>
<tr>
<td>Mode</td>
<td>Specifies RETAIN (unmirroring is temporary) or REMOVE (unmirroring is permanent).</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see <a href="#">Dependencies</a>.</td>
</tr>
<tr>
<td>Preview</td>
<td>Preview the DDL generated from your choices. For more information, see <a href="#">Preview</a>.</td>
</tr>
</tbody>
</table>

3. Click **Execute**. For information on the scheduling option, see [Scheduling](#).
Unquiesce

The Unquiesce operation lets you restore user access to a single database or all databases of an instance previously quiesced.

**Platform Availability**

- **DB2 LUW**

**Note:** RUnquiesce Database for supported servers from IBM DB2 for Windows/Unix 7 or earlier clients is not supported.

**To Restore User Access to a Database**

1. Take one of the following actions, based on whether you are unquiescing a single database or all databases on an instance:
   - Right-click a datasource node and select *Command > Unquiesce* from the context menu.
   - Right-click the Instance node, select *Command > Unquiesce* from the context menu, and provide credentials if prompted.

   The **Unquiesce Database** or **Unquiesce Database** dialog opens.

2. Click **Execute**.

**Topics**

- **Quiesce**
Update Statistics

The **Update Statistics** dialog lets you update the statistics for an active table or index. As indexes grow and shrink in response to data modification, the accuracy of their statistics can deteriorate.

The following topics provide details on updating statistics by supported DBMS and object type:

- **Updating statistics for tables or indexes (IBM DB2 for Linux, Unix, and Windows version 8.2.2)**
- **Updating statistics for views (IBM DB2 for Windows, Unix, and Linux)**
- **Updating statistics for databases, indexes, or tables (Microsoft SQL Server)**
- **Updating statistics for indexes or tables (Sybase ASE)**

## Updating statistics for tables or indexes (IBM DB2 for Linux, Unix, and Windows version 8.2.2)

**To Update Statistics for an Index or Table**

1. Initiate an **Update Statistics** action against one or more tables or indexes. For more information see [Initiating an object operation](#).

The **Update Statistics** dialog opens.

2. Use the following table as a guide to understanding and modifying the settings in this dialog.

<table>
<thead>
<tr>
<th>Tab</th>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Options</td>
<td>Update table statistics</td>
<td>Updates table statistics.</td>
</tr>
<tr>
<td>Distribution Options</td>
<td></td>
<td><strong>Do not collect column statistics</strong> - Column statistics provide information that the optimizer uses to choose the best access plans for queries. <strong>Collect column statistics on key columns only</strong> - Collects column statistics on columns that make up all the indexes defined on the table. <strong>Collect column statistics on all columns</strong> - Collects column statistics for all columns. Column statistics provide information that the optimizer uses to choose the best access plans for queries. <strong>Frequency</strong> - Lets you specify the maximum number of frequency values to collect, between 1 and 32767. <strong>Quantiles</strong> - Lets you specify the maximum number of distribution quantile values to collect, between 1 and 32767.</td>
</tr>
</tbody>
</table>
Update Statistics

**Column Options**

- **Do not collect distribution statistics** - Does not collect basic statistics or distribution statistics on the columns. **Collect distribution statistics on key columns only** - Collects both basic statistics and distribution statistics on key columns only. **Collect distribution statistics on all columns** - Collects both basic statistics and distribution statistics on all columns. For efficiency both of RUNSTATS and subsequent query-plan analysis, you might collect distribution statistics on only the table columns that queries use in WHERE, GROUP BY, and similar clauses. You might also collect cardinality statistics on combined groups of columns. The optimizer uses such information to detect column correlation when it estimates selectivity for queries that reference the columns in the group. **Exclude XML columns** - Lets you collect statistics on non-XML columns only. XML columns are not included in statistics collection.

**Index Options**

- **Update index statistics** - Lets you enable and disable statistics updates for indexes and controls the following settings:
  - **Collect extended index statistics** - Collects extended index statistics, the CLUSTERFACTOR and PAGE_FETCHPAIRS statistics that are gathered for relatively large indexes.
  - **Collect sample statistics** - A CPU sampling technique is used when compiling the extended index statistics. If the option is not specified, every entry in the index is examined to compute the extended index statistics.

**Access Options**

- **Allow read only access during collection** - Allows read only access while the statistics are being updated.
- **Allow read/write access during collection** - Allows read and write access while the statistics are being updated.

3. Click **Execute**. For information on the **Preview** option, see [Preview](#).

**Updating statistics for views (IBM DB2 for Windows, Unix, and Linux)**

For IBM DB2 for Windows, Unix, and Linux, you can update the statistics for a view.

**To Update Statistics for a View**

1. Initiate an **Update Statistics** action against one or more views. For more information see [Initiating an object operation](#).
2. Use the following table as a guide to choosing options:
### Update Statistics

<table>
<thead>
<tr>
<th>Pane</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action</strong></td>
<td>Lets you work with the following settings: <strong>Column Statistics</strong> - lets you enable or disable collection of Column Statistics update, <strong>Distribution Statistics</strong>, <strong>Frequency</strong>, and <strong>Quantiles</strong> - let you enable and disable collection of distribution statistics and provide num_freqvalues and num_quantiles <strong>RUNSTATS</strong> options <strong>Allow Write Access</strong> - lets you enable or disable write access during statistics collection.</td>
</tr>
<tr>
<td><strong>Options</strong></td>
<td><strong>Dependencies</strong> Lets you view referencing or referenced objects. For more information, see Dependencies. <strong>Preview</strong> Lets you view the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. **Schedule** or **Execute** the statistics update.

### Updating statistics for databases, indexes, or tables (Microsoft SQL Server)

You can update statistics so that Microsoft SQL Server performs the most efficient query possible. This feature updates statistical information on your database so that the query processor can determine the optimal strategy for evaluating a query. These statistics record the key values used for distribution in an database.

You can use the **Update Statistics** dialog if there is significant change in the key values in the database, if a large amount of data in an indexed column has been added, changed, or removed, or if a table has been truncated causing significant changes in the distribution of key values.

The **Update Statistics** dialog lets you specify tables and indexes for validation. This dialog box offers different update options depending on your version of Microsoft SQL Server.

**Tip:** Avoid updating statistics on your target tables during busy access periods. Microsoft SQL Server locks remote tables and indexes while reading data for update statistics.

For Microsoft SQL Server version 7 or later, the **Update Statistics** dialog lets you specify a full or a percentage of a full scan to be used for updating table or index statistics. It also lets you enable or disable future automatic recomputations of statistics. These recomputations are made at Microsoft SQL Server’s discretion. When updating statistics for tables, this dialog box also lets you specify the type of statistics you require.

**To Update Statistics for a Database, Index, or Table**

1. Initiate an **Update Statistics** action against one or more databases, indexes, or tables. For more information see Initiating an object operation.

2. Use the following table as a guide to understanding and modifying the settings in the **Update Statistics** dialog:
## Update Statistics

### Step 1: Action Options

**Scan Range** (tables and indexes only)
- **Full Scan** - Select when you want index statistics on every available row.
- **Sample Scan** - Select when database size prohibits a full scan and you can afford to rely on statistics extrapolated from a sample of all available rows.

**Sample Count** (tables and indexes only)
- If you specified a **Scan Range** of **Sample Scan**, provide a count.

**Sample Unit** (tables and indexes only)
- If you specified a **Scan Range** of **Sample Scan**, specify either `%` or **Rows**.

**Statistics Type** (tables only)
- **Index** - Select if you only require statistics on the target columns.
- **Columns** - Select if you require statistics on the target tables in their entirety.
- **All existing statistics** - Select if you require statistics on the whole database.

**Statistics Recompute** (tables and indexes only)
- Select if you want Microsoft SQL Server to recompute and update the statistics for the index as part of its normal internal maintenance. Deselect if you want the scheduling of future recomputations to be solely your responsibility.

**Dependencies** (tables and indexes only)
- Lets you view referencing or referenced objects.

**Preview**
- Lets you view the DDL generated for the operation. For more information, see Preview.

### Step 2: Settings and Tasks

3. Use the **Execute** or **Schedule** button to perform the operation.

### Updating statistics for indexes or tables (Sybase ASE)

The **Update Statistics** dialog lets you specify tables and indexes for validation. This dialog box offers different update options depending on your version of Sybase ASE.

**Tip**: Avoid updating statistics on your target tables during busy access periods. Sybase ASE locks remote tables and indexes while reading data for update statistics.

### To Update Statistics for a Database, Index, or Table

1. Initiate an **Update Statistics** action against one or more tables or indexes. For more information see **Initiating an object operation**.
2. Use the following table as a guide to understanding and modifying the settings in the Update Statistics dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Settings and tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Options</strong></td>
<td></td>
</tr>
<tr>
<td>Index (tables only)</td>
<td>Enabling this option updates statistics for indexes of the table.</td>
</tr>
<tr>
<td>Table (tables only)</td>
<td>Enabling this option updates table-specific statistics. Column statistics stored in sysstatistics are not affected.</td>
</tr>
<tr>
<td>Partition Name (available when a single index or table is selected)</td>
<td>The name of the partition to be updated.</td>
</tr>
<tr>
<td>Step Values</td>
<td>Lets you specify the number of histogram steps.</td>
</tr>
<tr>
<td>Consumers</td>
<td>Specifies the number of consumer processes to be used for a sort when a list of columns is provided and parallel query processing is enabled.</td>
</tr>
<tr>
<td>Sampling Percent</td>
<td>Specifies the percentage of the column to be randomly sampled in order to gather statistics.</td>
</tr>
<tr>
<td>Columns (available only when a single table is selected)</td>
<td>Lets you specify all columns or specific columns to be used for the operation.</td>
</tr>
<tr>
<td>Dependencies</td>
<td>Lists referring and referenced objects potentially impacted by the change. For details, see Dependencies.</td>
</tr>
<tr>
<td>Preview</td>
<td>Lets you view the DDL generated for the operation. For more information, see Preview.</td>
</tr>
</tbody>
</table>

3. Use the **Execute** or **Schedule** button to perform the operation.
View Contents

The Backup Device Information dialog lets you view the contents of a Dump or Backup Device which stores backups of databases and transaction logs.

Platform Availability

- SQL SVR

To View the Content of a Backup or Dump Device:

1. On the Datasource Explorer select the Backup Devices node or in the Datasource Navigator select that node.

2. Right-click a backup device and then select View Contents.

DBArtisan opens the Backup Device Information dialog.
View Job History

This action opens a dialog showing the execution history for a job.

Platform Availability

- SQL SVR

To View the Execution History for a Job

1. On the Datasource Navigator/Explorer, expand nodes until the Server > SQL Server Agent > Jobs node is visible.
2. Select or expand the Jobs node.

The jobs are displayed in the right pane of the Explorer window.

3. Right-click a job and select View Job History from the context menu.

The Job History dialog opens.
Coding Environments/Editors

DBArtisan provides coding environments that let you create, edit, and where appropriate, execute scripts containing for example, SQL and DDL. These windows are context sensitive to the type of script you are opening or extracting. For example, if you extract the schema for a table, DBArtisan opens a DDL Window containing the script. If you execute a script, a result window displays containing the results of your execution statement.

The following topics describe use of the DBArtisan coding environments:

- **Common Word-processing Operations** describes common editor options such as file and clipboard operations.
- **Common Coding Environment Features** describes coding environment options such as commenting and working with line numbers.
- **Using the SQL Editor** provides details on the SQL Editor.
- **Using the DDL Editor** provides details on using the SQL Editor to generate object-creation code.
Common Word-processing Operations

The following topics describe features available in all coding environments/editors:

- Clipboard Functions
- File operations
- Find/Replace Options in Coding Environments
- Regular Expressions Support
- Changing Case
- Printing Options
Clipboard Functions

The coding/scripting environments all offer the most common clipboard-related options involving selecting text, cutting, copying, and pasting text. The following topic describes the clipboard option offered:

- Cutting/Copying and Pasting Columns
Cutting/Copying and Pasting Columns

To cut or copy and then paste a column, do the following:

1. In the Editor window, position the pointer in front of the column of the target text.
2. Press ALT and simultaneously drag the pointer over the target column.
3. On the Edit menu, select Copy or Copy.
4. In the Editor window, position the pointer where you want to paste the column.
5. On the Edit menu, select Paste.
File operations

The following topics provide key information on file options available in coding environments/editors:

- Opening Files
- Inserting a File Into an Open Script
- Saving and Closing Scripts
Opening Files

All text-based editors offer an **Open File** facility. It provides dedicated support for files of the following types:

- Script (.sql), data definition language (.ddl), query (.qry), and results (.rsl) files
- Query Builder files (.eqb) - for more information see Query Builder.
- XML (.xml) and text (.txt) files
- Web (.htm, .html, .asp) files
- Procedure (.prc, .pro), VBScript (.vbs),
- J Script (.js), and Java (.java) files

**To open a supported-type file**

1. Select **File > Open**. An **Open File(s)** dialog opens.
2. Use the dialog to locate, select a file type, and select one or more files to open.

If you select a file type of **All Files**, you can open a file with a suffix not corresponding to one of the supported file types. One of two actions is taken:

- It automatically opens the file in the SQL Editor
- It prompts you for additional information on the file before opening

**Note:** The specific action taken is dictated by an Options Editor selection. For details, see ISQL Options - Main Tab.

If you selected the Options Editor setting to prompt, when you select an unknown file type for opening, a **What Type of File Is** dialog opens. The table below describes the options and functionality on the dialog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The file is a general purpose SQL script</td>
<td>Select if the unknown file is a SQL script.</td>
</tr>
<tr>
<td>The file contains the DDL to create a database object or the file contains Oracle Anonymous PL/SQL.</td>
<td>Lets you select object type and owner and provide an object name.</td>
</tr>
<tr>
<td>Always open unknown files into a SQL window without prompting.</td>
<td>Select to hide What Type of File Is Dialog Box for future unknown file types.</td>
</tr>
</tbody>
</table>

An SQL Editor or DDL Editor opens, as appropriate. For details, see the following topics:

- Using the SQL Editor
- Using the DDL Editor

For more general information, see Coding Environments/Editors.
Inserting a File Into an Open Script

The ISQL Editor facilitates the reuse of SQL scripts by letting you insert an existing file into another script.

To insert a file at the current cursor location
1. In an open editor, place the cursor where you want to insert the file.
2. Select Edit > Insert File. The Insert File into Current File dialog opens.
3. Use the dialog to locate, select a file type, and select the files to insert.

For more general information, see Coding Environments/Editors.
Saving and Closing Scripts

In DBArtisan, untitled scripts are named according to the following conventions:

<table>
<thead>
<tr>
<th>Environment</th>
<th>Default File Name</th>
<th>Default File Suffix</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQL Editor</td>
<td>SQL1...SQLn</td>
<td>.sql</td>
</tr>
<tr>
<td>DDL Editor</td>
<td>The object name provided when invoking the DDL EDitor</td>
<td>.sql</td>
</tr>
</tbody>
</table>

**Note:** If you have set the Auto-Save feature in the Options Editor, a temporary copy of your scripts is automatically saved periodically as you work. For details, see ISQL Options.

**To close a script**

1. On the on the Main menu, click **Close**.
2. If you have not saved your script, you are prompted to save the file. Click **Yes** to save and **No** to close without saving.

**Explicitly Saving a Script**

With an ISQL window open, selecting **File > Save** or **File > Save As** opens a standard Save As dialog. It lets you save a new script, save an existing script with a new name and optionally with a different file suffix. The following **Encoding** schemes are supported:

- ANSI
- UNICODE
- UTF-16LE (No BOM)
- UTF-16 Big Endian
- UTF-16BE (No BOM)
- UTF-8
- UTF-8 (No BOM)
- UTF-32 Little Endian
- UTF-32LE (No BOM)
- UTF-32 Big Endian
- UTF-32BE (No BOM)

**Automatic Save Operations**

If you shut down the application or close an editor window while there are modified, unsaved scripts, you are prompted to save before completing the operation. The table below describes the options and functionality on the **Save Modified Documents** dialog.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save All</td>
<td>Click to save documents in all open ISQL windows.</td>
</tr>
<tr>
<td>Save Selected</td>
<td>Click to save selected documents.</td>
</tr>
<tr>
<td>Invert</td>
<td>Click to clear selection.</td>
</tr>
<tr>
<td>Save None</td>
<td>Click to not save documents and close the application.</td>
</tr>
</tbody>
</table>
Find/Replace Options in Coding Environments

Each text-based editor offers basic find and find/replace text functions.

To invoke the Find or Find/Replace facility

1. With a text editor active, select **Edit > Find** or **Edit > Replace**.
2. Use the following table as a guide to working with the resulting dialog:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Find What</td>
<td>Lets you type your search string.</td>
</tr>
<tr>
<td>Replace With (Replace only)</td>
<td>Lets you type the replacement text.</td>
</tr>
<tr>
<td>Match whole word only</td>
<td>Select to search for only the complete word.</td>
</tr>
<tr>
<td>Match Case</td>
<td>Select to make the search case-sensitive.</td>
</tr>
<tr>
<td>Regular expression</td>
<td>Indicates the the find string contains regular expressions. For more information, see <a href="#">Regular Expressions Support</a>.</td>
</tr>
<tr>
<td>Wrap around search</td>
<td>Lets you search from the end of the script and back to the insertion point.</td>
</tr>
<tr>
<td>Direction</td>
<td>Lets you specify the direction you want to search. Click the <strong>Up</strong> or <strong>Down</strong> option button.</td>
</tr>
<tr>
<td>Find</td>
<td>Click to find the next occurrence of your search string.</td>
</tr>
<tr>
<td>Bookmark All (Find only)</td>
<td>Places a bookmark at each line containing the find string. For details, see <a href="#">Working with Coding Environment Bookmarks</a>.</td>
</tr>
<tr>
<td>In Selection</td>
<td>Replaces all instance of the find string with the replace string within a selected block of text.</td>
</tr>
<tr>
<td>Replace Button (Replace only)</td>
<td>Click replace the current selection.</td>
</tr>
<tr>
<td>Replace All Button (Replace only)</td>
<td>Click to automatically find and replace all occurrences of your search string within the current window.</td>
</tr>
</tbody>
</table>

Selecting **Edit > Repeat Find** finds the next instance of the most recently used find string without opening the **Find** or **Replace** dialog.
Regular Expressions Support

Some features, such as file search, SQL Editor search, and Browser list filtering, support the use of regular expressions. This provides flexibility in searches and other situations in which text string qualification is required.
